PHASA

ORGANISING COMMITTEE

CMC

The two organising partners of the 18th World Congress on Public Health established a Congress Management Committee (CMC) consisting of representatives of WFPHA, PHASA and the PCO. The CMC has the full managerial and financial management responsibility for the Congress.

Chair: Luis Eugenio de Souza

Members:
Emma Rawson - WFPHA
Raman Bedi - WFPHA
Bettina Borisch - WFPHA
Marta Lomazzi - WFPHA
Harsha Somaroo - PHASA
Laetitia Rispel - PHASA
Moeketsi Modisenyane - PHASA
Saiendhra Moodley - PHASA

ICC

The International Congress Council (ICC) consisted of the Congress Management Committee and international public health experts representing various regions of the WFPHA, international health organizations, European health non-governmental organizations and Italian universities and institutes. The ICC in particular develops, in consultation with the CMC, the scientific programme including subthemes and plenary program of the WCPH and identify speakers/panellists/moderators of the plenary sessions.

Co-chairs:

Emma Rawson - WFPHA
Bettina Borisch - WFPHA
Tracey Naledi - PHASA
Lwando Maki - PHASA

Members:
Alessano Berioni
Andre Rose
Anh Le Vu
Arachu Castro
Betty Chiu
Clothilde Oliphant
Elisabet Schuele
George Amofah
James Chauvin
Jean-Marie Okwo-Bele
Jennifer Miller
Kasia Czabanowska
Laura Magana
Laurel Baldwin Ragawan
Lekan Ayo-Yusuf
Malabika Sarker
Margareth Kaseje
Mary Codd
Meru Sheel
Michael Asuzu
Mohannad AL Nsour
Monika Kosinska
Nicholas Crisp
Ntobeko Ntusi
Olagoke Akintola
Rajen Naidoo
Rômulo Paes Souza
Saadiq Karrim
Shakira Choonara
Shiva Murugasampillay
Sikhumbuzo Mabunda
Siphokazi Mthathi
Sylla Thiam
Walter Ricciardi
Xiao-Nong Zhou
Yogan Pillay

ISC

The International Scientific Committee (ISC) consists of experienced public health experts from around the world nominated by WFPHA, PHASA. It mainly advises the ICC on scientific matters of the conference and contributes to the scientific evaluation of the conference.

Aim & Scope

Population Medicine is a double-blind peer-reviewed open access online scientific journal that encompasses all aspects of population, preventive and public health research. The journal's scope encompasses all aspects of population health, with a strong focus on domains such as epidemiology and disease burden (studies on the distribution, determinants, and control of diseases, including research on mortality, causes of death, and the prevalence of specific conditions); health behavior and lifestyle factors (population-level behaviors, substance use, and mental health); global and specific public health challenges (investigations into large-scale public health events and and public health interventions) and health systems, policy, and delivery (i.e. research focused on improving health care systems and health policy). The journal is also interested in secondary dataset analyses that can provide real world evidence.

Full Journal Title: Population Medicine
Abbreviated Title: Popul Med
ISSN (electronic): 2654-1459
Publisher: European Publishing
Publisher Address: Science and Technology Park of Crete
Peer Review: Double Blind
Publication Frequency: Quarterly from 2026 (Monthly between 2019-2025)
Publication Medium: Electronic Only
Publication website: www.populationmedicine.eu

Disclaimer: All authors are responsible for the content of their abstracts and retain copyright of their abstract under an Open Access, Creative Commons License (CC BY-NC 4.0). Each abstract is citable and identifiable through its individual Digital Object Identifier (DOI).

Shaping the future of global health without borders:
WCPH 2026 in Cape Town

The global public health community is preparing for a landmark event: **the 18th World Congress on Public Health (WCPH 2026)**, taking place in Cape Town, South Africa, from 6 to 9 September 2026. Organized by the World Federation of Public Health Associations (WFPHA) in collaboration with the Public Health Association of South Africa (PHASA), the Congress will convene leaders, practitioners, policymakers, researchers, and advocates from around the world.

Under the theme **"Health Without Borders: Equity, Inclusion, and Sustainability,"** WCPH 2026 aims to confront the pressing health challenges of our time while fostering pathways for collaborative, sustainable solutions. Hosting the Congress in Southern Africa highlights the continent's growing influence in shaping the global health agenda and provides a platform to integrate diverse regional perspectives into international dialogue.

The Congress will feature a rich program designed to inspire collaboration and innovation. Keynote presentations from internationally recognized experts will address critical public health issues, while workshops, panel discussions, and interactive sessions will explore practical strategies, foster skills development, and create opportunities for long-term partnerships. Special attention is given to students and early-career professionals, ensuring the next generation of public health leaders actively contributes to shaping the field.

We are also delighted to present a series of **Plenary Sessions** that will bring together leading voices to explore the future of public health, including:

- Equity and Health
- Economics of Democracy and Public Health
- International Law and Global Treaties in Public Health
- Primary Health Care and the Health Workforce for Sustainable Health Equity
- Public Health in Conflict, War, and Peacebuilding
- Restoring Balance: Indigenous Knowledge Systems & Decolonizing Global Health
- One Health in a Changing World
- Imaging the Future of Public Health

WCPH 2026 is more than a conference; it is a catalyst for change. By bringing together voices from every corner of the globe, the Congress will strengthen networks, amplify innovative solutions, and promote equity, inclusion, and sustainability in public health practice, policy, and research.

For further information and updates, visit the official Congress website: https://www.wcph.org.

Table of Contents

Adults & Older Adults Health 41
Risk factors for cardiovascular diseases in people of working age: results of a survey of employees 41
The effects of internet and technology use on the ability to care for own health among the U.S. populations: An analysis from the Health Information National Trends Survey (HINTS 7) 41
Assessing Resident Trauma: Evaluating Trauma Informed Practices in Nursing Homes 41
Explaining the rural–urban gap in cervical cancer screening among older women in India using Fairlie decomposition 41
Trends in Multimorbidity among Ageing Populations in the Global South: Implications for Equity and Sustainable Health Systems 42
Loneliness, Nutritional Status, and Chronic Disease in Egyptian Older Adults: A Mediation Analysis 42
Social and Health Inequities in Rural Thai Older Adults: A Qualitative Meta-Synthesis of Community-Based Health Promotion Interventions 42
Towards integrated and sustainable post-diagnostic dementia support: Insights from care partners in the Australian Capital Territory 42
My mind is not the same: Cognitive complaints during the menopausal transition in Urban South Africa 43
Ageing well at home: interconnected care and addressing challenges in regional australia 43
Experience of Body Changes and Sexuality among Middle-aged Men and Women: A Community-Based Exploratory Qualitative Study 43
Understanding Dementia Caregiving Through a Public Health Lens: A Qualitative Exploration of Caregiver Experiences 44
Social determinants of functioning and well-being in older adults: a multidimensional approach 44
Happiness, functioning, health literacy, and well-being among older adults: a study in primary health care 44
Vascular contribution to mild behavioral impairment 45
Demographic, psychosocial, and health-related factors associated with depressive symptoms in older adults receiving antiretroviral therapy in a South African metropolitan 45
Evaluating Implementation of a Culturally Adapted Peer-Led Diabetes Self-Management Program for Black Men: A Convergent Mixed Methods Feasibility Study 45
Healthy Brain Tracker: An interactive data dashboard to monitor Hawai□i's progress towards supporting individuals with cognitive decline, their caregivers, and reducing dementia risk factors 45
Afterhood and Wellbeing Among Older Gay Men: A Mixed-Methods Study 46
Predictors of frailty and multimorbidity patterns among middle-aged adults in a rural population cohort in Burkina Faso, 2015-2022: A retrospective cohort study based on an AWI-Gen population. 46
Comparative analysis of methods for identifying multimorbidity patterns in an ageing rural African population: Insights from HAALSI 46
Transcending Health Borders: A Global Community of Practice for Integrated Multimorbidity Care- Redefining Primary Care through North-South Collaboration 47
Perimenopause in the workplace: The impact of media representation and online communities on women's health literacy 47
The Influence of Lifestyle Behaviors on Health-related Quality of Life: Results of a Non-Randomized Controlled Intervention Study 47
Healthy Longevity: Global Public Health's Next Frontier 48
A portrait of social participation in defending the right to healthy aging at the National Conference on the Rights of Older Persons. 48
Effects of psychosocial factors on Swedish waste collectors musculoskeletal pain through the mediating roles of occupational fatigue and physical demands: a structural equation model 48
Association of Fruit and Vegetable Intake with All-Cause and Cardiovascular Mortality Among Hypertension Populations in China: A Cohort Study 48
The benefit of learning circle approaches to grow trust and usage of AI-supported e-health programmes for the older population: Commentaries from the Global North and South 49
Social mobilization as a strategy for strengthening policies for the elderly: the Brazilian example of the free digital education conference. 49
Building blocks for public health ethics for the older population. Reporting on a South African study 49
Key issues in safeguarding research integrity for public health research on older people. Directives from global research integrity statements 50
Gogos as agents of change: exploring the role of grandmothers as catalysts for social change and inclusive public health programming .. 50
The institutionalization process of the elderly in brazil: challenges and perspectives of family caregivers 50
Taking blood pressure in both arms - a diagnostic necessity or a time luxury? 50
Vascular intervention in presenium can decide the quality of life in a patient with peripheral arterial disease 51
Sexual health of older people (SHOP): promoting dialogue and enhancing sexual well-being in older adults 51
Community-Based Participatory Research to Strengthen Rural Older Adults' Health Care Planning in Northeastern Brazil 51
Health outcomes in Brazilian adults one year after COVID-19 infection 51
A quantitative examination of how adults with Multiple Chronic Conditions experience chronic healthcare 52
Epidemiological profile of deaths from cellulitis and mouth abscess in Brazil: 1996–2024 52
Dietary patterns and adiposity risk in young adults aged 18-49, living in urban slums in a metropolitan city in Ghana: Implications on healthy lifestyle practices 52
Do Cross-National Differences in Increasing Early-Onset Colorectal Cancer Incidence Rates Reflect Inequities in Diagnosis and Surveillance 53
Antimicrobial Resistance 53
Kenyan Undergraduate Medical Curriculum Review: Integrating Antimicrobial Resistance (AMR) and Digital Health/ Information and Communications Technology (ICT) 53
Antimicrobial stewardship in rural Zambia: insights from a two-year primary care prescribing audit 53
Advancing equitable and meaningful youth engagement in Africa's antimicrobial resistance response 53
Bridging the Policy-to-Practice Gap in One Health Approaches to Antimicrobial Resistance: A Thematic Evidence Synthesis (2020–2025) . 54
Assessing antimicrobial susceptibility profiles among enterobacterales isolates: a case study of lekma hospital 54
Accelerated emergence of dolutegravir resistance among children in Malawi: implications for antimicrobial resistance control in HIV

programmes ... 54
Environmental surveillance of diarrheagenic Escherichia coli highlights spatial patterns of antimicrobial resistance and diarrheal risk along the Buffalo River, South Africa ... 55
Antibiotic consumption in hospital healthcare sector in Kazakhstan ... 55
Nationwide study of healthcare-associated infections in Kazakhstan ... 55
Antibiogram fingerprinting of Vibrio species recovered from commercial fish specimens collected from key retailers. ... 56
Assessment of surgical antibiotic prophylaxis practices in a Tunisian surgical hospital ... 56
Antimicrobial use, perceptions, and alternative practices regarding antimicrobial resistance amongst pig farms in Gauteng Province, South Africa ... 56
Inclusive and Complementary Assessment Approaches of Antimicrobial Stewardship Programs: Balancing Global Standards and Contextual Diversity ... 56
Prescribing appropriateness and combating antimicrobial resistance: results of a stewardship program ... 57
Tackling antimicrobial resistance: an AWaRe-based intervention for acute respiratory illness in primary care for low- and middle-income countries ... 57
The localisation process of an AWaRe-based antibiotic stewardship intervention in primary care across four low- and middle-income countries ... 57
Developing and disseminating an antimicrobial resistance (AMR) 3 Part animated series ... 58
A Multi-Dimensional Evaluation of the Antimycobacterial Activity, Cytotoxicity, and Mechanisms of Action of South African Medicinal Plants Against Mycobacterium smegmatis ... 58
Strengthening AMR Governance and Promoting Equity through One Health: A Civil Society Dialogue ... 58
Healthcare-Associated Infections as a patient safety challenge: Findings from a surgical hospital in Tunisia ... 59
Integrating Social Protection into Antimicrobial Resistance Response: A Critical Review and Framework Development ... 59
AMR public health research priorities for oral health in Africa: evidence gaps and pathways for action ... 59
The Implementation of Antimicrobial Consumption Surveillance and Stewardship in Human Healthcare in Post-Soviet States: A Systematic Review ... 59
Can we reduce microbial burden in frail patient care by dry fog disinfection? ... 60
Evaluating Infection Prevention and Control Competency Among Healthcare Workers in Kenya ... 60
Microbial profile and antimicrobial resistance patterns of diabetic wound infections in Nelson Mandela Bay Metro: A retrospective multi-hospital study ... 60
Strengthening the capacity of primary health care workers to drive optimal antibiotic use in the community ... 61
Youth, Experience and Artificial Intelligence: Designing Innovative Solutions to Antimicrobial Resistance ... 61
Inappropriate antibiotic use is a social practice, not just a knowledge gap: Uncovering the 'township effect' and systemic drivers of antibiotic use in South Africa ... 61
Climate Change, Environmental, One Health and Urban Health ... 62
Assessing Health-Related Climate Resilience Using an Urbanization Index in Fast-Track Cities ... 62
Efficacy of activated carbon for ammonia gas reduction in selected poultry farms in ido local government area, ibadan, oyo state ... 62
Neighborhood environment: Analysis of the physical availability and affordability of alcoholic beverages, tobacco and tobacco products in three regions of Russia ... 62
Land Surface Temperatures at Different Time Points in Pregnancy and Their Impact on Birth Outcomes within the Mother and Child in the Environment Birth Cohort in Durban, South Africa ... 62
"This will be the cause of our death": Air pollution as a wicked problem in a low resource high vulnerability urban setting ... 63
Global application of World Health Organization's building and measurement tools for climate-resilient health system and preliminary exploration of localization practice in Beijing ... 63
Unsupervised machine learning to investigate the joint effects of SO2, NO2, O3, PM2.5 and PM10 on respiratory and cardiovascular hospital admissions in the Vaal Triangle Airshed Priority Area, South Africa ... 63
"The heat really troubles us": Community perspectives on a cool roof intervention, Umlazi, KwaZulu-Natal, South Africa 2025 ... 64
Community perceptions of climate change and health: A qualitative study in a peri-urban health and demographic surveillance site in Umlazi, KwaZulu-Natal ... 64
Forced Animal Displacements: Indian Cattle Camps as a response to extreme weather conditions ... 64
Impact of climatic variations on the global distribution and prevalence of mpox disease: analysis of data from 52 countries using linear regression and time-series forecasting analyses ... 64
Green biomanufacturing: reducing carbon footprints in vaccine and biologics production ... 65
Forecasting Lyme Borreliosis Based on Climatic Factors Using a Negative Binomial Model in the Baltic States ... 65
One Health Assessment of Biosecurity Knowledge, Attitudes, and Practices for Zoonotic Disease Prevention among Small-Scale Farmers in the North-West Province of South Africa ... 66
Assessment of the carbon footprint of meat and fish procurement in israeli hospital settings: time trends, expenditures and alternative scenarios ... 66
Sustainability and nutritional composition of food choices in a hospital canteen: pre-intervention vs. post-intervention ... 66
How much do hospital canteens waste? ... 66
Drivers of zoonotic Campylobacter transmission in slaughterhouses: Insights from Nigeria for global One Health improvement ... 67
Toward a climate-informed predictive risk assessment for occupational hazards in mining and agriculture in zimbabwe ... 67
Effect of climate change on indigenous mental well-being from a one health perspective using a mixed methods approach ... 67
Use of Climate Information Services as a Decision-Making Tool for Monitoring Meningitis Outbreaks in Africa ... 68
Comparative assessment of PM2.5 and carcinogenic trace elements across four South African sampling sites ... 68

Climate & Health 101: Foundations for Public Health Action in a Warming World 68
Replacing traditional proteins with alternative protein foods: Results of two systematic reviews on psychosocial and environmental determinants 68
There is Nothing "Natural" about these Disasters: The Need for a Decolonial and Harm Reduction Approach in the times of Climate Crisis 69
Structural syndemics: from diagnosis to action on inequality, climate, and health sovereignty in Africa 69
Flood and Wellbeing – What is the Evidence? 69
Mapping Areas of High Risk for Waterborne Zoonoses in the Eastern Cape: Integrating Multi-Criteria Decision Analysis with GIS to Identify Critical Rivers 69
Where does public health go after the UN Framework Convention on Climate Change summit in Belem, Brazil (CoP30)? Opportunities arising from the International Court of Justice advisory opinion and a UN General Assembly Special Session on climate change 70
Climate Change and Health Adaptation: China's Practice 70
How to effectively co-create complex interventions for dual benefits of climate change and health? 70
Healthcare access vulnerability in groundwater-dependent regions: preliminary methods for a surveillance framework from the American High Plains aquifer 71
Strengthening One Health Governance for Pandemic Preparedness in a Changing Climate 71
Assessing the prevalence of Schistosoma mansoni infections among school-going children aged 5-14 years old in Nelson Mandela Bay: A comprehensive diagnostic approach. 71
Environmental exposure disparities in urban markets: A comparative air quality assessment in Lusaka, Zambia 72
Mercury as a Global Pollutant and its Lasting Effects on A Community, 35 Years Later 72
Sex Differences in the Association Between Typical Winter Ambient Temperature and Physical Activity in China: A Nationwide Study 72
Short-term effects of temperature and air pollution on childhood asthma exacerbations in Cape Town, South Africa 73
Migrant participation in addressing health challenges in a Chilean urban squatter settlement 73
Self-reported pesticide exposure and male reproductive development among boys in rural Western Cape, South Africa 73
Transition to sustainable diets in European food systems: stakeholders' perspective on determinants of alternative protein intake 73
ORGANISED SCIENTIFIC PANEL- 'ONE-HEALTH APPROACH SNAKEBITE MITIGATION' 74
Heatwave-related mortality among older Australians: A Two-Stage Small-Area Time Series Analysis 74
Co-designing a mobile cooling hub to reduce heat-health risks among people experiencing homelessness. 74
The Relationship between Organophosphate Pesticide Exposure and Anthropometric Outcomes among a Cohort of Children from Four Informal Settlements in the Western Cape 75
The association of joint effects of air pollution on cardiovascular and respiratory disease hospital admissions in cape town: 2011- 2016.. 75
Heat Stress in Early Childhood Development Centres in an Urban Informal Settlement in Tshwane, South Africa: Emerging Risks in a Warming Climate 75
Effects of climate change on health system, policy response, and factors hindering policy formulation in Malawi: A qualitative study. 75
Climate Change and Extreme Heat in Early Childhood Development Centres: Preschool Teachers' Awareness and Health Perceptions in an Urban Informal Settlement 76
Association between climate change and mental health outcomes in school-aged children: a systematic review protocol 76

Risk factors for cardiovascular diseases in people of working age: results of a survey of employees

Aleksandra Antsiferova[1], Anna Kontsevaya[1], Oxana Drapkina[1]
[1]Department of Public Health Promotion, National Medical Research Centre for Therapy and Preventive Medicine of the MH of Russian Federation, Moscow, Russian Federation

ABSTRACT
Background and Objective All risk factors for cardiovascular diseases (CVDs) are widespread among the working population. Well-being programs for employees in the workplace reduce the prevalence of risk factors. The aim is to determine risk factors CVDs in people of working age at the workplace by conducting a survey of employees on the Atria platform. Methodologies In 2020, experts developed the Atria platform, accessible to any Internet user. Using the survey method risk factors for CVDs were identified among employees. The survey identified the most preferred well-being programs for employees in the workplace. The survey took place from April 2020 to February 2024. The results are presented in absolute and relative values.
RESULTS
In total, 67,487 workers took part in the survey on the Atria platform (mostly women – 80.5%, n=54,389). The average age was 42.3 ± 11.9 years and 43.3 ± 11.7 years for men and women, respectively. 16.3% of employees currently smoke (n=10978); 58.4% of workers drink alcohol (n=39409) with varying frequency; two-thirds of workers do not consume vegetables and fruits on a daily basis; 33.85% of workers (n=22843) add salt to already prepared food, of which 1.7% of workers (n=1177) without first tasting the food; 66.7% of workers (n=45039) do not regularly engage in sports/physical education and 64.3% of workers (n=43425) were in a state of tension and stress during the last month. For employees, the most preferred well-being programs are the following: a medical examination (44.5%, n=30022), office exercises (28.6%, n=19329), organization of educational lectures on the topics of correction of behavioral risk factors, basics of healthy lifestyle (27.3%, n=18403).
CONCLUSIONS
The high prevalence of risk factors for CVDs among employees determines the importance of primary prevention in the workplace through the creation of a health-preserving environment and the introduction of well-being programs for employees.

The effects of internet and technology use on the ability to care for own health among the U.S. populations: An analysis from the Health Information National Trends Survey (HINTS 7)

Chulwoo Park[1]
[1]Department of Sociology, Anthropology, and Public Health, University of Maryland, Baltimore County, Baltimore, United States

INTRODUCTION
In the age of artificial intelligence, the use of the internet and technology, such as a desktop computer or laptop, smartphone, tablet, and smartwatch or other electronic wearable device, has become an important part of people's daily lives.1–3 The goal of this study was to determine how internet and technology use relates to confidence in the ability to care for own health among the United States populations.
METHODS
The Health Information National Trends Survey (HINTS 7), collected from March to September 2024, was used.4 The final HINTS 7 sample size was 7,278 respondents, with the overall household response rate of 28.1%. Hierarchical survey-weighted nested logistic regression models were designed: Model 1 for demographic factors (age, marital status, education, race/ethnicity, household size, and number of children in the household), Models 2-4 for internet and technology use (internet use frequency, health-related internet use, and internet connection satisfaction, health apps, tracking health, and sharing health data), Models 5-8 for digital literacy and mental health status, and Model 9 for incorporating all variables.
RESULTS
While the majority of digital engagement variables—internet use frequency, health-related internet use, health app use, tracking health, sharing health information, social media engagement, and trust in social media health information—were not statistically significant, internet connection satisfaction remained a significant predictor (OR = 1.31) for health self-care confidence, after adjusting for all the other factors. Regarding positive mental health and digital literacy, they showed a strong positive association with the ability to care for own health (OR = 11.41; OR = 1.29, respectively). The interaction between positive mental health and digital literacy was statistically significant (OR = 0.86).
CONCLUSIONS
Health policies and interventions focused on establishing reliable internet infrastructure and implementing education for digital literacy would improve people's ability to care for their own health.

Assessing Resident Trauma: Evaluating Trauma Informed Practices in Nursing Homes

Dr. Sherry Hodge[1], Dr. Nailya DeLellis[1], Dr. Tina Lewis-Kopka[1], Dr. Fadi Salloum[1]
[1]1 School of Health Sciences, Central Michigan University, Michigan, United States, Central Michigan University, Mount Pleasant, Michigan 48859, United States

BACKGROUND
The U.S. Centers for Medicare and Medicaid Services (CMS) mandate the integration of trauma-informed care (TIC) within nursing homes to enhance resident well-being and quality of care. Despite this requirement, gaps persist in the consistent recognition and response to trauma among nursing home residents. This dissertation addressed these gaps by examining the prevalence, implementation, and policy alignment of trauma-informed practices across three nursing homes in Southeastern Michigan.
METHODS
A retrospective cross-sectional design was employed using secondary data from 400 resident medical records collected between 2020 and 2025. Quantitative analyses were conducted to assess trauma documentation, resident characteristics, and facility-level factors associated with trauma-informed care. The study also incorporated policy and systems-level reviews to evaluate organizational readiness and alignment with CMS trauma-informed care guidelines.
RESULTS
Findings from the first manuscript revealed inconsistencies in the use of standardized instruments to assess resident trauma. Among the 400 residents studied, 206 had documented trauma histories; however, 61% lacked trauma-informed treatment plans. Males and younger adults (ages 18–44) were more likely to have recorded trauma histories, with post-traumatic stress disorder and stress-related conditions representing the most prevalent diagnoses. The second manuscript identified significant associations between trauma history, resident demographics, and facility characteristics. The third manuscript highlighted barriers to sustained TIC adoption, including limited access to mental health providers, weak referral networks, and inadequate community collaboration.
CONCLUSIONS
Collectively, the findings indicate that while progress toward trauma-informed care in nursing homes has begun, uniform application remains limited. Advancing trauma-informed long-term care requires leadership engagement, staff education, and alignment of organizational policies with community partnerships to ensure consistent, compassionate, and person-centered approaches to resident care.

Explaining the rural–urban gap in cervical cancer screening among older women in India using Fairlie decomposition

Aditya Singh[1]
[1]Institute of Science, Banaras Hindu University, Varanasi, India

INTRODUCTION
Cervical cancer remains a leading cause of cancer-related mortality among women in India, yet screening uptake is extremely low, particularly among older women. Although rural–urban inequalities in preventive healthcare are well documented, the mechanisms underlying geographic disparities in cervical cancer screening among older women remain insufficiently understood. This study examines the rural–urban gap in recent cervical cancer screening and quantifies the contribution of socioeconomic, health, and contextual factors.
METHODS
Data were drawn from the Longitudinal Ageing Study in India (LASI) Wave-1. The analytical sample included 35217 women aged 45 years and older. Multivariable logistic regression assessed the association between place of residence and recent cervical cancer screening after adjusting for demographic, socioeconomic, health, and healthcare-access factors. Fairlie decomposition was applied to quantify the extent to which observed characteristics explained the rural–urban difference in screening prevalence.
RESULTS
National screening prevalence was alarmingly low at 1.2%. Urban women were four times more likely to report recent screening than rural women at 3.3% versus

0.8%. After extensive adjustment, urban residence remained a strong independent predictor of screening with an adjusted odds ratio of 2.15. Fairlie decomposition explained 59.8% of the 2.46 percentage point rural–urban gap. The largest contributors were indicators of service integration proxied by prior mammography at 33.1% and state-level contextual effects at 32.2%, followed by media exposure at 15.0%. General health system contact contributed negatively at -3.5%, indicating missed opportunities for screening within routine rural healthcare encounters.
CONCLUSIONS
Rural disadvantage in cervical cancer screening among older women is driven less by individual characteristics and more by the absence of integrated preventive care pathways. Achieving cervical cancer elimination in India will require embedding screening within routine primary care and chronic disease services, with focused strategies for rural older women who remain structurally disconnected from preventive healthcare.

Trends in Multimorbidity among Ageing Populations in the Global South: Implications for Equity and Sustainable Health Systems

Abhinav Abhinav[1], Rifqah Aeeda Roomaney[2], Annibale Cois[2], Sanghamitra Pati[2]
[1]Public Health, ICMR-Regional Medical Researh Centre, Bhubaneswar, India, [2]Burden of Disease Research Unit, South African Medical Research Council, Cape Town, South Africa

INTRODUCTION
Multimorbidity is an increasing public health concern in low- and middle-income countries (LMICs), with important implications for health equity and the sustainability of health systems. As countries in the Global South experience rapid population ageing, understanding temporal trends in multimorbidity is critical for inclusive health planning. This study examined trends in the prevalence of multimorbidity and its socio-demographic correlates among older adults in India and South Africa between 2007 and 2015.
METHODS
We used nationally representative data from the World Health Organization's Study on Global AGEing and Adult Health (SAGE), collected in 2007 (Wave 1) and 2014/2015 (Wave 2). The analysis included adults aged ≥50 years (India: n=7,150 in Wave 1 and n=7,110 in Wave 2; South Africa: n=3,565 in Wave 1 and n=2,163 in Wave 2). We estimated weighted prevalence of multimorbidity at each time point and assessed changes over time. Socioeconomic correlates of multimorbidity were examined.
RESULTS
The prevalence of multimorbidity increased over time in both countries. In India, prevalence rose significantly from 26.4% (95% CI: 25.4–27.5) in 2007 to 29.2% (95% CI: 28.2–30.3) in 2014/15 ($p<0.001$). In South Africa, multimorbidity increased from 27.4% (95% CI: 22.2–33.2) to 30.2% (95% CI: 25.4–35.4), although this change was not statistically significant. Across all survey waves, multimorbidity was consistently more prevalent among individuals in higher wealth quintiles, highlighting complex patterns of social inequality in disease burden.
CONCLUSIONS
Multimorbidity is increasing over time among older adults in two Global South countries, underscoring the growing burden of chronic conditions in ageing populations. These findings highlight the need for equitable and sustainable health system responses that address multimorbidity across diverse socioeconomic groups and support inclusive planning for ageing societies in LMICs.

ABS1645
Loneliness, Nutritional Status, and Chronic Disease in Egyptian Older Adults: A Mediation Analysis

Jana AbouElezz[1]
[1]The American University in Cairo (AUC), Cairo, Egypt

ABSTRACT
Loneliness affects approximately one quarter of older adults globally, yet remains an overlooked health concern, particularly in collectivist societies like Egypt, where family-centered culture may mask its prevalence. Recent evidence demonstrates loneliness is associated with 32% increased diabetes risk and elevated cardiovascular disease incidence through multiple pathways, including systemic inflammation and compromised health behaviors. Loneliness reduces motivation for meal preparation and dietary quality, creating nutritional vulnerabilities that contribute to chronic disease development. However, whether poor nutritional status mediates the loneliness-chronic disease relationship remains unexplored in Egyptian older adults. The objectives of this study are to: examine whether nutritional status mediates the association between loneliness and nutrition-related chronic diseases (diabetes, hypertension, cardiovascular disease) in Egyptian older adults, and determine whether this relationship differs by gender. Data will be collected from 200 participants aged 60 years and above recruited from Ain Shams University clinics. Loneliness will be assessed using the UCLA Loneliness Scale, nutritional status through the Mini Nutritional Assessment, and chronic disease presence through self-reported medical history. Mediation analysis will test whether nutritional status mediates the loneliness-chronic disease association, controlling for depression, age, marital status, socioeconomic status, and physical functionality. We hypothesize that loneliness is associated with poorer nutritional status, which in turn is associated with higher chronic disease burden. This cross-sectional research will provide the first evidence on the loneliness-nutrition-disease pathway in Egyptian older adults, generating hypotheses for future longitudinal research and informing nutritional intervention strategies under Egypt's Elderly Law.

Social and Health Inequities in Rural Thai Older Adults: A Qualitative Meta-Synthesis of Community-Based Health Promotion Interventions

Worayuth Nak-Ai[1], Juraporn Krates[2], Rungrueng Kitpati[3], Phatcharapan Maneesiri[4], Patchaya Pet-O-part[5], Duangtawan Chinnawong[6]
[1]Sirindhorn College of Public Health, Chonburi, Faculty of Public Health and Allied Health Science, Praboromarajchanok Institute, Chonburi, Thailand, [2]College of Public Health Administration, Office of the Permanent Secretary, Ministry of Public Health, Nonthaburi, Thailand, [3]Department of Science Service, Ministry of Higher Education, Science, Research and Innovation, Bangkok, Thailand, [4]Praboromarajchanok Institute, Nonthaburi, Thailand, [5]Mappong Health Promoting Hospital, Chonburi, chonburi provincial administrative organization, Chonburi, Thailand, [6]Bureau of Medical Doctor and Health Care Professional Production and Development, Ministry of Public Health, Nonthaburi, Thailand

BACKGROUND
Thailand became an aged society in 2024, with over 20% of the population older than 60 years. Rural older adults often experience structural disadvantages – such as poverty, low education, and limited healthcare access – leading to pronounced health inequities.
METHODS
We conducted a qualitative documentary research and meta-synthesis of 94 research project reports (2023–2025) addressing health promotion for rural Thai elders. Reports were selected based on relevance to rural community settings and aging health promotion. Data were analyzed using content analysis and thematic synthesis. We coded recurring concepts, grouped codes into categories, and synthesized overarching themes. To ensure trustworthiness, multiple researchers cross-checked coding, and we applied criteria of credibility, dependability, confirmability, and transferability in analysis.
RESULTS
Three main themes emerged: Structural Inequities: Geographic isolation, inadequate transportation, and economic hardship (low income, reliance on meager pensions) limit rural elders' access to health services. Social determinants like low education and poverty underlie higher health risks. Community Mechanisms: Successful interventions leverage community participation – e.g. Village health volunteers, local health committees, "elderly school" programs, and home visits – to improve health literacy and access. Integrating care through primary health centers and trained community caregivers yields improved outcomes. (3) Social Innovations and Local Wisdom: Communities devised creative solutions, such as volunteer handyman teams installing home modifications to prevent falls, development of local exercise clubs and traditional herbal remedies, and use of telehealth technology to reach remote elders.
CONCLUSIONS
Structural disparities pose serious challenges for rural healthy aging in Thailand. However, community-driven models – grounded in local social and cultural capital – can effectively promote elder health. Policy makers should draw on these grassroots innovations to craft equitable health promotion strategies for Thailand's aging rural communities, bridging gaps in resources and access.

ABS1802
Towards integrated and sustainable post-diagnostic dementia support: Insights from care partners in the Australian Capital Territory

Abdeljalil Lahiouel[1], Jane Kellett[1], Stephen Isbel[1], Stephanie Mulhall[1], Nathan D'Cunha[1]

[1]Centre for Ageing Research and Translation, University Of Canberra, Canebrra, Australia

BACKGROUND

Despite growing recognition of the importance of post-diagnostic support for people with dementia, service delivery in the Australian Capital Territory (ACT) has been reported as fragmented and constrained by system- and individual-level barriers. This study examined the lived experience and perceptions of care partners of people with dementia regarding service accessibility and adequacy to inform person-centered and sustainable post-diagnostic support.

METHODS

An explanatory sequential mixed-methods design was employed. A cross-sectional survey explored the accessibility, availability, and responsiveness of dementia support services using a 69-item questionnaire. Purposive semi-structured interviews subsequently explored key issues raised in the survey. Quantitative data were descriptively analysed, while qualitative data underwent inductive content analysis. Findings were integrated to provide a comprehensive understanding of post-diagnostic support in the ACT.

RESULTS

Care partners (n=86; 75.6% female) encountered access barriers, notably protracted and distressing diagnostic delays exceeding six months for 46.5% of people with dementia. Financial constraints were reported by 75.0% of care partners, with services described as unaffordable which led to service discontinuation. System navigation was a considerable barrier for 69.4% of participants, who experienced difficulty with the aged care system and understanding available services. While early-stage supports from dementia organisations were valued by interviewees (n=13; 53.8% female), responsiveness declined as needs intensified, with 60.8% of survey respondents reporting insufficient tailored support to accommodate complex and evolving needs.

CONCLUSIONS

The findings advocate for a public health paradigm shift toward affordable, integrated post-diagnostic support tailored to the evolving needs of people with dementia and their care partners. Strengthening service coordination, funding sustainability, and workforce capacity aligns with priorities of the WHO's Global Action Plan on the Public Health Response to Dementia 2017-2025, including timely diagnosis, person-centered care across the continuum, structured care partner support (training, respite, psychological resources), and recognition of dementia as a public health priority.

My mind is not the same: Cognitive complaints during the menopausal transition in Urban South Africa

sostina matina[1]

[1]Africa centre for migration and society, University of the Witwatersrand, Johannesburg, Zimbabwe

ABSTRACT

Population ageing is accelerating in low- and middle-income countries (LMICs), increasing the proportion of women spending longer portions of the life course in midlife, including the menopausal transition. While menopause is a universal biological process, its symptoms and consequences are shaped by social context. Beyond vasomotor and urogenital symptoms, many women report cognitive changes such as forgetfulness, impaired concentration, and "brain fog," yet most evidence on menopause-related cognitive complaints derives from high-income settings and clinical cohorts. There remains limited population-based research on subjective cognitive experiences among women living in urban LMIC contexts characterised by structural inequality, chronic stress exposure, and multimorbidity. This study examines cognitive complaints and perceived cognitive functioning during the menopausal transition among urban women in Soweto, Johannesburg, South Africa. Using data from the Soweto Syndemics Survey (2018), we employed an explanatory sequential mixed-methods design. Quantitatively, we analysed women aged ≥40 years, categorising menopausal status using self-reported menstrual history into pre/early transition, late transition, and postmenopause. Menopausal symptom burden was measured using the Menopause Rating Scale (MRS). Two subjective cognitive outcomes were assessed: cognitive complaints captured through the MRS item on physical and mental exhaustion (including impaired memory and reduced concentration), and perceived cognitive functioning assessed via a quality-of-life item on the ability to concentrate in daily life. Ordinal logistic regression models were used to estimate associations between menopausal stage and cognitive outcomes, adjusting sequentially for age, education, employment, socio-economic position, chronic stress burden, and chronic health conditions. Sensitivity analyses explored the influence of depressive and anxiety symptoms.Qualitatively, we conducted an inductive thematic analysis of embedded open-ended survey responses to contextualise women's interpretations of cognitive changes, including narratives of fatigue, sleep disruption, emotional distress, and perceptions of ageing. Integration of findings aimed to identify convergence between statistical patterns and lived experiences.

ABS2081

Ageing well at home: interconnected care and addressing challenges in regional australia

Geraldine Vaughan[1], Robyn Preston[1], Anne-Marie Holt[2], Dean Carson[3], Wendy Newton[1], Ashlyn Sahay[1]

[1]Centre > Health Equity in Regional and Remote Communities C>HERRC, CQUniversity, Rockhampton, Australia, [2]The University of Notre Dame Australia, Perth, Australia, [3]Umeå University, Umeå, Sweden

INTRODUCTION

Ageing well at home is a key aspiration for many older adults, where connection to place, independence, and community ties are central to quality of life. However, an ageing population, shifting demographic trends, increasing resource demands and persistent workforce shortages have contributed to a crisis in services to support healthy ageing. In rural and regional areas, these issues are exacerbated by access barriers and resource limitations, with dispersed populations and inadequate infrastructures further compounding the sustainability of aged care services in these communities. Amidst significant policy and program change in this domain, there is a need to understand local community perspectives that shape their experiences of ageing.

METHODS

A qualitative study in the Central Highlands of Queensland, Australia explored how the community would like to age, support structures and initiatives, with perspectives of health/community services and industry; and community members aged 55+. The research was underpinned by a social justice perspective, drawing on critical theory to align with the study's focus on codesign and innovation.

RESULTS

Findings from interviews and focus groups highlighted challenges and innovations that were both broadly typical to the Australian context, and particular to rural areas. A need for greater connectivity and collaborations across several dimensions was evident.

CONCLUSIONS

Amidst entrenched barriers to effective, respectful ageing-at-home for rural community members in the Central Highlands of Queensland Australia, several existing strategies and opportunities are evident that support an imperfect system, as well as critical calls for change. As the Australian home-based aged care system moves to implement new policies and programs, the imperative to harness the local knowledge, existing strategies and address priorities of engaged rural communities is vital. The research findings have direct implications for other settings with similar economies and demographics.

Experience of Body Changes and Sexuality among Middle-aged Men and Women: A Community-Based Exploratory Qualitative Study

Latifat Ibisomi[1], Relebogile Mapuroma[1], Neo Masike[1,2], Ozo Ibeziako[3], Doyinmola Ojifinni[4]

[1]School of Public Health, Faculty of Health Sciences, University of the Witwatersrand, Johannesburg South Africa, Johannesburg, South Africa, [2]Improve Africa Systems, Johannesburg, South Africa, [3]Family Medicine Department, University of Pretoria, Pretoria, South Africa, [4]School of Clinical Medicine, Faculty of Health Sciences, University of the Witwatersrand, Johannesburg, South Africa

INTRODUCTION

The midlife is the period at the crossroads between the growth experienced in youth and the decline of old age which is associated with reduction in cognitive performance and physical health in addition to increasing responsibilities at the workplace, family and the community. Concerning sexual and reproductive health, the midlife is poorly researched compared to other age categories. Nonetheless, significant body changes occur during this phase, which may affect their mental state and sexuality negatively.

OBJECTIVE

Thus, this study explored the experience of body changes, sexuality and health among adults in midlife.

METHODS

This exploratory qualitative study was conducted in Ekurhuleni North Sub-District,

Ekurhuleni district, Gauteng Province, South Africa. The study included focus group discussions and in-depth interviews among men and women aged 45–64 years. Transcribed interviews were analysed thematically.
RESULTS
The themes identified include a description of the body and sexuality changes experienced, challenges with understanding the changes and gaining access to care as well as the effect of the changes. Body changes included hot flushes, reduced appetite and loss of beauty. While women described either heightened or reduced libido, the men described reduced libido. Challenges with understanding the changes were due to lack of information, effect of cultural norms and poor information provided by health workers from whom the participants sought guidance. The changes led to fragile emotions and performance anxiety among the participants.
CONCLUSIONS
The effect of midlife changes among men and women can be far-reaching when combined with other stressful factors such as household stresses and higher demands at the workplace. It is therefore important to raise awareness about the challenges experienced in this age group and to provide interventions to mitigate these effects so they are better able to cope.

ABS2107

Understanding Dementia Caregiving Through a Public Health Lens: A Qualitative Exploration of Caregiver Experiences

Muhammad Hoque[1], Refilwe Moeketsane[1]
[1]Public Health, Sefako Makgatho Health Sciences University, Pretoria, South Africa

BACKGROUND
Dementia caregiving is an essential but largely invisible part of public health systems, especially in settings with inadequate long-term care services. It is important to explore the lived experiences of caregivers to inform interventions and policies that promote the health and well-being of caregivers and people with dementia.
METHODS
This qualitative research used in-depth interviews with caregivers of elderly people with dementia. Thematic analysis was used to explore the motivations, challenges, emotional and personal effects, coping mechanisms, and systemic support needs of caregivers.
RESULTS
Five thematic domains were derived from the study. First, the motivations for caregiving were strong family bonds, affection for the elderly person with dementia, and a wish to help people with dementia. Second, the experience of caregiving was characterized by significant challenges, including the need for continuous patience, dealing with behaviour and mood changes, emotional effects, and day-to-day unpredictability. Third, the experience had a significant emotional and personal impact on the caregiver, including emotional exhaustion, the need for emotional endurance, and occasional feelings of fulfilment and purpose. Fourth, the caregivers used coping mechanisms such as personal networks and self-care techniques to deal with the emotional and structural challenges of caregiving. Lastly, the caregivers highlighted the need for systemic support and emphasized the importance of government recognition and increased availability of resources for caregivers.
CONCLUSIONS
Dementia caregiving is driven by strong family bonds and altruistic motivations but is also characterized by significant emotional and structural challenges. It is essential to address the psychosocial needs of caregivers by improving systemic support systems and resources to promote the health and well-being of people with dementia and caregivers within public health systems.

Social determinants of functioning and well-being in older adults: a multidimensional approach

Carla Chamouton[1], Beatriz Aragão[2], Andrezza Escarce[2,3], Stela Lemos[2,3]
[1]Department of Speech, Language and, Hearing Sciences, São Paulo State University, Marília, Brazil, [2]Graduate Program in Speech, Language, and Hearing Sciences, Federal University of Minas Gerais, Belo Horizonte, Brazil, [3]Department of Speech, Language, and Hearing Sciences, Federal University of Minas Gerais, Belo Horizonte, Brazil

BACKGROUND
Several factors accompany the aging process, including physical, cognitive, and social changes that may directly impact individuals' autonomy in health care and their quality of life1-2. Therefore, this study aimed to analyze the association between functioning, perceived well-being, health literacy, and contextual aspects among older adults.
METHODS
This was a cross-sectional analytical observational study with a sample of 101 older residents of a small city in Brazilian southeast, approved by the institutional ethics committee. Procedures included the application of the Brazilian Economic Classification Criterion (CCEB), the World Health Organization Disability Assessment Schedule (WHODAS 2.0), the Short Assessment of Health Literacy for Portuguese-Speaking Adults (SAHLPA-18), the WHO-5 Well-Being Index, and a clinical-care questionnaire. Descriptive and bivariate analyses, as well as multiple linear regression, were performed. Variables were manually removed from the initial model one by one, considering the highest p- value in each model, until only variables with a p-value <0.05 remained, forming the final model (backward elimination).
RESULTS
Most participants were female, and the majority belonged to the socioeconomic class with the lowest purchasing power. The mean age was 76.2 years (±8.95), and mean schooling was 4.58 years (±4.00), considered low. In WHODAS 2.0, the mean scores across domains indicated good functional clinical status. In the WHO-5, the mean score was 16.81 points (±6.35), indicating good perceived well-being. In SAHLPA-18, the mean score was 12.38 points (±4.01), which is considered inadequate. In the final regression model for the Cognition domain, significant predictors were age, well-being, and health literacy. In the other domains assessed, the final models identified age and psychological well-being as significant predictors.
CONCLUSIONS
Higher levels of health literacy and well-being were associated with better cognition and greater autonomy in health-related decision-making, whereas increasing age was associated with reduced functioning.
Popul. Med. 2026;8(Supplement 1):A65

Happiness, functioning, health literacy, and well-being among older adults: a study in primary health care

Stela Lemos[1,2], Beatriz Aragão[1], Andrezza Escarce[1,2], Carla Chamouton[3]
[1]Graduate Program in Speech, Language, and Hearing Sciences, Federal University of Minas Gerais, Belo Horizonte, Brazil, [2]Department of Speech, Language, and Hearing Sciences, Federal University of Minas Gerais, Belo Horizonte, Brazil, [3]Department of Speech, Language and, Hearing Sciences, São Paulo State University, Marília, Brazil

BACKGROUND
Considering the social context and the potential of primary health care, it is necessary to adopt effective public policies that promote autonomy, independence, and well-being in aging1-2. For this reason, the purpose of this study was to analyze the association between happiness, perceived well-being, functioning, health literacy, and contextual aspects among older adults.
METHODS
This was a cross-sectional analytical observational study, approved by the institutional ethics committee, with a sample of 81 users of the primary health care of a small city in Brazilian southeast. Procedures included the application of the Brazilian Economic Classification Criterion (CCEB), the Subjective Happiness Scale, the World Health Organization Disability Assessment Schedule (WHODAS 2.0), the Short Assessment of Health Literacy for Portuguese-Speaking Adults (SAHLPA-18), and the WHO-5 Well-Being Index. Analyses included descriptive and bivariate approaches, along with multiple linear regression.
RESULTS
Most participants were female, the majority belonged to socioeconomic classes with low purchasing power, and the mean age was 73.93 years (± 8.12). In WHODAS 2.0, the mean simple score was 48.77 (±18.27), indicating good functional clinical status. In WHO-5, the mean score was 16.81 points (±6.35), reflecting good perceived well-being. On the Subjective Happiness Scale, the mean score was 5.09 (±1.47), considered a good level of perceived happiness. In SAHLPA-18, most participants presented inadequate health literacy. In the final regression model for the Subjective Happiness Scale, significant predictors were well-being and the Mobility and Participation domains of WHODAS 2.0.
CONCLUSIONS
Higher levels of well-being and lower mobility limitations were associated with better perceived happiness, while reduced social participation had a negative impact on the perception of happiness.

Vascular contribution to mild behavioral impairment

Pavla Brennan Kearns[1], Tejaswi Ravi[1], Matěj Seifert[1], Zdeněk Linha[1]
[1]Department of Public Health, Second Faculty of Medicine, Charles University, Prague, Czech Republic

ABSTRACT
Mild Behavioral Impairment (MBI) is recognized as a prodromal stage of dementia, characterized by the later-life onset of neuropsychiatric symptoms. Although MBI is believed to arise primarily from neurodegenerative processes, it remains unclear whether vascular pathology also contributes to its development. We examined whether white matter hyperintensities (WMH)—a well-established marker of small vessel disease and cumulative cardiovascular risk factor burden—are associated with MBI. We analyzed data from 1,273 participants enrolled in the Alzheimer's Disease Neuroimaging Initiative (ADNI), all of whom had either normal cognition or mild cognitive impairment at baseline. MBI symptoms and status were derived from the Neuropsychiatric Inventory. WMH burden was measured volumetrically, and both global and regional associations with MBI were assessed. We employed general linear models to evaluate the relationship between total WMH volume and both MBI total score and MBI status. To investigate spatial specificity, we also conducted voxel-wise analyses across the white matter. Our results showed that greater total WMH volume was significantly associated with higher MBI total scores as well as with increased odds of meeting criteria for MBI. These associations were observed across individuals with normal cognition and those with mild cognitive impairment, suggesting that WMH may influence behavioral changes even before overt dementia develops. The voxel-wise analyses revealed a significant cluster within the left inferior longitudinal fasciculus, where higher WMH burden was related to elevated MBI total scores. This tract, which plays a key role in emotional regulation and social cognition, may represent a pathway through which vascular pathology contributes to behavioral alterations. Our findings indicate that both the overall burden and the spatial distribution of WMH are linked to MBI. These results support the hypothesis that MBI may, in part, reflect neurovascular mechanisms, highlighting the importance of considering vascular health in early behavioral changes associated with dementia risk.

Demographic, psychosocial, and health-related factors associated with depressive symptoms in older adults receiving antiretroviral therapy in a South African metropolitan

Gladys Kigozi-Male[1], Monique J Brown[2,1], Michelle Engelbrecht[3], Lerato Makhele[4,5]
[1]Centre for Health Systems Research & Development, University of the Free State, Bloemfontein, South Africa, [2]Department of Epidemiology and Biostatistics, Arnold School of Public Health, University of South Carolina, Columbia, United States, [3]Department of Psychology, University of the Free State, Bloemfontein, South Africa, [4]Free State Department of Health, University of the Free State, Bloemfontein, South Africa, [5]Department of Psychiatry, University of the Free State, Bloemfontein, South Africa

BACKGROUND
Globally, mental health disorders, including depression, present a key challenge among older people living with HIV (OPLHIV) – defined as those aged 50 years and older. Evidence, largely from high-income countries, highlights a complex interplay between aging, HIV, and psychosocial vulnerability. However, data from sub-Saharan Africa remains limited. This study examined demographic, psychosocial, and health-related factors associated with depressive symptoms among OPLHIV receiving antiretroviral therapy (ART) in a South African metropolitan area.
METHODS
Data were gathered cross-sectionally through fieldworker-administered interviews with 382 OPLHIV attending primary health care facilities. Depressive symptoms were assessed using the Patient Health Questionnaire-9 (PHQ-9). Demographic variables included age, sex, education level, and home language. Psychosocial variables comprised HIV-related stigma, substance use as a coping strategy, and perceived social support. Health-related variables included comorbidity status and self-rated health satisfaction. Multivariable linear regression was used to identify factors associated with depressive symptoms.
RESULTS
Participants' mean age was 57.4 (standard deviation [SD]: 5.5) years. Overall depressive symptom burden was low (mean PHQ-9 score = 2.0; SD: 3.7). Higher PHQ-9 scores were significantly associated with greater HIV disclosure concerns (B = 0.207, p = 0.007) and higher educational attainment (B = 1.013, p < 0.001). Sesotho home language was associated with lower PHQ-9 scores compared to other languages (B = -0.738, p = 0.031), while lower self-rated satisfaction with health was associated with higher scores (B = -0.545, p = 0.029). Support from friends was inversely associated with depressive symptoms, suggesting a protective effect (B = -0.222, p < 0.001).
CONCLUSIONS
Despite a low overall prevalence of clinically significant depression, symptoms were patterned by HIV-related stigma, social support, coping behaviour, and contextual factors. These findings suggest the need for targeted, preventive mental health interventions that integrate stigma reduction, substance use screening, and social support strengthening with HIV screening services.

ABS2443

Evaluating Implementation of a Culturally Adapted Peer-Led Diabetes Self-Management Program for Black Men: A Convergent Mixed Methods Feasibility Study

Jaclynn Hawkins[1], Alana Ewen[1], Maricruz Moya[1]
[1]Department of Learning Health Sciences, Medical School; School of Social Work, University of Michigan, Ann Arbor, United States

BACKGROUND
Black men in the United States experience disproportionately high type 2 diabetes burden and related complications yet remain underrepresented in self-management education and support programs. Sociocultural factors including masculine norms and historical mistrust of healthcare systems create engagement barriers. This mixed methods feasibility study evaluated the implementation of a culturally adapted, peer-led diabetes self-management and support intervention to assess acceptability, appropriateness, feasibility, and identify factors influencing implementation.
METHODS
We employed a convergent mixed methods design integrating three implementation science frameworks: the Consolidated Framework for Implementation Research, Framework for Reporting Adaptations and Modifications to Evidence-based Implementation Strategies, and Reach, Effectiveness, Adoption, Implementation, and Maintenance. Data collection included semi-structured interviews with one Certified Diabetes Care and Education Specialist and two trained Black male peer leaders with lived diabetes experience, plus two focus groups with prior program participants (N=11). Validated surveys measured acceptability, appropriateness, feasibility, implementation leadership, and satisfaction. Qualitative data were analyzed using the Rigorous and Accelerated Data Reduction (RADaR) technique with joint display integration.
RESULTS
Feasibility benchmarks were met: the intervention demonstrated high acceptability (4.46/5), appropriateness (4.41/5), and feasibility (4.40/5). Implementation leadership was strong (3.17/4). Participants reported moderate satisfaction (18.42/32), identifying specific enhancement opportunities including structured between-session support. Qualitative themes converged with quantitative findings, revealing culturally grounded communication, peer leaders' flexibility to adapt content, and shared racial and gender identity as mechanisms supporting high appropriateness. Brotherhood, psychological safety, and hybrid virtual delivery facilitated engagement and addressed access barriers. Maintenance themes included sustained peer meetings beyond the program period and shifts in mindset toward diabetes self-management.
CONCLUSIONS
Feasibility aims were achieved, with implementation measures exceeding acceptability thresholds. These findings suggest the intervention model warrants adaptation testing in other community-based settings serving Black men with type 2 diabetes. Future work should strengthen between-session support structures and evaluate effectiveness in a fully powered trial.

Healthy Brain Tracker: An interactive data dashboard to monitor Hawai□i's progress towards supporting individuals with cognitive decline, their caregivers, and reducing dementia risk factors

Julia Chosy[1], Saikaew Dudla[1], Tani Salazar[2], Whitney Katsutani[3], Rebekah Rodericks[1], Christy Nishita[3]
[1]Department of Public Health Sciences, University of Hawaii at Manoa, Honolulu, United States, [2]Executive Office on Aging, Hawaii State Department of Health, Honolulu, United States, [3]Center on Aging, University of Hawaii at Manoa, Honolulu, United States

BACKGROUND
As the population ages and life expectancy increases, the global prevalence of dementia is predicted to rise from 52.6 million in 2021 to over 152.8 million by 2050.1 In Hawai□i, the rate of adults experiencing cognitive disability is also rising,2 particularly as the older adult (65+) population grows.3 In response to

these trends, the state's Executive Office on Aging (EOA) initiated the development of a data tracker to monitor dementia-related trends.
METHODS
An online data dashboard was developed by the University of Hawai'i's Hawai'i Health Data Warehouse (HHDW) and Center on Aging, EOA, and other stakeholders. The majority of indicators are sourced from the Behavioral Risk Factor Surveillance System, a survey that collects data on health-related behaviors and chronic health conditions nationwide.4 In Hawai'i, approximately 7,800 adults are surveyed each year. Each indicator is updated annually, and displays point estimates, comparison values, trend data, and subgroup breakdowns.
RESULTS
The Healthy Brain Tracker includes 36 indicators around cognition, dementia prevalence and mortality, risk factors, and caregiving for the state of Hawai'i. Key results from the latest data are as follows: 11.2% of adults experience cognitive decline and the death rate due to Alzheimer's Disease is 21.4 per 100,000. The prevalence of dementia risk factors among adults 45+ years are increasing for six of the eleven indicators tracked: hearing loss, high blood pressure, depression, diabetes, sedentary lifestyle, and tobacco use. Among caregivers, 27.2% care for someone living with dementia.
CONCLUSIONS
The Healthy Brain Tracker was developed to monitor Hawai'i's progress towards reducing risk factors for cognitive decline, promoting healthy brain function, and supporting caregivers. The data provided in this dashboard helps direct programs and policies, and aids the development of a strong infrastructure to support individuals with dementia and their caregivers.

ABS2524
Afterhood and Wellbeing Among Older Gay Men: A Mixed-Methods Study

Jesus Ramirez-Valles[1], Sonya Arreola[1]
[1]Medicine, univeristy of california san francisco, San Francisco, United States

INTRODUCTION
Older gay men are a growing yet understudied population whose later lives are shaped by the aftermath of social marginalization, AIDS epidemic, and structural inequality. While research has examined HIV outcomes and aging separately, less is known about how older gay men live or how well-being differs by HIV status. This study integrates the concept of Afterhood—the period of life that unfolds after major collective biographical disruptions—to examine aging, health, and inequities among older gay men.
METHODS
We used a mixed-methods design drawing from the ongoing Openly Gray Study in San Francisco. Quantitative analyses were conducted on interim data collected 2023-2026 (N=410) among gay men aged 50+ to examine differences by HIV status. In parallel, we conducted in-depth interviews with a subsample of men (N=30) across ethnic and HIV status. Qualitative data were analyzed using thematic and constant comparative methods, guided by queer theory and life-course perspectives.
RESULTS
Findings revealed significant disparities by HIV status. Compared to HIV-negative men, those living with HIV report greater financial insecurity (in childhood and in the prior 12 months), higher loneliness, lower likelihood of having a primary partner, and poorer health (e.g., elevated inflammation, depression, anxiety, drug use). Suicidal ideation was alarmingly common across groups (≈20%). Qualitative interviews contextualized these inequities, showing how men describe afterhood as a stage of continuity and reorientation rather than decline. Participants emphasize sustaining a "queer essence"—authenticity, creativity—through spirituality, community engagement, and chosen family, while navigating aging, illness, and loss.
CONCLUSIONS
Afterhood is a critical period where aging, HIV, and inequity intersect. Addressing the well-being of older gay men—particularly those living with HIV—requires interventions extending beyond biomedical care to address loneliness, financial insecurity, mental health, and meaning-making. Centering afterhood offers a new framework for equity-driven global HIV and aging strategies.

Predictors of frailty and multimorbidity patterns among middle-aged adults in a rural population cohort in Burkina Faso, 2015-2022: A retrospective cohort study based on an AWI-Gen population.

Georges Some[1,2], Juliana Kagura[1], Palwendé Romuald Boua[2,3,4], Anniretouo Reines Poda[2], Definissery Joel Bognini[2], Zinisida Sophie Konkobo[2], Guétawendé Job Wilfried Nassa[2], Athanase Mwinessobaonfou Somé[2], Toussaint Rouamba[2], Berenger Kaboré[2], Innocent Valéa[2], Michele Ramsay[3], Hermann Sorgho[2], Halidou Tinto[2], Ngianga-Bakwin Kandala[1,5]
[1]Wits School of Public Health, Division of Epidemiology and Biostatistics, University of the Witwatersrand, Johannesburg, South Africa, [2]Institut de Recherche en Sciences de la Santé, Clinical Research Unit of Nanoro, Ouagadougou, Burkina Faso, [3]Sydney Brenner Institute for Molecular Bioscience, University of the Witwatersrand, Johannesburg, South Africa, [4]MRC Unit The Gambia, London School of Hygiene and Tropical Medicine, Atlantic Boulevard, Banjul, Gambia, [5]Schulich School of Medicine and Dentistry, Department of Epidemiology and Biostatistics, Western University, London, Canada

BACKGROUND
Frailty and multimorbidity are vulnerable geriatric syndromes among the elderly, and assessment of the determinants of both conditions has remained limited despite the prevalence established in previous studies. We determined factors associated with frailty and multimorbidity among middle-aged adults in rural areas from 2015 to 2022 in Burkina Faso.
METHODS
This study utilized data from the AWI-Gen sub-study, a retrospective cohort study of 1500 participants aged 40-65 residing in Nanoro and Yako in Burkina Faso. Fried's phenotypic frailty components, and twelve chronic diseases were assessed for derivation into frailty and multimorbidity score variants respectively. To determine the risk factors associated with frailty and multimorbidity, we performed an ordinal and multinomial logistic regression analysis respectively with a significance level of 5%.
RESULTS
Pre-frailty and frailty were 59.3% and 8.5% respectively while that of multimorbidity was 38.3%. Weight loss (23.9%) and self-reported exhaustion (23.1%) were the most frequent frailty components. Dyslipidemia (63.9%), hypertension (26.4%) and rheumatic arthritis (15.0%) were the most frequent chronic diseases. In adjusted analysis, increasing age (AOR 1.4), being widowed (AOR 1.5), being unemployed (AOR 2.5), smokeless tobacco use (AOR 2.5), being underweight, and multimorbidity (AOR 1.4) were independently associated with increased odds of frailty. Fruit and vegetables consumption (AOR 0.9) and being highly active (AOR 0.1) significantly reduced the odds of frailty. With regards to multimorbidity, increasing age (RRR 1.8), being a woman (RRR 2.6), being widowed (RRR 1.6), being unemployed (RRR 4.5), overweight and obesity (RRR 3.4), pre-frailty and frailty (RRR 2.1) were prominent predictors of multimorbidity. Nevertheless, fruit consumption (RRR 0.9) significantly reduced the risk of multimorbidity.
CONCLUSIONS
These findings provide additional evidence on the determinants of frailty and multimorbidity in Burkina Faso. Community awareness initiatives should be strengthened to influence lifestyle on tobacco consumption, alcoholism, physical activity, vitamin supplementation, and fruit and vegetables consumption.

ABS2713
Comparative analysis of methods for identifying multimorbidity patterns in an ageing rural African population: Insights from HAALSI

Rumbidzai Mupfuti[1], Cyril Chironda[1], Tariro Ndoro[1], Chodziwadziwa Whiteson Kabudula[1], Francesc Xavier Gómez-Olivé[1]
[1]MRC/Wits Rural Public Health and Health Transitions Research Unit (Agincourt), University of Witwatersrand, Johannesburg, South Africa

BACKGROUND
Multimorbidity (MM), defined as the coexistence of two or more chronic diseases, is an increasing global health concern with a particularly high burden in sub-Saharan Africa (SSA). Understanding patterns of disease co-occurrence is essential for effective care, yet MM clustering is complex and context specific. While clustering methods have advanced MM research, their application and validation in SSA remain limited. This study aimed to identify and compare multimorbidity patterns using multiple clustering methods and ensemble approaches in rural South Africa.
METHODS
We analysed data from the wave 4 HAALSI cohort of adults aged ≥40 years in rural South Africa, including fourteen chronic diseases. Five single clustering algorithms were applied: Latent Class Analysis (LCA), Partitioning Around Medoids (PAM), K-modes, Hierarchical Cluster Analysis (HCA), and Multiple Correspondence Analysis with K-means (MCA+K-means). Outputs were combined using two ensemble approaches—the Adaptive Clustering Ensemble (ACE) and the Cluster-based Similarity Partitioning Algorithm (CSPA)—to derive a consensus

solution. Model performance was evaluated using the silhouette index (SI), Davies–Bouldin index (DBI), predictive strength (PS), Adjusted Rand Index (ARI), and Calinski–Harabasz index (CHI).
RESULTS
The optimal number of clusters varied across single clustering methods, reflecting their differing assumptions. LCA and PAM demonstrated superior performance, whereas K-modes performed poorly. Ensemble clustering produced an interpretable eight-cluster solution, revealing distinct MM profiles. Common patterns included HIV/hypertension, HIV/dyslipidemia, anemia/depression/hypertension, and depression/dyslipidemia, highlighting interactions between infectious, cardiometabolic, and mental health conditions. Sociodemographic differences were evident, with women and older adults predominating in cardiometabolic–mental health clusters and younger individuals in HIV-related clusters.
CONCLUSIONS
This study provides a data-driven taxonomy of multimorbidity patterns in a rural SSA population and demonstrates the value of ensemble-based approaches for improving cluster interpretability. The coexistence of infectious, metabolic, and mental health conditions challenges single-disease care models and underscores the need for integrated, person-centred healthcare strategies in rural SSA.

Transcending Health Borders: A Global Community of Practice for Integrated Multimorbidity Care- Redefining Primary Care through North-South Collaboration

Sanghamitra Pati[1], Srinath Reddy[2], Bruno Nunes[3], Vundli Ramokolo[4], Akhtar Hussain[5], Abdullah Mamum[6], Jaya Kshatri[7]
[1]Additional Director General, Indian Council of Medical Research, New Delhi, India, [2]Honorary Professor, Public Health Foundation of India, New Delhi, India, [3]Department of Health and Kinesiology, University of Illinois, Illinois, United States, [4]Medical Research Council, MRC South Africa, Cape Town, South Africa, [5]IMPACT – Institute for Mental and Physical Health and Clinical Translation, School of Medicine, Deakin University, Geelong, Australia, [6]Poche Centre for Indigenous Health, The University of Queensland, Brisbane, Australia, [7]Regional Medical Research Centre, IndianCouncil of Medical Research, Bhubaneswar, India
ABSTRACT
Multimorbidity, the coexistence of multiple chronic conditions, is the definitive public health challenge of the 21st century. This session presents a "Evidence-to-Transformation" roadmap, derived from a transcontinental "Community of Practice" (CoP) involving India, Brazil, the UK, and Australia. The session centres on the CoP model as a mechanism for decolonizing evidence and building horizontal care capacity. Our work on synthesising findings from landmark longitudinal cohorts indicate that childhood health disadvantages and educational gaps are potent predictors of adult multimorbidity. Furthermore, evidence of our work with the Australian First Nations populations and large surveys among tribal communities of India reveal the increasing burden and challenges in managing multimorbity in vulnerable populations. The symposium advocates the need to move from "retail" clinical visits to "wholesale" public health strategies. Panellists will discuss: • The Policy Vision: Prof. K. Srinath Reddy (Public Health Foundation of India) on shifting from clinical siloed care to public health strategies for the SDG agenda. • The Life Course effect: Prof. Bruno P. Nunes (University of Illinois, USA) on the role of childhood disadvantage in adult disease accumulation. • Multimorbidity in pregnancy: Dr Vundli Ramokolo (South African MRC) on care needs and challenges in maternal multimorbidity. • Primary Care Reorientation: Dr. Sanghamitra Pati (ADG, Indian Council of Medical Research) on horizontal integration models in low-resource settings. • Vulnerable Populations: Prof. Abdullah Mamun (University of Queensland, Australia) on intergenerational multimorbidity challenges in Indigenous communities. • The Syndemic Interface: Dr. Akhtar Hussain (Deakin University, Australia) on managing the collision of acute infectious diseases and chronic conditions. • Moderator: Dr. Jaya Singh Kshatri, Geriatric Public Health Researcher, ICMR-Regional Medical Research Centre The session will feature an interactive discussion (45 minutes) and a moderated "North-South" dialogue (15 minutes). Attendees will gain actionable insights into bridging the research-policy gap through established Communities of Practice.

Perimenopause in the workplace: The impact of media representation and online communities on women's health literacy

Evie Kendal[1]
[1]Biomedical, health and exercise sciences, Swinburne University of Technology, Hawthorn, Australia
INTRODUCTION
According to a Senate Inquiry in Australia (2024), symptoms of perimenopause and a lack of workplace supports are responsible for significant loss of earnings, reduced superannuation, and high levels of unplanned early retirement for many working women. Citing data from the Australian Institute of Superannuation Trustees (2022), the report claims the economic cost to Australian working women is estimated at $17b a year. Similar trends can be seen in other economies around the world, and underreporting of the effects of perimenopause on employment outcomes is likely. The South Australian Government's Office for Women (2025) notes women in the relevant age bracket are the "fastest growing working demographic," justifying further research into reasonable workplace adjustments for women handling this transition.
METHODS
The Senate Inquiry noted many women experiencing symptoms of perimenopause feel stigmatised and report a lack of education and support from medical professionals, leading them to seek information through media and online support groups. This project assesses the depiction of perimenopause in mainstream and popular media, as well as various leading online communities. It compares the knowledge transferred via these sources to the up-to-date literature on the topic and the workplace adjustments these different media suggest.
RESULTS
The project demonstrates there is a lack of institutional awareness of perimenopause among employers of many women posting in online communities. Health literacy on this topic is poor with a lot of misinformation present. Perimenopause is also rarely shown in popular media, but where it does appear it is often used as a comedic element and betrays various stereotypes about older women.
CONCLUSIONS
Workplaces should be more proactive about supporting women experiencing perimenopausal symptoms and invest in education programs for men and women in the workplace to increase health literacy regarding this life transition.
Popul. Med. 2026;8(Supplement 1):A89

ABS2795
The Influence of Lifestyle Behaviors on Health-related Quality of Life: Results of a Non-Randomized Controlled Intervention Study

Claudia Pischke[1], Paula M Matos Fialho[1], Simone Weyers[1], Markus Vomhoff[2,3,4], Andrea Icks[2,3,4], Oliver Kuss[4,5,6], Alexander Lang[5]
[1]Institute of Medical Sociology, Heinrich Heine University Duesseldorf, Düsseldorf, Germany, [2]Institute for Health Services Research and Health Economics, Centre for Health and Society, Medical Faculty, Heinrich Heine University Duesseldorf, Düsseldorf, Germany, [3]Institute for Health Services Research and Health Economics, Leibniz Center for Diabetes Research, Heinrich Heine University Duesseldorf, Düsseldorf, Germany, [4]German Center for Diabetes Research, Partner Duesseldorf, Düsseldorf, Germany, [5]Institute for Biometrics and Epidemiology, Centre for Health and Society, Medical Faculty, Heinrich Heine University Duesseldorf, Düsseldorf, Germany, [6]Centre for Health and Society, Medical Faculty, Heinrich Heine University Duesseldorf, Düsseldorf, Germany
INTRODUCTION
Regular physical activity (PA) positively influences health-related quality of life (HRQoL). However, it remains less clear how an overall healthy lifestyle, combining PA with other lifestyle behaviors, affects this relationship. The aim of this investigation was to examine associations between lifestyle behaviors, including PA, measured by an established lifestyle index, and HRQoL in the non-randomized controlled ‚10,000 Steps NRW' study.
METHODS
Lifestyle behaviors (i.e., smoking, fruit and vegetable intake, German Health Update (GEDA) study, 2019, 2021; PA, Global Physical Activity Questionnaire; alcohol intake, Alcohol Use Disorders Identification Test) and HRQoL (EuroQol 5-Dimension: mobility, self-care, usual activities, pain/discomfort, anxiety/depression) were assessed via telephone-based interviews with residents of two German cities. A lifestyle index was generated combining non-smoking, daily fruit and vegetable intake, PA (≥600 metabolic equivalent of task (MET) minutes/week), and no or moderate alcohol intake (≤6 drinks/week). For each lifestyle behavior, a 1 was assigned when participants adhered to evidence-based recommendations, a 0 when they did not, resulting in a score ranging from 0 to 4 points. Cross-sectional associations between adherence to a healthy lifestyle and HRQoL were examined using multivariable linear regression models.
RESULTS
Of the 627 participants included in the analysis, 13% adhered to ≤2 favorable lifestyle behaviors, 31% to 3 behaviors, and 56% to all 4 behaviors. Adherence to

all favorable lifestyle behaviors was associated with higher HRQoL compared to adherence to ≤2 favorable lifestyle behaviors [β (95% CI): 0.037 (0.013, 0.070)]. Each additional favorable lifestyle behavior was associated with higher HRQoL [β (95% CI): 0.017 (0.003, 0.031)]. When investigating individual lifestyle behaviors separately, PA, in particular, was linked to higher HRQoL [β (95% CI): 0.069 (0.028, 0.110)].
CONCLUSIONS
Our findings indicate that higher adherence to a healthy lifestyle is associated with higher HRQoL and suggest that PA may be the largest contributor to this association.

Healthy Longevity: Global Public Health's Next Frontier

Laura Magaña[1]
[1]Association of Schools and Programs of Public Health (ASPPH), Washington, DC, United States

BACKGROUND
Global increases in life expectancy have not been matched by equivalent gains in healthspan, resulting in longer lives incumbered by chronic disease, disability, and inequity. Public health must move toward integrated strategies that promote health across the life course, repositioning aging as an opportunity for societal growth and resilience. The Association of Schools and Programs of Public Health (ASPPH) Healthy Longevity Framework provides a population-based, equity-centered model emphasizing prevention, multisectoral action, and systems change. This session will examine how the framework can be operationalized across diverse public health contexts to advance healthy longevity globally.
METHODS
This session is structured around the core domains of the ASPPH Healthy Longevity Framework and will focus on life-course prevention, social and structural determinants of health, health systems transformation, and equity and justice. Presentations will draw on applied research, policy initiatives, educational innovations, and community-based interventions from multiple regions. Case examples will highlight cross-sector collaboration, implementation challenges, and measurement approaches relevant to various income settings.
RESULTS
The session will demonstrate how applying a comprehensive healthy longevity framework shifts focus from aging as an individual biomedical issue to longevity as a population and societal outcome. Findings across cases illustrate improved alignment of public health practice with upstream determinants, stronger integration between health and social systems, and enhanced capacity to address inequities that shape longevity outcomes. Common enabling factors and barriers to implementing the framework and its recommendations will be identified.
CONCLUSIONS
By grounding healthy longevity in a public health framework, this session underscores the critical role of prevention, equity, and systems thinking in extending not only years of life but years of health, ensuring longer lives are matched by improved quality, purpose, and societal contribution. The ASPPH framework offers a scalable model to guide global action toward healthy longevity for all.

A portrait of social participation in defending the right to healthy aging at the National Conference on the Rights of Older Persons.

Alexandre Silva[1], Maria Fabiana Passos[2], Lucélia Pereira[1]
[1]National Secretariat for the Rights of Older Persons, Ministry of Human Rights and Citizenship of Brazil, Brasília - Distrito Federal, Brazil, [2]Oswaldo Cruz Fundation, Brasília, Brazil

ABSTRACT
Social participation in Brazil is ensured by normative frameworks such as the Statute of Older Persons, with the aim of strengthening democracy, addressing social inequalities, and promoting the rights and citizenship of people aged 60 years and over. Within the Brazilian Unified Health System (SUS), participatory governance has historically guided the development of health conferences as dialogical spaces for defining public policy priorities. This experience has served as an international reference, contributing to the inclusion of social participation on the global health agenda, as recognized by the 77th World Health Assembly. In Brazil, conferences function as national mechanisms to broaden popular representation. Within this context, the 6th National Conference on the Rights of Older Persons was held under the theme Multicultural Aging and Democracy: the Urgency of Equity, Rights, and Participation. Drawing from more than 2,900 municipalities and 22 national free conferences focused on groups in situations of vulnerability, 1,158 delegates were elected. These delegates formed 15 working groups with representation from all Brazilian states. The conference addressed key issues related to health, comprehensive care, violence and rights violations, financing, and the structure of councils to strengthen social participation. A total of 90 proposals were approved, including 15 priority proposals, aimed at promoting social protection, active and healthy aging, long-term care, and respect for the plurality of aging experiences. The outcomes highlight the importance of qualified listening, particularly to older adults, and the value of collective deliberation in shaping public policy agendas. The proposals underscored the need to improve financing strategies for policies targeting older populations, strengthen intersectoral coordination, and establish reference structures for comprehensive care. Overall, conference outcomes reaffirm that significant challenges remain in addressing inequalities and discrimination, and in ensuring the right to active, dignified, and healthy aging in a country with more than 16 million older adults.

Effects of psychosocial factors on Swedish waste collectors musculoskeletal pain through the mediating roles of occupational fatigue and physical demands: a structural equation model

Lihua He[1], Yun Wang[1]
[1]Department of Occupational and Environmental Health, School of Public Health, Peking University, Beijing, China

ABSTRACT
Background Musculoskeletal pain is the primary non-fatal disabling condition in waste collectors, but how psychosocial factors contribute to it via physical and psychosocial pathways is poorly understood. This study aimed to examine the effects of leadership quality, social support, and job demands on musculoskeletal pain among Swedish waste collectors. In addition, the mediating roles of physical demands and occupational fatigue and their chain mediation were also examined. Methods A 2015 cross-sectional survey of all Swedish waste collectors utilized validated scales (COPSOQ II, SOFI-20, Nordic Questionnaire) to assess exposures (psychosocial factors), mediators (occupational fatigue, physical demands), and outcomes (musculoskeletal pain). Of 1005 eligible workers (≥ 1 year experience), 662 analyzed (65.9% response rate). Structural equation modeling and bias-corrected bootstrapping were used to assess direct/indirect pathways, with $p \leq 0.05$ or 95% bootstrapped CIs excluded zero taken as significant. Results Occupational fatigue explains the majority of the intermediate processes. Specifically, occupational fatigue mediated the effects of job demands (β = 0.185, 95% CI: 0.134–0.246), leadership quality (β = -0.074, 95% CI: -0.123 - -0.031), and social support (β = -0.051, 95% CI: -0.095 - -0.007) on musculoskeletal pain. Physical demands mediated job demands (β = 0.113, 95% CI: 0.075–0.155) and leadership quality (β = -0.038, 95% CI: -0.077 - -0.003) on musculoskeletal pain. Physical demands also amplified occupational fatigue (β = 0.369, $p < 0.001$), forming a chain mediation pathway. Conclusions Leadership quality and job demands significantly influenced musculoskeletal pain through the mediating roles of occupational fatigue and physical demands, respectively. Social support's impact was limited to occupational fatigue mediation. Physical demands may translate to occupational fatigue and be linked to musculoskeletal pain. Managers of waste collectors should prioritize leadership training and the construction of good psychosocial factors to manage physical demands, ensure mental health, and thereby mitigate musculoskeletal pain.

Association of Fruit and Vegetable Intake with All-Cause and Cardiovascular Mortality Among Hypertension Populations in China: A Cohort Study

Xueqian Wu[1], Limin Wang[1], Xiao Zhang[1], Zhenping Zhao[1], Chun Li[1], Mengting Yu[1], Yuting Lian[1], Chuangjia Du[1,2], Yu Guo[1], Mei Zhang[1]
[1]National Center for Chronic and Noncommunicable Diseases Control and Prevention, Chinese Center for Disease Control and Prevention, Xicheng District, Beijing, China, [2]Department of Big Data in Health Science, and Center for Clinical Big Data and Statistics, the Second Affiliated Hospital, College of Medicine, Zhejiang University, Hangzhou, China

BACKGROUND
Previous studies have shown that fruit and vegetable intake was associated with a reduced risk of mortality. But evidence is limited among Chinese hypertension patients. This study explores the association of fruit and vegetable intake with mortality risk of all-cause and cardiovascular diseases (CVD) deaths.
METHODS

This study included 24,034 adults aged 45 years or older with hypertension from the 2015 China Chronic Disease and Risk Factors Surveillance (CCDRFS). Death data were ascertained by linking each participant's name and identification number to the China's Disease Surveillance Points system through 31 December 2022. To better reflect long-term intake conditions, vegetable intake was assessed by a three-day 24-hour dietary recall, and fruit intake was derived from a food frequency questionnaire (FFQ). Weighted Cox proportional hazards regression models were used to estimate the associations between fruit and vegetable intake and mortality. Schoenfeld residuals were used to test the proportional hazards assumption, and no violation was observed. Restricted cubic spline (RCS) models were used to examine the dose-response relationships.
RESULTS
Over a median 7.1-year follow-up, 2,503 all-cause deaths and 1,253 CVD deaths occurred. In the fully adjusted model, compared with the first quartile (<136.7g), the second (136.7-216.7g) and fourth (>318g) quarters of vegetable intake had lower risk of all-cause mortality (Q2: HR=0.81, [95% CI:0.66-0.99]; Q4: HR=0.80, [95%CI:0.66-0.97]), and CVD mortality (Q2: HR=0.71, [95% CI:0.54-0.93]; Q4: HR=0.72, [95% CI:0.55-0.95]). Compared with the first quartile (<10g), the second (10-42.9g) and fourth (>120g) quarters of fruit intake were associated with reductions in all-cause mortality (Q2: HR=0.82, [95% CI: 0.67-0.99]; Q4: HR=0.73, [95%CI: 0.59-0.90]). Nonlinear, L-shaped dose–response relationships were observed (all p for nonlinear <0.001), respectively.
CONCLUSIONS
In this national study, higher fruit and vegetable intake is associated with decreased all-cause and CVD mortality, and depicted non-linear relationship among individuals with hypertension.
Popul. Med. 2026;8(Supplement 1):A106

ABS3382
The benefit of learning circle approaches to grow trust and usage of AI-supported e-health programmes for the older population: Commentaries from the Global North and South

Ralf Von Bear[1], Laetus Lategan[2]
[1]Aalen University of Applied Sciences, Aalen, Germany, [2]Central University of Technology, Bloemfontein, South Africa

BACKGROUND
There is growing scholarship on healthcare in the Global South, highlighting challenges such as limited resources, budget constraints, a high disease burden, and the impacts of climate change and conflict. A critical issue is the shortage of skilled personnel and limited access to Artificial Intelligence to support healthcare systems. Although the Global North faces similar challenges, they are less severe. The increasing global older population further strains resources, especially financial ones. While technology and innovation offer potential solutions, educating older adults to use and trust AI within an e-health framework is essential.
METHODS
This presentation focuses on the setup of a learning circle approach. A structured approach for emphasising peer interaction and problem-solving to educate older adults on using AI-powered wearables for fall detection, vital signs monitoring, and caregiver alerts, is demonstrated. It also addresses voice-activated assistants for managing medication schedules. The Venn diagram is utilised to illustrate this approach. This diagram highlights the overlapping similarities (shared characteristics) and differences (unique characteristics) among three circles: (a) qualities of healthy ageing, (b) trust in emerging technologies, and (c) community members, healthcare professionals, and laypersons.
RESULTS
The experimental learning circle framework emphasises the importance of trust and confidence in shared AI-based healthcare for the older population. This framework requires a new narrative for older adults, highlighting not only the need to trust new technologies and their developments but also to engage actively with them and make use of their capabilities.
CONCLUSIONS
AI-based healthcare for older people necessitates a new narrative that encourages them to not only trust new technologies and their developments but also actively utilise them. The role of e-health in socio-technical transformation marks a major shift from in-person diagnosis and treatment to remote diagnosis and treatment, regardless of the patient's location on the planet.
Popul. Med. 2026;8(Supplement 1):A107

ABS3404
Social mobilization as a strategy for strengthening policies for the elderly: the Brazilian example of the free digital education conference.

Maria Fabiana Passos[1], Alexandre Silva[2], Paulo Carvalho[1], Meiriluci Lima[1], Neilton Oliveira[1], Raquel Oliveira[1], Celina Roitman[1]
[1]Oswaldo Cruz Foundation, Brasília - Distrito Federal, Brazil, [2]National Secretariat for the Rights of Older Person, Ministry of Human Rights and Citzenship of Brasil, Brasília - Distrito Federal, Brazil

ABSTRACT
Access to digital technologies has become a fundamental determinant of health, citizenship, and the provision of comprehensive care for older adults. In Brazil, more than half of the older population is illiterate or has low levels of formal education, limiting their ability to access increasingly digitalized essential services. The rapid digitalization of public and social services has outpaced the capacity of social structures and public policies to adapt to demographic aging, generating new forms of exclusion, deepening preexisting inequalities, producing rights violations, and constraining intersectoral action. Digital literacy, recognized as a pillar of the World Health Organization's Decade of Healthy Ageing (2021–2030), is therefore central to health equity in later life. This paper synthesizes the experience of the National Free Conference on Digital Education, collectively organized by participants from nine Brazilian states to contribute to the 6th National Conference on the Rights of Older Persons. The conference was held in a hybrid format and involved approximately 400 participants. A total of 53 proposals were developed, emphasizing the need to implement public policies aimed at democratizing access to digital tools and devices. The proposals highlighted the importance of ensuring the availability of professionals trained in digital literacy, education, misinformation management, and digital security to support older adults' access to government service platforms. They also reinforced the need to design strategies to prevent scams and fraud, mitigate financial and patrimonial violence, promote digital inclusion, and strengthen digital citizenship. By engaging students, university faculty, health professionals, social assistance teams, and older adults from diverse communities, the conference constituted a democratic and intergenerational space that enabled the sharing of territorial challenges. It supported the collective construction of a policy-oriented agenda to inform public authorities in addressing digital dimensions of comprehensive care for older persons within a public health framework.
Popul. Med. 2026;8(Supplement 1):A108

ABS3409
Building blocks for public health ethics for the older population. Reporting on a South African study

Laetus Lategan[1]
[1]Central University of Technology, Bloemfontein, South Africa

BACKGROUND
A qualitative study confirmed the neglected academic and policy narrative on the older population's healthcare in South Africa, let alone sufficient programmes from the country's national health departments. Whilst some evidence exists on clinical studies focusing on older people, their treatment and care, the public health debate is too silent, considering especially the ethical challenges associated with older people's healthcare.
METHODS
A mixed-method study was completed, using the Q-methodology to identify what should be part of such a public health ethics framework for the older population. Following the data collection from facilities for older people, eight building blocks were identified for such a framework. Following the development of the framework, the question was whether a value chain approach could be used for implementing this framework. This value chain aims to assess the framework's effectiveness in relation to emerging AI technologies, narratives of vulnerability, and the transfer of skills and knowledge. This value chain was developed in response to increasing distrust towards AI in healthcare, a shortage of skills in evidence-based healthcare, and the widening gap in health data availability.
RESULTS
The value chain pointed towards fundamental principles and ethics of public health as the basis for application. These principles will identify and address ethical challenges in service delivery for both the providers and recipients of health services. Additionally, it emphasises the importance of ethical leadership and the incorporation of ethics education. Promoting social justice in public health programmes should be based on professional ethics and care ethics. Furthermore, it is essential to develop ethical expertise and practice care ethics effectively.
CONCLUSIONS
A preliminary evaluation of the value chain indicated a shortage of necessary skills and emphasised the importance of a collaborative approach in practising public ethics rather than a singular focus on it.

ABS3458

Key issues in safeguarding research integrity for public health research on older people. Directives from global research integrity statements

Laetus Lategan[1]
[1]Central University of Technology, Bloemfontein, South Africa

BACKGROUND
The World Conferences on Research Integrity (WCRI, https://www.wcrif.org) have published several statements since 2010 to guide various aspects of the research value chain. Notable examples from the WCRI include the Singapore Statement (2010), the Hong Kong Principles (2019), and the Cape Town Statement (2022). In South Africa, only a few statements inform this discussion such as the joint statement on Ethical Research and Scholarly Publication Practices, issued by the Academy of Science in South Africa (ASSAf), the Council on Higher Education (CHE), the Department of Education and Training (DHET), the National Research Foundation (NRF), and Universities South Africa (USAf) in 2019.
METHODS
This presentation focuses on two key aspects for research committees in public health concerning older individuals: risk and vulnerable groups. Healthcare research related to older adults will be used as an example, highlighting both risk identification and the protection of vulnerable populations. According to the Older Persons' Act (Act 2013 of 2006), older individuals are defined as females aged 60 years and older and males aged 65 years and older.
RESULTS
This presentation will specifically address vulnerability as a key focus for research integrity committees. To illustrate these concerns, guidance is obtained from the World Conference on Research Integrity and various statements from South Africa regarding risk and vulnerability. The Amsterdam Agenda (2017) identifies responsible practices for sharing data, while the Montreal Statement (2013) provides guidelines for collaboration. The Cape Town Declaration (2022) addresses unfair and inequitable research practices throughout all stages of the research process.
CONCLUSIONS
These statements are important for several reasons, with risk identification and the protection of vulnerable groups being two key aspects. Research Ethics and Integrity Committees frequently deal with review reports where the formal research process is often the focus of the reviews, instead of identifying and dealing with risk factors.
Popul. Med. 2026;8(Supplement 1):A110

ABS3553

Gogos as agents of change: exploring the role of grandmothers as catalysts for social change and inclusive public health programming

Jane Simmonds[1], Hlumelo Gxotiwe[1]
[1]goGOGOgo, Johannesburg, South Africa

INTRODUCTION
Social behaviour change communication (SBCC) approaches recognise the importance of engaging community members to accelerate health-promoting norms across society. South African grandmothers, locally known as gogos, are influential leaders and repositories of knowledge for their families and communities. Despite this potential influence, grandmothers are underutilised in public health programming. Drawing on evidence from goGOGOgo interventions, this workshop explores the role of grandmothers as change agents capable of influencing health behaviours at all four levels of the SBCC socio-ecological model: individual, interpersonal, community and policy.
METHODS
This 1-hour interactive workshop will be structured around the socio-ecological model and use structured group activities and facilitated reflection to explore the impact of gogos on public health outcomes. Participants will be guided through the four levels of behaviour change, using case studies and findings from goGOGOgo programmes on digital inclusion, maternal and child health, sexual and reproductive health and mental health. Small-group activities will enable participants to map pathways through which grandmothers influence norms, behaviours and access to public health services. Participants will use these pathways to design contextual, relevant SBCC strategies rooted in intergenerational collaboration.
RESULTS
Evidence from goGOGOgo programmes shows that co-creating change with grandmothers leads to improved health knowledge, intergenerational communication, healthcare access, digital inclusion and reduced stigma around sexual and reproductive health. These effects influence community norms and access to critical public services. Workshop participants will gain practical tools and insights to help identify intergenerational barriers and interventions designed around inclusive practices.
CONCLUSIONS
Collaborating with grandmothers as active change agents supports programme design that is relevant to its target audience and grounded in empirical evidence. This workshop contributes actionable insights into how grandmothers can accelerate behaviour change and guide the creation of inclusive public health strategies.

The institutionalization process of the elderly in brazil: challenges and perspectives of family caregivers

Mateus Nague de Souza[1], Ana Claudia Pinheiro Garcia[1], Fabiana Turino[1], Erika Maria Sampaio Rocha[2], Maria Helena Monteiro de Barros Miotto[1], Stephania Mendes Demarchi[1], Caroline Feitosa Dibai de Castro[3], Rita de Cássia Duarte Lima[1], Fabíola Fernandes Bersot Magalhães[1], Maria Angélica Carvalho Andrade[1]
[1]1 Postgraduate Program in Public Health (PPGSC) - Health Sciences Center (CCS), Universidade Federal do Espírito Santo, Vitória, Espírito Santo, Brazil, [2]2 Universidade Federal do Sul da Bahia, Itabuna, Bahia, Brazil, [3]3 Medicine, Escola Superior de Ciências da Santa Casa de Misericórdia de Vitória (EMESCAM), Vitória, Espírito Santo, Brazil

INTRODUCTION
The increase in longevity in Brazil and worldwide has brought several challenges to be faced by society and policymakers, among which is the increased demand for Long-Term Care Facilities for the Elderly (LTCFs). Historical and cultural transformations have been modifying the relationship of home care, predominantly carried out by women. However, access to LTCFs by the Brazilian population is still limited, especially in contexts of greater social inequality. This study aims to discuss home care for dependent elderly people from the perspective of family caregivers and the limitations of public policies aimed at long-term care.
METHODS
This qualitative, cross-sectional study was conducted in the state of Espírito Santo, Brazil. Fifteen family members who actively cared for elderly individuals at home participated in the research. The study adhered to the ethical guidelines of Resolution No. 466/2012.
RESULTS
Home care for elderly people in Brazil is a social imposition, as elderly women assume this role without technical training and under intense physical, emotional, and economic strain. The absence of state support means that care is provided without a support network, potentially increasing the health of the caregiver and compromising the care of the elderly person. Long-Term Care Facilities for the Elderly (LTCFs) were recognized as a care alternative. However, they proved inaccessible to some participants, as the elderly person's retirement income was insufficient to cover expenses, making it impossible to contract the service.
CONCLUSIONS
The institutionalization of elderly people tends to increase with population aging. Although LTCFs present themselves as a care alternative, access is restricted and unequal, highlighting difficulties for the State in guaranteeing equity in access and ensuring quality standards in care. The findings reveal weaknesses in public policies and reinforce collective care as a necessary agenda in the face of accelerated population aging.

ABS3702

Taking blood pressure in both arms - a diagnostic necessity or a time luxury?

Katarina Dostalova[1], Martina Slovacikova[2], Lucia Kukuckova[3], Peter Petrasko[3], Diana Ponosova[3], Peter Mikula[4], Stefania Moricova[1], Katarina Gazdikova[2]
[1]Faculty of Public Health, Slovak Medical University, Bratislava, Slovakia, [2]Faculty of medicine, Slovak Medical University, Bratislava, Slovakia, [3]University Hospital, Bratislava, Slovakia, [4]Faculty of Medicine, Comenius University, Bratislava, Slovakia

BACKGROUND
Recommendations of international societies as well as the Standard Diagnostic and Therapeutic Procedures for Arterial Hypertension in Slovakia explicitly recommend measuring blood pressure in both upper extremities. The symptomatic upper extremity peripheral artery disease is poorly studied compared with the lower extremity. Case report: We describe the case of an 87-year-old woman with arterial hypertension, dementia, and adenocarcinoma of the uterus, She was many times hospitalized for collapses in the last 10 years. The patient worked as a hairdresser her entire life. Her work was also her passion and hobby. She

practically until nowadays does hairstyles for her friends and neighbors. The pain of her right shoulder was quite logically attributed to right-sided osteoarthritis. During last hospitalization in the long-term care department was it found that the pressure difference between the right and left arm was 40 mmHg. Color duplex sonography and CT angiography were performed. The examinations confirmed critical stenotization of the right subclavian artery with the presence of subclavian steal syndrome. Subsequently the vascular team attempted to patency the stenosed right subclavian artery, but the calcified lesion resisted. The patient was discharged to the nursing house. In the discharge report, the general practitioner was alerted to inter arm pressure difference, which he must take into account in the management of arterial hypertension. A follow-up examination is planned with consideration of further intervention

CONCLUSIONS

The case is an example of the long-standing ignoring of the recommendation regarding measuring blood pressure in both arms. Health insurance companies in Slovakia reimburse preventive examinations every two years (blood donors every year). A self-evident part of the preventive examination should be measured in both arms. Similarly, during the first visit to the department or hospital, in case of difficulties - dizziness, headaches and shoulder pain, or collapses.

Vascular intervention in presenium can decide the quality of life in a patient with peripheral arterial disease

Katarina Dostalova[1], Peter Mikula[2], Jakub Hennel[2], Martin Kokles[2], Katarina Tokarcikova[3]

[1]Faculty of Public Health, Slovak Medical University, Bratislava, Slovakia, [2]Faculty of Medicine, Comenius University, Bratislava, Slovakia, [3]Faculty of Medicine, Pavel Jozef Safarik University, Kosice, Slovakia

ABSTRACT

Peripheral artery disease (PAD) seriously affects the mortality rate of the population, as well as the quality of daily life of individuals, mainly through claudication, which limits walking and daily activities. Case: Three years ago, 60-year-old patient comes to our clinic with claudication of the right leg 100 m. Smoker with previously untreated arterial hypertension (AH), an electrician, married, 16-year-old daughter. Sonography showed severe atherosclerotic changes in the superficial femoral artery (AFS) l. dx. We encourage the patient to quit smoking, start to treat of AH, add statins. He starts daily muscle training. Claudication does not worsen further. We potentiate the treatment with naftidrofuryl and ginko biloba, he completely quit smoking. Claudication does not worsen but does not improve either. His desperate wife comes in, reporting erectile dysfunction (ED), the patient is considering prematurely terminating his work, there is a significant decrease in the ankle-brachial and toe-brachial index. So, despite the absence of signs of critical limb ischemia, we consult the vascular interventionist. CT angiography showed severe stenotizations of the a.ilica l.dx. (AIE) and the right AFS. Intervention technically successful recanalizes AIE l.dx., antiplatelet therapy follows. The claudication distance increases to 650 m. He returns to work, decides to support his daughter studies for the next 5 years. Management of risk factors as a prevention of restenosis continues.

CONCLUSIONS

A comprehensive, consistent approach to addressing risk factors as well as vascular intervention has the potential to improve and sustain quality of life in patients with PAD.

ABS3905

Sexual health of older people (SHOP): promoting dialogue and enhancing sexual well-being in older adults

Jane Simmonds[1], Makandwe Nyirenda[2]

[1]goGOGOgo, Johannesburg, South Africa, [2]South African Medical Research Council, Cape Town, South Africa

INTRODUCTION

Sexual health is an essential yet frequently overlooked component of healthy ageing, particularly in communities where stigma, ageism, and a lack of provider training inhibit open discussion. Despite growing evidence that sexual activity in later life is linked to improved physical, emotional, and cognitive well-being, older adults often encounter barriers to accurate information and supportive services. In partnership with Realize Canada, goGOGOgo implemented the Sexual Health of Older People (SHOP) initiative to address these gaps through inclusive, informed, and age-affirming approaches to sexuality in later life. SHOP encouraged individuals aged 50+ to embrace sexual health as a vital aspect of holistic well-being

METHODS

SHOP delivered structured, evidence-informed workshops facilitated by trained community members and professionals. Using participatory methods, the curriculum addressed: - Age-related changes in sexual function and desire. - Consent and sexual autonomy, including in contexts of cognitive decline and institutional care. - Safer sex practices and sexually transmitted infection (STI) risks among older adults. - Non-penetrative intimacy and supportive aids. - Communication strategies for discussing sexual health with partners and healthcare providers. Workshops incorporated real-life scenarios, discussion prompts, and local referral information to reinforce learning and resource navigation.

RESULTS

Findings from the pilot programme demonstrated: - Raised awareness among older adults and healthcare providers on the continued importance of sexual health. - Strengthened communication between older adults and healthcare workers. - Enhanced community recognition of sexual health as a human right across the life course. - Strengthened peer support among older adults in discussing the emotional, physical and relational aspects of sexuality

CONCLUSIONS

SHOP demonstrated the potential of tailored, community-based education to transform perceptions and practices around ageing and sexuality. By embedding sexual health within healthy ageing strategies, health and social care providers can reduce stigma, challenge ageism, and support the autonomy of older adults.

Community-Based Participatory Research to Strengthen Rural Older Adults' Health Care Planning in Northeastern Brazil

Ana Morais[1], Gislane Freitas[1], Ana Castro[1], Leidy Abreu[1], Thales Vieira[1], João Filho[1], Rodrigo Bandeira[1], Inara Moura[1], Antonio Júnior[1]

[1]CENTRO DE CIÊNCIAS DA SAÚDE, UNIVERSIDADE ESTADUAL DO CEARÁ, Fortaleza, Brazil

INTRODUCTION

Population aging in rural areas poses specific challenges to primary health care, particularly due to access barriers, social vulnerabilities, and the fragmentation of public policies. In this context, community-based participatory research emerges as a methodological strategy capable of strengthening health planning through listening to and fostering the protagonism of territorial subjects. This study aimed to collaboratively develop an action plan focused on comprehensive health care for older adults living in rural areas, grounded in the expanded clinical approach and community-based participatory research.

METHODS

This was a participatory research study2 conducted between November 2025 and January 2026, based on the establishment of a community advisory committee composed of older adults, health and social assistance professionals, representatives of the municipal council, and intersectoral initiatives. Six in-person meetings were held using participatory dynamics, brainstorming, collective discussions, and records in field diaries and voice recordings. The activities corresponded to phases 1 to 5 of community-based participatory research, with a focus on problem identification and the collective construction of strategies.

RESULTS

The formation of the committee enabled the creation of an intersectoral space for qualified listening and co-production of knowledge. The participatory diagnosis identified the insufficiency of intersectoral actions to protect against and address violence against older adults as the central problem. The analysis revealed that underreporting, associated with fear and the cultural naturalization of violence, constitutes a critical barrier. Participants mapped local assets and agreed on strategies for an integrated action plan between health and social assistance.

CONCLUSIONS

Community-based participatory research proved effective in transforming latent demands into management priorities. Strengthening health planning for rural older adults requires intersectoral articulation, valuing community knowledge, and qualifying practices within primary health care.

Health outcomes in Brazilian adults one year after COVID-19 infection

Francisca Elisângela Teixeira Lima[1], Alice Passos do Nascimento[1], Victor Caetano Rodrigues[1], Glaubervania Alves Lima[1], Brena Shellem Bessa de Oliveira[1], Maria Williany Silva Ventura[1], Maria Gabriela Miranda Fontenele[1], Lanese Medeiros de Figueiredo[2,1], Larissa Bento de Araujo Mendonça[1], Juan David Dussan Chaux[1], Lorena Pinheiro Barbosa[1]

[1]Departamento de Enfermagem, Universidade Federal do Ceará, Fortaleza/Ceará, Brasil, [2]Departamento de Morfologia, Universidade Federal do Ceará, Fortaleza/Ceará, Brasil

INTRODUCTION

Post-COVID-19 conditions have emerged as an important public health challenge due to the persistence of symptoms and clinical sequelae long after the acute phase of infection. These outcomes may affect multiple organ systems and generate sustained health demands. This study aimed to estimate the prevalence and describe post-COVID-19 symptoms and clinical outcomes in Brazilian adults one year after COVID-19 infection.

METHODS

This cross-sectional, retrospective, quantitative study included 854 Brazilian adults aged 18 years or older with a confirmed diagnosis of COVID-19 at least one year prior to data collection. Data was collected through an electronic questionnaire. Post-COVID-19 symptoms and clinical outcomes were identified based on self-report. Descriptive statistical analyses were performed.

RESULTS

Overall, 64.3% of participants reported at least one post-COVID-19 symptom or sequela. The most prevalent persistent symptoms were fatigue (74.1%), difficulty breathing (43.7%), hair loss (42.7%), and other persistent symptoms (42.7%). Regarding post-COVID-19 clinical outcomes, systemic arterial hypertension was reported by 16.0% of participants, followed by muscle weakness (34.2%), severe respiratory infection (6.9%), chronic neuropathic pain (6.8%), and diabetes mellitus after COVID-19 (5.3%). Less frequent but clinically relevant outcomes included deep vein thrombosis (1.9%), pulmonary embolism (1.5%), acute kidney injury (1.4%), stroke (0.9%), and acute myocardial infarction (0.7%). These findings demonstrate a wide spectrum of post-COVID-19 manifestations affecting cardiovascular, metabolic, neurological, respiratory, and musculoskeletal systems.

CONCLUSIONS

Post-COVID-19 conditions were highly prevalent one year after infection, with a substantial burden of persistent symptoms and clinically relevant sequelae. The diversity and frequency of these outcomes highlight the need for long-term monitoring, integrated care strategies, and health service planning to address the ongoing consequences of COVID-19.

ABS4129

A quantitative examination of how adults with Multiple Chronic Conditions experience chronic healthcare

Olona Mzimkulu[1]

[1]Medicine, University of Cape Town, Cape Town, South Africa

BACKGROUND

Individuals with more than two chronic conditions, known as Multiple Chronic Conditions (MLTCs), often experience increased health care utilization and polypharmacy. The Patient Assessment of Chronic Illness Care (PACIC) scale is most appropriate for assessing self-reported experience in chronic care; however, its use in the MLTC cohort in the African context is limited.. Objectives We aimed to assess the experience of chronic care of patients with MLTCs using baseline data from the ENHANCE clinical trial. Objectives were: (i) to compare the experience of care received by two groups with MLTCs, those with HIV and other non-communicable diseases. (ii)To examine the association between experience of care and demographic characteristics of patients with MLTCs. (iii)To describe the frequency of health service utilization by individuals living with MLTCs.

METHODS

We conducted a secondary analysis of 1746 patients with MLTCs aged 40 and above in 32 clinics in two South African Provinces, KwaZulu-Natal and Western Cape. We collected data using the PACIC instrument, a standardized questionnaire for the experience of chronic care. Descriptive statistics were performed to report the socio-demographics of the participants. In addition, we fitted linear regression models to explore the association of experience of chronic care and sociodemographic characteristics.

RESULTS

Overall, the mean age was 58 years (SD: 9.8), 76% were women. The experience of chronic care was positively associated with being married (p=0.002) and widowed (p=0.002), employed (p=0.001), and receiving care in the Western Cape Province (p=0.004), having ≥3 chronic conditions (p=0.021), and three clinic visits (p=0.011). After adjusting for all other variables, patients who were employed (p=0.001), residing in the Western Cape province (p=0.006), who were widowed (p=0.010), and who had three visits experienced person-centered chronic care.

CONCLUSIONS

The findings suggest that socioeconomic context, play an important role in shaping chronic care experiences for patients with MLTCs.

ABS4146

Epidemiological profile of deaths from cellulitis and mouth abscess in Brazil: 1996–2024

Nicole Justo[1], Lisie Justo[2]

[1]Odontologia, Unisagrado, Bauru, Brazil, [2]Medicina, Faculdade São Leopoldo Mandic, Araras, Brazil

BACKGROUND

ICD-10 K12.2 (cellulitis and abscess of the mouth) encompasses acute orofacial infections, primarily of odontogenic origin. Although often overlooked in large-scale surveys, these conditions belong to a group of oral disorders that affected 139 million people globally in 2017, posing a critical public health challenge due to the risk of sepsis and airway obstruction [2,3].

OBJECTIVE

To describe the epidemiological profile of deaths caused by cellulitis and mouth abscess in Brazil between 1996 and 2024.

METHODS

Quantitative, descriptive, and cross-sectional study using data from the Mortality Information System (SIM/DATASUS). Analyses were performed using descriptive statistics via SPSS software (v.27). As the study utilized public domain secondary data, it was exempt from ethical committee approval.

RESULTS

During the study period, there was a 10.1% increase in deaths. Mortality was predominant among males (58.1%), individuals of white race/color (45.8%), single individuals (38.1%), and those with 8 to 11 years of education (22.3%). Regionally, the state of São Paulo accounted for 24.1% of occurrences. Although 91.8% of deaths occurred in a hospital setting and 67.7% received medical assistance, only 13.2% underwent diagnostic tests and 6.1% underwent surgical intervention. In 33.1% of cases, the death was certified by the physician who treated the patient.

CONCLUSIONS

The high number of deaths contrasts with the low rate of diagnostic testing and surgical procedures, suggesting barriers to timely clinical management or late diagnosis. These data underscore the need to strengthen dental emergency networks and hospital integration to reduce mortality from preventable orofacial infections.

ABS4147

Dietary patterns and adiposity risk in young adults aged 18-49, living in urban slums in a metropolitan city in Ghana: Implications on healthy lifestyle practices

shamima Alhassan[1], Frank Hayford[1]

[1]Department of Dietetics, University of Ghana, Accra, Ghana

BACKGROUND

Dietary behaviour in urban slums in Ghana has undergone significant transformation due to rapid urbanization. This transition is characterized by increased consumption of energy-dense and processed foods, leading to rising levels of adiposity and associated health risks. This study explored dietary patterns in relation to adiposity among young adults aged 18–49 years living in selected urban slum communities in Accra. Additionally, socioeconomic and environmental determinants of dietary behaviour were examined within this vulnerable population.

METHODS

A quantitative cross-sectional study design was employed, involving 200 respondents selected using stratified sampling from three urban slum communities in the Ablekuma West District of Accra. Data was collected using socio-demographic questionnaires and Food Frequency Questionnaire. Adiposity was assessed using bio-impedance analysis, waist circumference and waist-to-hip ratio. Dietary patterns were identified using Principal Component Analysis with Varimax rotation, and associations with adiposity were examined using multinomial logistic regression.

RESULTS

Two major dietary patterns emerged. The Mixed Pattern, which explained 47% of total variance, included a wide range of food groups such as carbohydrates, animal products, vegetables, legumes, fats, and refined sugars. Although indicative of dietary diversity, this pattern included unhealthy components. The High Carbohydrate and High Alcohol Pattern explained 12% variance and was characterized by high intake of carbohydrates and alcohol. This pattern was significantly associated with increased adiposity risk (OR: 1.94; 95% CI: 1.14–3.32; p = 0.013), representing nearly a two-fold risk. The Mixed Pattern showed no significant association with adiposity.

CONCLUSIONS
The study identified unhealthy dietary patterns dominated by processed foods, sugary beverages, and refined cereals, which were strongly associated with increased obesity risk. Financial constraints influence food choices, encouraging consumption of low-cost, high-calorie foods. Public health interventions should prioritize affordable healthy food options and targeted nutrition education to reduce obesity and related non-communicable diseases among urban slum populations.
Popul. Med. 2026;8(Supplement 1):A131

ABS4180
Do Cross-National Differences in Increasing Early-Onset Colorectal Cancer Incidence Rates Reflect Inequities in Diagnosis and Surveillance

Avi Magid[1], Dorit Nitzan[2], Manfred Green[3]
[1]International Health, Maastricht University, Maastricht, Netherlands, [2]School of Public Health, Ben Gurion University of the Negev, Beer Sheva, Israel, [3]School of Public Health, University of Haifa, Haifa, Israel

BACKGROUND
Colorectal cancer (CRC) incidence rates is increasing among young adults in several high-income countries, while remaining stable or declining s at older ages. Whether similar trends are occurring in high- and middle-income countries is less clear. Cross-national comparisons of CRC incidence rates can help clarify whether observed differences reflect true risk patterns or inequities in risk exposure, detection or surveillance. These trends.
OBJECTIVES
To compare temporal trends in age-adjusted CRC incidence rates among young adults in high- and middle-income countries.
METHODS
We analysed age-specific CRC incidence rates from the IARC database. High-income countries included Norway, the United Kingdom, Sweden, Israel, the United States, and Canada. Middle-income countries included Turkey, Croatia, Belarus, and India. Analyses focused on adults aged 20–49 years. Sex-specific trends were assessed using Joinpoint regression, estimating Annual Percentage Changes (APCs) and Average Annual Percentage Changes (AAPCs).
RESULTS
High-income countries showed consistent and sustained increases in early-onset CRC incidence rates in both sexes, often accelerating from the mid-2000s or early-2010s. In contrast, middle-income countries demonstrated greater heterogeneity. Turkey and Belarus exhibited clear recent increases, Croatia showed marked sex-specific divergence with a pronounced late increase among females, and India displayed substantially lower incidence with more variable and often non-significant trends.
CONCLUSIONS
Increasing early-onset CRC age-adjusted incidence rates in low-income countries are not identical to the trends in low-income countries. This may reflect broader global inequities in exposure risk, detection, and surveillance. Uniform increases in high-income countries may reflect earlier exposure to modifiable risk factors, alongside stronger cancer registry systems. In middle-income countries, heterogeneous patterns likely reflect later epidemiological transitions, uneven diagnostic access, and variable registry capacity. Comparative analyses across income settings are essential to inform equitable prevention and risk-adapted screening strategies.

ANTIMICROBIAL RESISTANCE

ABS0066
Kenyan Undergraduate Medical Curriculum Review: Integrating Antimicrobial Resistance (AMR) and Digital Health/ Information and Communications Technology (ICT)

Marie-Claire Wangari[1], Hafeez Hamza[2], Bonnke Arunga[1], Sylivia N. Ntamwinja[3], Nyakio Mburu[3]
[1]Kenya Medical Association (KMA), Nairobi, Kenya, [2]Ducit Blue Foundation (DBF), Abuja, Nigeria, [3]Medical Students' Associations of Kenya (MSAKE), Nairobi, Kenya

INTRODUCTION
Antimicrobial resistance (AMR) is a major global health threat driven by inappropriate antibiotic use, leading to longer hospital stays and increased mortality. Simultaneously, digital health and information and communications technology (ICT) are reshaping healthcare through improved patient management and care coordination. To prepare future physicians, undergraduate medical curricula must adapt to address both AMR and digital innovation.
METHODS
The review began by mapping medical schools offering undergraduate medicine courses, as identified by the Kenya Medical Practitioners and Dentists Council (KMPDC). Curricula were then examined against KMPDC guidelines to assess the presence of AMR and Digital Health/ICT content. To complement this review, a student survey was conducted via Google Forms, focusing on exposure to AMR, Digital Health/ICT, and awareness of emerging technologies such as nanobots
RESULTS
Findings revealed strong but imperfect integration of AMR compared to limited coverage of Digital Health/ICT. Among respondents, 94.4% reported receiving AMR training, predominantly delivered through lectures (75%). However, 41.7% rated this training as only "somewhat adequate." In contrast, only 61.1% of respondents reported exposure to Digital Health/ICT, most often through online resources (44.4%), with 44.4% rating its depth as "not at all adequate." Awareness of emerging technologies was particularly low: 83.3% of students reported never encountering the concept of nanobots during their training, while 36.4% of those who had were introduced to it exclusively through research contexts.
CONCLUSIONS
The findings expose a clear gap between AMR and Digital Health/ICT education in Kenyan medical schools. While AMR is broadly covered, teaching quality needs improvement. Conversely, Digital Health/ICT content remains insufficient and lacks emphasis on rapidly evolving technologies. Modernising curricula to strengthen AMR pedagogy and embed comprehensive Digital Health/ICT training—including emerging innovations—is essential for equipping future physicians to address pressing health challenges and leverage digital tools effectively in patient care.
Popul. Med. 2026;8(Supplement 1):A136

ABS0896
Antimicrobial stewardship in rural Zambia: insights from a two-year primary care prescribing audit

Elizabeth Timperley[1], Joanna Taylor[1], Joseph Jameson[1], Clare Greevy[1], Luned Nicholas[1], Edward Sibeene[1], Eunice Sinyemu[1]
[1]On Call Africa, Livingstone, Zambia

INTRODUCTION
Antimicrobial resistance (AMR) is a growing global public health threat, disproportionately affecting low and middle-income countries.1 High resistance from common bacterial pathogens is reported in Zambian hospitals, but data from rural primary care are limited.2 Understanding prescribing practices in these settings is essential to guide national strategies and support sustainable antimicrobial stewardship.
METHODS
Three retrospective audit cycles were conducted by a non-governmental organisation working with a rural health facility in Southern Province, Zambia. Prescribing practices were assessed against the Zambian Standard Treatment Guidelines (2020). Outcomes included prescribing frequency, multi-antibiotic use and guideline adherence. In October 2024, 143 patient notebooks were randomly sampled. Following teaching sessions and educational resources over 2 months, 85 notebooks were re-audited. The third cycle in October 2025 captured 491 patient encounters over the preceding 10 months (199 patient notebooks and 292 outpatient logbook entries).
RESULTS
In 2024, 69% (n=99) of the sample population were prescribed at least 1 antibiotic; post-intervention, this decreased to 42% (n=36). In 2025, 56% (n=273) received antibiotics: 86.8% (n=237) one, 8.8% (n=24) two, 4.4% (n=12) three or more. Metronidazole (n=86) and amoxicillin (n=78) accounted for over 50% of prescriptions. Guideline adherence remained low: in 2024, 8–13% appropriate; in 2025, 16.5% (n=45) fully and 8.8% (n=24) partially adherent. Multi-antibiotic prescribing declined from 78% (2024) to 13% (2025).
CONCLUSIONS
Antibiotic prescribing remained high, with over half of all prescriptions consisting of broad-spectrum agents, and guideline adherence limited. These prescribing practices contribute to accelerating AMR and reflect persistent barriers in rural healthcare settings, such as minimal diagnostics, stock shortages, staff turnover, and low community awareness. Targeted education can reduce inappropriate prescribing, but sustained improvement requires ongoing mentorship, guideline access, routine surveillance, and community engagement. These findings provide actionable insights for national AMR strategies and emphasise the urgent need for locally driven system-level stewardship interventions.

Advancing equitable and meaningful youth engagement in Africa's

antimicrobial resistance response

Hafeez Hamza[1], Daniel Waruingi[2,1], Gathai Mundia[2,1], Yusuf Babatunde[3,1], Mayowa Akinpelu[4,1], Niniola Williams[5]
[1]African Youth Antimicrobial Resistance Alliance (AYARA) Task Force, Lusaka, Zambia, [2]Department of Research, Zihi Institute, Nairobi, Kenya, [3]Alliance Against Antimicrobial Resistance, Ibadan, Nigeria, [4]Africa Public Health Student Network Initiative (AfricaPHSN), Abuja, Nigeria, [5]Dr. Ameyo Stella Adadevoh (DRASA) Health Trust, Abuja, Nigeria

INTRODUCTION
Antimicrobial resistance (AMR) is a critical global public health threat, with Sub-Saharan Africa bearing the highest burden. Despite Africa's youthful demographic, nearly 70% of the population is under 30, young people remain largely excluded from AMR policy, governance, and implementation processes. This exclusion limits the equity, sustainability, and effectiveness of AMR responses. The objective of this paper is to examine the current landscape of youth engagement in AMR initiatives across Africa and makes the case for institutionalizing equitable and meaningful youth engagement as a core pillar of AMR mitigation.
METHODS
The paper synthesizes evidence from peer-reviewed literature, scoping and umbrella reviews on youth participation in health, and documented case studies of youth-led and youth-serving AMR initiatives across Africa. Using the World Health Organization's Global Consensus Statement on Meaningful Adolescent and Youth Engagement as a guiding framework, this paper articulates key principles and practical strategies for embedding youth as co-creators in AMR responses.
RESULTS
Findings indicate that youth engagement in AMR initiatives is often tokenistic, episodic and limited to awareness-raising. In contrast, evidence from youth-led AMR programs demonstrates measurable impacts, including improved antimicrobial-use behaviors, strengthened community stewardship, and large multiplier effects through peer-to-peer engagement. Programs that integrate youth as co-designers and implementers show greater relevance, reach, and sustainability. The paper presents 'The AMR Meaningful Youth Engagement Wheel' which entails the core principles of equitable and meaningful youth engagement in tackling this global health threat.
CONCLUSIONS
Institutionalizing meaningful youth engagement is both a moral imperative and a practical necessity for achieving equitable, inclusive, and sustainable AMR responses. Embedding youth within AMR decision-making, funding mechanisms, and accountability frameworks can strengthen health systems and ensure long-term resilience in the fight against AMR. ABS1552

Bridging the Policy-to-Practice Gap in One Health Approaches to Antimicrobial Resistance: A Thematic Evidence Synthesis (2020–2025)

Tarini Jayaprakash[1], Danish Razdan[2], Nathalia Nunes[3], Mayumi Wakimoto[3]
[1]Department of Global and Public Health, McGill University, Montreal, Canada, [2]Center for Health Policy, Asian Development Research Institute, Patna, India, [3]Department of Health Surveillance, Evandro Chagas National Institute of Infectious Diseases - Oswaldo Cruz Foundation, Rio de Janeiro, Brazil

INTRODUCTION
Antimicrobial resistance (AMR) poses a critical global health threat, undermining modern medicine and disproportionately affecting low- and middle-income countries. Although the One Health approach integrating human, animal, and environmental health has been widely endorsed and embedded within National Action Plans (NAPs), progress remains stalled due to persistent gaps between policy adoption and effective implementation. This review examines how integrated One Health interventions contribute to AMR policy implementation and identifies the systemic factors shaping their success or failure.
METHODS
A critical narrative review methodology was employed. A systematic search of PubMed, Scopus, and Web of Science was conducted for English-language publications from 2020 to 2025. From 13227 initial records, 58 studies meeting inclusion criteria were selected after screening. Data were extracted and analysed using thematic synthesis to identify cross-cutting themes influencing policy implementation.
RESULTS
The evidence confirms that integrated OH interventions are effective but hindered by systemic barriers. Three interdependent themes were pivotal: governance, financing, and surveillance. Successful implementation was associated with strong inter-ministerial governance structures, dedicated long-term financing, and integrated surveillance systems with shared data platforms. Conversely, the implementation gap was driven by political silos, reliance on short-term project funding, and fragmented, sector-specific data collection. Country-level analyses illustrate how the interplay of these factors determines outcomes, from the sustained progress seen in high-income countries to the significant challenges faced in many resource-constrained settings.
CONCLUSIONS
The AMR crisis is stalled by an implementation gap rooted in political, financial, and technical systems. Bridging this gap requires moving beyond policy endorsement to actionable measures: institutionalising mandated OH governance with dedicated budgets, reforming international financing to support integrated systems, and prioritising the development of shared surveillance platforms to enable collaborative accountability and targeted interventions.

Assessing antimicrobial susceptibility profiles among enterobacterales isolates: a case study of lekma hospital

Folasade Ojo-Benys[1], Joana Twasam[2], Akua Gyimah-Asante[3], Edward Ampadu[4], Gracelyn Asare[3], Deborah Sekoh[2], Isaac Appiah[1], Emilia Udofia[5]
[1]Public Health and Research Unit, LEKMA Hospital, Accra, Ghana, [2]Microbiology Laboratory, LEKMA Hospital, Accra, Ghana, [3]Paediatrics Department, LEKMA Hospital, Accra, Ghana, [4]Emergency Department, LEKMA Hospital, Accra, Ghana, [5]Community Health Department, Korlebu Teaching Hospital, Accra, Ghana

INTRODUCTION
The emergence of drug-resistant organisms, both in healthcare settings and the community, poses a significant challenge for healthcare providers. Among these organisms, Enterobacterales, including Escherichia coli, Klebsiella pneumoniae, Enterobacter cloacae, and Proteus mirabilis, are of particular concern due to their prominent roles in both community and hospital-acquired infections. The study aimed to evaluate the antimicrobial susceptibility profiles of Enterobacterales isolates and determine the prevalence of antimicrobial resistance (AMR) among patients at lekma hospital.
METHODS
Conducted from september 2022 to july 2023, the study involved collecting and examining 688 clinical samples (503 from females and 185 from males) for bacterial cultures using standard procedures. Samples were cultured on various media to isolate and identify bacterial species and assess their susceptibility.
RESULTS
Antimicrobial susceptibility testing (AST), following clinical and laboratory standards institute (CLSI) guidelines, revealed an overall resistance rate of 42.6% among the isolated pathogens. Notably, Escherichia coli, the most frequently isolated pathogen, demonstrated a 44.3% resistance rate, with significantly higher resistance in males (48.5%) compared to females (43.3% p = 0.0447). Similar trends of higher male resistance were seen in Pseudomonas aeruginosa (49.4% vs. 44.4%) and Klebsiella spp. (45% vs. 37.9% p = 0.0137). Conversely, Staphylococcus aureus showed higher resistance in females (41.3%) than males (37.4%, p = 0.0320). Minimum inhibitory concentration (MIC) data indicated alarming resistance to conventional beta-lactams but highlighted the effectiveness of newer combination therapies.
CONCLUSIONS
The findings reveal a high rate of AMR at lekma hospital, marked by significant gender-based differences and declining efficacy of beta-lactam treatments. While traditional antibiotics face increasing resistance, the effectiveness of novel combination therapies presents a crucial alternative for clinical management. This underscores the need for gender-responsive antimicrobial stewardship and the integration of advanced susceptibility testing to address the rising challenge of drug-resistant infections.

ABS1835

Accelerated emergence of dolutegravir resistance among children in Malawi: implications for antimicrobial resistance control in HIV programmes

Bilaal Wilson Matola[1,2], Juliet Yauka Charity Nyasulu[1], Edward Nicol[1]
[1]Global Health, Stellenbosch University, Cape Town, South Africa, [2]HIV, STIs & Viral Hepatitis, Ministry of Health, Lilongwe, Malawi

BACKGROUND
Dolutegravir (DTG) based regimens form the backbone of contemporary HIV treatment due to their high potency and high genetic barrier to resistance. However, the emergence of DTG resistance poses a growing antimicrobial resistance (AMR)

threat to sustained HIV epidemic control. Evidence on age-related differences in the timing of DTG resistance remains limited, yet is critical for informing paediatric HIV treatment strategies and resistance surveillance.
OBJECTIVES
To compare the duration of DTG exposure at the time of resistance detection between children (≤14 years) and adults (≥15 years) in Malawi.
METHODS
We conducted a retrospective analysis of ART-experienced individuals receiving DTG-based regimens who underwent HIV drug resistance testing within the Malawi national HIV programme from January 2019 to October 2025. DTG resistance was defined as a resistance score ≥30. The primary outcome was duration of DTG exposure (months) at resistance detection. As DTG exposure time was not normally distributed, results were summarised using medians and interquartile ranges. Differences between children and adults were assessed using the Wilcoxon rank-sum (Mann–Whitney U) test, with statistical significance set at $p<0.05$.
RESULTS
Among 200 individuals with confirmed DTG resistance, 68 (34%) were children and 132 (66%) were adults. Children developed DTG resistance after substantially shorter exposure than adults. Median DTG duration at resistance detection was 28 months (IQR: 21–37) among children compared with 48.5 months (IQR: 33–58) among adults. Mean DTG exposure was 29.5 months in children and 47.4 months in adults.
CONCLUSIONS
The earlier emergence of DTG resistance among children represents a critical AMR concern for HIV programmes. These findings underscore the need for intensified paediatric viral load monitoring, age-appropriate adherence support, and timely regimen optimisation. Prioritising children within national AMR surveillance frameworks is essential to preserve DTG effectiveness and sustain long-term HIV epidemic control in Malawi and similar high-burden settings.

ABS1910
Environmental surveillance of diarrheagenic Escherichia coli highlights spatial patterns of antimicrobial resistance and diarrheal risk along the Buffalo River, South Africa

Chidozie Iwu[1], Anthony Okoh[1]
[1]University of Washington, Seattle, United States

INTRODUCTION
Surface waters serve as reservoirs for diarrheagenic and antimicrobial-resistant bacteria. This study applied environmental surveillance to examine spatial patterns of diarrheagenic Escherichia coli (DEC), antimicrobial resistance, and diarrheal risk along the Buffalo River, Eastern Cape province, South Africa.
METHODS
Water samples were collected from four access points along the Buffalo River. E. coli were isolated, confirmed using polymerase chain reaction (PCR), and pathotyped for DEC. Antimicrobial susceptibility testing and PCR detection of resistance genes were performed. Diarrheal infection risk was estimated using microbial risk assessment with Monte Carlo simulation, and spatial variation in resistance was assessed using resistance indices and diversity metrics.
RESULTS
Mean E. coli concentrations ranged from approximately 8.2 × 10 to 1.6 × 10 CFU/100 mL across sites, exceeding guideline values at all access points. Of 200 presumptive isolates, 180 (90%) were confirmed as E. coli, and 50 (28%) were identified as DEC. Enterohemorrhagic E. coli accounted for up to 54% of DEC at some access points and was detected at all sites. Multidrug resistance was common, with 58% to 84% of DEC isolates resistant to three or more antibiotic classes. Mean multiple antimicrobial resistance indices ranged from 0.15 at upstream sites to 0.42 at downstream sites, with three access points exceeding the high-risk threshold of 0.2. Tetracycline- and β-lactam–associated resistance genes were detected in 30–62% of DEC isolates, and strong correlations were observed between phenotypic and genotypic resistance profiles ($r = 0.83–0.93$). Estimated annual diarrheal infection risks exceeded international guideline values at all access points.
CONCLUSIONS
Environmental surveillance along the Buffalo River revealed consistently elevated diarrheal risk and substantial spatial variation in antimicrobial resistance among DEC. These findings support the use of surface water monitoring to guide water safety planning and antimicrobial resistance surveillance in communities reliant on untreated surface water.

ABS1920
Antibiotic consumption in hospital healthcare sector in Kazakhstan

Yuliya Semenova[1]
[1]School of Medicine, Nazarbayev University, Astana, Kazakhstan

INTRODUCTION
Kazakhstan is an upper-middle-income country located in Central Asia. The healthcare system is a legacy of the Semashko model. Several aspects of antimicrobial stewardship (AMS) have been introduced in Kazakhstan, with a hospital AMS program in place in a few hospitals. This study aimed to analyze the nationwide antibiotic consumption trends and patterns over the period 2016-2024 using internationally comparable methodology.
METHODS
This study relied on data from SK-Pharmacia, the sole supplier of pharmaceuticals to hospital facilities in Kazakhstan. Data on systemic antibacterials (J01 code) from the Anatomical Therapeutic Chemical (ATC) classification system were extracted for both public and private hospitals, covering the period from January 1, 2016, to December 31, 2024. The extraction was disaggregated at the ATC5 level and included details such as the active ingredient(s), dosage form, route of administration, number of preparations per package, and number of packages administered. The extracted data were entered into the Excel template of the Global Antimicrobial Resistance and Use Surveillance System for AMR and antimicrobial use surveillance (GLASS-AMC)1. The calculation of defined daily doses per 1000 inhabitants per day (DID) for each ATC5 code was performed in the next stage2.
RESULTS
An average of 3.3 DID of antibacterials was annually consumed by the hospital healthcare sector. The consumption peaked in 2020 and 2024 with 5.2 and 6.2 DID, respectively. Quinolone antibacterials and other beta-lactams, including cephalosporins, were the most consumed pharmacological subgroups. Watch group antibacterials constitute the bulk of consumption, exceeding 60% each year. The consumption of Access group antibacterials mirrored this trend and constituted <40%. The share of Reserve group antibiotic consumption was mild, but showed significant growth during the study period.
CONCLUSIONS
There is an urgent need for the implementation of the AMS program in the hospital sector to address these emerging challenges.

Nationwide study of healthcare-associated infections in Kazakhstan

Yuliya Semenova[1]
[1]School of Medicine, Nazarbayev University, Astana, Kazakhstan

INTRODUCTION
There is a paucity of studies investigating the prevalence of healthcare-associated infections (HAIs) and antimicrobial use at a national level in Kazakhstan. Therefore, this study aims to address this gap by reporting the results of the first nationwide investigation into healthcare-associated infections and antimicrobial use in acute care hospitals.
METHODS
A point-prevalence survey was conducted in 26 acute care hospitals across Kazakhstan in June 2023. The methodology strictly adhered to Protocol 5.3 of the European Centre for Disease Prevention and Control1. The sample consisted of 8,076 patients.
RESULTS
The median length of hospital stay until study was 4.0 days. Systemic antimicrobials were administered to 40.2% of hospitalized patients (3250/8076), and HAIs were identified in 2.4% of hospitalized patients (196/8076). Patients receiving antimicrobials were generally younger than those not receiving antimicrobials (median age: 34.42 vs. 37.76 years, respectively). Similarly, patients with HAIs were younger than those without HAIs (median age: 30.88 vs. 36.31 years, respectively). Most antimicrobials were administered to patients hospitalized in surgical wards (57.1%), and a similar trend was observed for HAIs, which were more common among patients hospitalized in surgical wards (42.9%) Pneumonia was the most common type of healthcare-associated infection (25.0%), followed by surgical site infections (13.2%), and gastrointestinal tract infections (11.8%). Cephalosporins were the most frequently prescribed pharmacological group (59.7%). Resistance to third-generation cephalosporins and carbapenems was the most commonly observed resistance in microorganisms isolated from HAI cases, accounting for 47.6% of cases each.
CONCLUSIONS

Kazakhstan needs to continue implementing infection prevention and control measures and foster the development of antimicrobial stewardship programs tailored to the specific needs of its hospitals.

Antibiogram fingerprinting of Vibrio species recovered from commercial fish specimens collected from key retailers.

Asiphe Hobe[1], Ishmael Jaja[1,2], Luyanda Msolo[2], Anthony Okoh[2]
[1]Animal and Pasture Science, University of Fort Hare, Alice, South Africa, [2]Department of Biotechnology and Biological Sciences, University of Fort Hare, Alice, South Africa

INTRODUCTION
Antimicrobial resistance (AMR) is a growing global public health challenge that compromises the effective treatment and prevention of infectious diseases. The current investigation focused on the fingerprints of antibiotic resistance in Vibrio species isolated from commercial fish specimens collected from prominent merchants in the Eastern Cape region of South Africa
METHODS
Fresh-frozen fish samples were collected from selected retail stores. Presumptive Vibrio isolates were recovered using standard microbiological techniques and confirmed by polymerase chain reaction (pcr). Confirmed Vibrio isolates were tested for susceptibility to multiple antibiotics. Genotypic analysis was performed to detect resistance determinants, including blaTEM, mcr-1 to mcr-4, and tet genes. Multiple antibiotic resistance indices (mari) were calculated to assess contamination risk.
RESULTS
a total of 190 presumed isolates; 92 isolates were verified to be members of the Vibrio genus and subsequently examined for antibiotic susceptibility. In the study, multiple drug resistance fingerprints were observed among Vibrio isolates, including resistance to Erythromycin (79%), Nitrofurantoin (40.2%), Colistin (34.8%), Ampicillin (31.5%), Cefotaxime (17.4%), Oxytetracycline (17.4%), Azithromycin (15.2%), Ceftazidime (15.2%), Trimethoprim (5.4%), Ciprofloxacin (3.3%), Imipenem (4%), and Ceftazidime (1.4%). Mari values ranged from 0.25 to 0.5, exceeding the 0.2 threshold and indicating high-risk contamination. Genotypic screening detected blaTEM in 12% of resistant isolates, predominantly in V. Vulnificus (75 %) and V. Parahaemolyticus (12%). Mcr genes were present in 30.8 % of resistant isolates and tet genes in 17.4 %
CONCLUSIONS
The presence of multidrug-resistant Vibrio species in commercial fish highlights a significant threat to food safety and public health. These findings emphasise the need for enhanced surveillance and sustainable antibiotic management in aquaculture and healthcare. The study underscores the importance of equitable and inclusive public health interventions to address antimicrobial resistance across food systems.

Assessment of surgical antibiotic prophylaxis practices in a Tunisian surgical hospital

Zeineb Mallek[1], Maroua Trigui[1], Yosra Mejdoub[1], Mouna Baklouti[2], Emna Mziou[3], Fedi Ben Dhaou[1], Mondher Kassis[1]
[1]Hygiene, Habib Bourguiba Hospital Sfax,Tunisia, Sfax, Tunisia, [2]Community and preventive medicine, Faculty of medicine, Sfax, Tunisia, [3]Community and preventive medicine, Hedi Chaker University Hospital, Sfax, Tunisia

INTRODUCTION
Surgical antibiotic prophylaxis (SAP) is an essential preventive strategy aimed at reducing the risk of surgical site infections. Its effectiveness depends on strict adherence to international recommendations. The objective of our study was to assess adherence to SAP in surgical departments at a University Hospital in Tunisia, with the French Society of Anesthesia and Intensive Care (SFAR) recommendations.
METHODS
We conducted a clinical audit at Habib-Bourguiba University Hospital during June–July 2025, including patients who underwent surgery. For each patient, we assessed whether SAP was indicated. When indicated, we evaluated compliance across several dimensions: SAP administration, antibiotic choice, timing of SAP administration relative to the incision, prescribed dosage, and SAP duration.
RESULTS
We included 133 patients who underwent surgery in the hospital's surgical departments, with a sex ratio equal to 1.55. Their median age was 51years(Interquartile range (IQR)= [31.5-65]). Of the 133 surgical interventions performed, 49.6% (n =66) were classified as clean-contaminated according to Altemeier's classification. In addition, 78.2% (n = 104) of the procedures were scheduled, and 21.8% (n = 35) involved the implantation of prosthetic material. SAP was indicated and administered in 68.4% of cases (n = 91), while it was indicated but not administered in 11.3% of cases (n = 15). The choice of antibiotic for SAP was aligned with SFAR recommendations in 84.2% of cases (n = 77). Regarding the timing of administration relative to the incision, it was compliant with SFAR recommendations in 88.9% (n = 88). In comparison, the prescribed antibiotic dosage and duration were appropriate in 57% of cases (n = 49) and 67% of cases (n = 59), respectively.
CONCLUSIONS
Our study showed that although adherence to SFAR recommendations was generally adequate, inconsistencies in antibiotic dosage and SAP duration indicate that preventive measures should be reinforced, including staff training and standardized protocols

Antimicrobial use, perceptions, and alternative practices regarding antimicrobial resistance amongst pig farms in Gauteng Province, South Africa

Japhta mokoele[1], Japhta Mokoele[1]
[1]Animal health, UNISA, Roodepoort, 170, South Africa

ABSTRACT
The inappropriate use of antimicrobials, coupled with inadequate knowledge and misconceptions, in livestock farms can contribute to the development and spread of antimicrobial resistance (AMR), leading to increased mortality and a substantial economic burden in the public health sector. This cross-sectional questionnaire study evaluated antimicrobial use among 65 commercial and developing pig farms in Gauteng Province, South Africa, from 2021 to 2022. It also assessed farmers' perceptions and alternative practices concerning antimicrobial use and AMR. Descriptive analysis was applied to determine the frequencies of demographics, practices, and perceptions. Then their associations with the farming category (commercial vs. developing) were explored using the Chi-square or Fisher's test. Associations across variables regarding usage, perceptions, and alternative practices, as well as individual categorization, were analysed by multiple correspondence analysis (MCA) and multiple factor analysis (MFA). A significantly higher proportion of developing farmers than commercial farmers engaged in inappropriate practices that can be associated with AMR ($p<0.05$). They rarely discussed antimicrobial dosages and the risk of AMR with veterinarians, and they poorly understood or observed withdrawal periods. This category of farmers also used antimicrobials for prophylaxis, which implies overuse of drugs. Moreover, alternative measures such as cleaning and disinfection, administration of vaccines, and adherence to vaccination frequency and regimes were categorised as poor in developing farms. There is a need for effective access control of antimicrobials used in the livestock industry, and authorities should ensure that farmers benefit from food safety and biosecurity advice. Additionally, targeted research should aim at alternative and applicable practices that mitigate the use of antimicrobials and benefit livestock productivity.
Popul. Med. 2026;8(Supplement 1):A196

ABS2376
Inclusive and Complementary Assessment Approaches of Antimicrobial Stewardship Programs: Balancing Global Standards and Contextual Diversity

Mohammed Khogali[1]
[1]Institute of Public Health, United Arab Emirates University (UAEU), Al Ain, United Arab Emirates

BACKGROUND
Antimicrobial stewardship programs (AMS) are central to addressing antimicrobial resistance. Assessment of AMS implementation, however, relies on tools that differ substantially in scope, content, and intended use. This heterogeneity raises concerns regarding inclusion, equity, and the capacity of diverse health systems, particularly those operating under resource constraints, to engage in stewardship evaluation, comparison, and global benchmarking. To better understand this landscape we mapped and compare tools used to assess the implementation of hospital-based antimicrobial stewardship programs, focusing on how assessment approaches accommodate diversity in health system capacity and context.
METHODS
We conducted a comparative review of peer-reviewed studies and policy documents published between 2011 and 2024 that applied structured tools to assess AMS implementation in inpatient hospital settings. Five electronic databases and

relevant grey literature sources were searched. Identified tools were examined by origin, scope, assessed components, geographic application, and alignment with internationally recognized AMS domains.
RESULTS
Twenty-four documents met inclusion criteria, identifying twelve distinct AMS assessment tools developed by international, national, and facility-level institutions. Globally endorsed frameworks, including WHO toolkits and the CDC Core Elements, were most frequently used. Core domains—such as leadership commitment, education and training, and stewardship actions—were consistently assessed. In contrast, domains critical for inclusive implementation, including public awareness, pharmacy expertise, information technology capacity, surveillance infrastructure, and resource allocation, were inconsistently captured. Local adaptations were common but varied widely across settings
CONCLUSIONS
Current AMS assessment practices reveal an imbalance between standardization and contextual adaptation. While some tools support comparability, resource-intensive assessment frameworks may exclude health systems with limited resources or differing organizational structures. More inclusive and complementary approaches are to balance global alignment with local context. Combining complementary global and locally adapted tools may offer a pragmatic pathway toward equitable stewardship evaluation, meaningful participation across diverse health systems, while supporting global learning and policy development.

Prescribing appropriateness and combating antimicrobial resistance: results of a stewardship program

Nicola Cogo[1], Davide Bonaldo[1], Valentina Didone'[2], Monica Varotto[3], Vania Zambon[3], Antonio Marco Miotti[4], Alberto Ruggeri[5], Giacomo Mezzapelle[5], Desire' Bastarolo[6], Luca Gino Sbrogio'[7], Enrico Pinton[8], Emanuela Zilli[1]
[1]Medical Board of Directors, ULSS 6 Euganea, Hospital of Cittadella, Cittadella, Italy, [2]Health Profession Service, ULSS 6 Euganea, Hospital of Cittadella, Cittadella, Italy, [3]Infection Prevention and Control Specialist Nurse, Hospital of Cittadella, Cittadella, Italy, [4]Service of Infectious Disease, ULSS 6 Euganea, Hospital of Cittadella, Padua, Italy, [5]Microbiology Laborator, ULSS 6 Euganea, Hospital of Cittadella, Padua, Italy, [6]Hospital Pharmacy, ULSS 6 Euganea, Hospital of Cittadella, Cittadella, Italy, [7]Department of Prevention and Hygiene, ULSS 6 Euganea, Padua, Italy, [8]Clinical Risk Management, ULSS 6 Euganea, Padua, Italy
INTRODUCTION
The misuse and overuse of antimicrobials in humans is one of the main factors driving the development of resistant pathogens. It is therefore a priority to adopt effective antimicrobial stewardship strategies to improve the appropriateness of antibiotic use. This scenario is particularly critical in the veneto region, where the padua healthcare trust is located.
METHODS
The local healthcare trust serves nearly one million residents, has four acute care hospitals, and 1300 beds. To increase the appropriateness of antibiotic prescribing, the following antimicrobial stewardship measures have been adopted. These strategies include periodic monitoring of reports on the epidemiology of sentinel microorganisms, resistance rates, and antibiotic consumption; discussion of reports in multidisciplinary teams; focus on the operating units with the greatest critical issues; dissemination of guidelines for empiric therapy (pneumonia, urinary tract, skin); and finally the use of digital tools/apps to facilitate consultation of empiric therapy and dissemination of pathogen-specific control and prevention measures for both specialists and medical practitioners.
RESULTS
Following the introduction of strengthened antimicrobial stewardship strategies, overall antibiotic consumption decreased from 74.55 DDD per 100 bed-days in 2022 to 70.11 in 2024 and 66.29 in 2025. Specifically, fluoroquinolones, classified in the "Watch" group by the WHO due to the risk of resistance development, decreased from 7.8 DDD per 100 bed-days to 5.66 in 2024 and 4.9 in 2025. Carbapenems, also in the Watch group, were reduced from 8.5 in 2022 to 1.2 in 2025 (1.59 in 2024). Finally, third-generation cephalosporins decreased from 14.7 in 2022 to 14.2 in 2024 and 13.8 in 2025.
CONCLUSIONS
This study demonstrates how raising awareness of antibiotic resistance, implementing effective antimicrobial stewardship measures, and digitalization are essential to contain this phenomenon, which is considered by the WHO to be a global health threat.

Tackling antimicrobial resistance: an AWaRe-based intervention for acute respiratory illness in primary care for low- and middle-income countries

Nafessa Saldulker[1], Ruth Cornick[1], Candice Daniels[2], Michaela Levy[3], Christy-Joy Ras[3], Daniella Georgeu-Pepper[4], Kathryn Jacobs[3], Pearl Spiller[5], Mike Sharland[6], Max Bachmann[7]
[1]Clinical Content, Knowledge Translation Foundation, Cape Town, South Africa, [2]Innovation, Knowledge Translation Foundation, Cape Town, South Africa, [3]Learning and Development, Knowledge Translation Foundation, Cape Town, South Africa, [4]Implementation, Knowledge Translation Foundation, Cape Town, South Africa, [5]Design, Knowledge Translation Foundation, Cape Town, South Africa, [6]Centre for Neonatal and Paediatric Infection, Institute for Infection and Immunity, Centre for Neonatal and Paediatric Infection, Institute for Infection and Immunity, Northampton Square, United Kingdom, [7]Public Health, University of East Anglia, Norwich, United Kingdom
ABSTRACT
Background - About 90% of antibiotics prescribed for humans occurs in primary care, and most are inappropriate, contributing to global antimicrobial resistance (AMR)(1). To promote safer antibiotic use, the World Health Organisations (WHO) AWaRe system categorises antibiotics into Access, Watch and Reserve groups(1). The AWaRe1 trial(2) focusses on common acute respiratory illnesses (ARIs) in four low- and middle-income countries (LMICs) – Nigeria, Indonesia, Bangladesh, and Vietnam – and aims to improve antibiotic use by changing health worker prescribing behaviours using an AWaRe-based intervention. Methods – Content from the 2022 WHO AWaRe antibiotic book(1) guided the development of an intervention package, including tools and training. Algorithmic approaches to four common ARI presentations (sore throat, sore ear, sore face and new cough) in adults and children aged 1-12 years include key messages around antibiotic use. This informed an educational outreach approach to deliver training sessions to health workers by local champions, guided by the COM-B behaviour change model. Workshops with stakeholders from the WHO AMR Division ensured clinical accuracy and alignment with the AWaRe book1. An internal pilot assessed and improved content flow and ease of usability, and the intervention was aligned to AWaRe branding. Results – The intervention comprises a clinical decision support tool, four behaviour change posters, a self-audit log for health workers, a one-page clinical summary to help diagnose ARIs, and a training package comprising case studies, slides and quizzes linked to a reporting system. It is ready for localisation to the four trial countries to reflect local policy and guidelines, available resources, and cultural norms. Conclusion – This intervention provides a template for an educational strategy for the AWaRe system to support appropriate antibiotic prescribing for ARIs in LMIC primary care. Following evaluation, it may be optimised to be expanded to other clinical presentations and to other LMICs.

The localisation process of an AWaRe-based antibiotic stewardship intervention in primary care across four low- and middle-income countries

Michaela Levy-Haigh[1], Daniella Georgeu-Pepper[1], Christy-Joy Ras[1], Kathryn Jacobs[1], Candice Daniels[1], Ruth Cornick[1], Nafeesa Saldulker[1], Pearl Spiller[1], Michael Sharland[2,3], Max Bachmann[3,2]
[1]Learning & Development/Research, Knowledge Translation Unit, Cape Town, South Africa, [2]Norwich Medical School, University of East Anglia, Norwich, United Kingdom, [3]St George's School of Health and Medical Sciences, City St George's, University of London, London, United Kingdom
BACKGROUND
Inappropriate antibiotic use contributes to millions of deaths globally each year1. The World Health Organization's AWaRe system aims to improve antibiotic prescribing practices1. The AWaRe1 trial2, designed to test this system's effectiveness, was initiated in four low- and middle-income countries (LMICs) - Nigeria, Indonesia, Bangladesh and Vietnam. An intervention package addressing acute respiratory illnesses (ARI) was developed from the AWaRe antibiotic book by the Knowledge Translation Unit (KTU). To enable global implementation, the package required localisation across diverse settings.
METHODS
Components requiring localisation included a clinical decision tool, behaviour change posters, a clinician self-audit log, training presentations with case studies and quizzes, implementation manuals, and a reporting system – all first presented in English. Project management tools supported communication and document transfer between the KTU and implementation teams. Online workshops were held at key stages, collectively and per country. Implementation teams considered local health systems, policies, medication availability, disease burden and cultural

context. Translation into local language occurred where required and AI-generated voices were utilised for local narration. Final materials were produced in online and offline formats, allowing for varied training settings.
RESULTS
The AWaRe1 intervention package was successfully localised for four LMICs. All components were adapted to align with country-specific contexts, enabling future implementation of the AWaRe intervention. Key challenges included discrepancies between local medication availability and clinical guidelines, compared with AWaRe guidance; coordination with broader AWaRe1 trial activities; health system and funding related delays; variation in implementation team capacity; and internal decisions regarding digital tools and data collection requirements.
CONCLUSIONS
This process demonstrates the feasibility of localising an AWaRe-based intervention for primary care in LMICs and establishes a foundation for a streamlined, replicable approach to adapting and implementing the AWaRe system across diverse settings. This will be evaluated during the AWaRe1 trial and accompanying process evaluation.

Developing and disseminating an antimicrobial resistance (AMR) 3 Part animated series

Mbali Jiyane[1], Andiswa Kona[2], Samkele Mkumbuzi[2], Yonwaba Olo[1], Mitchell Gilbert Messina[1], Marc Mendelson[2], Esmita Charani[2], Edward Young[1], Anastasia Koch[1,3]
[1]EHWOZA NPC, Cape Town, South Africa, [2]Division of Infectious Diseases & HIV Medicine, UCT Faculty of Health Sciences, University of Cape Town, Cape Town, South Africa, [3]MRC/NHLS/UCT Molecular Mycobacteriology Research Unit, Department of Pathology and Institute of Infectious Disease & Molecular Medicine, Faculty of Health Sciences, University of Cape Town, Cape Town, South Africa

BACKGROUND
antimicrobial resistance (AMR) is making common infections harder to treat and threatens global health1. Its impact extends beyond hospitals, affecting families and communities1. Effective public engagement is essential to make AMR understandable and relevant in order to effect behaviour change2.
METHODS
we developed a three-part animated series2 to raise awareness of AMR among youth, translating complex scientific concepts into engaging, relatable narratives. The series was co-created by researchers, scientists, artists, and community members. Animations were designed to highlight the scientific and social dimensions of AMR, illustrate the consequences of antibiotic misuse, and encourage community-level understanding and action. Central to the approach was co-creation: learners from eh!woza programmes watched the first draft of the series and provided feedback on content, language, and visual storytelling, ensuring relevance and clarity. Animations were initially produced in English, with translation into isiXhosa to broaden accessibility within local communities.
RESULTS
the animations3,4,5 were shown during community engagement workshops, stimulating discourse around AMR and responsible antibiotic use. The series was shared with postgraduate health science students and community healthcare workers, facilitating discussion on AMR and public engagement strategies. The animation was adapted into an audio series broadcast on an eastern cape local radio station, reaching 10000 listeners daily and disseminating the message to families and the broader community. Notably, translation of animations from english into isixhosa was complex and required several iterations, including a translation workshop to ensure AMR concepts were accurately represented using isixhosa terms.
CONCLUSIONS
creative media can make complex health topics like AMR accessible and relevant4. By engaging youth as collaborators and reaching communities, students, and health workers, the series supports dialogue, awareness, and practical understanding of AMR. To ensure that concepts in complex health communication are accurately represented, it is critical to reserve time and resources for their translation into local languages6.

A Multi-Dimensional Evaluation of the Antimycobacterial Activity, Cytotoxicity, and Mechanisms of Action of South African Medicinal Plants Against Mycobacterium smegmatis

Ramokone Florah Mothupi[1], Mashilo Mash Matotoka[1], Tshwahla Gabriel Mashabela[2], Peter Masoko[1]
[1]1 Biochemistry, Microbiology and Biotechnology, University of Limpopo, Polokwane, South Africa, [2]2 Centre for TB Research Division of Molecular Biology and Human Genetics, Stellenbosch University, Cape Town, South Africa

BACKGROUND
Tuberculosis remains a major global health challenge, intensified by rising multidrug resistance and the ability of Mycobacterium tuberculosis to persist in dormant states 1,2. Given the limitations of current therapies, medicinal plants offer a potential source of new antitubercular agents 3,4. This study examined how varying concentrations of selected plant extracts influence resistance-related mechanisms in Mycobacterium smegmatis, with the aim of understanding how natural compounds may disrupt bacterial resistance and support future TB treatment development.
METHODS
The study determined the antimycobacterial activity of the plant extracts and examined how it corresponds to the extract concentrations effective for antibiofilm activity, metabolic disruption, mechanisms of action and cytotoxicity. Comparative bioactivity analyses were conducted across the different plant extracts to identify the most promising species for further pharmacological exploration. Cytotoxic effects were evaluated using the human leukemia monocytic (THP-1) cell line.
RESULTS
The minimum inhibitory concentrations (MICs) of the plant extracts ranged from 310 to 1250 µg/mL, with Polygala myrtifolia exhibiting the most potent antimycobacterial activity. The concentrations required to inhibit biofilm formation and metabolic activity at various developmental stages were significantly lower than the MIC values and differed among the plant species. All extracts were non-toxic to THP-1 cell lines, except for Harpephyllum caffrum, which displayed an IC value of 18.43 ± 1.13ab µg/mL, indicating measurable cytotoxicity 5. The plant extracts disrupted the membrane integrity of M. Smegmatis as shown by the protein and DNA leakage which was proportional to extract concentrations 6,7.
CONCLUSIONS
The plant extracts showed strong antimycobacterial activity, with P. Myrtifolia most effective. Sub MIC levels reduced biofilms and metabolic activity, indicating disruption of persistence mechanisms. Most extracts were non toxic to THP 1 cells, though H. Caffrum showed some cytotoxicity. Overall, these plants appear promising sources of new antimycobacterial agents.

ABS2964

Strengthening AMR Governance and Promoting Equity through One Health: A Civil Society Dialogue

Hafeez Hamza[1], Federica Castellana[1], Katherine Urbáez[2,3]
[1]Young WFPHA, Geneva, Switzerland, [2]Health Diplomacy Alliance, Geneva, Switzerland, [3]WHO Civil Society Task Force, Geneva, Switzerland

INTRODUCTION
Antimicrobial resistance (AMR) is a complex global health challenge shaped not only by biomedical factors but also by governance, equity, and accountability gaps across human, animal, and environmental health systems. Addressing AMR through a One Health approach requires strong civil society leadership to ensure policies reflect lived realities and promote inclusive, equitable responses at community levels. Civil society organizations (CSOs), including youth-led and grassroots groups, play a critical role in AMR response, yet their engagement often remains limited and uneven.
METHODS
This session employs a participatory civil society dialogue approach, convening youth-led, community-based, and civil society actors working on AMR across One Health sectors. The methodology combines structured presentations on the WHO Civil Society Task Force on AMR and with case examples of youth-led and grassroots initiatives. A moderated panel discussion and interactive question-and-answer session facilitate shared learning, collective reflection, and co-creation of priorities to strengthen coordination, accountability, and equity in AMR governance.
RESULTS
The dialogue enhances participants' understanding of civil society's role in One Health–driven AMR governance and increases awareness of the WHO Civil Society Task Force on AMR as a platform for coordinated civil society action. Youth-led and community-based experiences showcase innovative and context-responsive approaches to advocacy, awareness, and accountability across human, animal, and environmental health. The session culminates in the co-creation of a joint civil society statement outlining practical recommendations to advance inclusive, equitable, and accountable AMR governance.
CONCLUSIONS
Strengthening AMR governance requires moving beyond consultation toward

meaningful civil society and youth leadership within One Health frameworks. Inclusive dialogue and shared leadership enhance accountability and ensure AMR responses are grounded in community realities. Institutional platforms such as the WHO Civil Society Task Force on AMR are critical for sustaining equitable civil society engagement in global and national AMR efforts.

Healthcare-Associated Infections as a patient safety challenge: Findings from a surgical hospital in Tunisia

Zeineb Mallek[1], Maroua Trigui[1], Emna Mziou[2], Mouna Baklouti[3], Fedi Ben Dhaou[1], Jihen Jdidi[3], Sourour Yaich[2], Mondher Kassis[1], Yosra Mejdoub[1]
[1]Hygiene, Habib Bourguiba Hospital Sfax,Tunisia, Sfax, Tunisia, [2]Community and preventive medicine, Hedi Chaker University Hospital, Sfax, Tunisia, [3]Community and preventive medicine, Faculty of medicine, Sfax, Tunisia

INTRODUCTION
Healthcare-associated infections (HAIs) represent a major public health issue, particularly in healthcare settings, and serve as an indicator of the quality and safety of care. The objectives of our study were to determine the prevalence of HAIs in a surgical university hospital in Tunisia and to identify its main associated factors.
METHODS
We conducted a point prevalence survey of HAIs in June 2025, including all patients hospitalized at the Habib Bourguiba University Hospital in Sfax for more than 48 hours. HAIs were defined according to the Centers for Disease Control and Prevention (CDC) criteria.
RESULTS
A total of 247 patients were included. The median age was 56 years (interquartile range (IQR)= [39-68.25] years), and the sex ratio was 1.71. Forty-seven patients had at least one HAI, representing a HAI prevalence of 19%. The median number of HAIs per patient was 2 (IQR = [1-3]). Urinary tract infections were the most identified site infections (34.7%, n = 25), followed by respiratory tract infections and surgical site infections (20.8%, n = 15) each. The most frequently isolated organisms were Klebsiella pneumoniae (18.2%, n=18) and Acinetobacter baumannii (16.2%, n=16). According to the antibiograms, 67.7% (n=23) of the isolates were multidrug-resistant. Multivariate analysis of factors associated with HAIs showed that hospitalization lasting 10 days or more (adjusted odds ratio (AOR)=15.04; p<0.001), transfer from another hospital or department (AOR=7.72; p=0.002), diabetes (AOR=7.3; p=0.002), and current urinary catheterization (AOR=4.47; p=0.025) were independently associated with the occurrence of HAIs.
CONCLUSIONS
Our study revealed a higher prevalence of HAIs compared to previous national data. This underscores the importance of continuous prevention, surveillance, and control strategies of infections to enhance patient safety and improve the quality of care.

ABS3396

Integrating Social Protection into Antimicrobial Resistance Response: A Critical Review and Framework Development

Joris Michielsen[1], Abdirahman A. Sulleiman[2]
[1]Public Health, Institute of Tropical Medicine, Antwerp, Belgium, [2]Public Health, Independent consultant, Hargeisa, Somalia

BACKGROUND
Antimicrobial resistance (AMR) causes 1.27 million deaths annually, with disproportionate burden in low- and middle-income countries. Current AMR policies emphasize biomedical interventions—stewardship, surveillance, infection control—yet fail to address structural drivers. A growing body of evidence point to the need of considering the social determinants of health in the fight against AMR. Based on this insight one could suggest that social protection interventions would prevent AMR by addressing these upstream determinants. This review critically examines how social protection can address structural AMR drivers and develops an implementation framework.
METHODS
We reviewed global and national AMR policies and conducted systematic literature searches in Web of Science, Scopus, PubMed, Embase, WorldCat, Semantic Scholar and Google Scholar using terms combining "antimicrobial resistance," "social protection," and "social determinants." We analyzed policies for structural determinants and equity dimensions, distinguished proximal drivers (antibiotic use, transmission) from distal drivers (poverty, infrastructure, climate impacts), and developed an integrative framework mapping six social protection instruments (transfers, insurance, labour policies, services, food programs, housing) to AMR pathways.
RESULTS
Critical gaps emerge: Although the link between poverty and AMR is gaining attention in global discourse, NAPs overwhelmingly emphasize proximal interventions while ignoring distal structural drivers. Social protection integration is minimal; when present, it focuses narrowly on financial access to care. However, evidence demonstrates effectiveness—nutritional support and social housing reduce susceptibility to recurring infectious diseases (food born, water born, respiratory), cash transfer, labour market interventions and sick leave enable treatment completion, livestock insurance reduces prophylactic antibiotic use in agriculture.
CONCLUSIONS
Social protection represents evidence-based structural intervention addressing root causes of AMR. The proposed framework provides actionable guidance for integrating social protection into NAP revisions and One Health strategies, advancing equity while enhancing AMR response effectiveness.

ABS3434

AMR public health research priorities for oral health in Africa: evidence gaps and pathways for action

Sudeshni Naidoo[1], Precious Moedi[1]
[1]Community Dentistry, University of the Western Cape, Cape Town, South Africa

INTRODUCTION
Dentistry accounts for an estimated 10% of global antibiotic use, with misuse and inappropriate prescribing reported in up to 90% of cases in several countries, including many in Africa.1-2 Africa bears a high burden of oral diseases (approximately 42%), combined with a severe shortage of oral health workers (3.7 per 100 000 population).3 As a result, oral pain and infection are frequently managed by non-dentists or through self-medication, increasing the risk of antimicrobial misuse. Key drivers of antimicrobial resistance (AMR) in dentistry include defensive and prophylactic prescribing, lack of adherence to clinical guidelines, limited access to diagnostics, and weak stewardship and surveillance systems.4 While the WHO has identified 40 global AMR research priorities5, many of which focus on low- and middle-income countries6, oral health remains largely absent from this agenda.7-11
METHODS
This analysis maps oral health–related AMR challenges in Africa against the WHO global AMR research priority framework across prevention, diagnosis, treatment, stewardship, and cross-cutting domains. We identify gaps where oral health is directly implicated but insufficiently addressed in current AMR research and policy.
RESULTS
Key gaps aligned with WHO AMR priorities include: prevention—limited evidence on the role of water, sanitation and hygiene (WASH) and infection prevention and control (IPC) in reducing dental antibiotic use; diagnosis—lack of feasible, point-of-care tools to distinguish bacterial from non-bacterial oral infections; (3) treatment and stewardship—absence of context-specific stewardship interventions addressing prescribing behaviours in dental and non-dental care settings; and cross-cutting gaps—weak AMR surveillance systems that exclude oral health data.
CONCLUSIONS
Oral health is a missing component of Africa's AMR response. Addressing this gap requires prioritising African-generated evidence on antibiotic prescribing, stewardship strategies, and resistance patterns, and integrating oral health into national AMR surveillance and action plans.

ABS3509

The Implementation of Antimicrobial Consumption Surveillance and Stewardship in Human Healthcare in Post-Soviet States: A Systematic Review

Zhanar Kosherova[1], Dariga Zhazykhbayeva[1], Yuliya Semenova[1]
[1]School of Medicine, Nazarbayev University, Astana, Kazakhstan

BACKGROUND
Antimicrobial consumption (AMC) surveillance and antimicrobial stewardship (AMS) are core strategies for mitigating the global burden of antimicrobial resistance (AMR).– Despite international commitments, evidence from post-Soviet countries remains fragmented, rendering the region a persistent blind spot in global AMR monitoring frameworks. This systematic review aims to assess and characterise the implementation of AMC surveillance and AMS in post-Soviet countries.

METHODS
A systematic search was conducted in PubMed, Embase, Scopus, Google Scholar, and regional databases, supplemented by grey literature from international and national health authorities. Eligible sources included peer-reviewed publications and official policy documents addressing AMC surveillance and AMS in human health systems of post-Soviet countries.
RESULTS
Following screening and critical appraisal, three peer-reviewed publications and 31 policy and technical documents were included. Eleven of the fifteen countries with updated national action plans on AMR explicitly defined AMC surveillance and AMS as strategic objectives.– All reviewed countries reported submission of antimicrobial consumption data to international surveillance platforms and the existence of regulatory frameworks governing antibiotic sales. However, substantial heterogeneity was observed in the scope, digitalisation, and operational maturity of surveillance systems, with high-income countries demonstrating more comprehensive implementation than lower-middle-income counterparts.,
CONCLUSIONS
Significant disparities persist in AMC surveillance and AMS implementation across post-Soviet countries. While regulatory frameworks are formally established, enforcement gaps—particularly regarding over-the-counter antibiotic access—continue to undermine policy effectiveness. Strengthening governance mechanisms, expanding digital surveillance infrastructures, and investing in workforce capacity are critical to closing implementation gaps. Sustainable progress requires long-term political commitment, regular policy review cycles, and blended financing models that support transition from external to domestic funding.–

ABS3725
Can we reduce microbial burden in frail patient care by dry fog disinfection?

Katarina Dostalova[1], Jan Mikas[1], Viera Pastrnakova[2], Maria Kmetova[2], Karol Dzupa[3], Pavol Pavlovic[3], Nina Kotlebova[1], Stefania Moricova[1]
[1]Faculty of Public Health, Slovak Medical University, Bratislava, Slovakia, [2]University Hospital, Bratislava, Slovakia, [3]Detectair Technologies Association, Bratislava, Slovakia

BACKGROUND
A general practitioner(GP) who cares for elderly patients discharged from hospital to a home or nursing home faces the challenges of healthcare-associated infections(HAIs). An antimicrobial dry fog disinfection(DFD) is a new modality of multimodal infection control strategy. We assessed the effectiveness of antimicrobial DFD disinfection in the open healthcare microenvironment of a long-term care department.
METHODS
We analysed the microbiological contamination of surfaces and air in patient rooms.
RESULTS
I. We analysed the microbiological contamination of surfaces. Before the DFD application, we detected: Staphylococcus epidermidis, a potential cause of HAIs, Enterobacteriaceae and Pseudomonas aeruginosa, clinically serious pathogens (urinary, respiratory tract and wound infections), Bacillus spp. And Micrococcus spp., a common part of the environment, but indicate general contamination. In one sample, Penicillium spp. was also present, indicates the presence of Mold. After the application of DFD, all tested surfaces were negative for pathogens such as Staphylococcus, aureus, Pseudomonas aeruginosa, Enterobacteriaceae or yeast. Only occasionally were detected Bacillus spp. and Micrococcus spp., which are considered non-pathogenic, environmental bacteria, naturally present in the environment. II.We analysed the microbiological contamination of air. Before disinfection, the total number of microorganisms reached 304 - 393 CFU (Colony Forming Units) /m3, which represents high environmental contamination. Molds were captured in the cut (118 – 142 CFU/ m3). Yeasts and Staphylococcus spp. were not detected before disinfection. After DFD the total number of microorganisms dropped to 73 – 102 CFU/m3. Molds were reduced to 53 – 73 CFU/ m3. Yeasts and Staphylococcus spp. were not detected even after disinfection. DFD reduced the microbial load of the air by 70-80%.
CONCLUSIONS
The use of DFD has the potential to significantly reduce the microbial burden as part of a comprehensive HAI prevention strategy in department caring of frail patients. and then facilitate the work of GPs after discharge.

ABS3749
Evaluating Infection Prevention and Control Competency Among Healthcare Workers in Kenya

Abigail Nyanjui[1], Langelihle Ndebele[1], Sakhile Ndwandwe[1], Samuel Mungai[1]
[1]School of Pharmacy and Health Sciences, United States International University, Nairobi, Kenya

INTRODUCTION
Carbapenem-resistant gram-negative bacteria, namely Enterobacteriaceae, Acinetobacter baumannii and Pseudomonas aeruginosa are emerging as consequential threats to public health due to their high levels of antimicrobial resistance and associated mortality (Cerceo et al., 2016). Kipsang et al. (2023) found a prevalence of 22.7% of multidrug-resistant Acinetobacter baumannii in a Kenyan intensive care unit. While the Ministry of Health has established Infection Prevention and Control (IPC) guidelines, staff literacy and its correlation with infection outcomes remain under-researched.
METHODS
This study aimed to assess the level of self-reported IPC competency among healthcare workers and its influence on carbapenem-resistant hospital-acquired infection (HAI) prevalence in the country. It utilized a convergent parallel mixed methods approach to collect data. 31 healthcare workers were surveyed using a paper-based, self-administered questionnaire derived from the World Health Organization's IPC framework at the facility level. It contained 5 core components and was administered across 12 departments. Key informant interviews were carried out with 7 members of the anti-microbial stewardship team. Statistical analysis was done using Rstudio 2024.12.1 +563.
RESULTS
The distribution of levels was as follows: 48.39% intermediate, 38.71% basic, 9.68% advanced and 3.23% inadequate. A Pearson's correlation coefficient of -0.79 (p = 0.2144, CL: 95%) revealed a strong but non-significant negative association between IPC competency level and carbapenem resistance prevalence rates. Component 5, targeting multimodal strategies for implementation of IPC interventions, was the lowest scoring with a mean of 20 points (s = 18.46). It most strongly predicted high carbapenem-resistance rates.
CONCLUSIONS
Low self-reported IPC knowledge is a major factor influencing the prevalence of carbapenem-resistant HAIs in Kenya. There is a need for continuous medical education and training to reinforce knowledge on IPC strategies. Targeted interventions like multimodal hand hygiene campaigns and IPC audits can elevate scores, potentially reducing the burden of carbapenem resistance.

ABS3764
Microbial profile and antimicrobial resistance patterns of diabetic wound infections in Nelson Mandela Bay Metro: A retrospective multi-hospital study

Vuyiseka Ntsalu[1], Saartjie Roux[2], Wilbert Sibanda[3]
[1]1 Pharmacy, Nelson Mandela University, Gqeberha, South Africa, [2]2 Nanomedicine Platform, Medical School, Nelson Mandela University, Gqeberha, South Africa, [3]3 Biostatistician, Faculty of Health Science, Nelson Mandela University, Gqeberha, South Africa

INTRODUCTION
Diabetic wound infections represent a major cause of morbidity and mortality globally, with disproportionate impact in resource-limited settings where access to timely diagnostic services is limited1. In South Africa, delayed diagnosis and reliance on empiric antibiotic therapy contribute to preventable complications including cellulitis, gangrene, sepsis, and lower limb amputations. Addressing these challenges is essential for advancing equitable and sustainable healthcare delivery2.
METHODS
A retrospective analysis was conducted on 154 diabetic wound infection cases managed in both public and private hospitals within the Nelson Mandela Bay Metro. Microbial profiles, antimicrobial resistance patterns, hospitalization trends, surgical outcomes, and infection-related complications were evaluated.
RESULTS
Hospitalization was required in 80.5% of patients, with 41.5% experiencing multiple admissions. Length of stay ranged from 3 to 18 days (mean: 10.38 days). Polymicrobial infections were predominant and were associated with more severe clinical presentations. High levels of antimicrobial resistance was identified among frequently prescribed antibiotic classes, including penicillin's, cephalosporins, and carbapenems, limiting the effectiveness of empiric therapy. Severe complications, such as cellulitis, gangrene, and sepsis, were commonly observed, with sepsis showing a strong association with progression to major amputation. Surgical interventions comprised major amputations in 43.9% of

cases, minor amputations in 14.6%, and debridement in 19.5%.
CONCLUSIONS
Diabetic wound infections impose substantial clinical, psychosocial, and economic burdens, particularly in settings where diagnostic services are not readily accessible. Delays associated with conventional culture-based diagnostics (2–7 days) hinder timely clinical decision-making and contribute to disease progression, prolonged hospitalization, and high amputation rates. Many primary healthcare facilities lack on-site microbial testing, reinforcing dependence on empiric antibiotics despite escalating antimicrobial resistance. These results support the urgent need for rapid, accessible point-of-care diagnostic tools capable of guiding early targeted therapy. Such innovations have the potential to improve antimicrobial stewardship, reduce preventable amputations, and promote sustainable healthcare delivery in resource-limited settings.

Strengthening the capacity of primary health care workers to drive optimal antibiotic use in the community
Samkele Mkumbuzi[1], Candice Bonaconsa[1], Tlangelani Makamu[1], Andiswa Kona[1], Hannah Hussey[2,3], Eunice Beneke[2,3], Arne Von Delft[2,3], Marc Mendelson[1], Esmita Charani[1]
[1]1 Division of Infectious Diseases and HIV Medicine, Department of Medicine, Groote Schuur Hospital, University of Cape Town, CAPE TOWN, South Africa, [2]2 Cape Town Systematic Healthcare Action Research Project (C-SHARP), Provincial Health Data Centre, Western Cape Department of Health and Wellness, University of Cape Town, CAPE TOWN, South Africa, [3]3 School of Public Health, University of Cape Town, CAPE TOWN, South Africa
BACKGROUND
Community-based services play an integral role in health systems, especially in low-resource settings where access to health facilities is under strain. Community Health Workers (CHWs), who come from the communities they serve, are key role players who are well positioned to bridge the gap between the public and healthcare services. Accelerating interventions that empower and enhance the role of CHWs in public health, including for infection-related care, can support efforts aiming to respond to the threat of Antimicrobial Resistance (AMR).
METHODS
We facilitated two rounds of participatory workshops with CHWs in partnership with two non-government organisations in Bishop Lavis and Nomzamo in Cape Town, South Africa. Using exploratory visual participatory methods, the first workshop established a baseline understanding of CHWs' roles in primary care and identified areas for capacity strengthening in infection-related care. The second workshop was: 1) part-educational and 2) centred around AMR communication strategies. It included a pre-tested survey developed as part of a Delphi process that focused on identifying actionable, context-specific messages for AMR awareness.
RESULTS
In July and October 2025, four sessions (two per workshop round) were conducted with 158 and 163 CHWs, respectively. Interpretative analysis showed that CHWs valued their roles and reported themselves as key agents for delivering public health services. A total of 163 CHWs completed the survey. CHWs ranked themselves as the most reliable sources for health information. Encouraging communities to finish antibiotic treatment was the most preferred message in local languages, while community events were rated as the most effective public communication medium.
CONCLUSIONS
Interactive community-based workshops offer an opportunity for health systems strengthening to address AMR. This collaborative project provided important first steps to explore how engagement through community-based research can enhance the role of CHWs in delivering sustainable and context-specific public health interventions such as AMR awareness campaigns.

Youth, Experience and Artificial Intelligence: Designing Innovative Solutions to Antimicrobial Resistance
Winnifred Akello[1,2], Jacopo Garlasco[3,1]
[1]AMR Committee, Young World Federation of Public Health Associations (YWFPHA), Geneva, Switzerland, [2]College of Veterinary Medicine, Animal Resources and Biosecurity, Makerere University, Kampala, Uganda, [3]Department of Diagnostics and Public Health, University of Verona, Verona, Italy
BACKGROUND
Antimicrobial resistance (AMR) is a major threat to global health, with disproportionate impacts in low- and middle-income countries, where surveillance systems are weak, fragmented and under-resourced. Even in high-income settings, surveillance seldom captures resistance to newer antibiotics. Advances in information technology and artificial intelligence (AI) offer new opportunities to improve AMR surveillance, anticipate resistance detection, optimize antimicrobial stewardship, and integrate different data sources to support data-driven decision-making. However, responsible and effective AI adoption requires contextual relevance, ethical safeguards, and strong capacity-building. Thus, it would benefit from involving young and early-career professionals, often actively engaged in local AMR research, policy, clinical and community work, but underrepresented in global decision-making spaces.
METHODS
This interactive workshop, led by the Young WFPHA AMR Committee, will use participatory and youth-centered methodologies. Participants will engage in small-group discussions to share lived experiences of AMR work and key challenges encountered across diverse One Health settings and geographic contexts, and to map structural, social and technical barriers to AMR mitigation. An expert-facilitated session will introduce AI applications in AMR surveillance, antimicrobial stewardship and decision support, with attention to ethical, equity and data-governance issues. Groups will then co-create youth-led, AI-enabled intervention concepts emphasizing feasibility, sustainability, community inclusion and One Health integration.
RESULTS
Expected outputs include a consolidated set of youth-identified AMR challenges, practical examples of AI-supported interventions, cross-cutting recommendations for inclusive and sustainable AMR strategies, and the co-development of a youth-led position paper or peer-reviewed commentary capturing the workshop insights. The session is also intended to catalyze collaboration among youth networks, researchers, practitioners and digital health stakeholders.
CONCLUSIONS
By centering youth experience and responsible AI use, this workshop aims to strengthen equitable, context-relevant and collaborative responses to AMR. The outcomes will inform policy advocacy, program design and future research, contributing to resilient and sustainable global AMR mitigation efforts.
Popul. Med. 2026;8(Supplement 1):A223

ABS4094
Inappropriate antibiotic use is a social practice, not just a knowledge gap: Uncovering the 'township effect' and systemic drivers of antibiotic use in South Africa
Nishana Ramdas[1], Natalie Schellack[2], Corrie Uys[3], Brian Godman[4,5,1], Stephen Campbell[6,1], Johanna Meyer[1,7]
[1]Department of Public Health Pharmacy and Management, Sefako Makgatho Health Sciences University, Pretoria, South Africa, [2]Department of Pharmacology, University of Pretoria, Pretoria, South Africa, [3]Applied Microbial and Health Biotechnology Institute, Cape Peninsula University of Technology, Cape Town, South Africa, [4]Strathclyde Institute of Pharmacy and Biomedical Sciences, University of Strathclyde, Glasgow, United Kingdom, [5]Antibiotic Policy Group, University of London, London, United Kingdom, [6]School of Health Sciences, University of Manchester, Manchester, United Kingdom, [7]South African Vaccination and Immunisation Centre, Sefako Makgatho Health Sciences University, Pretoria, South Africa
INTRODUCTION
Antimicrobial resistance (AMR) threatens global public health, yet stewardship in the Global South often relies on a "knowledge deficit" model, assuming education changes behaviour. This ignores complex socio-structural drivers in resource-constrained settings. This study aimed to investigate how social norms and health literacy shape antibiotic use behaviours among patients in primary healthcare (PHC) settings.
METHODS
A large-scale cross-sectional survey was conducted amongst 1283 patients across 25 public-sector PHC facilities in South Africa. Data was collected on tablets via face-to-face interviews. The locally developed and psychometrically validated Community Antimicrobial Use Scale (CAMUS) was used to measure five behavioural domains of antimicrobial use. Functional health literacy was assessed in a nested sub-sample (n=463) using the Health Literacy Test for Limited Literacy Populations. Multivariable generalized linear models were fitted to identify independent predictors of non-prescribed antibiotic use, adjusting for sociodemographic factors.
RESULTS
Participants were predominantly female (67.4%) with 39.5% unemployed. Overall, 22.8% of participants reported obtaining antibiotics without a prescription. Geography was a significant driver: non-prescribed use was notably higher in

high-density peri-urban settlements (36.3%) compared to rural areas (16.0%; p<0.001). While general antibiotic knowledge scores were high, knowledge alone did not protect against social pressure. In the multivariable model, inadequate health literacy emerged as the strongest independent predictor of inequality, associated with a 13-fold increase in the odds of non-prescribed antibiotic access (AOR=13.86; 95% CI: 2.60–73.93; p=0.002).
CONCLUSIONS
Findings confirmed a distinct "township effect", suggesting that inappropriate antibiotic use in South Africa is not merely a knowledge gap, but a social practice rooted in rapid urbanisation and health inequity. Traditional "awareness" campaigns failing to address these determinants will remain ineffective. To secure a sustainable future for antimicrobials, public health strategy must pivot from passive education to community-embedded interventions, leveraging community health workers to bridge literacy gaps and reshape household norms.

CLIMATE CHANGE, ENVIRONMENTAL, ONE HEALTH AND URBAN HEALTH

ABS0013

Assessing Health-Related Climate Resilience Using an Urbanization Index in Fast-Track Cities

Jose Manuel Zuniga[1]
[1]Fast-Track Cities Institute, Washington, DC, United States

INTRODUCTION
Urban centers face escalating climate-related health risks, including heat stress, flooding, and vector-borne diseases. Measuring resilience is critical for protecting populations. Fast-Track Cities, engaged in global health initiatives, provide a unique context for assessing how urbanization influences health-related climate resilience.
METHODS
A composite Health–Climate Urban Resilience Index (HCURI) was developed comprised of four domains: environmental (green space, heat-island intensity), infrastructural (healthcare density, flood protection), social (poverty, density), and governance (disaster response, health investment). Data were drawn from municipal and national sources for Amsterdam, Netherlands; Paris, France; São Paulo, Brazil; Nairobi, Kenya; and Johannesburg, South Africa. Domains were standardized and aggregated, then correlated with heat-related hospitalizations and vector-borne disease incidence using regression models adjusted for socioeconomic variables.
RESULTS
Amsterdam ranked highest (+1.75 SD), reflecting strong climate adaptation and health infrastructure, followed by Paris (+0.85 SD). São Paulo scored near average (+0.10 SD), balancing investments with persistent inequities. Nairobi (−0.50 SD) and Johannesburg (−1.20 SD) scored lowest, reflecting infrastructural and governance gaps despite ongoing public health initiatives. Higher HCURI values correlated strongly with lower heat-related hospitalizations ($r = -0.82$, $p = 0.005$) and moderately with lower vector-borne disease incidence ($r = -0.65$, $p = 0.04$). Adjusted models showed a one-unit increase in HCURI corresponded to a 30% reduction in heat-related admissions (95% CI: 15–45%) and a 20% reduction in vector-borne cases (95% CI: 5–35%).
CONCLUSIONS
The HCURI provides a practical tool to quantify health-related climate resilience in urban contexts. Findings highlight how integrated planning – linking environmental, infrastructural, social, and governance factors – can mitigate climate-sensitive health outcomes. Policymakers should adopt cross-sectoral resilience strategies to safeguard health, with potential to scale the HCURI for broader monitoring and evaluation across the Fast-Track Cities network.

ABS0036

Efficacy of activated carbon for ammonia gas reduction in selected poultry farms in ido local government area, ibadan, oyo state

Juliet Ugbedeojo Shaibu[1]
[1]Environmental Health Sciences, University of Ibadan, Ibadan/Oyo State, Nigeria

INTRODUCTION
Ammonia gas is one of the major toxic pollutant gases when inhaled in high doses. Previous studies have demonstrated increase in ammonia emission levels among poultry farms in Nigeria, but there is little information on ammonia gas emission reduction. Hence, this study utilized activated carbon filter in the reduction of ammonia emissions produced in selected poultry farms.
METHODS
The study adopted a quasi-experimental design and four poultry farms within Ibadan metropolis (renamed A, B, C and D) were purposively selected. Also, a fabricated glass chamber was used to monitor ammonia gas emission and reduction levels in the farm. Measurements of ammonia levels was carried-out six days in a week, three times daily for two weeks at specific periods of the day (8-11am, 12-3 pm and 4-7pm) with a total sampling period of eight weeks. Activated carbon produced from coconut shells and palm kernel shells was used as ammonia absorbent. Data were analysed using descriptive statistics, T-test and ANOVA at 5% level of significance.
RESULTS
The ammonia emissions (ppm); 1150.67, 953.67, 1068.06, and 859.3 for farms A, B, C and D, respectively were higher than the guideline limits for ammonia gas by NIOSH (25ppm) and OSHA (50ppm). Coconut shells-based activated carbon had a higher absorbency capacity with the average ammonia level reduced from 36.15±30.48 at baseline to 16.38±17.71 at post-treatment level and a percentage reduction of 19.77% while Palm Kernel shells-based activated carbon had 35.80±31.15 at baseline and 18.54±16.85 at post-treatment level, with a percentage reduction of 17.26% across all the poultry farms.
CONCLUSIONS
The study showed that activated carbon obtained from coconut shells had a greater absorbency potential for ammonia gas reduction when compared to palm kernel shells activated carbon. Therefore, poultry managers should include activated carbon filters as a mechanism to reduce ammonia levels in poultry farms.

Neighborhood environment: Analysis of the physical availability and affordability of alcoholic beverages, tobacco and tobacco products in three regions of Russia

Aleksandra Antsiferova[1], Anna Kontsevaya[1], Oxana Drapkina[1]
[1]Department of Public Health Promotion, National Medical Research Centre for Therapy and Preventive Medicine of the MH of Russian Federation, Moscow, Russian Federation

BACKGROUND
Neighborhood environment influences the formation of behavioral habits, as well as the risk of developing behavioral risk factors. Aim was to analyze the physical availability and affordability of alcoholic beverages, tobacco and tobacco products in three regions of Russia. Methodologies A study was conducted to assess the actual status of urban infrastructure in three regions of Russia (Arkhangelsk, Yekaterinburg, Tver). In order to assess the existing infrastructure, a special software was developed allowing to collect and analyses the required data using Open Street Maps. The data collection took place in January-March 2022.
RESULTS
A total of 1180 alcohol outlets (AOs) and 726 tobacco outlets (TOs) were identified on the selected urban sites. The median value of the total number of AOs located within a radius of 1000 meters from the place of residence of an ESSE-RF3 participant was 33, within a radius of 400 meters - 8. A 0.5-liter bottle of vodka was sold below the minimal legal cost in 55.1% of specialized alcohol outlets in the Sverdlovsk region, and in 66.8% of such outlets in the Tver region. The median value of the total number of TOs located within a radius of 1000 meters from the place of residence of an ESSE-RF3 participant was 18, within a radius of 400 meters - 4. The median of the lowest selling price for one pack of cigarettes on the study sites was 120 rubles [110; 179].
CONCLUSIONS
The results reflect the high physical availability and affordability of alcoholic beverages, tobacco and tobacco products and outline the need for interventions both at the state level, and at the level of local authorities.

Land Surface Temperatures at Different Time Points in Pregnancy and Their Impact on Birth Outcomes within the Mother and Child in the Environment Birth Cohort in Durban, South Africa

Jihada Cassim[1], Rajen Naidoo[1], sujatha Hariparsad[1], Sheena Muttoo[1]
[1]Discipline of occupational and environmental health, University of KwaZulu-Natal, Durban, South Africa

INTRODUCTION
Climate change has resulted in increasing temperatures worldwide(1). Associations between thermal exposure during pregnancy and adverse birth outcomes have been found(2-5). Few studies on this topic have been conducted

among pregnant women living in low socioeconomic communities(6). This study aims to investigate land surface temperature (LST) at different time points in pregnancy and its impact on birth outcomes within the Mother and Child in the Environment (MACE) birth cohort in Durban, South Africa
METHODS
A Retrospective cohort study was conducted utilizing outcomes data for 820 pregnant women within the MACE study, recruited at public-sector antenatal clinics in Durban, from 2012-2018. MODIS satellite LST for the period of study was linked to each participant's residence using GPS coordinates, and to individual pregnancy timelines based on dates of conception and delivery. Regression analyses were conducted to examine associations between exposure and outcomes during different gestational periods. Models were adjusted for maternal age, socioeconomic status, smoking, alcohol-consumption, gestational age, and maternal co-morbidities.
RESULTS
Average LST ranged from 25-32 degrees Celsius over the entire pregnancy period, with a mean of 28.7. Significant associations were observed between average LST and mean birthweight; for every 1 degree increase in LST over the entire pregnancy, there was decrease in birthweight by 33g (95% CI: -54.70,-11.45; p=0.003), and 29% increased odds ratio of LBW (OR=1.29; 95% CI: 1.08,1.53; p=0.004). Second trimester showed birthweight reduction by 11g for every 1 degree increase in LST (95% CI: -19.8,-2.65; p=0.01).
CONCLUSIONS
Increased average LST over the entire pregnancy and during the second trimester was associated with decreased birthweight and higher ORs for LBW, in this sample of pregnant women from low socioeconomic communities. This signifies the relationship between pervasive thermal exposure and adverse birth outcomes, evidencing climate impacts on vulnerable populations, highlighting the need for inclusive and gender-sensitive adaptation.

"This will be the cause of our death": Air pollution as a wicked problem in a low resource high vulnerability urban setting

Shahan Salim[1], Plinio Morita[1]
[1]School of Public Health Science, University of Waterloo, Waterloo, Canada

INTRODUCTION
Air pollution in Ulaanbaatar, Mongolia, is a critical environmental and public health crisis that disproportionately affects residents in low resource high vulnerability districts. Using the Social Ecological Model, this study examines how individuals and communities experience air pollution and how intersecting inequities and policy gaps position it as a wicked problem.
METHODS
We conducted semi structured interviews with adult residents of Ulaanbaatar, drawing on lived experience across diverse districts. Interviews were audio recorded, transcribed and analysed using a hybrid inductive and deductive thematic approach.1 The Social Ecological Model guided interpretation across individual, interpersonal, community, organizational and policy levels, with ongoing input from Mongolian partners to ensure contextual relevance.2
RESULTS
Participants described vivid physical symptoms, emotional stress and a sense of inevitability captured in the expression "this will be the cause of our death." Household level coping was constrained by crowded housing, financial limitations and inadequate access to reliable information. These everyday constraints were tightly linked to broader structural forces, including inequitable urban planning, insufficient healthcare capacity and mistrust in government measures that were perceived as poorly designed or unevenly enforced. Together, these dynamics created feedback loops where interventions produced unintended consequences and reinforced existing inequities.
CONCLUSIONS
Findings position air pollution in Ulaanbaatar as a wicked problem that emerges from interlocking social, environmental and policy factors rather than individual choices alone. Addressing air pollution in low resource high vulnerability urban settings requires interdisciplinary, community engaged approaches that integrate public health, urban planning and policy reform, and that explicitly centre the lived experience of residents in the design of surveillance and interventions.

Global application of World Health Organization's building and measurement tools for climate-resilient health system and preliminary exploration of localization practice in Beijing

Yang Hao[1], Na Li[2], Minghui Ren[2,3,4,5]
[1]Institute of medical technology, Peking University Health Science Center, Beijing, China, [2]Department of Global Health, School of public Health, Peking University, Beijing, China, [3]China Center for Health Development Studies, Peking University, Beijing, China, [4]Beijing Institute for Health Development, Peking University, Beijing, China, [5]Institute for Global Health, Peking University, Beijing, China

BACKGROUND
Global climate change poses unprecedented threats to public health, underscoring the urgent need to build climate-resilient health systems. The World Health Organization (WHO) has developed frameworks and assessment tools to guide this process. This study aims to systematically analyze the global application patterns of WHO tools and conduct a preliminary localized assessment of climate-resilient health system of Beijing, China.
METHODS
The study utilized a literature review to analyze national adaptation plans and reports from 10 countries, summarizing key application strategies of WHO tools. Based on strategies, the study uses public data and policy documents from Beijing City to locally adapt the WHO assessment tool, evaluates and rates the climate resilience of Beijing's health system. A SWOT analysis is further employed to identify the internal strengths, weaknesses, the external opportunities and threats, of the system in addressing climate change.
RESULTS
The global analysis identified four primary application strategies: policy integration, international collaboration, phased implementation, and localization. Countries prioritized governance, multi-sectoral coordination, human resources, surveillance and infrastructure, while environment and financing indicators were less frequently adopted. The empirical assessment of Beijing revealed that the City scored high in "Leadership and Governance"(2.80) and "Emergency Preparedness"(3.00). However, lower scores were observed in "Health Workforce"(1.67) and "Infrastructure and Technology"(1.75), particularly at the primary care and peripheral facility level. SWOT analysis further revealed structural advantages (policy support, monitoring capacity) and weaknesses in primary care resilience, supply chains and equity for vulnerable groups.
CONCLUSIONS
The study summarizes four main application strategies of WHO tools, and confirms the practicality of localizing WHO tools for health resilience assessments. The Beijing case demonstrates the feasibility of translating WHO frameworks into a city-level assessment, and provides a reference for building and measuring the climate resilience of health systems for other cities in China and even abroad.

Unsupervised machine learning to investigate the joint effects of SO2, NO2, O3, PM2.5 and PM10 on respiratory and cardiovascular hospital admissions in the Vaal Triangle Airshed Priority Area, South Africa

Nandi Mwase[1,2], Moses Kabalepile[3], Washington Junger[4], Janine Wichmann[2]
[1]Department of Family Medicine and Primary Care, University of Witwatersrand, Johannesburg, South Africa, [2]School of Health Sytems and Public Health, University of Pretoria, Pretoria, South Africa, [3]Facalty of Health Sciences, University of Witwatersrand, Johanessburg, South Africa, [4]State University of Rio de Janeiro, Rio de Janerio, Brazil

ABSTRACT
Exposure to air pollution is associated with an increased risk of respiratory diseases (RD) and cardiovascular diseases (CVD). The abundant epidemiological evidence on the health effects of air pollution often focuses on individual pollutants, rather than complex mixtures of simultaneous exposure to multiple air pollutants. Traditional statistical approaches to investigate the effects of air pollution often predict the health outcome of a specific pollutant, and control for confounding by other pollutants. This is a limitation which could result in an underestimation of the health risks. Recently, the application of Machine Learning (ML) has been used to predict the health effects of complex air pollution mixtures. The aim of this study was to use unsupervised ML clustering methods to determine the joint effects of SO2, NO2, O3, PM2.5, and PM10 on hospital admissions for RD and CVD in the Vaal Triangle Airshed Priority Area (VTAPA), South Africa. Due to the missing air pollution from January 2011 to February 2020, data were imputed using the multiple imputation by chain equations (mice) method. K-means and spectral clustering methods were then applied to the air pollution data. A three-cluster spectral clustering model using the normalised Laplacian matrix, showed that the risk of RD hospital admission increased when exposed to SO2, NO2, PM2.5, and PM10 in higher concentration levels, and lower levels of O3 by 1.04 (95 % CI 1.01–1.08). No cluster models showed an increased risk of CVD hospitalisation.

Although the clustering methods used in this study were quick to run and analyse, it is evident that more studies need to be done before considering unsupervised ML a reliable and definite tool to study joint effects of air pollution on different health outcomes.

"The heat really troubles us": Community perspectives on a cool roof intervention, Umlazi, KwaZulu-Natal, South Africa 2025

Saloshni Naidoo[1], Nisha Nadesan-Reddy[1], Nompumelelo Nzimande[2], Isabel Madzorera[3], Cheng He[4,5], Till Bärnighausen[4], Wafaie Fawzi[5]
[1]Discipline of Public Health Medicine, University of KwaZulu-Natal, Durban, South Africa, [2]Umlazi Surveillance Initiative to Nurture Grassroots Action" (USINGA), SAPRIN, Umlazi, Durban, South Africa, [3]School of Public Health, University of California, Berkeley, California, United States, [4]Heidelberg Institute of Global Health, University of Heidelberg, Heidelberg, Germany, [5]Harvard T.H. Chan School of Public Health, Harvard University, Boston, United States

BACKGROUND
Climate change disproportionately affects communities experiencing social and environmental vulnerabilities. In South Africa, rising temperatures pose significant risk to peri-urban communities where poorly constructed housing and low socioeconomic status increase exposure to heat stress. Knowledge gaps exist in designing climate-smart solutions tailored to communities affected. This pilot study explored community perceptions and attitudes toward passive cooling technologies for homes, focusing on cool roofs, as a climate adaptation strategy in Umlazi, South Africa.
METHODS
Trained facilitators conducted two focus group discussions with community members, using a structured guide, to explore perceptions and attitudes toward cool roof interventions. Discussions were recorded, transcribed and analysed using inductive thematic analysis following Braun and Clarke's approach.
RESULTS
Four themes emerged: perceived benefits and acceptance, concerns and reservations, affordability and equity, and durability and maintenance. Participants recognised the potential of cool roofs in reducing indoor heat, improving comfort, reducing extreme fatigue, and benefiting vulnerable populations; they viewed the intervention as timely and necessary. However, concerns were raised that some older people might believe that white roofs attracts death, and some may indulge in the conspiracy theory that the coating is associated with disease. Participants questioned the long-term effectiveness of cool roofs and their compatibility with existing informal housing structures lacking traditional roofs. They felt that the current cost of paint may make the intervention inaccessible to those most in need of it, thereby limiting equitable distribution, as most people were unemployed. Furthermore, they believed that if cool roofs lacked long-term durability and required constant maintenance, people were unlikely to accept the intervention.
CONCLUSIONS
While overall perceptions were positive, engaging and educating the community through transparent communication and information on cool roof interventions will address concerns and encourage the adoption of these interventions. More research is required to inform acceptable and scalable implementation in peri-urban settings.

Community perceptions of climate change and health: A qualitative study in a peri-urban health and demographic surveillance site in Umlazi, KwaZulu-Natal

Nisha Nadesan-Reddy[1], Nompumelelo Nzimande[2], Isabel Madzorera[3], Cheng He[4], Till Bärnighausen[5], Wafaie Fawzi[4], Saloshni Naidoo[1]
[1]Discipline of Public Health Medicine, University of KwaZulu-Natal, Durban, South Africa, [2]Umlazi Surveillance Initiative to Nurture Grassroots Action, SAPRIN site, Umlazi, Durban, South Africa, [3]School of Public Health, University of California, Berkeley, California, United States, [4]Harvard T.H. Chan School of Public Health, Harvard University, Boston, United States, [5]Heidelberg Institute of Global Health, University of Heidelberg, Heidelberg, Germany

BACKGROUND
South Africa is experiencing more frequent extreme weather events, including heatwaves and floods, with vulnerable communities experiencing the worst impact. Communities' perceptions of climate change and its health impact can inform policy and guide the development of contextually appropriate interventions. This pilot qualitative study explored perceptions of climate change and health experiences of communities in a peri-urban township in KwaZulu-Natal.
METHODS
Trained facilitators conducted two focus group discussions with adult community members, using a structured guide to explore perceptions of climate change, extreme heat, and health-related impacts. Discussions were recorded, transcribed and analysed using inductive thematic analysis following Braun and Clarke's approach.
RESULTS
Two major themes emerged: perceived climate and environmental change with subthemes of unpredictable weather patterns; environmental degradation, and urbanisation, and health impacts of extreme heat with subthemes of physical and emotional well-being; nutritional and behavioural responses; and livelihood vulnerabilities. Participants described climate change as a lived reality, observed through blurred seasonal boundaries, more intense heat, and localised flooding. They attributed these changes to deforestation, expansion of informal settlements, inadequate drainage, and waste pollution. Reported health effects of heat stress included exhaustion, sleep disruption, cardiovascular and respiratory problems. During periods of heat, water scarcity forced a shift to unhealthy beverages, including alcohol and fizzy drinks, which can negatively impact health. Floods were reported to disrupt employment, agriculture, and household stability, deepening social vulnerability in a constrained community. Children, older adults, and people with chronic illnesses were viewed as especially at risk and climate events threaten food production, increasing hunger and economic strain.
CONCLUSIONS
Communities demonstrated local knowledge of climate change, linking environmental changes to health and livelihood impacts. This awareness highlights the need to engage them in future research to quantify health impacts of climate change and co-design effective adaptation strategies in South African settings.

Forced Animal Displacements: Indian Cattle Camps as a response to extreme weather conditions

Piera Ceschi[1], Giorgia Casti[2], Chandralekha Nair[3], Emanuele De Ponti[4], Francesca Squillace[5]
[1]Department of Prevention - Epidemiological Surveillance Unit, South Tyrolean Healthcare Services, Bressanone/Brixen (BZ), Italy, [2]Struttura Semplice Dipartimentale Salute donna e Consultori materno-infantili, ASL Medio Campidano, Sanluri, Italy, [3]Independent Researcher, Alappuzha, India, [4]University Vita-Salute San Raffaele, Faculty of Medicine, Milan, Italy, [5]Fondazione IRCS Ca' Granda Ospedale Maggiore Policlinico, Milan, Italy

ABSTRACT
Background Environmental emergencies and conflicts are major drivers of human displacements. Among the environmental variables, water represents one of the most critical factors, and populations in arid regions are the most exposed to droughts and more likely to migrate. In such contexts, farmers are among the most vulnerable communities. As a matter of fact, when animals are forced to move, disputes among communities may arise, and the risk of transboundary diseases' spread increases. In India chronically arid landscape and rising temperatures result in severe droughts which in turns lead to migrations. This abstract explores the phenomenon of forced displacements at the human-animal interface and the related promising strategies adopted in Maharashtra (India). Methods A research was conducted on PubMed®, followed by a search of grey literature. Results The establishment of cattle camps in Maharashtra is essential in mitigating the adverse effects of extreme weather, thereby ensuring the survival of entire farmers communities. Cattle camps can open during times of drought, where water and fodder are distributed for the animals. In 2019 the Authorities of the districts of Beed and Nashik published the procedures for their establishment. The documents (available in Hindi only) describe the requirements that must be fulfilled before starting a camp. This approach has been included since 2022 among the strategies to address emergencies in the Disaster Management Plan of the district of Beed. Non-governmental organizations and the press are raising awareness on this strategy. Only one paper mentions the Indian cattle camps. Conclusion When animals are forced to move with their owners, it is vital to acknowledge the relevance of the human-animal-environment interconnections to develop effective strategies. To date no studies have been carried out on Indian cattle camps and further research is required to better understand opportunities and issues concerning this promising strategy.

Impact of climatic variations on the global distribution and

prevalence of mpox disease: analysis of data from 52 countries using linear regression and time-series forecasting analyses

Iyanuloluwa S. Ojo[1], Olurotimi John Badero[2], Muhammad Aziz Rahman[3], Nicholas Aderinto[4], Onur Oral[5], Rishad Choudhury Robin[6], Emmanuel Jesuyon Dansu[7], Faridat Ibidun[8], Temitope Ogunjimi[1]

[1]University College Hospital Ibadan, Ibadan, Nigeria, [2]Department of CardioNephrology, Cardiac Renal and Vascular Associates, Jackson, MI, United States, [3]Discipline of Public Health, Institute of Health and Wellbeing, Federation University Australia, Victoria, Australia, [4]Ladoke Akintola University of Technology, Ogbomosho, Nigeria, [5]Faculty of Health and Sports Sciences, Ege University, Izmir, Turkey, [6]The Leprosy Mission International, Dhaka, Bangladesh, [7]Graduate School of Life Sciences, Tohoku University, Sendai, Japan, [8]Nobles Hospital, Douglas, Isle of Man

INTRODUCTION

Mpox infection has emerged as a significant global public health concern, with marked epidemiological variations across countries. This study employed a quantitative, cross-sectional approach to examine the impact of climatic variations on mpox prevalence and mortality. We analysed daily confirmed mpox cases from 52 countries using linear regression and time-series forecasting methods (prophet and sarimax), focusing on average mean surface air temperature (amsat), precipitation, and climate types based on the köppen classification.

METHODS

Daily mpox case counts, climatic indicators and mortality data were evaluated using regression modelling and forecasting frameworks. Associations between temperature, precipitation and mpox outcomes were assessed globally and regionally.

RESULTS

Globally, no statistically significant relationships were observed between temperature or precipitation and mpox prevalence (p=0.99 and p=0.82) or mortality (p=0.45 and p=0.54). Region-specific analyses showed stronger associations: temperature significantly influenced mpox prevalence in Europe (p=0.049) and South America (p=0.0036), while precipitation was associated with mpox prevalence in South America (p=0.044). Tropical and temperate climate types demonstrated the strongest associations with increased mpox transmission. The prophet model, which incorporates seasonality, revealed fluctuating influences of temperature and precipitation over time, with their effects diminishing. Higher temperatures were associated with increased mpox prevalence, while precipitation displayed a two-legged influence. The sarimax model indicated a potential but less impactful resurgence of mpox in 2030; although higher temperature trends were again associated with increased prevalence, this did not reach statistical significance (p=0.561). Precipitation levels between 500mm and 1500mm were associated with slight increases in mpox prevalence (p=0.113), possibly explaining higher prevalence in countries within this range.

CONCLUSIONS

These findings highlight the nuanced role of climatic factors in mpox transmission and emphasise the need for enhanced regional surveillance. Monitoring temperature, precipitation and climate type may support improved understanding and mitigation of mpox spread and mortality.

Green biomanufacturing: reducing carbon footprints in vaccine and biologics production

Courage Chandipwisa[1], Harrison Banda[2], Kapembwa Chabala[3], Tendai Pride Zenda[4], Agness Shimilimo[5]

[1]Infectious Diseases, Global Empathy Project, Lusaka, Zambia, [2]Department of Pure and Applied Chemistry, School of Natural and Applied Sciences, University of Zambia, Lusaka, Zambia, [3]Directorate of Licensing, Surveillance and Enforcement, Zambia Medicines Regulatory Authority (ZAMRA), Lusaka, Zambia, [4]Pharmacy and Pharmaceutical Sciences, University of Zimbabwe, Harare, Zimbabwe, [5]Reproductive Health, Pan African University Life and Earth Sciences (including Health and Agriculture), Ibadan, Nigeria

INTRODUCTION

the environmental burden of conventional vaccine and biologics production has become increasingly and remarkably unsustainable due to high energy consumption, water usage and greenhouse gas emissions. Green biomanufacturing offers a transformative alternative by integrating renewable energy, sustainable raw materials, process intensification and circular supply chains. This review explores how these innovations can reduce the carbon footprint of biologics manufacturing while supporting global health and climate goals.

METHODS

a systematic review of literature was conducted following prism guidelines. Peer-reviewed articles, industrial case studies, and policy briefs published between 2010 and 2025 were retrieved from pubmed, scopus, web of science, and google scholar using predefined keywords including green biomanufacturing, low-carbon biologics, and sustainable vaccine production. Studies were screened for relevance to biologics and sustainability, with inclusion and exclusion criteria applied to ensure methodological rigor. Data extraction and thematic synthesis were organized into five domains: energy systems, raw materials, process design, supply chains, and socioeconomic/policy considerations.

RESULTS

this systematic review indicates that green biomanufacturing can play a vital role in economizing energy, minimizing waste, and improving operational efficiency. The crucial strategies include the adoption of solar and wind energy, biodegradable feedstocks, continuous bioprocessing, and smart packaging. Life-cycle analysis has emerged as a critical tool for evaluating environmental performance and guiding sustainable decision-making. The one health framework further reinforces the value of green biomanufacturing in addressing zoonotic disease prevention and ecosystem resilience.

CONCLUSIONS

green biomanufacturing presents a viable pathway toward sustainable vaccine and biologics production. However, some issues remain in scaling technologies, harmonizing regulatory frameworks and therefore ensuring equitable implementation in low- and middle-income countries. Addressing these barriers will cost a coordinated investment, policy reform, and interdisciplinary collaboration to build climate-conscious health systems.

Forecasting Lyme Borreliosis Based on Climatic Factors Using a Negative Binomial Model in the Baltic States

Gintare Kaliniene[1], Vidmantas Vaiciulis[1], Robertas Petrolis[2], Ingrida Grabauskyte[2], Renata Paukstaitiene[2], Justina Miniene[3], Stella Shaumyan[4], Liene Grike[5], Emils Zinkevics[5], Gabriele Domkute[6]

[1]Department of Environmental and Occupational Medicine, Lithuanian University Of Health Sciences, Kaunas, Lithuania, [2]Department of Physics, Mathematics and Biophysics,, Lithuanian University of Health Sciences, Kaunas, Lithuania, [3]Vilnius Public Health Bureau, Vilnius, Lithuania, [4]Strategic Planning Services, International Project Centre of Excellence, Tallinn Strategic Management Office, Tallinn, Estonia, [5]City Development Department, Riga City Council, Riga, Latvia, [6]Kaunas Public Health Bureau, Kaunas, Lithuania

BACKGROUND

Lyme borreliosis (LB) is the most common tick-borne disease in Europe, with an increasing incidence over time. The incidence is increasing due to climate change and has been linked to warm winters, higher summer temperatures, lower seasonal temperature variation, and higher vegetation indices. The highest incidences were reported in Baltic states, Nordic countries and Western Europe [2,3]. This work aims to provide a prognostic model for LB in the Baltic states as part of the forecasting and early warning system of the AURORA project.

METHODS

Surveillance data, reporting the number of cases per month of LB in Vilnius (Lithuania), Riga (Latvia), and Tallinn (Estonia) and meteorological data were used to conduct the epidemiological modelling. The availability of historical data varied across countries: the analysis included data from 2010-2024 for Vilnius, 2006-2023 for Riga, and 1993-2019 for Tallinn. Negative binomial regression was used to predict the monthly LB incidence.

RESULTS

The model for Vilnius data showed that temperature (°C), relative humidity (%), precipitation (mm), and atmospheric pressure (hPa) were significantly associated with monthly LB morbidity ($p<0.05$), with regression coefficients (B) of 0.137, 0.074, -0.148, and 0.04, respectively. In Riga, the monthly number of LB cases showed a significant positive relationship with temperature (B=0.144, p=0.001) and humidity (B=0.061, p=0.001). However, average wind speed (m/s) had a negative effect, with a one-unit increase corresponding to a 57.3% reduction in cases. The Tallinn model revealed similar

RESULTS

the temperature and relative humidity coefficients showed a significant positive relationship with the monthly LB cases, with coefficients of 0.111 and 0.078, respectively; average wind speed had a negative effect (B=-0.785, p=0.001).

CONCLUSIONS

Higher temperatures and increased humidity increase the prevalence of the LB across the Baltic states, while wind reduces transmission, highlighting the need for climate-based monitoring, control, and early warning systems.

One Health Assessment of Biosecurity Knowledge, Attitudes, and Practices for Zoonotic Disease Prevention among Small-Scale Farmers in the North-West Province of South Africa

Mpinda Edoaurd Tshipamba[1], Baitsholetsi Gloira Mokolopi[1]
[1]Agriculture and Animal Health, University of South Africa, Florida-Roodepoort, South Africa

INTRODUCTION
Poor biosecurity of farms in small-scale livestock farming systems leads to risks of zoonotic illnesses. We evaluated the knowledge, attitudes, and practices of small-scale farmers in the Ngaka Modiri Molema District, North-West Province, South Africa on biosecurity.
METHODS
Cross-sectional research employed questionnaires that were structured, and 162 farmers were included in the study in addition to a focus group discussion and key-informant interviews. Frequencies/percentages were computed, and associations test were made using chi-square (alpha=0.05).
RESULTS
Complete biosecurity responses were available for 83 farmers (60.2% male, 50/83). Awareness of animal-to-human transmission was 43.4% (36/83) and awareness of zoonotic impacts on health/economic outcomes was 33.7% (28/83). Farmers aware of transmission were more likely to report awareness of impacts (58.3% [21/36] vs 14.9% [7/47]; chi-square=17.52, p<0.001). Biosecurity was considered important by 96.4% (80/83). Among those reporting practices (n=82), 96.3% (79/82) reported implementing ≥1 measure. Veterinary consultation was rare/never for 70.7% (58/82). Sick animals were mainly self-treated (68.7%, 57/83) rather than isolated (15.7%, 13/83) or managed with veterinary support (15.7%, 13/83). Financial constraints were the main barrier (68.3%, 56/82), while training/extension support was the top need (83.1%, 69/83). Practising any biosecurity measure did not differ by gender (p=1.00) or age group (p=0.514).
CONCLUSIONS
Nonetheless, there are gaps in zoonotic awareness and veterinary participation, which are perceived to be of high importance. One Health that combines specific farmer education as a part of extension services and enhancing veterinary outreach is required to enhance the biosecurity adoption and minimize the risks of zoonotic.

Assessment of the carbon footprint of meat and fish procurement in israeli hospital settings: time trends, expenditures and alternative scenarios

Ilknur Ayvaz[1], Meidad Kissinger[2], Sigal Frishman[3], Moran Blaychfeld-Magnazi[4], Raanan Raz[1]
[1]Braun School of Public Health and Community Medicine, Hebrew University of Jerusalem, Jerusalem, Israel, [2]The Department of Environmental, Geoinformatics and Urban Planning Sciences, Ben-Gurion University of the Negev, Beer-Sheva, Israel, [3]Nutrition Department, Clalit Health Services, Tel Aviv, Israel, [4]Nutrition Division, Israel Ministry of Health, Jerusalem, Israel

BACKGROUND
Climate change poses a major threat to global health, underscoring the need for mitigation efforts, including sustainable practices within the healthcare sector. Food procurement in healthcare institutions contributes to greenhouse gas (GHG) emissions, with red meat being a major driver. This study aimed to evaluate the carbon footprint of meat and fish procurement in Israeli hospitals and to assess the effects of alternative procurement scenarios on GHG emissions and food expenditures.
METHODS
This simulation study examined meat and fish procurement in 13 Clalit hospitals, Israel's largest healthcare provider, using procurement data from 2019 to 2023. GHG emissions from meat and fish procurement, covering stages from cradle to farm gate, were calculated using Israeli emission coefficients where available. Expenditures, procurement quantities, and related GHG emissions were normalized by the average number of hospital beds. Distributions by food category, temporal trends, and inter-hospital comparisons were analyzed. Alternative procurement scenarios were modeled to reduce beef consumption and replace it with healthier, more sustainable options, including poultry, fish, and plant-based proteins, accounting for portion-size adjustments, post-cooking weight changes, and equivalent protein content.
RESULTS
Meat and fish accounted for 25% of total food expenditures in Clalit hospitals, whereas legumes comprised less than 1%. Beef was responsible for 71% of total GHG emissions despite representing less than 20% of the total quantity procured. Substantial variability in expenditures, GHG emissions, and carbon intensity was observed across hospitals. Scenario analyses showed that replacing beef with poultry and fish reduced GHG emissions, while greater inclusion of plant-based proteins achieved further reductions in emissions alongside cost savings.
CONCLUSIONS
Beef procurement is the dominant contributor to food-related GHG emissions in major Israeli hospitals. Gradual substitution of beef with plant-based proteins offers a feasible strategy to reduce hospitals' carbon footprints, lower food costs, and promote healthier diets for patients and staff.

Sustainability and nutritional composition of food choices in a hospital canteen: pre-intervention vs. post-intervention

Elisa Mansutti[1], Federica Fiori[1], Diana Menis[2], Peter Cautero[3], Caterina Liudmila Graziani[4], Daniela Zago[3], Yvonne Beorchia[5], Lucia Lesa[3], Lucrezia Grillone[6], Francesca Cortelazzo[6], Angelica Cosolo[6], Manuela Mauro[6], Laura Brunelli[1,7], Maria Parpinel[1]
[1]Department of Medicine, University of Udine, Udine, Italy, [2]Health District of Gemona, Friuli Centrale Healthcare University Trust, Gemona, Italy, [3]Medical Directorate, Hospital "Santa Maria della Misericordia" of Udine, Friuli Centrale Healthcare University Trust, Udine, Italy, [4]Health District of Udine, Friuli Centrale Healthcare University Trust, Udine, Italy, [5]Institute of Hygiene and Evaluative Epidemiology, Friuli Centrale Healthcare University Trust, Udine, Italy, [6]Food hygiene and nutrition Unit, Department of Prevention, Friuli Centrale Healthcare University Trust, Udine, Italy, [7]Accreditation, Quality, and Clinical Risk Unit, Friuli Centrale Healthcare University Trust, Udine, Italy

BACKGROUND
Workplace canteens provide an effective setting to improve user's dietary habits, and hospital canteens should also serve as exemplary models. The aim of this study was to investigate users' choices regarding nutrient composition and environmental impact in a hospital canteen before and after a combined educational and environmental intervention.
METHODS
A cross-sectional study was conducted in the canteen of Udine University Hospital (Italy) during two index weeks in September 2022 (T0) and September 2023 (T1). A mixed intervention was introduced between T0 and T1, consisting of educational posters on healthy eating, a self-service fruit and salad bar, and posters with descriptive norm messages. Photos of lunch trays were collected, and choices were analyzed for nutritional composition and sustainability, using the Italian Food Composition Database for Epidemiological Studies and the SU-EATABLE LIFE dataset, respectively.
RESULTS
A total of 1,803 user trays were analyzed (798 at T0, 1,005 at T1). In terms of energy contribution (%E), there was a decrease in protein (-1%E) and lipids (-1%E), and an increase in carbohydrates (+1%E) and fibers (+1%E) from T0 to T1. The median energy content of the meal increased slightly (854 kcal/tray at T0 vs 884 kcal/tray at T1). The carbon footprint (CF) and water footprint (WF) of the meal were 1,338 gCO2eq. and 1,229 L H2O at T0, and 1,227 gCO2eq. and 1,207 L H2O at T1.
CONCLUSIONS
After the mixed intervention, we observed an improvement in environmental indicators, although CF and WF remain above the recommended range (CF: 800–1,000 g CO2 equivalents/meal, WF: 700–1,000 L H20/meal). Minimal improvements were also observed in the macronutrient composition of the meal. Further strategies should include changes in the food offer to nudge healthier choices for users and for the planet.

How much do hospital canteens waste?

Elisa Mansutti[1], Federica Fiori[1], Diana Menis[2], Peter Cautero[3], Caterina Liudmila Graziani[4], Daniela Zago[3], Lucia Lesa[3], Enrico Scarpis[5], Alessandro Conte[6], Laura Brunelli[1,7], Maria Parpinel[1]
[1]Department of Medicine, University of Udine, Udine, Italy, [2]Health District of Gemona, Friuli Centrale Healthcare University Trust, Udine, Italy, [3]Medical Directorate, Hospital "Santa Maria della Misericordia" of Udine, Friuli Centrale Healthcare University Trust, Udine, Italy, [4]Health District of Udine, Friuli Centrale Healthcare University Trust, Udine, Italy, [5]Medical Directorate, Hospital of Palmanova-Latisana, Friuli Centrale Healthcare University Trust, Palmanova, Italy, [6]Medical Directorate, Hospital of San Daniele-Tolmezzo, Friuli Centrale Healthcare

University Trust, San Daniele, Italy, [7]Accreditation, Quality, and Clinical Risk Unit, Friuli Centrale Healthcare University Trust, Udine, Italy

INTRODUCTION

Food waste in canteens includes food served but not consumed (plate waste, PW) and leftovers on the counter after service (counter food waste, CFW). The study aim was to characterize PW in terms of weight, energy, environmental indicators, and food categories, and to quantify CFW in three hospital canteens in the province of Udine (northeastern Italy).

METHODS

During a reference week in September 2023, user trays in three hospital canteens (C1, C2 and C3) were photographed before and after lunch. A modified Comstock visual scale was used to assess PW, and the SU-EATABLE Life database was used to estimate its environmental indicators. To evaluate CFW, leftover dishes on the canteen counter were weighed at the end of service.

RESULTS

A total of 1,624 trays were analyzed, of which 1,005 were in C1, 348 in C2, and 271 in C3. Of these, 59%, 79%, and 75% were fully consumed (zero PW), respectively. Side dishes were the main wasted food category in all canteens, accounting for 20-37% of total PW. The largest canteen (C1) reported the highest values of PW (44.3 g/tray, 58.7 kcal/tray) and the worst sustainability values, with a carbon footprint of 93.4 g CO2 eq./tray and a water footprint of 83.7 L H2O/tray. Considering the analysed trays, the PW accounts for approximately 113 kg of CO2 and 80,245 wasted kcal. Approximately 66 kg of CFW were weighed in C1, 101 kg in C2, and 8 kg in C3.

CONCLUSIONS

The environmental impact of PW and CFW in hospital canteens should be considered in addition to energy and nutrients waste. In line with the European Green Deal, improvement strategies should address the 3 Rs of food waste: Reducing plate waste, Reusing leftovers or donating surplus food, and Recycling by composting or sending scraps for energy recovery or feed production.

Drivers of zoonotic Campylobacter transmission in slaughterhouses: Insights from Nigeria for global One Health improvement

Emmanuel O Njoga[1], James W Oguttu[1], Kennedy F Chah[2]

[1]Agriculture and Animal Health, University of South Africa, Johannesburg, South Africa, [2]Faculty of Veterinary Medicine, University of Nigeria, Nsukka, Enugu State, Nigeria

ABSTRACT

A cross-sectional survey was conducted among 188 randomly selected slaughterhouse workers (SHWs) in Enugu State, Nigeria, to determine the drivers of zoonotic Campylobacter transmission in slaughterhouse setting. Data on socio-demographics, hygiene practices, knowledge of Campylobacter transmission, and self-reported gastroenteritis symptoms were collected using a validated questionnaire. Descriptive statistics and a binary logistic regression model were applied to identify determinants of Campylobacter transmission risk practices and knowledge gaps. Over half of the respondents (56.4%) were at a high-risk of Campylobacter infection, due to non-use of personal protective equipment (PPE) (77.1%), washing multiple carcasses in the same water bowl (54.8%), eating or drinking during carcass/meat processing (45.7%), and consuming raw or undercooked meat (36.7%). Most workers (90.4%) used non-potable water for carcass/meat processing, with only 14.1% reporting purification of the water used. Age (p = 0.028; OR = 2), slaughterhouse location (OR = 2; p = 0.007), absence of training (OR = 3.7; p = 0.001), and low educational level (OR = 3.7; p = 0.020 were significantly associated with Campylobacter transmission risky practices. Significant knowledge gaps were evident, as 28.2%, 51.1%, 52.7% and 56.9% of the SHWs, respectively, did not recognize that Campylobacter infection could arise from consuming contaminated meat, eating/drinking while handling carcasses, using unsafe water during processing, neglecting PPE. Most (64.4%) SHWs reported gastroenteritis symptoms, with 76% of them continuing carcass processing despite the illness. Workers who had low knowledge scores were five times more likely (OR = 4.5) to report gastroenteritis symptoms. This study revealed low education, lack of training on meat processing, unhygienic meat processing practices, and high prevalence of gastroenteritis symptoms among the SHWs. Context-specific interventions, including provision of potable water, strict enforcement of hygiene standards, routine training in local languages, regulatory oversight and mandatory PPE use, are imperative.

Toward a climate-informed predictive risk assessment for occupational hazards in mining and agriculture in zimbabwe

Bernadette Jani[1], Tatenda Nyenda[2]

[1]1 Environmental science and technology, Marondera university of agricultural sciences and technology, Marondera, Zimbabwe, [2]2 Geography, environmental sustainabilty and resilience building, Midlands state university, Gweru, Zimbabwe

ABSTRACT

introduction. Climate change is increasingly amplifying occupational health and safety (OHS) risks, particularly in climate-sensitive sectors such as mining and agriculture. In southern africa, and zimbabwe in particular, climate-related stressors pose significant threats to worker health, safety, and productivity. However, most existing occupational risk assessment tools remain static, retrospective, and insufficiently responsive to dynamic climatic conditions. Methods. This study develops a climate-informed predictive risk assessment model for zimbabwe's mining and agricultural sectors. The methodology involves a structured synthesis of peer-reviewed climate–health literature, occupational safety guidelines, and sector-specific hazard assessments to identify key predictive variables. A conceptual model integrating these variables into an interpretable risk scoring framework is proposed. The model's operational logic is simulated using microsoft excel to validate variable interactions and demonstrate the generation of actionable risk alerts. In addition, a low-cost, practitioner-centred software framework is conceptually designed for field application. Results. The study produces three key outputs. First, a validated set of climate and workplace variables critical for predicting occupational hazards in the target sectors is identified. Second, a functional excel-based simulation demonstrates the internal logic of the model and its capacity to generate context-specific risk outputs. Third, a prototype software design outlines a feasible implementation pathway for safety, health and environmental (SHE) personnel operating in resource-constrained settings. The findings further establish a clear conceptual pathway for future integration of wearable physiological monitoring data to support personalised risk assessment. Conclusions. By providing a practical and scalable framework, this research supports a shift from reactive to anticipatory occupational health practice. The proposed model has the potential to reduce climate-attributable occupational injuries and illnesses, thereby strengthening climate-responsive public health protection for vulnerable workers in low- and middle-income country contexts. Keywords: climate change, occupational health and safety, predictive risk assessment, mining, agriculture, zimbabwe

Effect of climate change on indigenous mental well-being from a one health perspective using a mixed methods approach

Kusumsheela Bhatta[1], Madhusudan Subedi[2]

[1]Policy, Planning and Public Health Division, Ministry of Health, Gandaki, Pokhara, Nepal, [2]School of Public Health, Patan Academy of Health Sciences, Lalitpur, Nepal

INTRODUCTION

according to the intergovernmental panel on climate change (IPCC), the increasing trend of climate change presents a growing concern for mental health and psychosocial well-being. Leading to emotional distress, anxiety, depression, grief, and potentially suicidal behavior. Using a one health lens, which acknowledges the interconnectedness of human health, environmental integrity, and animal well-being, this study explores the impacts of climate change on mental well-being among indigenous populations.

METHODS

a sequential exploratory mixed-method design was used in madi municipality of chitwan district and madhyabindu municipality of nawalparasi district. The qualitative phase involved in-depth interviews with 23 tharu community members to explore experiences of climate change-related stress and coping mechanisms. Findings informed a quantitative survey of 510 participants to assess climate change anxiety. Data were collected using kobo toolbox and analyzed in STATA 13 MP and EZR. Bivariate and multivariate logistic regression analyses assessed associations between climate change vulnerability factors and mental well-being, controlling for potential confounders. Ethical clearance was obtained from nepal health research council.

RESULTS

qualitative findings were organized into a one health framework showing how environmental, animal, and human health disruptions collectively influence mental well-being. Quantitative results indicated that 71.2% of participants scored above the cut-off of 21 on the climate change anxiety scale. Multivariate analysis showed higher odds of anxiety among individuals using chemical fertilizers (AOR 7.34, 95% CI 2.38-22.60), perceiving worsening animal treatment (AOR 2.72, 95% CI

1.27-5.83), and receiving early warning information (AOR 2.59, 95% CI 1.44-4.67). Traditional farming practices (AOR 0.16, 95% CI 0.08-0.30) and low climate change perceptual awareness (AOR 0.24, 95% CI 0.13-0.44) were protective.

ABS1449
Use of Climate Information Services as a Decision-Making Tool for Monitoring Meningitis Outbreaks in Africa
WENDLASIDA COMBERE[1], Ousmane Ndiaye[1], Pierre Kamsu[1]
[1]Climate and health, African Centre of Meteorological Applications for Development, Niamey, Niger
BACKGROUND
Epidemic meningitis remains a major public health challenge in the African "meningitis belt," stretching from Senegal to Ethiopia and affecting over 500 million people. Outbreaks are strongly associated with dry-season environmental conditions, including high temperatures, low humidity, and increased dust concentrations. To address this challenge, the African Centre of Meteorological Applications for Development (ACMAD) has developed a co-production approach that integrates real-time sub-seasonal and seasonal climate forecasts into a Meningitis Early Warning System (MEWS). Climate forecast products are used to co-design tailored information that supports public health decision-making. This work presents the MEWS co-production framework and highlights the added value of climate information services in public health response.
METHODS
MEWS integrates sub-seasonal forecasts of temperature, humidity, and dust to identify areas at risk of meningitis outbreaks. A coordination platform brings together ACMAD team and health stakeholders to co-design meningitis vigilance maps. During the epidemic season, weekly forecasts and vigilance maps are produced and discussed during biweekly coordination meetings with WHO-AFRO team to guide response actions. The platform also serves as a feedback mechanism, enabling continuous validation of forecasts to improve system accuracy and operational relevance.
RESULTS
The co-production framework resulted in operational vigilance maps and sustained user engagement, facilitating effective uptake of forecasts by health-sector decision-makers. Since implementation, MEWS maps have been issued twice weekly, enabling timely alerts and preparedness actions. In 2021, it supported the rapid containment of epidemic clusters within the meningitis belt. The initiative strengthened cross-sector collaboration, improved knowledge sharing, and enhanced the usability of climate information.
CONCLUSIONS
Climate-informed early warning systems represent a cost-effective adaptation measure for epidemic control. Institutionalizing MEWS, ensuring policy uptake, and sustaining climate–health partnerships are essential to achieving the WHO "Defeating Meningitis by 2030" goals.

Comparative assessment of PM□.□ and carcinogenic trace elements across four South African sampling sites
Janine Wichmann[1], Johan Boman[2], Peter Molnar[3]
[1]School of Health Systems and Public Health, University of Pretoria, Pretoria, South Africa, [2]Department of Chemistry and Molecular Biology, University of Gothenburg, Gothenburg, Sweden, [3]Department of Occupational and Environmental Medicine, Institute of Medicine, Sahlgrenska Academy, University of Gothenburg, University of Gothenburg, Sweden
BACKGROUND
Fine particulate matter (PM.) is a major contributor to global disease burden, yet long-term monitoring and chemical characterisation remain limited in low- and middle-income countries, including South Africa. While PM. mass concentrations are routinely reported, less is known about PM.-bound carcinogenic trace metals and their associated health risks in African settings. These metals can penetrate deep into the respiratory system and induce oxidative stress, inflammation and cancer, underscoring the need for site-specific exposure and risk assessments. The aim was to compare PM. concentrations and carcinogenic trace element risks across four South African sites (Pretoria, Thohoyandou, Mabopane and Bloemfontein).
METHODS
24-hour PM. samples were collected at regular intervals, analysed gravimetrically and chemically characterised using energy-dispersive X-ray fluorescence. Health risks were estimated following the U.S. EPA Human Health Risk Assessment framework, with lifetime excess cancer risks calculated for arsenic (As), nickel (Ni) and hexavalent chromium (Cr(VI)). The World Health Organization (WHO) annual PM. guideline of 5 µg/m was used as a reference.
RESULTS
Mean PM. concentrations exceeded the WHO annual guideline at all sites, with the highest levels observed in Pretoria (23.2 µg/m), followed by Thohoyandou (11.0 µg/m), Bloemfontein (11.0 µg/m) and Mabopane (10.0 µg/m). Ni was the most consistent contributor to cancer risk across sites, with lifetime excess cancer risks exceeding commonly accepted benchmarks. As contributed additional seasonal risk in Pretoria, while Cr(VI) dominated cancer risk in Bloemfontein.
CONCLUSIONS
PM. pollution in South Africa remains well above the WHO guideline, with carcinogenic trace metals contributing substantially to health risks. Concentrations were consistently elevated during cold and dry seasons, reflecting increased domestic fuel combustion and reduced atmospheric dispersion. Ni sources may include traffic, industrial activities and combustion sources. Expanded chemical speciation monitoring and targeted emission control strategies are needed to reduce exposure, particularly in vulnerable communities and high-risk environments.

Climate & Health 101: Foundations for Public Health Action in a Warming World
Azeeza Rangunwala[1], Shweta Narayan[2]
[1]groundWork South Africa, Pietermaritzburg, South Africa, [2]Campaign Lead, Global Climate and Health Alliance, Kumily, India
INTRODUCTION
Climate change is the greatest public health threat and equity challenge of the 21st century, disrupting progress across the Sustainable Development Goals. Yet many practitioners lack accessible, foundational training on the core pathways linking climate change and health. This 60-minute session aims to build essential literacy in climate-health science, impacts, and public health actions. Health professionals play a role in ensuring that the health sector is climate resilient.
METHODS
The session will employ a blended pedagogical approach combining: Evidence-based framing using current scientific assessments to outline the major exposure pathways, including extreme heat, air pollution, changing disease vectors, food and water insecurity, mental health impacts, and climate-related displacement. Contextual and equity-focused analysis to highlight disproportionate risks faced by low-income communities, Indigenous peoples, children, older adults, and workers in climate-exposed sectors. Case-based learning, drawing on global examples—from heat action plans and air-quality interventions to community-led resilience initiatives—to illustrate practical mitigation and adaptation strategies. Interactive engagement, including a short framing exercise enabling participants to articulate climate-health risks and solutions in their own contexts.
RESULTS
Participants will gain: A clear understanding of the fundamental scientific links between climate change, fossil-fuel pollution, and health. Improved ability to identify and explain key health impacts across the life course. Insights from real-world public health responses demonstrating effective policy, practice, and community action. Strengthened confidence in communicating climate and health issues to policymakers, peers, and the public. Practical entry points for integrating climate considerations into existing public health programs and institutional strategies.
CONCLUSIONS
Equipping public health professionals with foundational climate-health knowledge is essential to protecting health in a rapidly warming world. By combining evidence, equity, and practical tools, this session aims to catalyze stronger public health engagement, foster interdisciplinary collaboration, and support a global shift toward healthier, more resilient, and fossil-free communities.

ABS1732
Replacing traditional proteins with alternative protein foods: Results of two systematic reviews on psychosocial and environmental determinants
Aleksandra Luszczynska[1], Hanna Zaleskiewicz[1], Anna Kornafel[1], Natalia Paduszynska[1]
[1]SWPS University, Warsaw, Poland
INTRODUCTION
Sustainable dietary changes, such as replacing traditional proteins with alternative protein food (APF) based on plants, microorganisms, fungi or insects,

requires changing consumers beliefs and motivations, as well as presence of social and physical facilitators in the environment. This study investigates (i) psychological and social determinants of APF intake and (ii) characteristics of physical environment structures (e.g., supermarkets, restaurants, online vendors) that act as barriers or facilitators of APF choices.
METHODS
13 databases were searched in two preregistered systematic reviews (#CRD42023388700 and #CRD42023388694). A total of 28 reviews were included to identify psychosocial determinants and 36 original studies addressing build food environment were analyzed. Risk of bias was evaluated with ROBIS and Joanna Briggs Institute quality evaluation tools.
RESULTS
Psychosocial determinants of APF intake may differ depending on the APF sources. For plant-based APF choices, consistent support was obtained for associations with: capabilities (e.g., cooking skills), familiarity with APF, consumers' beliefs (health-related, pro-environmental, and sustainability benefits, animal welfare), younger age, and higher education. For insect-based APF intake, consistent support was obtained for APF knowledge, APF familiarity, positive social and cultural norms, low technology distrust, perceived health benefits and risks, perceived pro-environmental and sustainability benefits, emotions (curiosity, neophilia, disgust), male gender, and younger age. Environmental barriers to regular AFP intake refer to a mismatch between retailers' actions of making APF available in one type of environmental structure (e-commerce), and consumers' preference for availability in other structures (supermarkets, local groceries). Effects of social factors are moderated by the type of APF and the environmental structure. For example, in restaurants, masculinity-related social norms act as barriers for plant-based APF choices, but not for insect-based APF intake.
CONCLUSIONS
Recognizing differences in potential determinants across various APF sources is essential for designing environment-matching interventions that aim to mainstream sustainable diets, rich in alternative proteins.

There is Nothing "Natural" about these Disasters: The Need for a Decolonial and Harm Reduction Approach in the times of Climate Crisis
Tanagra Maria Melgarejo[1]
[1]National Harm Reduction Coalition, San Juan, Puerto Rico
ABSTRACT
Fires. Hurricanes. Drought. Typhoons. Medicaines. Tornados. Overfishing. Pollution. Aggressive deforestation. Unbridled construction. What do all of these have in common? Capitalism, sexism, imperialism, racism and greed. Our planet is suffering and the consequences of putting profits over people is having a profound impact on humanity and in particular those that are most vulnerable - people who use drugs, engage in sex work, those that are unhoused or live in communities threatened by environmental racism and ecological catastrophes. The goal of this organized workshop session is to demonstrate the connections between the systemic and structural violence experienced by people who use drugs, environmental and ecological racism and how harm reduction can be a concrete practice and approach that can provide communities a space for organizing, transformation and action.
Popul. Med. 2026;8(Supplement 1):A338

Structural syndemics: from diagnosis to action on inequality, climate, and health sovereignty in Africa
Moeketsi Modiseyane[1], Joyce Shirinde[1], Suzan Nzenze[2], Bono Nemukula[3]
[1]1 School of Health Systems and Public Health, University of Pretoria, Pretoria, South Africa, [2]2 Division of Public Health Surveillance and Response, National Institute for Communicable Diseases, Johannesburg, South Africa, [3]3 Environmental Health and Port Health, National Department of Health, Pretoria, South Africa
ABSTRACT
The defining problem for public health in Africa is the complex interaction between infectious disease threats, increasing burden for non-communicable diseases, climate-enhanced disasters, and deeply ingrained health disparities. Current strategies often treat these as distinct crises, resulting in disjointed, symptom-focused solutions that overlook the underlying social, political, and economic systems that consistently create vulnerability. When disasters strike, these forces interact as structural syndemics—mutually reinforcing systems based on gendered inequality, extractive political economies, and misaligned global financing architectures that systematically determine who is most vulnerable, who becomes ill, and who recovers. This organised session will present "Structural Syndemic Cycle" framework to clarify how political-economic processes create differential vulnerability, how disasters cause synergistic health crises, and how traditional solutions sustain cycles of dependency. Key questions: • How can the pillars of the Africa Health Security and Sovereignty (AHSS) agenda be used to eliminate systemic injustices that cause health disparities during disasters rather than to make accommodations for them? • How can financing for pandemic prevention and climate adaptation directly support community-led, gender-transformative health sovereignty amidst rising non-communicable disease burden? • In restructuring health and climate governance, how can African youth, the largest demographic and most impacted generation, be positioned as agents of structural change? Session format: The aim is to transform evidence of systemic injustices into a concrete agenda for transformative health sovereignty. • Utilize the "Structural Syndemic Cycle" model to show why the success of the AHSS Agenda rests on addressing the underlying political and economic causes of vulnerability. • Moderated discussion on practical levers, climate-resilient primary care, financing community-led, gender-transformative health systems, and positioning youth as agents of structural change. • This session will develop a "2026 Action Compact" as Africa's transformative sovereignty agenda, to outline how global climate finance and pandemic governance must be realigned.

Flood and Wellbeing – What is the Evidence?
Amber Abrams[1]
[1]Civil Eng, Future Water research institute - Civil - EBE, Cape Town, South Africa
BACKGROUND
Lack of access to clean, safe water is a global health crisis affecting billions of people. Evidence suggests an increase in diseases attributable to climate change, especially in low-income countries where limited budgets and infrastructure create challenges in responding to extreme climate or weather events (EWEs). Climate change impacts water-related diseases and healthcare concerns, however, data on climate-impacted, water-associated public health concerns are not often consolidated and synthesized. Research suggests that climate change is contributing to increased frequency and severity of EWEs. This requires understanding the extent to which these events may impact wellbeing, human health and ecosystems around us (OneHealth). A team of researchers have reviewed flood-related events since 2020 to understand the landscape on available research and map the evidence base.
METHODS
In May 2025, four databases (SCOPUS [140], PubMed [883], Africa Wide [239] and Web of Science [2054]) were searched using the original search string from the first health vulnerability indicator (HVI) flooding study (available upon request). Our data extraction and analysis enables us to report on emergent topics, as well as offering an evidence base to understand health impacts linked to flooding.
RESULTS
Studies from databases/registers were extracted with n = 2978 studies. Thereafter, 133 duplicates were removed, and 2845 studies were moved into Covidence for initial screening (title and abstract screening). Two thousand five hundred twenty-six (2526) studies were excluded at title abstract screening. In August three hundred nineteen (319) studies remained for full-text review. In December 64 studies remained for data extraction. Data extraction has been completed. Data analysis is underway to identify and report on the research landscape and the available evidence base.
CONCLUSIONS
Early analysis indicates that disease that incidence of studies exploring these topics, as well as the geographic spread of such studies has increased over time.
Popul. Med. 2026;8(Supplement 1):A340

ABS1779
Mapping Areas of High Risk for Waterborne Zoonoses in the Eastern Cape: Integrating Multi-Criteria Decision Analysis with GIS to Identify Critical Rivers
Siyabonga Mazibuko[1]
[1]Institute for Water Research, Rhodes University, Grahamstown, South Africa
INTRODUCTION
Waterborne zoonotic diseases remain a major global public health concern, contributing to approximately 2.5 billion infections and 2.7 million deaths annually. The Eastern Cape Province of South Africa is particularly vulnerable due to extensive rural settlements, high livestock density, and inadequate water and sanitation infrastructure. Many communities depend on river systems that are frequently contaminated with zoonotic pathogens, yet spatial tools to identify

high-risk areas are limited. This study aimed to develop and validate a spatial risk map for waterborne zoonotic diseases in the Eastern Cape Province.
METHODS
A multi-criteria decision analysis (MCDA) integrated with geographic information systems (GIS) was applied to develop a provincial risk map. Eight environmental drivers, including flooding, temperature, rainfall, wastewater treatment plants, population density, drought, livestock presence, and agricultural activities, were weighted using the analytic hierarchy process (AHP). The resulting composite map classified the province into five risk levels. Validation was conducted at eight sampling sites along the Bloukrans and Buffalo rivers during winter and summer using microbiological and molecular analyses.
RESULTS
Strong positive correlations were observed between predicted risk levels and measured concentrations of Escherichia coli O157:H7, particularly during summer (Bloukrans River R = 0.92 p = 1.8 × 10; Buffalo River R = 0.93 p = 1.6 × 10). Turbidity also correlated significantly with site risk level. Polymerase chain reaction analysis confirmed the presence of the fliC H7 gene in 97.9% of isolates and the invA gene for Salmonella enterica in 43.8% of presumptive isolates. The eaeA virulence gene was detected in 29.8% of Bloukrans River isolates.
CONCLUSIONS
The integration of MCDA and GIS effectively identified and predicted areas vulnerable to waterborne zoonotic contamination in the Eastern Cape Province, providing a useful decision-support tool for targeted intervention and public health planning.

Where does public health go after the UN Framework Convention on Climate Change summit in Belem, Brazil (CoP30)? Opportunities arising from the International Court of Justice advisory opinion and a UN General Assembly Special Session on climate change

David Patterson[1,2,3], Farhang Tahzib[4,5], Hannah Marcus[6], Eva Maria Mfutso Bengo[7]
[1]Groningen Centre for Health Law, Faculty of Law, University of Groningen, Groningen, Netherlands, [2]Law and Public Health Section, European Public Health Association, Utrecht, Netherlands, [3]Aletta Jacobs School of Public Health, University of Groningen, Groningen, Netherlands, [4]Ethics and Public Health Section, European Public Health Association, Utrecht, Netherlands, [5]Public Health, Ethics and Law Network, Global Network for Academic Public Health, Washington, DC, United States, [6]Environmental Health Working Group, World Federation of Public Health Associations, Toronto, Canada, [7]School of Business and Economic Sciences, Malawi University of Business and Applied Sciences, Blantyre, Malawi
BACKGROUND
Climate change is causing extreme weather, spreading of disease, devastating and lasting harm to humans, nature and the planet, and heightened conflict and insecurity.(1,2) We have increasingly dire scientific evidence of the health arguments for urgent climate action.(3,4) This workshop will review the opportunities for advocacy and legal action following the International Court of Justice (ICJ) advisory opinion on climate change(5), and highlight the case for an UN General Assembly Special Session (UNGASS) on climate change.(6,7) Thirty years after the adoption of the UN Framework Convention on Climate Change (UNFCCC), progress has been hampered by the limitations of CoP meetings and processes, with the need for consensus, influence of the fossil fuel industry, the rise in populism, and recent geopolitical fragmentation. Opportunities have also emerged. In July 2025 the ICJ delivered a wide-ranging advisory opinion which also affirmed states' international legal obligations to advance the right to health in the climate crisis. Similar guidance has been delivered by regional courts in the Americas and Europe (Africa is pending). Description: The workshop will review the outcomes of CoP30 from a public health perspective and the positioning of health as the argument for climate action. It will draw on experience with a prior and continuing threat to global health, the HIV pandemic, and consider how a UNGASS on climate change might break the logjam of state inaction. Speakers with direct experience of the UNGASS on HIV and CoP30 will highlight opportunities for civil society, states and other actors to use these developments as opportunities for climate action. An open discussion of the role of the public health community in climate action will follow.
CONCLUSIONS
The ICJ advisory opinion and an UNGASS on climate change provide critical new opportunities for public health advocacy for climate action at national, regional and global levels.

Climate Change and Health Adaptation: China's Practice

Tiantian Li[1,2], Minghui Ren[3,4], Limin Wang[5,6], Taiyuan Zhang[7], Bin Li[8], Feng Yang[9], Raman Bedi[10,11]
[1]Environmental Health Branch, Chinese Preventive Medicine Association, Beijing, China, [2]National Institute of Environmental Health, Chinese Center for Disease Control and Prevention, Beijing, China, [3]Vice President, Chinese Preventive Medicine Association, Beijing, China, [4]China Center for Health Development Studies, Peking University, Beijing, China, [5]Committee on Healthy Lifestyles and Community Health, Chinese Preventive Medicine Association, Beijing, China, [6]National Center for Chronic and Noncommunicable Disease Control and Prevention, Chinese Center for Disease Control and Prevention, Beijing, China, [7]Huafeng Meteorological Media Group of China Meteorological Administration, Beijing, China, [8]President, Chinese Preventive Medicine Association, Beijing, China, [9]Executive vice president & Secretary General, Chinese Preventive Medicine Association, Beijing, China, [10]World Federation of Public Health Associations, London, United Kingdom, [11]King's College London, London, United Kingdom
INTRODUCTION
Climate change is a critical public health threat, triggering extreme weather events, aggravated air pollution, shifted disease transmission patterns and growing health inequities. The World Health Organization urges countries to strengthen climate-health adaptation systems, yet translating scientific evidence into cross-sectoral, sustainable interventions remains a global bottleneck. In response, China has developed systematic policy innovations and technical practices for climate-health adaptation. This session spotlights China's progress in policy coordination, early warning technologies, behavioral interventions and public communication, aiming to identify replicable models for global knowledge sharing and resilient governance.
METHODS
Adopting an interactive format, the session convenes experts from public health, climate science and health communication. Discussions cover climate-health governance policies, lifestyle-based risk intervention, heat-health early warning practices, and innovative public communication approaches, integrating presentations, guided dialogue, and audience interaction.
RESULTS
The session is structured around four core themes. At the policy level, it will review global and Chinese policy frameworks and implementation pathways for climate-health governance, clarifying the evolution and distinctive features of China's approach. At the technical level, it will examine lifestyle-based intervention strategies and heat-health early warning mechanisms. At the practice level, the session will showcase case studies of heat-health protection in key settings and targeted health communication tools. Cross-sector dialogue seeks to build consensus on an integrated "monitoring–early warning–intervention–communication" framework to bridge knowledge and action.
CONCLUSIONS
This session will synthesize scalable experience models, identify opportunities and challenges in current practice, and contribute to strengthening climate change and health adaptation systems. The outcomes are intended to provide actionable references for countries and regions to develop and implement context-specific climate and health adaptation strategies, supporting the joint advancement of global climate governance and health equity.

How to effectively co-create complex interventions for dual benefits of climate change and health?

Nushrat Khan[1], Asri Maharani[2], Sujarwoto Sujarwoto[3]
[1]Primary Care and Public Health, Imperial College London, London, United Kingdom, [2]Nursing & Midwifery, University of Manchester, Manchester, United Kingdom, [3]Department of Public Administration, University of Brawijaya, Malang, Indonesia
ABSTRACT
The catastrophic effects of climate change on our lives are becoming more evident than ever, and those living in low-resource settings are particularly vulnerable to this. To tackle such challenges, it is important to co-develop context-specific solutions with the local communities and ensure co-benefits to the environment and human health. Besides this, health systems strengthening is vital to prepare for the emerging health challenges and provide adequate and timely care to the community. In this workshop, we will present a case study from East Java in Indonesia where air pollution due to plastic burning is an ongoing challenge. Drawing on work from a Global Health Research Centre, we will showcase the co-development and implementation of two interlinked complex interventions.

The first is the co-design of the SMARThealth Climate intervention, a digitally enabled primary health care model iteratively developed with frontline healthcare professionals, community members, and local health authorities to integrate climate-related risk assessment, non-communicable disease prevention and management into routine care. The second is a multisectoral intervention with the aim to improve plastic waste management in the region, build capacities on the ground and improve awareness among the community. In the first part of the workshop, we will describe the unique strategy we have developed as part of our Centre for co-creating complex planetary health interventions and how such processes could be adapted to other settings. In addition, we will detail the components of both complex interventions, how these are integrated to address the issue of plastic burning, and challenges we faced along the way. In the second part of the workshop, we will engage in an interactive activity using the Round Robin technique to collaboratively ideate around context-specific planetary health issues and what tools and frameworks can be used to address these challenges in a structured manner.

Healthcare access vulnerability in groundwater-dependent regions: preliminary methods for a surveillance framework from the American High Plains aquifer

Chase Branstetter[1], Ethan Laudie[2], Kaya Nies[3]

[1]Internal Medicine and Pediatrics, Children's Mercy, Kansas City, United States, [2]School of Medicine, University of Missouri Kansas City, Kansas City, Missouri, United States, [3]School of Medicine, University of Kansas, Kansas City, Kansas, United States

INTRODUCTION

Groundwater depletion drains aquifers supporting irrigation, drinking water, and economies, yet healthcare access implications are incompletely captured by public health surveillance. In groundwater-dependent regions, water stress may precede healthcare system strain by reshaping agricultural viability, population stability, and service demand before morbidity and mortality signals emerge. 3 The High Plains Aquifer (~450,000 km) provides a well-instrumented reference case to compare healthcare access vulnerability in groundwater-dependent regions.4

METHODS

We developed a county-level, cross-sectional surveillance framework in western Kansas assembling a dataset across domains: groundwater exposure and dependence, climate stress, socioeconomic and language barriers, service availability and redundancy, and geographic accessibility to hospital, emergency, and obstetric care. Indicators were fixed a priori and maintained in a registry for reproducibility and cross-setting comparison. The staged framework includes Tier 1 exposure classification via polygon intersection with the High Plains Aquifer; Tier 2 domain population to characterize access configurations; and Tier 3 computation under facility-loss scenarios to quantify shock sensitivity. Unlike composite indices, domains are not collapsed into a single score, preserving surveillance of structural access conditions.

RESULTS

Tier 1 identified 56 aquifer-exposed counties with heterogeneity in aquifer overlap, demonstrating feasibility of exposure classification. An indicator registry and preliminary Tier 2 integration has been established, including socioeconomic and language-access indicators and an inventory of hospitals, emergency departments, and obstetric services. Climate stress, groundwater dependence, and accessibility metrics are in advanced integration.

CONCLUSIONS

This framework supports surveillance of healthcare access vulnerability in groundwater-dependent regions by tracking configurations that may shift under upstream water stress. 5 Early changes may manifest as service contraction, rising travel burdens, and socioeconomic strain.3,5 Using reproducible, cross-sectional indicators from public and administrative data, the framework can screen for configuration shifts without reliance on outcome-based measures or prospective modeling. This work documents preliminary methods to support future utilization in other groundwater-dependent regions.

INTRODUCTION

The convergence of climate change, rapid urbanization, and ecosystem degradation has significantly amplified the risk of zoonotic spillover and future pandemics. Urban centers, characterized by high population density and complex interactions between humans, animals, and the environment, are particularly vulnerable to these emerging threats. Effective pandemic prevention and preparedness (PPP) require a robust One Health governance framework that integrates environmental surveillance with public health infrastructure. However, translating political commitments into operational capabilities remains a critical challenge, compounded by a lack of standardized evaluation metrics.

METHODS

This 60-minute session, co-organized by the One Health Working Group under the World Federation of Public Health Associations (WFPHA), the Chinese Preventive Medicine Association (CPMA), and the Brazilian Association of Collective Health (ABRASCO), addresses the urgent need to align One Health structures with the realities of climate change to enhance resilience against pandemics by bridging the gap between theory and practice. It features a keynote on One Health governance, a technical presentation on the Global One Health Index (GOHI) as an evaluation tool, and case studies illustrating implementation challenges in urban settings. The session concludes with a multidisciplinary panel discussion to synthesize these insights, featuring five world-renowned experts.

RESULTS

The session demonstrates how integrating One Health governance theory, quantitative tools, and field evidence reveals systemic vulnerabilities. Results highlight that data-driven assessments identify specific weaknesses in preparedness, while strong governance facilitates timely interventions, in line with the Pandemic Agreement. The session demonstrates that aligning environmental health metrics with public health planning is essential for reducing the lag between detection and response in urban environments.

CONCLUSIONS

It concludes that effective pandemic prevention demands transformative governance supported by rigorous evaluation. By aligning global frameworks with local realities, it aims to provide policymakers with a roadmap for building resilient health systems that proactively mitigate pandemic threats.

Assessing the prevalence of Schistosoma mansoni infections among school-going children aged 5-14 years old in Nelson Mandela Bay: A comprehensive diagnostic approach.

Maryline Vere[1], Wilma ten Ham-Baloyi[2], Lucy Ochola[3], Opeoluwa Oyedele[4], Lindsey Beyleveld[5], Siphokazi Tili[5], Takafira Mduluza[6], Paula Melariri[1]

[1]Environmental health, Nelson Mandela University, Summerstrand, Port Elizabeth, South Africa, [2]Nursing science, Nelson Mandela University, Summerstrand, Port Elizabeth, South Africa, [3]Institute of Primate Research, Institute of Primate Research, Nairobi, Kenya, [4]Computing, Mathematical and Statistical Sciences, University of Namibia, Nairobi, Namibia, [5]Medical Laboratory Services, Nelson Mandela University, Summerstrand, Port Elizabeth, South Africa, [6]Biochemistry and Biotechnology, University of Zimbabwe, Harare, Zimbabwe

INTRODUCTION

Intestinal schistosomiasis caused by Schistosoma mansoni is frequently underestimated in low-transmission settings due to the low sensitivity of stool

microscopy. Low-intensity infections often occur without detectable eggs, necessitating the use of more sensitive diagnostic tools such as point-of-care circulating cathodic antigen (POC-CCA) tests and molecular methods. This study determined the prevalence of S. Mansoni infection among school-going children in Nelson Mandela Bay (NMB), South Africa, using complementary diagnostic approaches.
METHODS
A cross-sectional study was conducted among 759 children aged 5–14 years from 15 primary schools in NMB. Stool samples were analysed using the Kato-Katz technique. Urine samples were tested using POC-CCA assays, and stool samples corresponding to POC-CCA–positive cases were analysed using conventional polymerase chain reaction (cPCR).
RESULTS
Among the 759 school participants, 438 (57.7%) were males and 321 (42.3%) females, mean age 11.00 ± 1.50 years, in grades 0 to 7. No cases of S. Mansoni were found by the Kato-Katz. Most participants were in grades four to seven (61.5%), and no S. Mansoni infections were detected by Kato-Katz microscopy. Additionally, further testing for S. Mansoni was performed using POC-CCA tests, revealing a prevalence rate of 3.2%. Given the impracticality of testing all samples with molecular methods, a more focused and cost-effective strategy was adopted by targeting the 28 POC-CCA–positive samples, representing 3.2% of the total. Because POC-CCA indicated probable S. Mansoni infection, cPCR was used to confirm low-intensity cases likely missed by Kato-Katz, targeting the S. Mansoni cox-1 repeat sequence for definitive identification. Remarkably, 32.1% (9/28) of the CCA-positive samples tested positive for S. Mansoni DNA, demonstrating the method's effectiveness in identifying infections that were missed by traditional microscopy.
CONCLUSIONS
The findings indicate low-level but ongoing transmission of S. Mansoni in NMB. Sensitive diagnostic tools are essential for accurate surveillance in low-endemic settings.

ABS1923
Environmental exposure disparities in urban markets: A comparative air quality assessment in Lusaka, Zambia

Emmy Nkhama[1], Jigar Jani[2], Timothy J Dvonch[2]
[1]School of Public Health and Environmental Sciences, Levy Mwanawasa Medical University, Lusaka, Zambia, Levy Mwanawasa Medical University, Lusaka, Zambia, [2]School of Public Health, University of Michigan, Ann Arbor, USA, University of Michigan, Ann Arbor, United States

BACKGROUND
Urban areas exhibit stark infrastructure disparities; unpaved, high-traffic facilities versus paved, enclosed structures. The study quantified PM2.5 and PM10 exposure differences between market infrastructure types and characterized temporal patterns.
METHODS
Conducted in two marketplaces, in Lusaka, Zambia, located 20 km apart, representing paved (control) and unpaved (exposed) environments. Two low-cost PurpleAir sensors were installed at each market to continuously monitor PM2.5 and PM10 concentrations, May 25–July 9, 2025. Measurements were recorded every 2 minutes between 7 am and 7 pm, corresponding to market operating hours. Data analysis used synchronized monitoring periods when all sensors were active to minimize temporal confounding. Welch's two-sample t-tests were conducted to compare pollutant concentrations between the two site types, statistical significance set at $p<0.05$.
RESULTS
There were 16,079 observations. Exposure sites recorded significantly higher mean concentrations of PM2.5 (32.7 versus 27.6 µg/m; 95% CI: 3.9–6.2; $t = 8.63$, $p < 0.001$) and PM10 (44.4 versus 33.3 µg/m; 95% CI: 9.7–12.6; $t = 15.05$, $p < 0.001$) compared to control site; increases of 18.5% and 33.3%, respectively. PM2.5 levels at exposure sites exceeded the WHO 24-hour guideline value (15 µg/m) by 118%. Exposure and control sites demonstrated weekday elevations irrespective of infrastructure type for temporal patterns. Control sites exhibited weekend-to-weekday; 214% to 228%, whereas exposure sites showed smaller increases of 102% to 105%. Diurnal patterns were observed at both locations, peak concentrations occurring mid-afternoon (15:00–16:00), during maximum market activity and traffic.
CONCLUSIONS
PM2.5 concentrations were significantly higher in unpaved, high-traffic market environments. There is need for targeted urban infrastructure improvements such as paving, dust control, and traffic management to reduce air pollution exposure and protect the health of market workers and vendors.

Mercury as a Global Pollutant and its Lasting Effects on A Community, 35 Years Later

SUJATHA HARIPARSAD[1]
[1]Discipline of Occupational & Environmental Health, UNIVERSITY OF KWAZULU-NATAL, DURBAN, South Africa

INTRODUCTION
Mercury remains a worldwide pollutant. Although banned in many countries the legacy of Mercury contamination remains as a lasting disastrous crisis in many communities. In South Africa, the ominous introduction to mercury began in a small community when a Mercury recycling plant began its operation.
METHODS
The study was conducted on 51 ex-workers of the mercury recycling plant. The study involved a 3-pronged approach which included occupational medicine clinical assessment (which included a detailed questionnaire focusing on occupational history & a thorough clinical assessment by OMPS), Occupational Therapy assessments by trained OTs focussing on balance, posture, ADL and musculoskeletal impairments; and lastly a neuropsychological screening interview by a qualified neuropsychologist which included a detailed interview with collateral information. Exposure was assessed via hair, nails, blood and urine samples from all participants. These samples were analysed at the National Institute of Occ Health in South Africa. The results were then captured on Excel and analysed using bivariate analysis looking for associations between outcomes and exposure measurements.
RESULTS
The study enrolled all living 51 ex-workers. The average age of the workers was 65 and their employment tenure was an average of 11 years. Clinical assessments revealed that 33 of the workers exhibited impairments with postural alignment, exhibited tremors and neurocognitive delays and impairments. At least 14 of the workers showed elevated levels of Hg in their hair, nails and blood.
CONCLUSIONS
These results although in a small study sample clearly indicate the lasting and latent effects of Hg toxicity. Although a strong association to occupational exposure, these results also indicate the involvement of environmental toxicity and a community at risk. The neighboring communities are low socio-economic population that rely heavily on subsistence farming and small livestock farming. These results are a startling reality of community mercury toxicity.

Sex Differences in the Association Between Typical Winter Ambient Temperature and Physical Activity in China: A Nationwide Study

Chuangjia Du[1,2], Mei Zhang[2], Xiao Zhang[2], Xiaolei Zhu[3], Chun Li[2], Zhenping Zhao[2], Mengting Yu[2], Yuting Lian[2], Xueqian Wu[2], Yu Guo[2], Xiuyang Li[1], Limin Wang[2]
[1]1Department of Big Data in Health Science, and Center for Clinical Big Data and Statistics, the Second Affiliated Hospital, College of Medicine, Zhejiang University, Hangzhou, China, [2]2National Center for Chronic and Noncommunicable Diseases Control and Prevention, Chinese Center for Disease Control and Prevention, Beijing, China, [3]3Office of NCD Control and Aging Health, Chinese Center for Disease Control and Prevention, Beijing, China

BACKGROUND
Previous studies had indicated that physical activity (PA) can be affected by extreme temperatures. However, little is known about whether typical winter ambient temperatures are associated with PA.
METHODS
The data was from China Chronic Disease and Risk Factor Surveillance (CCDRFS), a nationwide survey that covered 298 out of all 605 disease surveillance points (DSPs) in China. Information on PA was collected using the Global Physical Activity Questionnaire (GPAQ). Ambient temperatures were matched with the monthly average temperature of each DSP. A total of 134720 individuals who completed the survey from October 1 to December 31, 2018, were included in this study. Design-based weighted linear regression and logistic regression were used to estimate the associations between temperatures and PA (continues time and whether insufficient).
RESULTS
The average total PA time was 1,320 minutes per week (including 1,008 minutes occupational, 226 minutes transportational, and 86.2 minutes recreational PA time per week, respectively). The average ambient temperature during these months

was 284.0 K (10.9). In the fully adjusted model, 1 K increase in temperature was associated with an increase of 8.3 (95% CI: 0.8-15.8) minutes per week in total PA time, but was not associated with occupational, transportational, or recreational PA time, respectively. In sex-stratified analyses, higher temperature was significantly associated with longer total PA (β=12.4, 95% CI: 5.4-19.4) and occupational PA (β=10.0, 95% CI: 3.9-16.0) time among women, but these associations were not significant among men. The weighted prevalence of insufficient PA was 22.5%. Higher temperature was an independent protective factor for insufficient PA (OR=0.98, 95% CI: 0.96-0.99), both among men (OR=0.98, 95% CI: 0.97-0.99) and women (OR=0.97, 95% CI: 0.96-0.99).
CONCLUSIONS
In this national study, higher ambient temperatures in winter were significantly associated with PA. This association was more pronounced among women.
Popul. Med. 2026;8(Supplement 1):A357

Short-term effects of temperature and air pollution on childhood asthma exacerbations in Cape Town, South Africa

Tshepo Phakisi[1,2], Edda Weimann[3,4], Hanna-Andrea Rother[1]
[1]Division of Environmental Health, School of Public Health, University of Cape Town, Observatory, South Africa, [2]Department of Environmental Health, Nelson Mandela University, Gqeberha, South Africa, [3]Digital Health, Department of Information Systems, School of Information Technology, Commerce Faculty, University of Cape Town, Cape Town, South Africa, [4]TUM School of Medicine and Health, Children Campus Munich Schwabing, Technical University of Munich, Munich, Germany

INTRODUCTION
climate change and rapid urbanisation are intensifying respiratory health risks, disproportionately affecting children in low- and middle-income countries (LMICs). Evidence on the short-term impact of ambient temperature and air pollution on childhood asthma in African urban settings is limited. Understanding this relationship is crucial for informing equitable and sustainable public health strategies.
METHODS
daily childhood asthma hospital visits (n = 7753) recorded in 2009, 2014, and 2019 were analysed alongside citywide air quality and meteorological data from Cape Town, South Africa. The exposures included mean temperature, particulate matter (PM2.5 and PM10), nitrogen dioxide (NO2), and ozone (O3). Negative binomial mixed-effects models and distributed lag non-linear models were used to capture the immediate and delayed exposure effects, while accounting for temporal trends and spatial heterogeneity.
RESULTS
increased risk of childhood asthma exacerbations was consistently associated with NO2 and PM10, with additional delayed effects observed for PM2.5, PM10, and NO2. Mean temperature was associated with an elevated risk at short (lag 0–1) and medium (lag 4–5) delays, highlighting children's vulnerability to temperature exposure.
CONCLUSIONS
ambient temperature variability and traffic-related air pollution contribute to childhood asthma exacerbations in urban LMIC settings. The findings support equitable child-centred early warning systems, strengthened air quality standards, and climate-resilient urban health systems. The inclusion of environmental health exposure data in routine health surveillance can enhance public health planning, aligned with WHO guidance and the sustainable development goals.

Migrant participation in addressing health challenges in a Chilean urban squatter settlement

Teresita Rocha-Jimenez[1,2], Baltica Cabieses[1], Loreto Watkins[3], Estela Blanco[4], Miguel Perez[3], Javiera Barraza[3]
[1]SENTINET: Surveillance, Epidemiology, and New Technologies for Infectious Emerging Threats, SENTINET: Surveillance, Epidemiology, and New Technologies for Infectious Emerging Threats, Santiago, Chile, [2]Society and Health Research Center, Universidad Mayor, Santiago, Chile, [3]Escuela de Antropología, Universidad Diego Portales, Santiago, Chile, [4]College y Escuela de Salud Pública, Pontificia Universidad Católica, Santiago, Chile

ABSTRACT
Migrants living in informal settlements face overlapping health and environmental vulnerabilities shaped by exclusion from formal housing, citizenship regimes, and essential services [1,2]. Research has shown that informal settlements are associated with heightened health risks due to inadequate infrastructure, environmental exposure, and climate-related stressors, particularly in low- and middle-income countries [3–5]. Un Nuevo Amanecer, a squatter settlement located on a former landfill at the outskirts of Santiago, Chile, illustrates these dynamics. Rising housing costs and precarious labor conditions have pushed migrants to self-construct housing on marginal land with limited state oversight, reproducing patterns of urban exclusion documented in Chile and beyond [1,6]. This qualitative study examines how residents experience and respond to health and infrastructure challenges through community-based strategies. Drawing on long-term, community-engaged research, data were collected through 17 in-depth interviews and one focus group (n=5) with 19 participants recruited via snowball sampling. Interviews explored settlement trajectories, access to services, waste exposure, food insecurity, and coping strategies. Findings reveal persistent challenges—including irregular water access, inadequate sanitation, waste accumulation, and power outages—that compromise hygiene, food safety, and overall well-being, echoing prior research on health impacts in informal urban contexts [3–5]. Despite these constraints, residents developed grassroots responses, including informal water systems, collective waste management, and mutual aid networks. The study highlights migrant communities as active agents whose everyday practices and local knowledge should inform inclusive urban health and housing policies, particularly in the context of migration and climate vulnerability [4,6].

ABS2032

Self-reported pesticide exposure and male reproductive development among boys in rural Western Cape, South Africa

Wisdom Basera[1], Martin Roosli[2], Mohamed Aqiel Dalvie[1]
[1]Centre for Environmental and Occupational Health Research, School of Public Health, University of Cape Town, Cape Town, South Africa, [2]Epidemiology, Swiss TPH, Basel, Switzerland

INTRODUCTION
Epidemiological evidence on the association between endocrine-disrupting current-use pesticides and male reproductive health is limited and inconsistent. This study investigated associations between self-reported pesticide exposures and reproductive development among adolescent boys in rural Western Cape in South Africa.
METHODS
As part of the Child Health Agricultural Pesticide Cohort Study (CapSA), conducted in three agriculturally intense areas, 372 school boys aged 9–15 years were followed for 24 months. Questionnaires included exposure data (farm work, take-home exposure, consumption of field crops, observation of spraying, and contact with contaminated surface water) and sociodemographic factors. Outcomes included testicular volume, Tanner staging (pubic hair and genital development), and serum levels of testosterone, oestradiol, luteinising hormone (LH), follicle-stimulating hormone (FSH), and sex hormone-binding globulin (SHBG). Linear and mixed-effects regression models adjusted for confounders assessed associations cross-sectionally and longitudinally.
RESULTS
Median age was 11 years (IQR 10–12) at baseline and 12 years (IQR 11–13) at follow-up. Farm residence was reported by ~45% at baseline and ~42% at follow-up; 66% of households included farm workers, and 52% of boys engaged in occupational farm tasks. Notable pubertal progression over the follow-up period included an 8 mL increase in combined testicular volume (95% CI 0–40) and calculated free testosterone increase of 1.4 (IQR:1.0-11.1). Associations between self-reported exposures and changes in outcomes between baseline and follow-up were inconsistent and largely statistically nonsignificant.
CONCLUSIONS
In this study conducted among adolescent boys in pesticide-intensive Western Cape areas, self-reported pesticide exposure factors are not correlated with reproductive outcomes in adolescent boys. To confirm the absence of detrimental effects, larger, longitudinal studies incorporating repeated pesticide biomarkers and sensitive outcomes are recommended. Interventions to reduce pesticide exposure in rural communities are required.

ABS2048

Transition to sustainable diets in European food systems: stakeholders' perspective on determinants of alternative protein intake

Hanna Zaleskiewicz[1], Maria Siwa[1], Zofia Szczuka[1], Ewa Kulis-Stefanczyk[1], Anna Banik[1], Anna Kornafel[1], Jowita Misiakowska[1], Natalia Paduszynska[1], Dominika Wietrzykowska[1], Aleksandra Luszczynska[1]

[1]SWPS University, Wroclaw, Poland

INTRODUCTION

Transitioning toward alternative protein foods (APFs)—including plant-based, insect, and microbial sources—could play a critical role in reducing negative environmental impacts of human nutrition. Consumer food choices, shaped by individual, social, and environmental factors, have the potential to influence actions of other food system stakeholders and accelerate system-wide transitions toward sustainability. This study employed system mapping to investigate determinants of APF inclusion in daily diets across 13 European countries, to identify key leverage points and examine feedback loops and cross-country similarities.

METHODS

This study conducted 17 participatory system mapping workshops across 13 European countries (Austria, Czech Republic, Denmark, France, Germany, Greece, Italy, Norway, Poland, Portugal, Slovenia, Spain, Turkey), involving food system stakeholders (N = 166; e.g., producers, policymakers, nutritionists, and consumers). Applying group model building methodology, participants jointly developed 17 system maps capturing determinants of APF adoption. Centrality indices were calculated to identify key leverage points; feedback loops were analyzed to assess system dynamics and cross-country patterns.

RESULTS

Common leverage points (identified across>6 maps) included: consumer education and knowledge of APFs, social norms, and the influence of advertising and social media. Additional leverage points common for 3-4 maps) were identified: health perceptions, curiosity or neophobia, national food culture, and attitudes toward ultra-processing, sustainability, and animal welfare. Stakeholders emphasized the central role of consumers' beliefs and behaviors in shaping food system change. Feedback loop analysis identified recurring mechanisms, such as in Italy, where improved product safety strengthened advertising effects and consumer curiosity, creating reinforcing dynamics that supported local development, lower prices, and enhanced food safety.

CONCLUSIONS

By identifying interconnected determinants underlying European food systems and APF adoption, this study highlights pathways for accelerating dietary transitions. The identification of leverage points and feedback loops offers valuable guidance for policymakers and other stakeholders seeking to promote more sustainable, protein-diverse diets.

ORGANISED SCIENTIFIC PANEL- 'ONE-HEALTH APPROACH SNAKEBITE MITIGATION'

Jaideep Menon[1], Sanghamitra Pati[2], Abdulrazak Habib[3], Sara Padidar[4]
[1]Adult Cardiology & Public Health, Amrita Institute Of Medical Sciences, Kochi, India, [2]Inidan Council For Medical Research, New Delhi, India, [3]Department Of Internal Medicine, Bayero University, Kano, Nigeria, [4]Biological Sciences, University Of Praetoria, Praetoria, South Africa

ABSTRACT

1.Burden of snakebite and socio-economic consequences with a focus on Africa ABDULRAZAK G HABIB (NIGERIA) The burden of snakebite envenoming in addition to direct mortality, morbidity and disability also extends to the economic loss both in humans and livestock. Given that SBE is most commonly rural, in the impoverished, in outdoor professions and largely in the productive age-groups of 20-65 years, the socio-economic consequences to the victim and family are particularly devastating. 2. Reaching Zero Snakebite Deaths through Community Engagement, Supported by Multisectoral Collaboration, Research and Policy shift. SARA PADIDAR (SOUTH AFRICA) Snakebite is the most neglected of the 'Neglected Tropical Diseases' languishing on all fronts; clinical interest, funding, research, policy and pharmaceutical industrial buy-in. The different aspects that contribute towards the neglect, and the steps taken by Eswatini to reach zero deaths from snakebite envenoming are discussed. 3. The determinants of snake-human conflict through a one-health lens JAIDEEP C MENON (INDIA) We look at the determinants of snake-human conflict across the different geographical zones of India assessing social, behavioral, economic, environmental, demographic, occupational and health systems to assess the determinants of snake-human conflict in over 20000 victims of snakebite. This has been studied through a one-health lens framing outer and inner settings for snake-human conflict. 4. The one-health approach to reducing snake-human -livestock conflict SANGHAMITRA PATI (INDIA) Snake-human conflict is studied from the one-health approach utilizing the 'epidemiological triad' of agent (snake), host (human and livestock) and the environment. The socio-behavioral, health-system, and environmental and community empowerment measures towards mitigation of snake-human conflict embedded in a one-health framework carried out as an ICMR funded study 'SARPA' (Snakebite Awareness, Response, Prevention and Action) This organised session spanning 2 hours looks at snake-human and -animal conflict through a one-health framework, discusses various aspects with from burden, to determinants and mitigation.

Heatwave-related mortality among older Australians: A Two-Stage Small-Area Time Series Analysis

Sabrina Günsche[1], Olga Anikeeva[1], Matthew Borg[1], Blesson Varghese[1], Peng Bi[1]
[1]School of Public Health, Adelaide University, Adelaide, Australia

INTRODUCTION

Older adults are particularly vulnerable to heat exposure, yet evidence on the magnitude and spatial heterogeneity of heat-related mortality across Australia remains limited., Excess Heat Factor (EHF), the national heatwave metric, captures both short-term and acclimatisation-adjusted heat stress but has not been applied in fine-scale mortality analyses among older populations. This study aimed to quantify heatwave-related mortality among Australians aged ≥65 years from 1 January 2012 to 31 December 2022, accounting for regional variation.

METHODS

A two-stage case time series analysis was conducted. In the first stage, quasi-Poisson conditional time-series models were fitted for Australian Statistical Area Level 3 (SA3) regions, with EHF modelled using distributed lag non-linear models over lags 0–7 days. In the second stage, area-specific estimates were pooled using multivariate meta-regression with principal component analysis to account for spatial heterogeneity and to derive national exposure–response relationships, which were used to inform small-area spatial mapping.

RESULTS

Between 2012 and 2022, a total of 1 450 271 deaths occurred among adults aged ≥65 years, predominantly in major cities and temperate climate zones. Across states and territories, both heatwave intensity and the number of heatwave days varied substantially. Preliminary pooled results showed a non-linear association between heatwave intensity and mortality risk, with increasing risk at higher EHF values. Over lags 0–7 days, relative risks compared with the non-heatwave reference (EHF = 0) were 1.09 (95% CI: 1.03–1.14) at the severe heatwave threshold (EHF = 15 K) and 1.31 (95% CI: 1.14–1.50) at the extreme threshold (EHF = 31 K).

CONCLUSIONS

This study provides a nationwide small-area assessment of heat-related mortality risk among older Australians, showing substantially higher mortality during severe and extreme heatwave conditions. These findings can inform targeted heatwave preparedness and adaptation strategies for ageing populations.

Co-designing a mobile cooling hub to reduce heat-health risks among people experiencing homelessness.

Alejandro Vasquez-Hernandez[1], Lisa Wood[2], Matthew Larkin[1], Jon Swain[3], Glenn Miller[1], Nuala Fogarty[1], Paul Rosenthal[1], Charles Cosgrove[1], Danielle Austin[4], Sidney Siyuan Guo[5], Alexander Moses[5], Timothy English[5]
[1]Homeless Health Service, St Vincent's Hospital Sydney, Sydney, Australia, [2]Institute for Health Research, The University of Notre Dame Australia, Perth, Australia, [3]Homelessness Service, City of Sydney, Sydney, Australia, [4]Nursing Services, St Vincent's Hospital Sydney, Sydney, Australia, [5]Heat and Health Research Centre, University of Sydney, Sydney, Australia

BACKGROUND

Extreme heat is the leading cause of weather-related mortality globally and disproportionately affects people experiencing homelessness due to prolonged outdoor exposure, limited access to cooling, water, and healthcare, and high prevalence of chronic illness and medication or substance use that can impair thermoregulation. Despite this vulnerability, people experiencing homelessness are rarely included in the design of heat-health responses.3 Co-design may allow equitable climate adaptation by embedding lived-experience expertise within intervention development.4

METHODS

In Sydney, Australia, we established a sustained, cross-sector co-design group comprising people with lived experience of homelessness, clinicians, researchers, and local government staff. The group met regularly over two years and was supported by a co-design expert, shared governance, equitable remuneration, and administrative coordination to ensure continuity. Lived-experience members were mentored in co-design and research processes and participated in shared decision-making across intervention design, operational planning, research, and dissemination. The process was iterative, with learning from each deployment

informing refinements.
RESULTS
Co-design outcomes extended beyond the initial intervention concept. Through lived-experience leadership, the cooling hub evolved to incorporate solar-powered batteries, reclining chairs for recovery, peer-support, entertainment, and strengthened safety and security protocols. As the project matured, the group divided into operational and research streams to manage complexity while maintaining shared membership. The co-design team remained consistent, supporting deployments across 11 heatwave days between January 2024 and January 2026 in public parks. Members jointly contributed to scholarly outputs, including a published perspectives article, and conference abstracts. The project also received national and international media attention.
CONCLUSIONS
This project demonstrates how sustained, well-resourced co-design can generate durable partnerships and adaptive public health innovation. Key enablers included cross-sector collaboration, remuneration and mentoring of lived-experience members, clear governance, and administrative support. Future research should assess feasibility, costs, risks, and comparative effectiveness of mobile cooling hubs relative to other heat adaptation strategies.

ABS2134
The Relationship between Organophosphate Pesticide Exposure and Anthropometric Outcomes among a Cohort of Children from Four Informal Settlements in the Western Cape

Hayley Wallace[1], Wisdom Basera[1], Toyib Olaniyan[1], Mohamed Aqiel Dalvie[1]
[1]Centre for Environmental and Occupational Health Research, School of Public Health, University of Cape Town, CAPE TOWN, SOUTH AFRICA, South Africa

INTRODUCTION
There is limited data on the association between pesticide exposure in children and anthropometric outcomes, particularly in non-agricultural communities and developing countries. This study investigated the association between organophosphate pesticide (OPP) exposure and anthropometric outcomes in primary schoolchildren from four informal settlements in Western Cape Province in South Africa.
METHODS
Using a repeated cross-sectional design of 600 schoolchildren over a 12-month period, urinary dialkyl phosphate (DAP) metabolites, diethylphosphate (DEP), dimethylphosphate (DMP), and dimethylthiophosphate (DMTP) were measured at baseline with DEP and DMP measured at follow-up. Anthropometric measurements height, weight, and Body Mass Index (BMI) were collected at both time points.
RESULTS
The mean age for all participants at baseline was 9.93 ± 0.90 years and mean ΣDAP at baseline was 41.78 ± 33.80 ng/mL. Mean changes in weight, height, and BMI from baseline to follow-up for all participants were 6.04 ± 5.29 kg, 6.83 ± 4.00 cm, and 1.05 ± 2.01 kg/m2, respectively. Eighty percent of participants measured below the 50th percentile in height-for-age at baseline, and 76.8% at follow-up. No consistent associations were found between DAPs and anthropometric outcomes. Urinary OPP metabolite measurements and the prevalence of short stature among children in the study were high compared to other settings.
CONCLUSIONS
The study did not find evidence of an association between OPP exposure and child anthropometric outcomes. Large longitudinal studies with follow-up periods exceeding two years and incorporating pesticide biomonitoring at multiple time-points are recommended.

ABS2136
The association of joint effects of air pollution on cardiovascular and respiratory disease hospital admissions in cape town: 2011-2016

Maxine Bianca Nunu[1], Janine Wichmann[1]
[1]School of Health Systems and Public Health, University of Pretoria, Pretoria, South Africa

INTRODUCTION
Air pollution affects many health outcomes, but most studies focus on single pollutants, with few investigating the combined effects of multiple pollutants 1-2. Predicting at-risk individuals is particularly challenging in low and middle-income settings with complex exposure–health relationships3. This study investigated the joint effects of air pollutants on cardiovascular and respiratory hospital admissions in Cape Town from January 2011 to October 2016
METHODS
Respiratory and cardiovascular hospital admission data were obtained from a private hospital group, and PM10, NO2, SO2, and weather data from the Department of of Forestry, Fisheries and the Environment and South African Weather Services. Associations between daily air pollution and hospital admissions were assessed using classification and regression trees and time-series quasi-Poisson regression models, with results reported as rate ratios and 95% confidence intervals (CI).
RESULTS
Respiratory (n = 47 611) and cardiovascular (n = 45 021) admissions on 1,766 days with complete pollutant data were included. Among respiratory admissions, 49%, 33%, and 18% were aged 0–14, 15–64, and ≥65 years; for cardiovascular admissions, 47% and 46% were 15–64 and ≥65 years. Using pollutant quartiles, 64 unique air pollution mixtures were possible. Classification and regression tree and time-series quasi-Poisson models showed significant joint effects of PM10, NO2, and SO2, with rate ratios of 1.3 (95% CI: 1.3–1.5) for respiratory and 1.2 (95% CI: 1.1–1.4) for cardiovascular admissions.
CONCLUSIONS
Significant joint effects of PM10, NO2, and SO2 were observed on cardiovascular and respiratory hospital admissions. Building on these findings, the ongoing PhD extends the framework by applying and comparing multiple machine learning algorithms, including advanced ensemble approaches and neural networks, using integrated environmental and health data to predict respiratory symptoms and hospitalisation risk.

Heat Stress in Early Childhood Development Centres in an Urban Informal Settlement in Tshwane, South Africa: Emerging Risks in a Warming Climate

Joyce Shirinde[1], Mandla Bhuda[1], Jan Hugo[2]
[1]School of Health Systems and Public Health, Faculty of Health Sciences, University of Pretoria, Pretoria, South Africa, [2]Department of Architecture,Faculty of Engineering, Built Environment and Information Technology, University of Pretoria, Pretoria, South Africa

ABSTRACT
Backround: Children living in informal settlements are among the most vulnerable to the impacts of climate change, such as rising temperatures, which can lead to heat stress and associated health risks.
METHODS
This study was conducted at eight early childhood development centres at an urban informal settlement in Tshwane Metropolitan Municipality, South Africa. The indoor thermal conditions were monitored for a period of 12-month using factory calibrated SSN-22-USB data loggers. The sensors were located in two classrooms in each of the ECDs, on the southern or internal walls, 1200-1800mm above floor level. The data collection started in May 2023. The analysis period focused on the summer period, October 2023 to March 2024, specifically included a heatwave that was experienced in Tshwane in March 2024. The heat stress exposure was calculated using an Apparent Temperature Metric.
RESULTS
The empirical data reflect concerning outdoor temperatures and indoor temperatures in all the monitored ECDs. In terms of the outdoor conditions mean temperatures of 24.2 °C were documented over this period. As a CwA Köppen-Geiger climate region, the summer period is generally very hot, as a result maximum temperature of 46.2 °C were measured in November. During the same period the ECDs performed similarly with mean indoor temperatures ranging from 24.6 °C to 25.9 °C. In terms of maximum indoor temperatures, a range of between 40.6 °C to 51.4 °C were measured.
CONCLUSIONS
The study findings indicate that children attending early childhood development centres are exposed to extremely high temperatures, which may negatively affect their health. In collaboration with the Department of Environmental Health, a community engagement and health promotion session was conducted with pre-school teachers and principals to identify practical strategies to protect children from heat exposure, particularly during heatwaves. Participants explored feasible, context-appropriate actions to reduce indoor heat stress, protecting children's well-being.

ABS2180
Effects of climate change on health system, policy response, and factors hindering policy formulation in Malawi: A qualitative study.

Chancy Skenard Chimatiro[1], Martina Lembani[1]
[1]Public Health, University of the Western Cape, Cape Town, South Africa

BACKGROUND
Evidence shows that both developed and developing countries are refining and establishing regulatory frameworks to address climate change in health policies. However, progress in sub-Saharan African countries, including Malawi, is slower than in other regions, despite their vulnerability to multiple climate-change-induced factors. This study understands the effects of climate change on the health system, policy responses, and the factors hindering policy formulation in Malawi.
METHODS
A descriptive qualitative study was conducted through key informant interviews with policymakers, including health planning officials and academicians. Purposive and snowballing sampling techniques were used to identify study participants. Data was analysed using thematic analysis.
RESULTS
Twelve in-depth interviews were conducted with policymakers and two with academicians. Three main themes were identified, including the effects of climate change on the health system, policy responses, and barriers to policy formulation. The effects of climate change on the health systems reported include infrastructure damage, increased pressure on health finances, reduced human resource capacity, and service delivery disruption. Policy responses identified include the inclusion of climate change strategies in Health Sector Strategic Plan III, the establishment of the One Health Department, and the National Health Emergency Preparedness Plan. Barriers to the formulation of climate change policy reported were the lack of political will, insufficient knowledge among health workers, and inadequate research on climate change and health.
CONCLUSIONS
The study concludes that the effects of climate change on the health system require a policy response. Generating enough evidence to inform policy is one of the key elements towards the formulation of climate change-specific health policy. The study recommends continuous sensitization and advocacy to gain political support and commitment from relevant stakeholders. Further studies must be conducted to understand how health systems' policies are linked with other sectors in the fight against climate change.
Popul. Med. 2026;8(Supplement 1):A372

ABS2186
Climate Change and Extreme Heat in Early Childhood Development Centres: Preschool Teachers' Awareness and Health Perceptions in an Urban Informal Settlement

Joyce Shirinde[1], Sanelisiwe Mlilo[1], Jan Hugo[2]
[1]School of Health Systems and Public Health, Faculty of Health Sciences, University of Pretoria, Pretoria, South Africa, [2]Department of Architecture,Faculty of Engineering, Built Environment and Information Technology, University of Pretoria, Pretoria, South Africa

BACKGROUND
Preschool children aged 0–5 years are highly vulnerable to extreme heat due to limited thermoregulation and dependence on adults for protection. This vulnerability is intensified in informal urban settlements where poor infrastructure, overcrowding, and limited access to water, electricity, and cooling increase heat exposure. Despite rising temperatures, little is known about preschool teachers' awareness, perceptions, and practices regarding heat-related health risks. This study explored preschool teachers' understanding and mitigation of extreme heat risks among young children.
METHODS
A descriptive qualitative study using a phenomenological approach was conducted. Sixteen preschool teachers were purposively selected from seven early childhood development (ECD) centres. Data were collected through face-to-face in-depth interviews using an interview guide. Interviews were audio-recorded, transcribed verbatim, and analysed thematically.
RESULTS
Teachers reported limited formal knowledge of extreme heat and climate change but observed increasing summer temperatures over time. They identified heat-related symptoms among children, including fatigue, dehydration, skin irritations, diarrhoea, and nosebleeds. Environmental conditions such as corrugated iron structures, lack of electricity, and insufficient shaded outdoor spaces were perceived to worsen heat exposure. Risk-reduction practices included encouraging frequent hydration, adjusting outdoor playtimes, promoting lightweight clothing, and using available natural or built shade. However, implementation of additional protective measures was constrained by limited resources and staffing shortages.
CONCLUSIONS
Preschool teachers demonstrate practical awareness of heat-related health risks but face significant challenges due to inadequate training, infrastructure, and resources. Strengthening teacher capacity, improving ECD infrastructure, and fostering community engagement are essential to protecting young children from the health impacts of extreme heat.

Association between climate change and mental health outcomes in school-aged children: a systematic review protocol

Yuko Arimura[1], Daichi Suzuki[2], Ellie Suzuki[3], Eiko Saito[4]
[1]Graduate Program in Sustainability Science, Graduate School of Frontier Sciences, The University of Tokyo, Kashiwa, Japan, [2]Graduate School of Nursing Science, St. Luke's International University, Tokyo, Japan, [3]Department of Cognitive Science, Barnard College, Columbia University, New York, United States, [4]Sustainable Society Design Center, Graduate School of Frontier Sciences, The University of Tokyo, Kashiwa, Japan

INTRODUCTION
Climate change poses escalating, disproportionate risks to mental health, particularly for children and adolescents during critical developmental stages. Climate-related stressors disrupt daily lives and exacerbate psychological distress. Although research among adults is expanding, existing evidence remains fragmented and lacks a comprehensive synthesis specifically addressing children and adolescents. This systematic review aims to address this critical gap by assessing observational studies to clarify the association between diverse climate-related stressors and mental health outcomes in school-aged children aged 5 to 19 years.
METHODS
This review follows a systematic protocol registered in PROSPERO (registration number: CRD420251138746) and adopts PRISMA guidelines. We will include quantitative observational studies including cohort, case-control, and cross-sectional designs involving children and adolescents aged 5 to 19 years. Exposure encompasses climate-related stressors. Primary outcomes include mental disorders such as anxiety, depression, and PTSD, alongside psychological distress and climate-specific impacts such as eco-anxiety. A systematic search was conducted in PubMed and Web of Science without language or date restrictions. Two reviewers independently perform study selection and data extraction. Risk of bias will be assessed using the Risk of Bias Assessment tool for Non-randomized Studies (ROBANS). Meta-analysis will be conducted if data are sufficiently homogeneous; otherwise, a narrative synthesis will be performed.
RESULTS
As of January 2026, the systematic search has been completed, identifying 2453 records. The screening process is currently ongoing. Final synthesis and evidence certainty assessment using the Grading of Recommendations Assessment, Development and Evaluation (GRADE) approach are scheduled for completion by March 2026.
CONCLUSIONS
This systematic review will provide a comprehensive synthesis of current evidence regarding climate change impacts on school-aged children's mental health. Findings will identify critical knowledge gaps and inform public health policies to support their mental well-being facing climate-related challenges.
Popul. Med. 2026;8(Supplement 1):A377

ABS2280
The health system strategies and responses to the effects of climate change in Sub-Saharan Africa: A scoping review

Chancy Skenard Chimatiro[1], Martina Lembani[1], Solange Mianda[1], Precious Hajison[1]
[1]Public Health, University of the Western Cape, Cape Town, South Africa

BACKGROUND
Climate change is now regarded as a global health challenge of the 21st century, posing a negative health risk to the population. Sub-Saharan Africa is disproportionately affected more than any other region worldwide. This study was conducted to map the health system's strategies and responses to the effects of climate change in Sub-Saharan Africa.
METHODS
Electronic database searches were conducted on PubMed, CINAHL, Scopus, and Medline, and grey literature from Climate Health Africa Resources, Alliance for Transformative Action on Climate and Health, and World Health Repositories. We targeted articles published from January 2015 to January 2025. Covidence software was used for study selection and data extraction. The results were analysed using descriptive analysis.
RESULTS
Out of 9434 articles, 8 studies met our inclusion criteria. Out of the eight, two were country-specific literature review studies, two cross-sectional studies, two

qualitative studies, one systematic review, and one mixed-methods study. The location of the included studies was from Ghana (n=2), Senegal (n=1), Ethiopia (n=1), Tanzania (n=1), South Africa (n=1), and two were multi-country studies. Most studies provided strategies and responses centered on service delivery, health workforce, health information, leadership and governance, with few on health financing and medicinal products. Implementation challenges identified include inadequate funding, lack of knowledge among health workers on CC and health, inadequate surveillance and reporting structures, and low prioritization of climate change activities among health workers.
CONCLUSIONS
The findings provide an opportunity to inform policy and the formulation of guidelines that will enhance the health system's response to the effects of climate change in the Sub-Saharan region. Prompt efforts should be made to reduce the impact of climate change on health systems if the Sub-Saharan African region is to achieve the Sustainable Development Goals and the desired African Agenda 2063.

ABS2302
Water-related Climate Impacted Health; transdisciplinary meetings and working group

Amber Abrams[1]
[1]Civil Eng, Future Water research institute, University of Cape Town - Civil - EBE, Cape Town, South Africa

INTRODUCTION
As a climate-sensitive infectious disease (CSID) Fellow, my aim is to bring attention, discussion and action to the intersection of water-related and climate sensitive infectious disease. With the understanding that climatic shifts will change the patterns of disease prevalence, especially with regard to vectors, and pathogens that historically were not endemic, this work aims to build a network of concerned, attentive and keen players to develop public epidemiology monitoring and real-time GIS mapping to understand emergent water-related concerns and perhaps even develop a network of early warning systems that are public facing. My aim is to engage and grow a network of peoples, organizations and institutions that can address water-related climate sensitive infectious diseases.
METHODS
The current water surveillance work is done through government networks, some at national level in the context of COVID, but some pre-dating the turn in interest to waste-water surveillance since SARS COV2. While data that monitors some emergent water-related health concerns exists, most monitoring and surveillance is not necessarily easily accessible by publics, advocacy groups or interested activists. Bringing together the research scientists exploring water-related climate impacted health care concerns in one room, and then bringing those people together with policy makers, municipal budget developers, citizens and advocacy groups is key – as acting in silos has not provided opportunities to fully understand the landscape of water-related climate impacted emerging health concerns. The network we propose to bring together in this meeting will offer opportunities for researchers, practitioners and others to discuss emergent topics, develop networks, and share.
RESULTS
Growth of an emergent network; learnings across fields/understanding landscape; prioritization of topics.
CONCLUSIONS
We aim to host a meeting to further develop our community of practice at the intersection of water-related, and climate impacted disease concerns; public/researcher/practitioners interfacing is key to our goals.
Popul. Med. 2026;8(Supplement 1):A379

ABS2304
Carbon footprinting and action planning for Health professionals

Azeeza Rangunwala[1], Sanskrithi Thakur[2]
[1]Special interest group: Climate, Energy and Health, Public Health Association of South Africa, Pretoria, South Africa, [2]Data science, Healthcare without Harm, Hyderabad, India

BACKGROUND
The health sector is a significant contributor to global greenhouse gas (GHG) emissions, accounting for approximately 5% of total emissions globally1. This contribution is paradoxical to the sector's ethical mandate to "do no harm", as climate change poses substantial risks to population health and health system resilience. Health institutions will benefit from developing climate mitigation strategies as they are central to dealing with the climate crisis. The starting point is calculating greenhouse gas emissions to determine baselines.
METHODS
The session will give an outline on the Climate Impact Checkup Tool, which estimates greenhouse gas emissions from health care institutions globally. The capacity-building intervention provides participants with a structured overview of GHG emissions, including key concepts, sources, and accounting principles, followed by hands-on training in the use of the tool, a globally recognized GHG accounting tool for the health sector2. Participants, including health professionals, researchers, and representatives from Ministries of Health will engage in practical exercises to emissions estimation. The approach is a practical, skills-building session that looks at aspects of the tool and its application for research as well as evidence for informing policy.
RESULTS
Participants demonstrate an enhanced understanding of the interlinkages between climate change and health, as well as the health sector's role in contributing to and mitigating emissions. Facility and country-level stakeholders identify their primary emission sources, establish emissions baselines, and acquire the skills necessary to calculate facility-level GHG footprints to inform evidence based planning and identifying priorities.
CONCLUSIONS
By enabling health facilities and national stakeholders to quantify emissions and develop data-driven mitigation strategies, such interventions will support integration of climate action into health system planning and policy. A practical skills building session allows participants to identify the starting point and their role in climate action.

Working in a Hot World: The Missed Heat-related Epidemics in the Global South. A Worker's Perspective into the Realities of Working in Heat

Rajen Naidoo[1], Sujatha Hariparsad[1], Jason Glaser[2], Patrick Ndlovu[3], Shailendra Sharma[4], William Martinez[2], Surendra Lama[4]
[1]Discipline of Occupational and Environmental Health, University of KwaZulu-Natal, Durban, South Africa, [2]La Isla Network, California, United States, [3]Asiye eTafuleni, Durban, South Africa, [4]Global Health Advocacy and Research, California, United States

BACKGROUND
Heat-related illness leads to $1billion in healthcare costs every summer. More than 2.4 billion workers worldwide are exposed to extreme heat annually. Almost 93% of Africa's workforce is exposed to excessive heat. In 2020, exposure to excessive heat was linked to an estimated 22.85 million non-fatal occupational injuries, 18,970 deaths, and 2.09 million disability adjusted life years worldwide. By 2030, heat stress will reduce global GDP by USD 2,400billion. These figures hide the devastation brought by work-related heat: in several poorest regions of the world, these effects have reached epidemic proportions. Evidence from Latin America, India, Nepal and south-east Asia highlight the consequences of this changed world of work. In 2020, heat stress related chronic kidney disease was prevalent among 26.2 million people worldwide.
METHODS
A novel researcher-worker paired panel discussion approach will be adopted. This pairing will consist of an international expert in the field of occupational heat exposure and health outcomes working in specific geographical location, together with a local worker from that location. The expert will address the research questions and the social impacts these raise, while the worker representative will describe the working conditions, potential for intervention and the social consequences at community levels of these hidden epidemics. The worker representative will share the reality and lived experiences of working in these extreme conditions.
RESULTS
Team 1 (Jason Glaser/William Martinez) will address "The heat-related chronic kidney disease epidemic and the destruction of the social fabric of communities in Latin America". Team 2 (Shailendra Sharma/Surendra Lama) will address how migrant workers from Nepal work in distant countries under extreme heat and return to their countries without any health care Team 3 (Rajen Naidoo/Patrick Ndlovu) will address "Heat and Health for Informal Workers in Durban, South Africa"

Characterisation of fine inhalable particles (PM2.5) and related health threats in low-income households of the Western Cape, South Africa

Kereemang Gaoaaga[1], Heleen Vos[1], Ronelle Burger[2], Susanne Fietz[1]

[1]Department of Earth Sciences, Stellenbosch University, Stellenbosch, South Africa, [2]Department of Economic and Management Sciences, Stellenbosch University, Stellenbosch, South Africa

ABSTRACT
Socioeconomic conditions in low-income settlements of the Western Cape have potential implications for indoor air quality. As part of a broader project 'Building Healthier Communities' that aims to evaluate living conditions in low-income households with children under five years old, this study determined the geochemical composition, Hazard Indices, and sources of fine particulate matter (PM2.5) collected between November 2022 and March 2024. Indoor PM2.5 samples were collected across 13 low-income settlements using Ultrasonic Personal Air Sampler (UPAS) equipped with PTFE filters and analysed using Inductively Coupled Plasma Mass Spectrometry (ICP-MS) and Scanning Electron Microscopy (SEM). Most abundant elements included Al, Fe, Zn, Ba, Mn, As, Sr, Cd, and Pb, with Fe concentrations reaching peak concentrations of 54.5 µg/m. Potentially toxic elements Pb, As, Se, Cd, Cr, Cu and V were also detected in these indoor samples. Enrichment Factors (EF) indicated a crustal origin (EF < 10) for Mn and Fe in PM2.5, while Zn, Pb, As, Cd, Cu, Ba, Cr, and Ni (EF > 10) appear to receive an anthropogenic addition. Calculated metal content-based Hazard Indices point to the occurrence of health threats, particularly for children. Positive Matrix Factorization identified three pollution sources for the particles that are partially unexpected for indoor samples: (i) manufacturing and steel industries, which accounted for 18% of the total analysed particles; (ii) solid waste burning (58%); and (iii) traffic-related emissions and oil combustion (24%). Implementing stricter regulations on local combustion sources, establishing metal-specific emission guidelines at a Southern African scale, and enhancing public awareness on the health risks of solid waste burning are important strategies to reduce indoor PM2.5 levels in low-income communities of the Western Cape.

BACKGROUND
In 2023, the Global Framework on Chemicals – For a Planet Free of Harm from Chemicals and Waste (GFC) was adopted. The multisectoral, multistakeholder approach of this framework is intended to enhance engagement among the health, environment, agriculture, and labour sectors, along with the private sector, non-governmental and governmental organisations, and academia, to protect the planet and human health. While the will is there, the reality is that the health sector is severely underrepresented during negotiations, and health professionals are unaware of the GFC. However, health effects linked to chemical exposures such as cancers, developmental and neurological effects, allergies, diseases (e.g., Parkinson's) and infertility continue to rise.
METHODS
This interactive session will engage participants in practical activities to implement the GFC at the local level. This will be done through: 5-minute global framing presentation (Vision of GFC) 10-minute icebreaker mapping chemical issues in each country - Chemicals Without Borders (shared global problem) 15-minute International Case Carousel (prevention and protection) 15-minute Safety Data Sheet and chemical information in medical products/devices challenge (transparency) 10-minute Patient-to-policy mapping (implementation) 5-minute participants' global commitments and way forward (accountability)
RESULTS
Participants will be invited to co-author a post-conference paper on the outcomes of the exercises and to increase knowledge of the topic beyond those who were at the conference. Participants will be provided with handouts, which will also be circulated on social media and health professional networks.
CONCLUSIONS
The GFC cannot succeed without the support of health professionals. It is only through the active participation of Ministries of Health and health professionals that the effective implementation of strategies nationally and internationally will reduce and prevent chemical risks.

ABS2434

Policy advocacy training for health professionals in Africa on health and climate change in preparation for the 32nd Conference of Parties in Ethiopia 2027.

Lujain Alqodmani[1], Josh Karliner[1], Mafoko Phomane[2], Friday Phiri[3], Thandi Kapwata[4], Sean Patrick[5]

[1]Health Care Without Harm, Virginia, United States, [2]GroundWork, Pietermaritzburg, South Africa, [3]Amref Health Africa, Nairobi, Kenya, [4]South African Medical Research Council, Parow-Valley, South Africa, [5]Association of Schools of Public Health in Africa (ASPHA), Nairobi, Kenya

BACKGROUND
Health professionals are among the most trusted voices in society and have a long history of influencing public policy on issues that affect population health. Climate change poses an escalating threat to health in Africa, exacerbating existing inequalities and placing additional strain on health systems. Framing climate change as a public health and ethical issue can help depoliticize climate debates and strengthen public and political support for ambitious climate action. In the lead-up to the thirty-second Conference of the Parties to the United Nations Framework Convention on Climate Change, to be hosted in Ethiopia, there is a critical opportunity to equip African health professionals with the skills and confidence needed to advocate effectively for health-centred climate policies. This session is designed to strengthen regional leadership and amplify African health voices in global climate negotiations.
METHODS
This interactive, skill-building session will provide practical training in policy advocacy and campaigning tailored to the African context. Methods include short expert presentations, case studies highlighting successful health-led climate advocacy, and facilitated breakout group exercises focused on message development, stakeholder mapping, and identifying strategic advocacy opportunities before and during the climate conference in Ethiopia. Participants will engage in applied exercises to translate evidence on climate and health into clear policy demands.
RESULTS
Participants will demonstrate improved understanding of advocacy strategies, enhanced capacity to articulate health-based climate policy messages, and increased awareness of regional and global advocacy opportunities linked to the upcoming climate conference.
CONCLUSIONS
Strengthening the advocacy capacity of African health professionals is essential to ensuring that health is positioned at the centre of climate policy discussions. This session will support coordinated, informed, and impactful health-led advocacy in preparation for the climate conference in Ethiopia and beyond.

Can Brief Psychosocial Interventions Increase Alternative Protein Intake? Evidence from a Randomized Controlled Trial.

Anna Kornafel[1], Natalia Paduszyńska[1], Hanna Zaleśkiewicz[1], Dominika Wietrzykowska[1], Zofia Szczuka[1], Aleksandra Luszczynska[1]

[1]Center for Applied Research on Health Behavior and Health, SWPS University, Wrocław, Poland

BACKGROUND
Alternative protein foods (APFs), derived from insects, krill, fungi, or plants, have a lower environmental impact than conventional protein sources (e.g., meat and dairy). Changing the protein sources in daily diet would reduce water, energy and land use. Compared to traditional proteins, APF also offer similar or superior nutritional value. This study examined whether a brief intervention targeting (i) familiarity with APFs through tasting products based on algae, crickets, and chickpeas, and (ii) perceived availability of APFs by increasing knowledge about

local purchasing options, would increase APF intake.
METHODS
Adult participants (N=398; aged 18–85 years; 34.1% men) were randomly assigned to either an experimental group receiving the tasting and availability intervention (n=204) or a waitlist control group (n=194). At baseline and one-month follow-up, participants completed questionnaires assessing self-reported APFs intake and psychosocial and environmental determinants of consumption. The primary outcome was frequency of APFs intake. Data were collected in Poland.
RESULTS
A significant TimexGroup interaction was found for the intake of snacks containing insect-based proteins, fungi, algae, and other microorganism-based APFs. Compared to the waitlist control group, participants in the intervention group increased their intake, with a medium effect size (d = 0.51). No significant Time×Group interaction was observed for plant-based proteins, including plant-based snacks and meat substitutes such as sausages and burgers. No main effects of time were detected, indicating that the results were not attributable to a mere measurement effect.
CONCLUSIONS
Brief interventions that enhance experiential familiarity and perceived availability may effectively increase consumption of AFP-based snacks that are genuinely novel or exotic for European consumers (e.g., insects), but not plant-based alternatives. Future research should replicate these findings across diverse populations and contexts, investigate potential moderators such as baseline familiarity and perceived availability, and assess the long-term durability of intervention effects.

ABS2442
The Sustainability of Stewardship: Decarbonizing Health Systems through Primary Care-Led Management Models

Mohamed Osman Gafar Abdalla[1], Federica Castellana[1]
[1]Young WFPHA, Geneva, Switzerland

BACKGROUND
Global healthcare sustainability often focuses on technical "greening" of facilities, yet the most significant environmental determinant is the overarching management model. A hospital-centric, reactive system is inherently carbon-intensive due to its reliance on complex, energy-heavy diagnostic tools often utilized in secondary and tertiary centers. This session argues that a fundamental shift toward a Primary Health Care (PHC)-led model, focusing on early detection and simpler investigations, offers a lower-intensity, high-value pathway. We explore how preventive stewardship can reduce the sector's 5% global emissions while preserving patient safety.
METHODS
Utilizing a Systemic Comparative Analysis, this session contrasts two health systems architectures. We model the lifecycle carbon footprint of clinical pathways within a "Reactive-Hospital" system against a "Preventive-PHC" system. The evaluation examines the "Diagnostic Intensity of Care," specifically comparing high-resource tertiary diagnostics against early detection protocols in community settings. The methodology focuses on exploring how public health policy can incentivize the use of simplified, low-carbon investigations for preventable diseases that deliver equivalent safety outcomes.
RESULTS
Findings indicate that systems prioritizing PHC-led early detection achieve a "Carbon Dividend" by bypassing the energy-intensive cascades of hospital-based care. The results demonstrate that "low-tech" community-based monitoring for preventable illnesses yields superior safety outcomes by preventing acute crises. We identify that "Diagnostic Over-Engineering" in tertiary centers is a primary driver of environmental impact, whereas PHC-integrated stewardship provides a scalable path to decarbonization through reduced clinical redundancy and energy-optimized diagnostics.
CONCLUSIONS
Decarbonization is a prerequisite for planetary health, but it can't be achieved within a hospital-centric vacuum. A shift toward early detection and simplified investigations within a PHC-led model is essential for sustainable health governance. Public health leaders must recognize that preserving patient safety does not require high-carbon complexity. To "walk the talk," we must institutionalize PHC as the primary engine for both health equity and environmental resilience.

ABS2455
Quantifying Disposable Diaper Waste as a One Health and Climate-Sensitive Public Health Threat: Evidence from a 72-Hours Diapers Collection for Accountability Campaign in Kilifi County, Kenya

Kevin Shikuku[1]
[1]Public Health, Health, Kilifi, Kenya

ABSTRACT
Introduction/Problem: The use of disposable diapers has increased rapidly in urban and peri-urban settings in Kenya; however, systems for safe disposal and end-of-life management remain inadequate. Improper disposal of diaper waste in open spaces, drainage lines, and pit latrines poses growing environmental and public health risks, yet empirical evidence quantifying this burden remains limited. Aim/Research Question: This initiative aimed to quantify the volume of improperly disposed disposable diapers and assess their environmental, economic, and public health implications within Kilifi County using a One Health lens.
METHODS
A community-led 72-hour diaper collection exercise was conducted from 21–23 January 2026 across eleven sites, including designated municipal disposal points and undesignated dumping areas. Used diapers were collected, weighed, and categorized by site type. Estimates of diaper counts, faecal load, volume, and economic value were calculated using standardized assumptions on average diaper weight, faecal content, and retail cost.
RESULTS
A total of 2,318.45 kg (2.32 tonnes) of used diapers, equivalent to approximately 13,880 diapers, were collected, with the majority retrieved from undesignated dumping sites. The collected diapers were estimated to contain over 1,000 kg of human faecal matter exposed to the open environment. These findings indicated substantial risks for faecal–oral disease transmission, accelerated filling of pit latrines, loss of productive land to non-biodegradable waste, and an estimated retail value of KES 416,400 discarded within 72 hours.
CONCLUSIONS
Disposable diaper waste represents a significant but overlooked One Health and climate-sensitive public health challenge. Strengthened waste governance, public education, and enforcement of Extended Producer Responsibility are urgently required to reduce environmental contamination and disease risk.

Ambient $PM^{2.5}$ air pollution in Botswana: Composition, source apportionment, and implications for air pollution policy

Tshephang Tumoyagae[1], Bontle Mbongwe[1], Janine Wichmann[2]
[1]Environmental Health, University of Botswana, Gaborone, Botswana, [2]University of Pretoria, Pretoria, South Africa

BACKGROUND
Fine particulate matter (PM.) is a major environmental health concern due to its ability to penetrate deep into the respiratory system and enter the bloodstream, causing significant morbidity and mortality. In Sub-Saharan Africa, ambient PM. concentrations remain among the highest globally, yet monitoring infrastructure and epidemiological evidence are limited. In Botswana, available studies indicate that urban centres such as Gaborone frequently exceed the World Health Organization (WHO) annual guideline of 5 µg/m. PM. pollution in Botswana is influenced by local sources such as vehicular emissions, biomass burning, and windblown dust, as well as transboundary transport from neighbouring countries. However, existing studies are sporadic, short-term, and insufficient for comprehensive exposure and health risk assessment.
METHODS
This review synthesizes published studies on PM. concentrations, chemical composition, source apportionment, meteorological influences, and health impacts relevant to Botswana. Measurement approaches assessed include gravimetric sampling, regulatory-grade continuous monitors, low-cost sensors, and satellite-derived aerosol optical depth products. Studies on apportionment methods such as Positive Matrix Factorization and trajectory analysis using HYSPLIT were reviewed. Studies evaluating health impacts using both epidemiological evidence and hazard-based health risk assessment frameworks applicable to data-limited settings were included.
RESULTS
Available evidence shows that PM. concentrations in Gaborone commonly exceed WHO guidelines, with pronounced diurnal and seasonal variability. Winter time temperature inversions and biomass burning episodes result in elevated concentrations. Chemical analyses reveal a mixture dominated by crustal dust, black carbon, organic carbon, and trace metals. Limited source apportionment studies identify vehicular emissions, biomass burning, and resuspended dust as major contributors.
CONCLUSIONS
PM., poses a significant but under-characterized environmental health risk in

Botswana. Establishing continuous monitoring networks, integrating low-cost sensors and applying source apportionment models are critical for evidence-based policy. Strengthened air quality management will support public health protection and sustainable development goals in Botswana.

Biodiversity, Human Health and Nature-Based Solutions

Sheetal Rao[1]
[1]Medicine, University of Illinois, Chicago, United States

ABSTRACT
The loss of biodiversity intertwines with climate change and various types of pollution to bring about the planetary health crisis, threatening the health and survival of humans, animals and plants in multiple, compounding and cascading ways. Biodiversity, defined as the variety of life on Earth, is declining rapidly, driven primarily by habitat loss, poor land use, pollution, overexploitation and climate change. These five primary causes of biodiversity loss are interrelated, with climate change increasingly intensifying biodiversity loss, leading to reduced ecosystem resilience and further intensification of the crisis. Biodiversity loss is also linked with pandemics, nutritional deficiencies, associated increase in chronic disease and loss of medicinal plants. Current and future health care professionals must understand these interrelationships and learn to foster and advocate for the multidisciplinary wisdom and policies needed to mitigate further harm. This organized session, geared towards health care professionals, will identify the biodiversity hypothesis, review case examples of biodiversity loss and allow the audience to discuss associated impacts on human health. The session will also explore equity considerations such as nature deficiency and its relationship with the human microbiome. Co-benefits of nature will be discussed with special emphasis on a One Health approach. Nature-based solutions that improve biodiversity and health will be highlighted and the audience will have an opportunity to work through a real-life case that incorporates several drivers of biodiversity loss and One Health principles. Addressing this multifaceted crisis requires urgent integration of planetary health concepts into medical and continuing medical education to prepare current and future health professionals for the rising burden of diseases linked with ecological decline. This session provides the necessary information in an interactive way that will fundamentally shift how healthcare professionals perceive this issue, while providing them with a framework that they can share at their own institutions.

ABS2579
Physiological and perceptual responses to a co-designed mobile cooling hub exposure in people experiencing or at risk of homelessness during extreme heat: A pilot study

Sidney Siyuan Guo[1], Alejandro Vasquez-Hernandez[2], Lisa Wood[3], Matthew Larkin[2], Jon Swain[4], Glenn Miller[2], Nuala Fogarty[2], Paul Rosenthal[2], Charles Cosgrove[2], Alexander Moses[1], Danielle Austin[5], Timothy English[1]
[1]Heat and Health Research Centre, University of Sydney, Sydney, Australia, [2]Homeless Health Service, St Vincent's Hospital Sydney, Sydney, Australia, [3]Institute for Health Research, The University of Notre Dame Australia, Perth, Australia, [4]Homelessness Service, City of Sydney, Sydney, Australia, [5]Nursing Services, St Vincent's Hospital Sydney, Sydney, Australia

INTRODUCTION
People experiencing homelessness are admitted to the emergency department for heat-related illness at a 27-fold higher rate than those not experiencing homelessness. This pilot study aimed to determine entry-to-exit changes in physiological and perceptual outcomes among people experiencing or at risk of homelessness attending a co-designed mobile cooling hub on days of extreme heat (≥35°C).
METHODS
Sixty-eight adults experiencing (n=37) or at risk of homelessness (n=31) attended a cooling hub with shaded seating, airflow from electric fans, cold-water misting, and drinking water for a self-determined duration. Physiological outcomes of heart rate, systolic and diastolic blood pressure (to calculate mean arterial pressure) and core temperature (sublingual or tympanic), and perceptual outcomes of thermal sensation and discomfort, were recorded at entry and exit. Visit duration was calculated from entry/exit times. Hub air temperature and relative humidity were measured each minute to calculate mean apparent temperature over each visit. Linear mixed-effects models examined physiological entry-to-exit differences and the influence of visit duration and apparent temperature. Paired Wilcoxon tests assessed perceptual outcomes.
RESULTS
Heart rate was lower on exit than entry ($p<0.001$), and participants reported cooler thermal sensation ($p<0.001$) and less thermal discomfort ($p<0.001$). Core temperature remained stable ($p=0.386$), while mean arterial pressure showed a trend towards a decrease ($p=0.089$). Visit duration ranged from 23–300 minutes (mean 72 minutes) with no influence on physiological outcomes. Mean apparent temperature exposure ranged from 24–43°C (mean 38°C), with no effect on outcomes except for a slightly higher core temperature (0.02°C) on exit per +1°C ($p=0.021$).
CONCLUSIONS
The co-designed mobile cooling hub provided short-term heat relief for people experiencing or at risk of homelessness – participants exited with lower heart rate, reduced thermal discomfort and cooler thermal sensation while maintaining stable core temperature and blood pressure – suggesting it is a promising, community-embedded response during extreme heat.
Popul. Med. 2026;8(Supplement 1):A398

ABS2586
The intersection of fossil fuel emissions and public health: the anatomy of a polycrisis

David le Page[1], Sam Bovim[1], Sandrine Mpazayabo[1], Steph Cookson[1]
[1]Fossil Free South Africa, Cape Town, South Africa

BACKGROUND
Fossil fuels account for approximately 75% of global greenhouse gas emissions, yet their health impacts extend beyond climate change. In South Africa, the "cradle-to-grave" lifecycle of coal and gas—from extraction to combustion—drives a polycrisis of air pollution, energy poverty, and social inequity. This study draws on global evidence of fossil fuel–related health harms to examine how fossil fuel dependence functions as a driver of mortality and systemic health disparities.
METHODS
A literature synthesis approach is used to assess fossil fuel impacts on South African public health, with a focus on Eskom and Sasol operations and their effects on surrounding communities. Sources include peer-reviewed academic literature and grey literature.
RESULTS
Using the Global Climate and Health Alliance's "Cradle to Grave" framework (Narayan & Kuhl, 2025), this research expects to show that fossil fuel pollution causes severe, systemic health harms across the human lifecycle. These impacts are anticipated to be persistent and unevenly distributed within South Africa's "sacrifice zones," compounding existing socio-economic health disparities. The study also aims to demonstrate how current climate and health policies inadequately account for these multidimensional harms. Findings are intended for submission to a peer-reviewed public health journal or publication as an independent policy report.
CONCLUSIONS
Transitioning away from fossil fuels and halting capital flows to fossil fuel companies should be treated as a public health imperative, not merely an environmental objective. Integrating health-cost accounting into energy policy could prevent thousands of premature deaths annually in South Africa. By documenting the systemic nature of fossil fuel harms, this study contributes to the growing global case for urgent action, arguing that redirecting the $7 trillion in annual fossil fuel subsidies toward health-aligned energy systems is both a moral and economic necessity, offering a pathway to address historical health inequities and protect marginalised communities.
Popul. Med. 2026;8(Supplement 1):A399

ABS2659
Estimating the impact of energy supply shocks on indoor air pollution and the health of vulnerable children in South Africa

Ronelle Burger[1], Marisa Von Fintel[1], Jack Grimston[1]
[1]Economics, Stellenbosch University, Stellenbosch, South Africa

BACKGROUND
Recent systematic reviews suggest that early-life exposure to fine particulate matter (PM2.5) may be associated with altered brain development trajectories (Parenteau et al., 2024), with meta-analytic evidence indicating potential cognitive function losses of approximately 0.27 IQ points per 1 µg/m increase in PM2.5 exposure (Alter et al., 2024). Despite these emerging health concerns, policy debates around energy subsidies and electricity reliability in low-income settings have largely focused on affordability and productivity, with limited attention to potential long-term health consequences. We leverage short-term electricity supply shocks to provide causal estimates of how unreliable or unaffordable electricity affects indoor air pollution exposure among vulnerable young children.
METHODS

We analyse high-frequency indoor air quality data from more than 500 low-income households across eight South African communities, all with children under five years of age. Indoor PM2.5 concentrations were recorded at two-minute intervals using PurpleAir monitors installed in household kitchens, yielding data covering 641 scheduled electricity outages. We estimate pollution responses using a regression discontinuity design around outage onset, complemented by fixed effects and difference-in-differences, and event analysis.
RESULTS
Loadshedding events generate sharp and statistically significant increases in indoor PM2.5 at outage onset, with average increases of approximately 4 µg/m, but more pronounced among households reporting substitution toward polluting fuels such as paraffin and wood. The observed immediate spike is consistent with high, localised emissions during ignition of wood or paraffin fuel sources. Pollution increases are most pronounced during evenings and colder months, indicating heating-related fuel use as a key mechanism. During high-risk periods, indoor concentrations frequently exceed World Health Organization short-term exposure guidelines.
CONCLUSIONS
Electricity supply shocks causally increase indoor air pollution exposure among vulnerable children in low-income South African households. Evaluations of energy subsidy and load-management policies should incorporate indoor air pollution exposure and potential developmental consequences alongside conventional economic outcomes.

ABS2663
Ultra-processed food consumption among primary school children and caregivers in low socio-economic communities in Nelson Mandela Bay, South Africa

Annelie Gresse[1], Kirsty Louw[1]
[1]Human Nutrition and Dietetics, Nelson Mandela University, Gqeberha, South Africa, Gqberha, South Africa

BACKGROUND
In the modern food environment, ultra-processed foods (UPFs) are increasingly accessible, affordable and desirable. In South Africa, UPFs form a substantial portion of commonly consumed foods and that could lead to an increased risk of malnutrition.
AIM
This study described the consumption of UPFs (NOVA classification system level 4) among children and caregivers in selected primary schools in low socio-economic areas of Nelson Mandela Bay, and examined associations between children's anthropometric status and UPF intake and caregivers' UPF nutrition knowledge and dietary patterns.
METHODS
In a quantitative, cross-sectional study, participants included 1234 primary school children from a larger project done in 2019 and 109 caregivers recruited in 2025 from the same schools. Children's anthropometric and dietary intake data were analysed. Caregivers completed a UPF knowledge questionnaire and a 24-hour dietary recall.
RESULTS
Children consumed an average of 10.91 UPF items per week (SD = 7.69). Correlations between children's UPF intake and anthropometric outcomes were weak and largely non-significant overall, except for nine-year-olds. Caregivers scored an average of 54.70% on the UPF knowledge questionnaire, with 35.77% scoring below 50%. Caregivers consumed an average of 4.18 (SD = 1.93) UPF items per day. Caregiver UPF knowledge and intake were not strongly correlated, but caregiver education level was moderately associated with UPF knowledge ($r_s = 0.40$, $p < 0.001$). A significant association was found between caregiver and child UPF consumption ($\chi(1, N = 214) = 4269.00$, $p < 0.001$), and although not significant, caregivers consumed now more UPF items per day ($t(214) = 1.23$, $p = 0.22$), indicating an increase in UPF consumption since 2019.
CONCLUSIONS
The high prevalence of malnutrition alongside high UPF consumption in children, paired with limited caregiver nutrition knowledge, highlights the need for strengthened nutrition support and food environment interventions.

From vulnerability mapping to action: artificial intelligence and geospatial methods for urban heat resilience

Craig Parker[1], Geir Kjetil Sandve[2], Bjørn Sandvik[3], Sibusisiwe Audrey Makhanya[4], Sam Zermatten-Jack[1], Natasha Lalloo[1], Benjamin Devantier Du Plessis[1], Nicholas Brink[1], Guéladio Cissé[5], Christopher Jack[6], Matthew Chersich[1], Sabina Omar[6]
[1]Wits Planetary Health Research, University of the Witwatersrand, Johannesburg, South Africa, [2]Department of Informatics, University of Oslo, Oslo, Norway, [3]DHIS2 Climate and Health, University of Oslo, Oslo, Norway, [4]IBM Research Africa, IBM, Johannesburg, South Africa, [5]Swiss Tropical and Public Health Institute, University of Basel, Basel, Switzerland, [6]Climate System Analysis Group, University of Cape Town, Cape Town, South Africa

INTRODUCTION
African cities face escalating heat exposure, yet fine-scale heat-associated vulnerability data to guide public health interventions remains scarce. The HE2AT Centre aims to reduce heat-related morbidity and mortality across African cities by generating evidence, building capacity, and translating research into actionable public health tools. This workshop explores how heat vulnerability mapping could translate into operational surveillance systems through the DHIS2 Climate & Health platform, an open-source health management information system currently deployed across seven African countries.
METHODS
We integrated high-resolution satellite data (land surface temperature, vegetation indices), ERA5 climate reanalysis, and GCRO socio-economic variables to create ward-level heat vulnerability indices for 135 Johannesburg wards. Machine learning models with SHAP interpretability methods identified key predictors and threshold effects. Multi-scale spatiotemporal data harmonisation protocols enabled integration across disparate data sources. We developed methods to design vulnerability data layers for integration into DHIS2 to support real-time surveillance.
RESULTS
Johannesburg analyses revealed extreme intra-urban heterogeneity, with vulnerability concentrated in informal settlements with limited vegetation and healthcare access. Machine learning identified non-linear exposure-response relationships, with SHAP values highlighting critical temperature thresholds. The heat vulnerability index demonstrates how such analyses can identify priority areas for intervention. DHIS2 Climate & Health, deployed across Niger, Senegal, Nigeria, Guinea Bissau, Mozambique, Malawi, Ghana, and DRC, provides a platform for linking vulnerability hotspots to health facilities.
CONCLUSIONS
This interactive workshop equips participants with practical geospatial and machine learning methods for heat vulnerability assessment and pathways for integration into operational health surveillance systems. Participants gain hands-on experience with DHIS2 Climate tools and connection to a pan-African network advancing climate health equity. We demonstrate the power of collaboration between researchers, technology developers, and public health practitioners across international scales.

Strengthening Integrated Community-Centred Municipal Strategies for Water-Related Public Health under Climate and Infrastructure Stress in South Africa

Eunice Ubomba-Jaswa[1], Chika Nnadozie[2], Amber Abrams[3], Marisa von Fintel[4], Paula Melariri[5]
[1]Water Quality & Health, Research Development and Innovation, Water Research Commission, Pretoria, South Africa, [2]Institute of Water Research, Rhodes University, Makanda, South Africa, [3]Future Water Institute, University of Cape Town, Cape Town, South Africa, [4]Department of Economics, Stellenbosch University, Stellenbosch, South Africa, [5]Faculty of Health Sciences, Nelson Mandela University, Gqeberha, South Africa

BACKGROUND
South Africa faces ongoing water and sanitation challenges, with millions lacking reliable services amid climate change, population growth, and aging infrastructure. Water quality degradation, inadequate wastewater treatment, flooding, drought, and unsafe household water storage increase risks of waterborne and zoonotic diseases, including diarrhoeal illnesses and schistosomiasis, particularly in low-income communities. Municipalities in the Eastern and Western Cape illustrate these intersecting challenges, experiencing recurrent droughts, compromised water quality, and persistent disease transmission despite relatively high sanitation coverage. This panel convenes multidisciplinary research addressing water-related health vulnerabilities through behavioural, environmental, and One Health approaches.
METHODS
The panel synthesises evidence from multiple integrated studies: a randomised field experiment testing behavioural nudges to improve household water storage; a One Health surveillance framework for early detection of waterborne zoonoses

in Eastern Cape municipalities; participatory ethnographic research on flooding-related health vulnerability; and multidisciplinary investigations of waterborne diseases. Mixed methods included molecular diagnostics, water quality and snail host assessments, epidemiological surveys among schoolchildren, microbial analyses of water sources, hygiene education interventions for municipal workers, and community workshops co-designing nature-based and water-sensitive solutions.
RESULTS
Findings reveal substantial under-detection of schistosomiasis with conventional diagnostics, while molecular tools uncovered hidden infections even in low-transmission areas. Environmental assessments showed widespread microbial contamination and water bodies conducive to snail survival. Behavioural and WASH-related risk factors were prominent, but hygiene education and behavioural nudges led to measurable improvements in knowledge and practices. Integrated analyses informed a drought-related waterborne infection prediction tool linking environmental conditions, water quality, and human behaviour to disease risk.
CONCLUSIONS
These studies highlight the need for integrated surveillance, climate-resilient water management, molecular diagnostics, and community-centred interventions. By bridging One Health, behavioural science, and participatory adaptation, the panel identifies scalable, evidence-informed strategies to reduce waterborne disease transmission and strengthen public health resilience in water-stressed settings.

The One Health concept is the key to a healthy future – or how to prepare leaders and experts to implement this idea in the functioning of policies and communities

Tomasz Gosiewski[1], Malgorzata Bala[2], Jacek Czepiel[3]
[1]Chair of Microbiology, Jagiellonian University Medical College, Krakow, Poland, [2]Chair of Epidemiology and Preventive Medicine, Jagiellonian University Medical College, Kraków, Poland, [3]Chair of Infectious Diseases and Tropical Medicine, Jagiellonian University Medical College, Krakow, Poland

INTRODUCTION
Una Europa is an alliance of 11 European universities established in 2019 to promote innovative educational formats. Within this framework, the One Health Self-Steering Committee at Jagiellonian University developed a Polish-language webinar introducing the core principles of the One Health (OH) approach. Despite its increasing relevance, OH remains insufficiently understood among the general public and parts of the academic community. Effective implementation of the One Health framework requires a shared understanding and common terminology across disciplines. Establishing such a "common language" is essential for raising awareness, fostering public support, and enabling coherent action. Therefore, educators, experts, community leaders, and policymakers should be equipped with foundational OH knowledge to support public education and the development of policies aligned with the One Health concept. This abstract presents our experience in developing and disseminating OH-related educational materials within the Una Europa alliance.
METHODS
The webinar, entitled "One Health Concept as the Key to a Healthy Future", which is planned to last until June 2026, will address vaccination, zoonotic diseases, and antimicrobial resistance. Participants will learn how to differentiate vaccine types, understand indications and contraindications, apply principles of responsible antimicrobial use, and reduce the risk of zoonotic infections.
RESULTS
Knowledge and competency gains will be assessed using pre- and post-webinar tests.
CONCLUSIONS
Detailed data on participant reach, knowledge improvement, and user feedback will be presented at the conference.
Popul. Med. 2026;8(Supplement 1):A407

Comparison of fine particulate matter (PM2.5) concentrations measured using low-cost sensors and gravimetric sampling in Mabopane, South Africa

Mandla Bhuda[1,2], Agot Watne[3], Peter Molar[4], Joyce Shirinde[2], Mattias Hallquist[5], Janine Wichmann[2]
[1]Department of Health Studies, Unisa, Pretoria, South Africa, [2]School of Health Systems and Public Health, University of Pretoria, Pretoria, South Africa, [3]Department of Environmental Intelligence, IVL Swedish Environmental Research Institute, Gothenburg, Sweden, [4]Occupational and Environmental Medicine, School of Public Health and Community Medicine, Sahlgrenska Academy, University of Gothenburg,, Gothernburg, Sweden, [5]Department of Chemistry and Molecular Biology, University of Gothenburg, Gothenburg, Sweden

BACKGROUND
Exposure to fine particulate matter (PM.) poses significant health risks, particularly in low- and middle-income countries.
OBJECTIVE
To evaluate PM. concentration variability using low-cost sensors and gravimetric sampling in Mabopane.
METHODS
PM. levels were measured on the rooftop of Mabopane Fire Station from 1 May to 22 September 2025 using two PurpleAir low-cost sensors and a GilAir-5 sampler operating at 4.0 L/min.
RESULTS
Between May and September 2025, the mean PM. concentration measured by Sensor 1 was 54.12 µg/m, while Sensor 2 recorded a mean of 52.46 µg/m. In comparison, the mean gravimetric PM. concentration was 23.30 µg/m. Sensor measurements were consistently higher than gravimetric values, indicating an overestimation of approximately 130–132% relative to the gravimetric sampler. PM. levels exceeded both the WHO 24-hour guideline and South African ambient air quality standards.
CONCLUSIONS
PM. levels pose a health risk and underscore the need for stronger air pollution control strategies in Mabopane and similar regions.

ABS2746
Prioritising indoor air quality - a landmark public health opportunity

Bronwyn King[1], Georgia Lagoudas[2]
[1]Air Club, Melbourne, Australia, [2]Brown University Pandemic Centre, Washington D.C., United States

INTRODUCTION
Healthy indoor air is a crucial yet overlooked topic that impacts both infectious and non-communicable diseases. Most populations spend 90% of the time inside so indoor air quality (IAQ) has a major influence on health. When measured, indoor air is typically poor quality, filled with pathogens, pollutants and plastics. No country has implemented health-based IAQ standards to guarantee access to safe air. This gap in public health frameworks is a landmark opportunity to improve health for communities the world over.
METHODS
In 2025, a global community of indoor air quality experts and advocates formed and convened a major event at United Nations headquarters in New York, on the sidelines on the United Nations General Assembly. During the event, the Global Pledge for Healthy Indoor Air was launched. The Global Pledge articulates six key reasons why indoor air quality must be addressed: for health, for human rights, for pandemic preparedness, for climate resilience, for work health safety and for accessibility.
RESULTS
France and Montenegro were welcomed as the inaugural signatories of the Global Pledge for Healthy Indoor Air, alongside over 200 health groups, universities, community groups and aligned businesses. Over the following months, indoor air quality advocates set about engaging in productive dialogue with government, health and business leaders, to increase awareness and drive action on healthy indoor air.
CONCLUSIONS
The global pledge for healthy indoor air serves as a catalyst for leadership and action on indoor air quality. In 2026 it is expected that numerous additional governments will become signatories, creating global momentum, mobilisation of leaders and substantial increase in public awareness. Everyone will benefit from prioritisation of indoor air quality. The science is clear, solutions exist and the rationale is undeniable. Awareness and leadership are two key challenges the global pledge aims to address.

Heat and homelessness: a practical toolkit to partner, implement and evaluate heat relief interventions for people experiencing homelessness

Timothy English[1], Alejandro Vasquez-Hernandez[2], Matthew Larkin[2], Jon Swain[3], Glenn Miller[2], Nuala Fogarty[2], Paul Rosenthal[2], Charles Cosgrove[2], Sidney Siyuan

Guo[1], Danielle Austin[4], Alexander Moses[1], Lisa Wood[5]
[1]Heat and Health Research Centre, University of Sydney, Sydney, Australia, [2]Homeless Health Service, St Vincent's Hospital Sydney, Sydney, Australia, [3]Homelessness Service, City of Sydney, Sydney, Australia, [4]Nursing Services, St Vincent's Hospital Sydney, Sydney, Australia, [5]Institute for Health Research, The University of Notre Dame Australia, Perth, Australia

INTRODUCTION
Extreme heat is a growing public health threat disproportionately affecting people experiencing homelessness, who have limited ability to avoid exposure and face barriers to cooling options.1 Public health responses often focus on opening cooling centres, yet these services can be under-used by people experiencing homelessness due to access barriers.1-3 We will facilitate a highly interactive session in which participants bring local challenges and questions, and together we translate evidence and field-based experience1 into practical implementation skills for low-barrier, community-embedded heat relief responses for people experiencing homelessness.
METHODS
This organised session is a skills-based workshop combining (i) a brief evidence and policy framing, (ii) a case study overview of co-designed mobile cooling hubs delivering shade, seating, airflow from electric fans, drinking water, cold-water spray, health checks, food, and referral pathways, and (iii) small-group activities. Participants will use guided discussion and structured problem-solving activities to develop a local implementation plan covering stakeholder partnership and co-design; site selection and operating model; communication and outreach; safety and cultural sensitivity; and a feasible evaluation approach, including a minimum dataset for service monitoring and impact assessment.
RESULTS
Participants will produce a context-specific Heat Action Plan and evaluation package adaptable across settings. Outputs will include a stakeholder partnership and governance map, a low-barrier operating model and site/logistics checklist, a communications and outreach plan, and a safety and cultural sensitivity checklist. Participants will complete a feasible evaluation framework, including a minimum dataset for routine monitoring and simple pre-post measures suitable for field delivery. A worked case example, underpinned by pilot findings, will illustrate practical implementation and measurement while maintaining low barriers to access.
CONCLUSIONS
This session will equip participants with knowledge and practical tools to implement and evaluate equitable, low-barrier heat relief responses for people experiencing homelessness, strengthening preparedness and accelerating scale-up in diverse public health systems.

Exploring predictors of short and long-term pesticide exposure using urinary pesticide biomarker data from children in South Africa

Regina Molomo[1,2], Adriana Veludo[1,2], Christian Lindh[3], Martin Röösli[1,2], Mohamed Aqiel Dalvie[4], Samuel Fuhrimann[1,2]
[1]Epidemiology, Swiss Tropical and Public Health Institute (Swiss TPH), Allschwil, Switzerland, [2]Epidemiology, University of Basel, Basel, Switzerland, [3]Occupational and Environmental Medicine, Lund University, Lund, Sweden, [4]Centre for Environmental and Occupational Health Research, School of Public Health, University of Cape Town, Cape Town, South Africa

INTRODUCTION
Pesticide exposure remains a major public health concern, yet predictors of short- and long-term exposure remain poorly understood, particularly in low- and middle-income settings. We investigated short- and long-term predictors of children's exposure to multiple pesticides over two-years in South African agricultural settings.
METHODS
We enrolled 518 children aged 9 -15 years from Grabouw, Piketberg and Hex River Valley. Between 2017 and 2019, children gave 1814 spot urine samples and completed pesticide exposure questionnaires at up to five-time points. Questionnaires assessed 11 behavioral (e.g., household pesticide use) and four environmental (e.g., spray drifts) exposure factors occurring within seven days prior to urine collection (short-term) and ever exposure factors reflecting long-term exposure. Nineteen biomarkers representing exposure to organophosphates, pyrethroids, dithiocarbamates and triazoles were analyzed using liquid chromatography tandem mass spectrometry and adjusted for specific gravity. Associations between short- and long-term exposure predictors and biomarker levels were assessed using linear mixed-effects models.
RESULTS
Twelve biomarkers were detected above the detection limit in 50% of the samples. Children residing on farms had up to threefold higher levels of TCPy, BCP, IMPy, 3PBA, 4F3PBA, OHP, and ETU compared with non-farm children. Recent household pesticide use was associated with up to 56% higher levels of 12 biomarkers and having noticed spray drifts in the last seven days with up to 30% higher levels of IMPy, 3PBA, DCCA, cisDCCA, 4F3PBA, ETU, OHBOS and OHP. Ever household pesticide use and ever exposure to spray drifts were associated with approximately 30% higher levels of IMPy, 2,4-D and 4F3PBA. Use of open drinking water sources was associated with higher TCPy, BCP and ETU levels.
CONCLUSIONS
Children in South African agricultural communities show sustained pesticide exposure from multiple sources. But few self-reported factors were predictive. Biomarker levels were mainly driven by exposures in the seven days preceding urine collection.

Quantifying misclassification in maternal heat exposure: Implications for heat-health alert thresholds for pregnant women

Ruvimbo Forget[1], Lebohang Radebe[1], Ijeoma Solarin[1]
[1]Wits Planetary Health Research, University of Witwatersrand, Parktown, South Africa

BACKGROUND
Rising ambient temperatures are a global public health concern, particularly in settings with limited access to cooling. Heat exposure during pregnancy is associated with adverse maternal and foetal outcomes. Heat-health alert systems are intended to reduce risks but mostly rely on weather station data. This may underestimate risk and misclassify heat exposure, with potential implications for the timing of protective actions.
METHODS
Maternal heat exposure was assessed among 63 women enrolled in the Bio-HEAT study in Johannesburg, South Africa. Personal-level exposure was measured using iButtons, while population level exposure was obtained from a local weather station. Daily mean (Tmean), maximum (Tmax) temperatures and heat index values were calculated for each method. We assessed agreement using mean difference (bias), Pearson correlation and Bland-Altman analysis. Misclassification was evaluated using National Weather Service Heat Index thresholds to examine whether personal measurement exceeded alert thresholds earlier than weather station data.
RESULTS
A total of 4,191 participant-days were analysed. Mean and maximum iButton temperatures exceeded station values by >5°C (Tmean: 5.67°C [SD 4.76; range −4.03–27.77]); (Tmax: 5.32°C [SD 7.56; range −10.8–39.58]). Agreement was moderate for mean temperature (r = 0.43) and weak for maximum temperature (r = 0.21). Bland–Altman analyses showed proportional bias with increasing variability at higher temperatures. Categorical agreement using Heat Index thresholds was poor. Weather station data classified 93.9% of participant-days as "Caution" (≥26.7°C), whereas iButton data classified 62.4% of the same days as "Extreme Danger" (≥32.2°C). Using an alert threshold of ≥32.2°C, 47.2% were misclassified, largely due to personal measurements reaching alert thresholds earlier than station data.
CONCLUSIONS
Personal and ambient temperature measurements differed substantially resulting in high misclassification of maternal heat exposure. These findings highlight limitations of ambient temperature-based heat-health alerts and the importance of considering vulnerable populations, including pregnant women in low resource settings, when setting thresholds.

[1]Division of Public Health Surveillance and Response, National Institute for Communicable Diseases, a division of the National Health Laboratory Service, Johannesburg, South Africa, [2]Communicable Disease Control and Outbreak Response, Western Cape Government, Department of Health and Wellness,

Emergency and Clinical Services Support, Service Priorities Coordination, Cape Town, South Africa, [3]City Health, Community Services and Health, Maitland, Cape Town, South Africa, [4]Food Control Unit, City Health: Community Services and Health, Cape Town, South Africa, [5]Centre for Enteric Diseases, National Institute for Communicable Diseases, a division of the National Health Laboratory Service, Johannesburg, South Africa, [6]Facilities Infrastructure Management, Environmental Health and Climate Change, Western Cape Government, Department of Health and Wellness, Cape Town, South Africa

BACKGROUND
Foodborne diseases (FBD) remain an important global public health concern, causing an estimated 420 000 deaths and 33 million lost healthy life years annually. In South Africa, FBD outbreaks are classified as category 1 notifiable medical conditions, requiring immediate investigation to identify possible causes and implement corrective measures. This report summarises the epidemiological, clinical and environmental investigations, and subsequent public health response to a suspected FBD outbreak linked to a restaurant in the City of Cape Town Metropolitan area.
METHODS
A descriptive cross-sectional study was conducted to characterise the outbreak and document the public health actions taken. Suspected cases were interviewed, and clinical specimens (stool or rectal swabs) were collected for laboratory testing. Environmental investigations included health inspections and assessments of the restaurant's food safety practices. Bacteriological swabs (hands and surfaces), water samples (tap water and ice machine) and ready-to-eat food samples (raw and cooked) were collected to evaluate microbial contamination.
RESULTS
Between 1–29 February 2024, 46 suspected cases were identified: 12 staff members and 34 patrons. The most common symptoms were diarrhoea (67%) and abdominal cramps (63%). Most affected individuals had consumed seafood (75%) or chicken (42%). Laboratory testing confirmed Shigella spp. or enteroinvasive Escherichia coli (EIEC) in 33 (67%) clinical specimens. Fifteen patrons required hospitalisation, with no fatalities. Environmental inspections revealed overstocked cold storage and poor stock rotation. Several food items did not meet microbiological standards for food: grilled chicken, prawn rissoles, cooked halloumi and mayonnaise sauce.
CONCLUSIONS
Although the precise outbreak source could not be confirmed, evidence strongly suggested a foodborne origin involving contaminated food items or an infected food handler. Shigella spp./EIEC was considered the most probable causative agent. The outbreak was contained following temporary closure of the restaurant for decontamination, deep cleaning, staff refresher training and exclusion of symptomatic employees until full recovery.

Design & public health. Can salutogenic cities, healthy buildings and the hospital of the future fix the emerging global public health challenges, through equity, inclusion, and sustainability?

Stefano Capolongo[1], Maddalena Buffoli[1], Andrea Rebecchi[1], Marco Gola[1], Andrea Brambilla[1], Bettina Borisch[2], Wolfgang Sunder[3], Jutta Lindert[4]
[1]Design & Health Lab, WHO Collaborating Center, Department of Architecture, Built environment and Construction engineering (ABC), Politecnico di Milano, Milano, Italy, [2]Institute of Global Health, University of Geneva, Geneva, Switzerland, [3]Institute of Construction Design, Industrial and Health Care Building, Technische Universität Braunschweig, Braunschweig, Germany, [4]Department of Public Health, University of Applied Sciences Emden/Leer, Leer, Germany

INTRODUCTION
Global Public Health challenges cross disciplinary boundaries. Built environment, outdoor and indoor, is a major determinant of population health, with nearly 24% of the global burden of disease attributable to environmental factors i.e. housing, infrastructures, urban environment, indoor and outdoor exposures. Its relevance is recognised as emerging Public Health field. Over 55% of people live in urban areas where poor design increases exposure to pollution, heat, inactivity, and unequal access to care . In healthcare settings, hospital architecture affects infection prevention, patient recovery, staff wellbeing, and system resilience, requiring new paradigms. Design expertise remains insufficiently embedded in Public Health policies.
METHODS
This interactive skill-building seminar session combines brief evidence inputs, real-world case studies, and facilitated co-design exercises. Experience-based cases will address the relationship between built environment and health at three levels: urban health, hospital design, and healthy buildings. Participants engage in interactive guided groups activities to discover how design professionals can support Public Health strategies, policies, and governance.
RESULTS
Participants will gain understanding of how design decisions affect exposure reduction, infection control, wellbeing, and health equity. Evidence links indoor environmental quality and ventilation to improved cognition and wellbeing. Research shows environmental and social contexts interact with biological processes across life, affecting ageing and mortality (6).
CONCLUSIONS
Integrating design and public health enables effective, equitable, and sustainable policies and embeds design expertise into decision making across hospitals, cities, and buildings (7–8). Tentative program • Design and Public Health: framing the challenge – B.Borisch, WFPHA • Hospital design and health system resilience. Determinants of snake-human conflict, based on the ICMR funded National Task Force pan-India study on the incidence, mortality, morbidity and socioeconomic burden of snakebite

Jaideep Menon[1]
[1]ADULT CARDIOLOGY & PUBLIC HEALTH, AMRITA INSTITUTE OF MEDICAL SCIENCES, Kochi, India

ABSTRACT
Snakebite and snakebite envenoming (SBE) is an underreported public health calamity with huge socioeconomic consequences. SBE is a condition associated with impoverishment, inequity and neglect. India is considered the snakebite capital of the globe burdened with half the incidence and deaths reported worldwide. The Indian Council of Medical Research (ICMR) funded National Task Force (NTF) study on the incidence, morbidity, mortality and socioeconomic impact of snakebite was pan-India, covering 36 districts across 14 states across the 5 geographical zones of India. The situations and contexts leading to bite, health seeking behaviour, therapy, complications, delay in initiating therapy, first-aid measures, alongside region, snake species were recorded in 20000 victims across India. Based on the geography; demography, socio-cultural and economic factors; ethnobiology; health care systems; occupation; climate, soil and rainfall; and other social determinants we study the determinants of snake-human conflict through a one-health approach. The framework we have utilised for the one-health approach is that of the 'epidemiological triad' of an agent (snake), host (humans and livestock) and environment. We have assessed the various determinants based on the epidemiological triad supplemented by an outer setting which includes the health systems, social determinants and other associated factors. This is the first study looking at the determinants of snake-human conflict from a holistic one-health aspect factoring for the medical and non-medical determinants, environment, contexts and situations that have contributed to the accident. We used logistic regression to assess the association of 14 determinants with snake-human conflict. We are in the process of creating 'hotspots' for the country based on the results of the study.

Operationalising Resilience: Bridging the Gap Between Climate Early Warnings and Health System Readiness in South Africa

Ozayr Mahomed[1], Nisha Nadasen Reddy[1], Serestina Viriri[1,2], Michael Gebreslasie[3], David < Ndzi[4], Muhammad Shakir[5], Fikile Nkwanyana[1], Natalie Dickinson[6], Fiona Henriquez-Mui[7], Llinos Haf Spencer[8], Mary Lynch[8], Saloshni Naidoo[1]
[1]Public Health Medicine, University of KwaZulu Natal, Durban, South Africa, [2]Discipline of Computer Science, School of Agriculture and Science, University of KwaZulu-Natal, Durban, South Africa, [3]Discipline of Geography, School of Agriculture and Science, University of KwaZulu Natal, Durban, South Africa, [4]School of Electrical and Mechanical Engineering,, University of Portsmouth, Portsmouth, United Kingdom, [5]School of Computing, Engineering and Physical Sciences,, University of the West of Scotland,, Paisley, United Kingdom, [6]School of Health and Life Sciences,, University of the West of Scotland,, Paisley, United Kingdom, [7]Civil and Environmental Engineering Department,, University of Strathclyde, Glasgow, United Kingdom, [8]University of Medicine and Health Sciences, Royal College of Surgeons in Ireland,, Dublin, Ireland

BACKGROUND

Climate change is exposing South African communities to increasingly frequent shocks, including drought, urban flooding, and extreme heat. During these events, frontline health services carry much of the response burden. While South Africa has an extensive framework of climate adaptation and disaster risk management policies, gaps remain in how effectively these arrangements translate early warnings into timely health system action. This paper examines whether existing governance arrangements link early climate warning systems to anticipatory health system preparedness.
METHODS
A structured policy mapping and functional readiness review was conducted across fifteen legislation, policies, and operational guidelines spanning the climate, disaster management, and health sectors. Documents were sourced from official legal databases and institutional repositories, including the National Department of Health, the National Disaster Management Centre, the Department of Forestry, Fisheries and the Environment, and the South African Weather Service. They were analysed using a functional readiness framework assessing hazard coverage, emergency-phase coverage, and the presence of defined trigger–action pathways linking meteorological warnings to health system activation.
RESULTS
The review identified a persistent gap between early warning systems and health system action. Although forecasts for extreme heat and severe weather are technically robust and widely disseminated, disaster frameworks tend to activate after formal disaster declarations. Health-sector preparedness is focused mainly on infectious disease threats to population health. As a result, early warnings do not consistently trigger anticipatory measures such as protecting infrastructure, securing cold chains, mobilising surge staff, or maintaining essential services. Health facilities are reactive. Emerging climate-health instruments begin to address this gap but are not yet operationalised.
CONCLUSIONS
South Africa's challenge is that of weak operational links between climate intelligence and health system readiness. Binding trigger-based protocols that integrate early warning systems into health-sector standard operating procedures, supported by clear accountability and appropriate financing will be required

When water connects us all: Climate-sensitive health risks through a One Health lens

Maxine Jonker[1], Dr Amber Abrams[2], Professor Hanna-Andrea Rother[1], Dr Josephine Walker[3], Professor Guy Howard[4,5], Dr Anisha Nijhawan[4], Dr Abraham Geremew[6], Dr Yohannes Mulugeta Demmu[6]
[1]School of Public Health, University of Cape Town, Cape Town, South Africa, [2]Future Water Institute, University of Cape Town, Cape Town, South Africa, [3]Bristol Medical School, University of Bristol, Bristol, United Kingdom, [4]School of Civil, Aerospace, and Design Engineering, University of Bristol, Bristol, United Kingdom, [5]Cabot Institute, University of Bristol, Bristol, United Kingdom, [6]School of Environmental Health, Haramaya University, Haramaya, Ethiopia
BACKGROUND
Climate change is a threat to global stability(1-3). The most direct impacts from climate change are from the effects of high temperatures and extreme weather events. These stressors produce direct health effects. Indirect health effects occur through climate interactions with ecosystems, water, biodiversity, and land use changes and can modify or mediate existing health effects and exacerbate inequalities. Climate change can lead to environmental degradation, affecting food and water availability and quality, and increasing risks to health from pathogens, vectors, diseases and pollutants. Therefore, climate change effects will be experienced across the human-animal-environment interface. Applying a One Health approach to the Water-Climate-Health nexus will aid in understanding the impact of climate change and the identification of effective interventions.
METHODS
This interactive session aims to help participants understand, discuss, and apply a One Health approach to water-related climate-sensitive health risks affecting humans, animals, and ecosystems. This will be done through: -A brief presentation addressing climate-water-health nexus, the pathways of interaction, changing public health risks and how a One Health framework is suited to these issues. -Breakout group activity where case studies on challenges within the climate-water-health space will be discussed and a One Health perspective used to identify the climate-drivers, water and health impacts (for humans, animals and environment), and a short-term and mid- to long-term One Health response to the issues.
RESULTS
By the end of the session, participants will: 1. Identify water-related climate-sensitive health risks across human, animal, and environmental systems 2. Explain how climate change alters water pathways of disease and exposure 3. Apply a One Health lens to design integrated responses 4. Recognize opportunities for cross-sector collaboration
CONCLUSIONS
Understanding the application of a One Health framework to the cross-cutting impacts of climate change on water and health is imperative to finding key solutions to these challenges.

Household hygiene practices and perceived responsibility for vector control shape frequent rat and mosquito sightings in resource-constrained urban settings

Bárbara Inês Arcanjo Xavier[1], Diogo César Carvalho Santiago[1], Hernán Darío Argibay[1], Max Thomas Eyre[2], Cleber Cremonese[1], Federico Costa[1], Adedayo Michael Awoniyi[1]
[1]Institute of Collective Health, Federal University of Bahia, Salvador, Brazil, [2]Department of Disease Control, London School of Hygiene & Tropical Medicine, London, United Kingdom
ABSTRACT
Informal settlements (favelas) are widespread across Africa, Asia, and South America and are characterized by inadequate infrastructure, poor sanitation, and socioeconomic vulnerability. These conditions, combined with suboptimal household hygiene practices, promote rat and mosquito proliferation and increase the risk of arboviral and rodent-borne zoonotic disease transmission. However, evidence remains limited on how household hygiene behaviors and perceptions of responsibility for vector control influence exposure. This study evaluated the effects of backyard hygiene practices and perceived responsibility for pest control on the frequency of rat and mosquito sightings in favelas. This study was conducted nested to an larger ongoing eco-epidemiological research project in peri-urban communities with historically high transmission of leptospirosis and dengue in Salvador, Brazil^6. Between March and August 2025, a modified, previously validated semi-structured questionnaire was administered to 136 heads of household from four socio-environmentally similar favelas. Structured backyard inspections documented environmental conditions, including waste presence and backyard use. Ordinal regression analyses were performed using univariate and multivariable cumulative link models with a logit link function, with model selection guided by Akaike Information Criterion. Lower socioeconomic status and poor backyard hygiene were associated with frequent rat and mosquito sightings. Among participants earning ≤USD 190/month, 54.0% and 71.4% reported daily rat and mosquito sightings, respectively. Participation in hygiene promotion programs (OR=0.39; p=0.022) and perceiving pest control as the responsibility of the community (OR=0.26; p=0.009) or the municipal government (OR=0.34; p=0.031) were protective against frequent rat sightings. Conversely, unclean backyards (OR=3.59; p=0.004), backyard gardening (OR=3.12; p=0.010), and disposal of household waste in centralized community bins (OR=3.19; p=0.010) increased the odds of frequent mosquito sightings. Exposure to rats and mosquitoes in favelas is shaped by structural vulnerabilities and household behaviors. Integrated interventions combining improved sanitation, community-based education, and shared responsibility for pest control are essential to reduce exposure and improve public health.

Sustainability and resilience in the territory: dialogues on healthy environments and climate change in a brazilian rural settlement

Leidy Dayane Paiva de Abreu[1], Lanna Rebeca Cavalcante Do Carmo[1], Antonio Carlos da Silva[1], Aretha Feitosa de Araújo[2], Mirna Neyara Alexandre de Sá Barreto Marinho[3], Rafael Bezerra Duarte[1], Ana Patrícia Pereira Morais[1], Alice Maria Correia Pequeno[1], Francisco Regis da Silva[1]
[1]Centro de Ciências da Saúde, Universidade Estadual do Ceará, FORTALEZA, Brazil, [2]Universidade Regional do Cariri, Crato, Brazil, [3]Universidade Regional do Cariri, Iguatu, Brazil
INTRODUCTION
Building sustainable health systems requires recognition of territories, local knowledge and community practices that connect health, environment and ways of life1. In rural areas of the Brazilian semiarid region, strategies such as productive home gardens, collective organization and care for nature strengthen resilience to climate change and socioenvironmental inequities2. This study aims to report a participatory experience that integrates sustainability, health and territory in a rural settlement.

METHODS
This is a participatory qualitative study based on life stories, field diaries and audiovisual records. The experience was developed in a rural semiarid settlement with the participation of five women farmers. Activities included a conversation circle mediated by symbolic territorial objects, thematic dialogue on sustainability and scientific initiation, use of generative words, and the production of drawings and short texts guided by the question "when you think about a healthy environment what comes to your mind". Visits to productive home gardens and sensitive listening to community narratives were also conducted. Data were analyzed using thematic analysis grounded in the ecology of knowledge and the pedagogy of hope. The study received ethical approval.
RESULTS
Narratives and artistic productions revealed healthy environments as spaces for life production, food security, care, water preservation, biodiversity, spirituality and family coexistence. Productive home gardens emerged as central devices for food sovereignty, environmental sustainability and climate adaptation. Participants expressed concerns about pollution, pesticide use, fires and water scarcity, while reaffirming resistance practices based on agroecology, seed preservation and collective care of the territory.
CONCLUSIONS
Participatory methodologies that integrate art, dialogue and territorial practices strengthen community protagonism and contribute to building sustainable and resilient health systems capable of protecting both people and the planet in the context of the climate crisis.
Popul. Med. 2026;8(Supplement 1):A425

ABS3042
Climate Change and Public Health Planning: The Participatory Development of the State of Bahia's Sectoral Health Plan for Mitigation and Adaptation, Brazil

Ynayara Rodrigues[1], Erika Ratis[1], Manuela Santos[1], Gustavo Leão[1], Rivia Barros[1]
[1]Bahia State Health Department, Government of the State of Bahia, Salvador, Brazil

ABSTRACT
Brazil has a Unified Health System (UHS) organized in a decentralized manner, coordinating actions in health promotion, prevention, surveillance, and care1,2. States and municipalities have autonomy to plan and implement activities within their territories, following federal guidelines and social participation2. Climate change increases the occurrence of extreme events, exacerbates socio-environmental inequalities, and intensifies epidemiological risks, demanding planned and coordinated governmental responses3,4,5. In this context, the development of sectoral plans for climate change mitigation and adaptation plays a strategic role, guiding decision-making and integrating the climate agenda into public health planning5.This study describes the process of developing Brazil's first Sectoral Health Plan for Climate Change Mitigation and Adaptation, which was created by an interinstitutional working group composed of managers, state technical teams, representatives of social oversight bodies, and environmental agencies, ensuring a participatory and integrated approach. The plan was based on situational analysis, literature review, assessment of climate vulnerabilities, integration of health surveillance data, epidemiological profiling, and identification of vulnerable populations. Workshops and meetings were held to establish actions and targets, as well as to guide the allocation of resources for activities structured around six strategic axes: Governance and Management; Health Surveillance and Information Systems; Resilient Care; Infrastructure and Sustainable Technologies; Education, Communication, and Research; and Protection of Vulnerable Populations. State-level strategic planning guided the structuring of the document over a ten-year period, including short-, medium-, and long-term actions. Therefore, the plan represents a strategic instrument that incorporates the effects of climate change into state health planning. The description of its development process contributes to the sharing of replicable experiences in other contexts, strengthening more sustainable health policies while upholding the SUS principles of universality, comprehensiveness, and equity.
Popul. Med. 2026;8(Supplement 1):A426

ABS3047
Health Sector Plan for Climate Change Mitigation and Adaptation in the State of Bahia, Brazil

Ynayara Rodrigues[1], Erika Ratis[1], Gabriel Murici[1], Manuela Santos[1], Gustavo Leão[1], Rivia Barros[1]
[1]Bahia State Health Department, Government of the State of Bahia, Salvador, Brazil

ABSTRACT
Climate change represents a critical challenge for public health1,2,3, affecting social and environmental determinants in the state of Bahia. Extreme events, such as droughts and floods, have altered the epidemiological profile, requiring a response from the Unified Health System (UHS) to protect the population3. The plan aims to strengthen the capacity of the UHS in Bahia in the prevention, preparedness, response, and recovery from the impacts of climate change. Developed through an intersectoral process by the Bahia State Department of Health, integrating scientific evidence and national and international legal frameworks, the methodology included a situational diagnosis and the definition of six strategic action axes for the period 2026–2035: governance, integrated surveillance, resilient health care, sustainable infrastructure, education, and protection of vulnerable populations. With 85.2% of Bahia's territory located in the semi-arid region, the diagnosis revealed projections of increasing temperatures and severe water stress by 2050. Environmental racism and territorial exclusion in precarious urban areas and traditional communities (quilombola and Indigenous) were highlighted as factors that exacerbate inequities, resulting in higher morbidity and mortality from disasters and waterborne diseases among these groups. The plan established 39 actions and targets across the axes, including technical support to 100% of municipalities for the development and implementation of emergency plans, the creation of climate risk maps, and early warning systems for heat waves. Actions by the Rapid Response Team for emergencies have already been carried out in the territory since the plan's inception. Additionally, it is projected that health facilities will incorporate renewable energy systems and that the new projects will comply with climate resilience criteria. The implementation of the plan is essential to promote climate justice and health equity, as well as to strengthen the resilience of the UHS in Bahia, requiring territorialized actions and affirmative policies that protect historically marginalized groups.

Heat – Not a Small Problem! Investigating the Association Between Heat, Heatwaves, and Birthweight in Sub-Saharan Africa

Natasha Lalloo[1], Darshnika Lakhoo[1], Samantha Jack[1], Perkins Watambwa[2], Lebohang Radebe[1], Ijeoma Solarin[1], Rutendo Sibanda[2], Ruvimbo Forget[1], Nicholas Brink[1], Craig Parker[1], Nandi Mwase[1], Zororo Chinwadzimba[2], Cherlynn Dumbura[2], Tatenda Makanga[2], Sibusisiwe Makhanya[3], Gueladio Cisse[4], Jemimah Nda[4], Matthew Chersich[1], Christopher Jack[5], Pierre Kloppers[5], Lisa van Aardenne[5], Stanley Luchters[2]
[1]Faculty of Health Sciences, Wits Planetary Health Research, Cape Town, South Africa, [2]Centre for Sexual Health, HIV and AIDS Research (CeSHHAR), Harare, Zimbabwe, [3]IBM Research Africa, Johannesburg, South Africa, [4]University Peleforo Gon Coulibaly, Korhogo, Côte dIvoire, [5]Climate System Analysis Group, University of Cape Town, Cape Town, South Africa

BACKGROUND
Climate change harms human health, particularly vulnerable populations including pregnant people and their newborns. A growing body of evidence suggests that maternal heat exposure during pregnancy is associated with low birthweight (LBW) and small for gestational age (SGA). Most studies are from high-income countries, and have relied on regression modelling, limiting temporal resolution. Sub-Saharan Africa (SSA) experiences distinct climate, socioeconomic, and vulnerability contexts, underscoring the need for region-specific evidence using advanced statistical methods. This study aims to investigate the association between maternal heat exposure during pregnancy and term LBW and SGA.
METHODS
This study is an individual participant data (IPD) meta-analysis using datasets from cohort studies from 7 SSA countries. The outcomes will be SGA, term birthweight, and term LBW. Heat exposure will include mean temperature, diurnal temperature variation, and universal thermal climate index (UTCI). Analyses will first be conducted using logistic regression (LBW/SGA) and linear regression (birthweight). A two-stage meta-analysis will be conducted: First, distributed lag non-linear models (DLNMs) examining non-linear and time-varying effects of heat exposure across gestation, stratified by region, country, and climate zone. Second, a meta-analysis for the pooled estimate. Results will be stratified by maternal factors (e.g. age, education), infant sex, and socioeconomic indicators.
RESULTS
Analyses will quantify the risk of term LBW and SGA associated with high temperatures and heatwaves and identify gestational windows of heightened vulnerability. It is anticipated that heat and heatwaves will be associated with a higher risk of LBW and SGA, with stronger associations during the first and second trimesters.
CONCLUSIONS
This study addresses critical evidence gaps on heat exposure and foetal growth in SSA using innovative IPD and DLNM approaches. Findings will inform climate-sensitive maternal and child health policy and guidance, support indicator

development for climate-health surveillance, and guide adaptation and resilience strategies in low- and middle-income settings.

Impacts of heat exposure on pregnant women, fetuses and newborns: a systematic review and meta-analysis

Darshnika P Lakhoo[1], Ijeoma Solarin[1], Lebohang Radebe[1], Nicholas Brink[1], Shobna Sawry[2], Nandi Mwase[1], Natasha Lalloo[1], Mags Beksinska[3], Jean le Roux[2], Sibusiso Mkwanazi[2], Ursula Gazeley[4], Matthew Chersich[1,5]
[1]Faculty of Health Sciences, University of Witwatersrand, Wits Planetary Health Research, Johannesburg, South Africa, [2]Faculty of Health Sciences, University of Witwatersrand, Wits RHI, Johannesburg, South Africa, [3]Wits Maternal, Adolescent and Child Health Research Unit, University of Witwatersrand, Johannesburg, South Africa, [4]Leverhulme Centre for Demographic Science, Nuffield Department of Population Health, University of Oxford, Oxford, United Kingdom, [5]Trinity College Dublin, Dublin, Ireland

BACKGROUND
Climate Change has wide-ranging, severe health impacts, especially for vulnerable groups. This systematic review and meta-analysis assessed the impact of heat exposure during pregnancy on maternal, fetal and neonatal health.
METHODS
We conducted a search in MEDLINE (PubMed) and Web of Science in December 2024. Employing Cochrane methodologies on vote counting, narrative synthesis, and meta-analysis, we quantified impacts and graded certainty of the evidence using an adapted IPCC grading.
RESULTS
The study synthesised data from 229 peer-reviewed articles across 27 health outcomes, predominantly in high-income countries (61.5%). The most studied outcomes were preterm birth (n=102), low birth weight (n=58), hypertensive disorders in pregnancy (n=35) and stillbirths (n=27). Generally, outcomes had a significant number of studies with a positive direction of effect, except for low birth weight, hypertensive disorders in pregnancy, and congenital anomalies, where results were heterogenous. Our results demonstrated increased odds of preterm birth of 1.04 (95%CI=1.03, 1.05) per 1°C increase in heat exposure and 1.22 (95%CI=1.08, 1.37) during heatwaves. Similar patterns were shown for stillbirths and congenital anomalies. Gestational diabetes mellitus odds increased by 28% (95%CI=1.05, 1.74) with higher exposures. Certainty grading revealed very high confidence in preterm birth, high certainty in gestational diabetes and stillbirths, while caesarean sections and neonatal mortality showed very low confidence due to limited evidence and agreement. The review was limited by heterogeneity in heat exposure metrics, outcome measures, and study designs. These differences complicated data synthesis.
CONCLUSIONS
The findings underscore significant threats to maternal and child health from heat. This highlights the urgent need for robust public health interventions and targeted climate adaptation strategies. This study informs research priorities and the selection of heat-health indicators.

ABS3097
A Public Health Approach to Climate Change

Natasha Lalloo[1], James Irlam[2], Mafoko Phomane[3]
[1]Faculty of Health Sciences, Wits Planetary Health Research, Johannesburg, South Africa, [2]Family, Community, and Emergency Care, University of Cape Town, Cape Town, South Africa, [3]GroundWork, Durban, South Africa

INTRODUCTION
Climate change is increasingly recognised as the greatest threat to public health, yet global and national responses have limited application of public health methods. Health considerations are frequently absent in climate governance, despite clear evidence that greenhouse gas emissions drive otherwise preventable morbidity and mortality. This panel explores: the justifications and rationale for a health-centred response to climate change; what tools could be applied in the coming decade; and reframing mitigation strategies around the fossil fuel industry as a commercial determinant of health.
METHODS
The panel draws on lessons from successful public health responses to other health-harming industries (e.g. tobacco, alcohol, and CFCs) and case-based discussions to examine how public health levers could be applied to reduce greenhouse gas emissions and mitigate climate change and its health impacts. The panel of 4 includes public health professionals and environmental justice advocates. Perspectives from southern Africa will be foregrounded and contrasted with current global climate-health approaches.
RESULTS
The session will identify public health strategies for reducing greenhouse gas emissions and mitigating health impacts, including: emissions labelling and health warnings on products; taxation based on health and social costs and the polluter pays principle; restrictions on industry influence in policymaking and advertising; fossil fuel divestment; strategic climate-health litigation; classifying carbon emissions as an air pollutant; and declaring a public health emergency of international concern. Presenters will examine the exclusion of health from global climate negotiating mechanisms and review the response of the World Health Organisation, highlighting governance gaps, missed opportunities, and emerging pathways for stronger health leadership.
CONCLUSIONS
By framing climate change as a preventable, commercially driven, health crisis, this panel presents a bold vision for a public health response to a global crisis. We demonstrate how established public health tools can be mobilised to protect population health and strengthen climate action.

Heat Exposure and Preterm Birth in Sub-Saharan Africa: An Individual Participant Data Meta-Analysis

Darshnika P Lakhoo[1], Perkins Watambwa (co-first author)[2], Natasha Lalloo[1], Samantha Jack[1], Cherlynn Dumbura[2], Tatenda Makanga[2,3], Nicholas Brink[1], Zororo Chinwadzimba[2], Rutendo Sibanda[2], Lebohang Radebe[1], Lisa van Aardenne[4], Ijeoma Solarin[1], Laura Munthali[2], Pierre Kloppers[4], Jemima Effah N'da[5], Margaret M Brennan[6,1], Matthew F Chersich[1,7], Christopher Jack[2], Gueladio Cissee[5], Sibusisiwe Makhanya[8], Stanley Luchter[2,9,10]
[1]Wits Planetary Health Research, Faculty of Health Sciences, University of Witwatersrand, Johannesburg, South Africa, [2]Centre for Sexual Health and HIV/AIDS Research, Harare, Zimbabwe, [3]Place Alert Labs, Department of Surveying and Geomatics, Faculty of the Built Environment, Midlands State University, Gweru, Zimbabwe, [4]Climate System Analysis Group, University of Cape Town, Cape Town, South Africa, [5]University Peleforo Gon Coulibaly, Korhogo, Côte dIvoire, [6]Discipline of Public Health and Primary Care, Institute of Population Health, School of Medicine, Trinity College Dublin, Dublin, Ireland, [7]Trinity College Dublin, Dublin, Ireland, [8]IBM Research Africa, Johannesburg, South Africa, [9]Liverpool School of Tropical Medicine, Liverpool, United Kingdom, [10]Department of Public Health and Primary Care, Ghent University, Ghent, Belgium

ABSTRACT
Preterm birth is the leading cause of child morbidity and mortality and has been consistently associated with heat exposure. However, most evidence comes from high-income settings. This study aimed to quantify the effects of short-term heat exposure on preterm birth across sub-Saharan Africa, where heat-related vulnerabilities are highest.
METHODS
We conducted an individual participant data (IPD) meta-analysis of clinical trials and cohorts conducted in sub-Saharan Africa (2000–2022). Eligible datasets were cleaned, geolocated, harmonised, and linked to ERA5 temperature data. A two-stage random-effects meta-analysis design was applied; each study was analysed separately using time-stratified case-crossover designs then, study-specific estimates were pooled. Effect modification by urbanicity and climate zones was explored.
RESULTS
We included 7 studies comprising 27217 singleton births, with MomCare Project (Kenya) contributing 41.7% (n=11341), followed by The Safe Passage Study (South Africa) (23.9%; n=6485) and PREGACT (multi-country) (12.1%; n=3304). Overall, 4622 births (17.0%) were preterm, ranging from 4.85% in STOPMIP (Kenya) to 24.7% in MomCare Project (Kenya). In pooled analyses, compared with the 75th percentile of temperature, exposure at the 90th percentile in the week before birth was associated with an 8% increase in the odds of preterm birth (OR=1.08; 95% CI: 0.93 – 1.26; I=16.7%). All studies showed a harmful direction of effect, with the largest effect (OR=1.36; 95% CI: 0.35-5.33) in STOPMIP, however, none were statistically significant. Meta-regression suggested a threshold-type exposure–response, with increasing risk above 21°C, with stronger effects in rural areas compared to urban and arid and tropical climate zones compared to temperate climate zones.
CONCLUSIONS
Short-term heat exposure may increase the risk of preterm birth in sub-Saharan Africa. As global warming intensifies, integrating pregnant women and newborns into heat-adaptation planning, early warning systems, and public-health surveillance is urgently needed, particularly in low- and middle-income countries

with the highest vulnerability to heat-related health impacts.

ABS3190

Hot Nights, Sleepy Days: An investigation into Ambient Temperature and Daytime Sleepiness - A cross-sectional study in adults in Johannesburg, South Africa (2017-2018)

Samantha Jack[1], Benjamin Devantier-DuPlessis[1], Lisa Micklesfield[2], Julia Goedecke[2,3], Nicholas Brian Brink[1], Matthew Chersich[1], Craig Parker[1]
[1]HEAT Center, Wits Planetary Health Research, Faculty of Health Sciences, University of the Witwatersrand, Johannesburg, South Africa, [2]SAMRC/Wits Developmental Pathways for Health Research Unit, Faculty of Health Sciences, University of the Witwatersrand, Johannesburg, South Africa, [3]Biomedical Research and Innovation Platform, South African Medical Research Council, Cape Town, South Africa

BACKGROUND
Excessive daytime sleepiness is an indicator of sleep disorders and disruptions 1. Heat exposure can impair sleep onset and quality through thermoregulatory disruption2,3, as the core body temperature must decrease for sleep initiation and maintenance2,4,5. Poor sleep quality and disturbances are associated with increased daytime sleepiness, impaired cognitive function, mood disorders, increased occupational risks and car accidents1,6. Heat-induced sleep disruptions are recognised as a pathway linking climate change to human health7. The aim was to investigate the association between ambient temperature and excessive daytime sleepiness in middle-aged Johannesburg adults.
METHODS
Data from the Middle-Aged Soweto Cohort (MASC), collected 2017-2018, were analysed. Participants (N=993) completed the Epworth Sleepiness Score (ESS; 0-24), a validated questionnaire measuring daytime sleepiness (higher ESS = increased sleepiness)1,8. ERA5 global climate dataset (from the European Centre for Medium-Range Weather Forecasts) was linked to individual clinic visits by date. Outcomes included continuous ESS and binary excessive daytime sleepiness (ESS >10, a clinical threshold). Logistic and linear regression models adjusted for age, sex, BMI, and HIV status.
RESULTS
Of 993 participants, 155 (15.6%) had excessive daytime sleepiness. Per 5°C temperature increase, ESS increased by 0.65 points (95% CI: 0.29, 1.01; p<0.001), indicating increased daytime sleepiness with increasing ambient heat. For each 5°C increase, odds of excessive daytime sleepiness increased by 57% (OR=1.57; 95% CI: 1.26, 1.97; p<0.001). Temperature was significantly associated with ESS; age, sex, BMI, and HIV status showed no independent associations with ESS.
CONCLUSIONS
Higher ambient temperature is significantly associated with daytime sleepiness in Johannesburg adults, with a 57% increased odds of excessive sleepiness per 5°C increase in temperature. As high temperatures interfere with the physiological temperature drop required for sleep onset and maintenance, heat-induced sleep disturbance represents a plausible mechanistic pathway linking climate to health outcomes. These findings support integrating sleep health into heat adaptation strategies.

ABS3207

It's time to go beyond awareness and advice: A systematic review and policy analysis of heat-protection interventions for people experiencing homelessness.

Alexander Moses[1], Sidney Siyuan Guo[1], Timothy English[1]
[1]Heat and Health Research Centre, University of Sydney, Sydney, Australia

INTRODUCTION
People experiencing homelessness face disproportionate heat-health risk, with global warming compounding that risk.1-4 This review aimed to identify, synthesise and characterise the types, implementation strategies, and effectiveness of interventions intended to mitigate heat-health risk among people experiencing homelessness during extreme heat.
METHODS
The literature search included keywords for "homelessness", "heat" and "intervention", with peer-reviewed English-language articles retrieved from eight scholarly databases from inception to January 2026. Quality assessment was completed on implementation and health effectiveness, with data extracted and synthesised narratively. Using the same search strategy, Overton was searched for Australian policies published from January 2016 to January 2026. Extracted policy data were imported into NVivo software, creating codes and themes for narrative synthesis. PROSPERO: CRD420251104580.
RESULTS
Thirteen articles were included. Implementation quality ranged from low to moderate; health effectiveness quality was very low. One study showed a reduction in mean body temperature and heart rate among older people experiencing homelessness after attending a cooling centre (air-conditioned space) for ≥70 minutes. However, evidence highlighted barriers to accessing cooling centres such as strict rules and limited hours, resulting in use of alternative public cool spaces, including libraries. Outreach teams providing cooling supplies and heat-health information showed high reach and acceptability. Shading propped above tents limited in-tent mean radiant temperature and, when removed overnight, increased in-tent airflow and reduced in-tent air temperature. Thirty policies were included. Beyond suggesting crucial long-term housing provision, policies relied on providing advice to attend a cool space without ensuring accessibility or evaluation. Promising exceptions aiming to improve accessibility, such as outreach-based mobile cooling hubs and provision of cooling supplies, remain under-evaluated.
CONCLUSIONS
Interventions intended to mitigate heat-health risk among people experiencing homelessness remain predominantly passive with limited evaluation. Shifting towards active outreach and low-barrier interventions, with robust evaluation, could generate evidence to guide effective heat protection.

BACKGROUND
Emerging infectious diseases increasingly originate at the human–environment interface, particularly in regions undergoing environmental degradation and social vulnerability,. Integrating ecological data into public health surveillance systems is essential for early detection and prevention of zoonotic risks. Within this context, the One Health approach has been recognized as a strategic framework linking human, animal, and environmental health,. Wild birds are especially relevant due to their ecological sensitivity, mobility, and potential role as reservoirs or sentinels of pathogens of public health importance,.
METHODS
This study assessed the prevalence and diversity of parasites in wild birds from forested and human-modified areas of the Atlantic Forest in southeastern Brazil between 2021 and 2023. Birds were captured using mist nets, and blood and fecal samples were collected for the detection of hemoparasites and intestinal parasites using standard parasitological methods.
RESULTS
Overall parasite prevalence was 44%, with higher occurrence in preserved forest environments. The most frequently detected parasites were Trypanosoma spp. (34.6%) and Plasmodium spp. (18%), followed by microfilariae (9%) and intestinal protozoa, including Cryptosporidium spp., Entamoeba spp., Giardia spp., and Isospora spp. All samples tested negative for Toxoplasma gondii. The observed prevalence exceeded values previously reported for wild birds in the Neotropical region.
CONCLUSIONS
The prevalence and diversity of parasites detected highlight the relevance of wild birds as components of integrated public health surveillance systems. Wildlife-based parasite monitoring can contribute to early detection of infectious agents circulating across ecosystems, supporting preparedness for emerging zoonotic risks. Incorporating ecological surveillance into public health strategies aligns with the One Health approach by linking environmental monitoring, biodiversity conservation, and disease prevention, thereby promoting more equitable,

inclusive, and sustainable public health policies.

Assessing the Effectiveness of Home Smoking Bans in Reducing Indoor Thirdhand Smoke and Children's Exposure Risk

Yun Wang[1], Juan Chen[2], Zhiyu Zhang[1], Zihui Li[1], Yuan Cao[3]
[1]Department of Occupational and Environmental Health, School of Public Health, Peking University, Beijing, China, [2]School of Public Health, Peking University, Beijing, China, [3]Health Education Institute, Beijing Center for Disease Control and Prevention, Beijing, China

BACKGROUND
Thirdhand smoke (THS), a persistent and hidden form of tobacco residue, poses a serious threat to children's health. While home smoking bans are known to reduce secondhand smoke exposure, their effectiveness against indoor THS pollution remains insufficiently evaluated. This study aims to comprehensively assess the effectiveness of home smoking bans in reducing indoor THS pollution and children's exposure risks.
METHODS
We enrolled 227 households with children, categorizing them into four groups: non-smoker households with a home smoking ban (NB), non-smoker households permitting smoking (NP), smoker households with a home smoking ban (SB), and smoker households permitting smoking (SP). We measured levels of THS markers—nicotine, N'-Nitrosonornicotine (NNN), and 4-(Methylnitrosamino)-1-(3-pyridyl)-1-butanone (NNK)—in indoor environments (airborne particulate matter, surface wipe samples, and towels), along with biomarkers (nicotine, cotinine, trans-3'-hydroxycotinine (3HC), and 4-(Methylnitrosamino)-1-(3-pyridyl)-1-butanol (NNAL)) in children's urine.
RESULTS
Concentrations of all environmental and internal THS markers followed the order: SP > SB > NP > NB. In the NP group, nicotine and NNK levels on hard surfaces (wipe samples) were significantly higher than in the NB group ($P<0.05$). Towels from children's rooms in the SP group contained significantly higher levels of nicotine, NNN, and NNK than those in the SB group ($P<0.05$). The presence of smokers combined with the absence of a home smoking ban significantly increased THS marker levels in all environmental samples (towels, wipes, particulate matter) and in children's urine ($P<0.05$). Multivariate analysis indicated that household smoking significantly elevated nicotine and cotinine in children's urine, NNN in wipe samples, and NNK in particulate matter. Home smoking bans effectively reduced cotinine and 3HC in children's urine, as well as THS markers in towels and wipe samples.
CONCLUSIONS
Home smoking bans play a positive role in mitigating indoor THS pollution and minimizing the risk of children's exposure.

Genotoxicity of cyphenothrin pesticide and the impact of encapsulation

Balázs Ádám[1], Moustafa Sherif[1], Abderrahim Nemmar[2], Bassam R. Ali[3]
[1]Institute of Public Health, United Arab Emirates University, Al Ain, United Arab Emirates, [2]Department of Physiology, United Arab Emirates University, Al Ain, United Arab Emirates, [3]Department of Genetics and Genomics, United Arab Emirates University, Al Ain, United Arab Emirates

BACKGROUND
Environmental and occupational exposure to pesticides is a significant public health concern, which is expected to increase with climate change. Intensive use, misuse, or inadequate control measures of these agrochemicals can lead to various adverse effects, including DNA damage. Pyrethroids are widely used insecticides that are considered relatively safe; although possibility of their genotoxicity has emerged. This study aimed to assess the genotoxic effects of the pyrethroid pesticide cyphenothrin.
METHODS
Cultured human white blood cells (HL60) and hepatocytes (HepG2) were exposed in vitro for 1 hr to cyphenothrin alone and to its product formulation (Bombex Farumy®) in encapsulated or released form at 0-200 □M and 0-1000 □M concentrations, respectively. Cytotoxicity was measured by propidium iodide staining and induced DNA damage was assessed using comet assay.
RESULTS
The study found that both the encapsulated and released product formulation, as well as cyphenothrin alone, reduced viability and increased DNA damage in the two cell types in a dose dependent manner. The encapsulated formulation showed less extensive cyto- and genotoxicity than the released form and the active ingredient. Cyphenothrin induced significant DNA damage in blood cells from 100 □M in all parameters consistently, the released formulation from 50 □M in tail length and at 100 □M in tail moment, while the encapsulated form only in tail length in an inconsistent manner. Regarding liver cells, significant DNA damage was induced only at a higher concentration (1000 □M) by cyphenothrin in all parameters and by the released formulation in tail DNA% and Olive tail moment.
CONCLUSIONS
These findings suggest that while encapsulation mitigates toxic effects, both cyphenothrin and its formulations may pose health risks. Our results confirm the genotoxicity of cyphenothrin and highlight the importance of considering both the active ingredient and its product formulations in genotoxicity assessments.

ABS3326

Genotoxic and epigenetic effects of prenatal and early-childhood pesticide exposure: a systematic review and meta-analysis

Balázs Ádám[1], Moustafa Sherif[2,1], Aya Darwish[3], Aya Samy[4], Shimaa Sami[5]
[1]Institute of Public Health, United Arab Emirates University, Al Ain, United Arab Emirates, [2]Department of Anatomy and Embryology, Benha University, Benha, Egypt, [3]Department of Physiology, Benha University, Moshtohor, Egypt, [4]Department of Statistics, Benha University, Benha, Egypt, [5]Central Clinical Pathology Labs, Ministry of Health and Population, Cairo, Egypt

BACKGROUND
Exposure to pesticides at early stages of life is a global environmental health concern, yet the genotoxic mechanisms potentially linking these exposures to adverse health outcomes remain incompletely characterized. This study aims to systematically review and meta-analyze evidence for genotoxic effects of early-life pesticide exposure.
METHODS
Following PRISMA guidelines we searched four databases for studies of prenatal/childhood pesticide exposure reporting primary DNA damage, cytogenetic damage, DNA methylation, or gene-expression outcomes. Risk of bias was assessed with the Newcastle–Ottawa Scale. Random-effects meta-analyses estimated pooled effect sizes and explored subgroup heterogeneity.
RESULTS
Twenty-eight studies met inclusion criteria. Meta-analysis revealed substantial DNA damage in pesticide-exposed groups (Cohen's d=4.85, 95%CI=3.31-6.39), with stronger effects in maternal and cord blood than in children's blood. Cytogenetic damage showed consistent increase in agricultural versus urban areas, though with significant heterogeneity in effect magnitude. Pathway-specific gene expression analysis revealed significant downregulation of DNA damage/repair genes (-1.08, 95%CI:-1.20,-0.96) and distinct biological responses across inflammatory, oxidative stress, and cell signaling pathways. DNA methylation responses varied by pesticide class, with o,p'-DDT consistently associated with hypermethylation. Pronounced sex-specific effects and genetic susceptibility emerged as important effect modifiers.
CONCLUSIONS
The evidence supports substantial genotoxic and epigenetic alterations following early-life pesticide exposure, highlighting mechanistic pathways that may underlie adverse health outcomes and reinforcing the need for effective environmental health policies during critical developmental windows.

ABS3331

Drinking water quality in the United Arab Emirates: a systematic review

Balázs Ádám[1], Ghada S. M. Al-Bluwi[1,2], Virgie Guy Pedo[2], Saif Al-Shamsi[2], Asma H. AlNababteh[3], Linda Östlundh[4], Janusz A. Jankowski[5]
[1]Institute of Public Health, United Arab Emirates University, Al Ain, United Arab Emirates, [2]Department of Internal Medicine, United Arab Emirates University, Al Ain, United Arab Emirates, [3]School of Health and Environmental Studies, Hamdan bin Mohammed Smart University, Dubai, United Arab Emirates, [4]University Library, Örebro University, Örebro, Sweden, [5]Institute for Clinical Trials, University College London, London, United Kingdom

BACKGROUND
One of the most important and challenging environmental health tasks worldwide is the provision of sufficient amount and adequate quality of drinking water for the public, especially in arid regions. Water shortage is a critical issue in most parts of the Middle East, even for wealthy countries. The United Arab Emirates (UAE) is not an exception, where bottled water is favored to tap water, which poses sustainability issues in the fight against climate change and microplastics

pollution. This systematic review aims to synthesize evidence on the quality of bottled water in comparison to tap water in the UAE.
METHODS
The systematic review followed the Preferred Reporting Items for Systematic Review and Meta-analysis (PRISMA) 2020 guidelines. A structured search of peer-reviewed publications was performed in five scientific databases. Screening, data extraction and risk of bias assessment were carried out by two reviewers independently. Data were synthesized in summary tables.
RESULTS
14 papers were finally included in this systematic review. All were cross-sectional studies from four of the seven Emirates of the UAE. Seven studies investigated components in bottled water, six in tap water and one in both, comparing their results to various national and international standards. The studies detected several parameters out of the normal range, especially in tap water, where physical parameters, such as turbidity and electrical conductivity, chemical parameters, such as chlorine and several metals, including carcinogens, and biological parameters, such as various bacteria and fungi, were found at unhealthy levels. In contrast, problems with bottled water were mainly limited to a few chemicals, such as fluoride, nitrite and bicarbonate.
CONCLUSIONS
The findings revealed quality issues with tap water in the UAE. To assure an environmentally and economically sustainable provision of healthy drinking water to the population, evidence-based actions need to be taken.
Popul. Med. 2026;8(Supplement 1):A443

ABS3364
Flooding and chemical contamination impacts on human health: a global scoping review

Sari Kovats[1], Hanna-Andrea Rother[2], Filiz Karakas,[1], Haydn Cole[3], Raquel Duarte-Davison[3]
[1]Public Health, Environments and Society, London School of Hygiene and Tropical Medicine, London, United Kingdom, [2]Division of Environmental Health, School of Public Health, University of Cape Town, Cape Town, South Africa, [3]Chemicals and Environmental Effects Department, Radiation Chemicals and Environmental Hazards Division, UK Health Security Agency, London, United Kingdom
ABSTRACT
Flooding can increase the mobilisation of hazardous chemicals in the environment and adversely affect human health. Climate change is already increasing heavy rainfall and flooding events, and the increased exposure to hazardous chemicals requires greater policy and research input. This scoping review provides an overview of current evidence on how flood events cause chemical contamination, population exposures and impacts on health. Exposures to hazardous chemicals can be caused by surface water flooding, coastal flooding, river flooding, storm surge, monsoon rainfall and high tides. We identified 108 studies examining the association between flooding and chemicals in the environment, with most focusing on heavy metals, polycyclic aromatic hydrocarbons, and arsenic. Over half of the papers reviewed investigated the aftermath of Hurricanes. There was a lack of information on rural population exposures and studies on mobilisation of pesticides. Limited studies mapped or modelled human exposures, including for high-risk populations (e.g., children, pregnant women), and this remains a critical evidence gap. Our results highlighted several pathways by which flood events can mobilise chemicals and pose risks to human health. A dual risk management strategy (i.e., the coordinated management of both flood-related and chemical release risks) is required to address flooding events, chemical releases, and health impacts.

ABS3375
Grounding Ethics in Climate Change and Health Research: A collaborative study triangulating perspectives of the communities, researchers and ethical committees

Joris Michielsen[1], Katerina Ceballos[1], Kochupurackal Ulahannan Sabu[2], Ana Lucia Martinez Abarca[3], Soledad Colombe[1]
[1]Public Health, Institute of Tropical Medicine, Antwerp, Belgium, [2]Public Health, Independent consultant, Kerala, India, [3]Public Health, Independent consultant, Antwerp, Belgium
BACKGROUND
As effects of climate change intensify, ethical considerations become critical for populations disproportionately affected by climate-induced health hazards. While EcoHealth, One Health, and Planetary Health frameworks emphasize stakeholder co-creation, existing ethical guidelines remain theoretical and top-down, rarely consulting affected communities. This two-phase study triangulates perspectives of communities, researchers, and ethics committees to develop grounded ethical recommendations for climate-health research.
METHODS
We gathered community perspectives through interviews and focus groups discussions (FGD) with Indigenous populations in India (16 interviews, 2 FGD) and coastal communities in the Philippines (16 interviews, 8 FGD), exploring experiences of ethical processes and practices. This informed the development of vignettes and corresponding statements for an online 2-rounds Delphi study with researchers and ethics committee members (52 respondents round 1; 23 round 2).
RESULTS
A central tension emerged between institutional ethics emphasizing individual procedural consent and extractive knowledge production versus communities' expectations of collective governance and relational accountability. Communities stressed reciprocity as foundational: willingness to participate and share data depends on researchers sharing their expertise, disseminating actionable findings, responding to community needs, and building long-term trust. Reciprocity was further described as requiring research materials in local dialects, respecting the traditional decision-making processes, and engaging community co-researchers. Delphi respondents emphasized balancing long-term climate objectives with participants' immediate rights, safety, and dignity. Strong consensus emerged on anticipating climate-related burdens, prioritizing participant well-being even when requiring protocol deviations, enabling context-appropriate compensation for contributed labor, and valuing Indigenous and experiential knowledge alongside scientific data. Though consensus was strong, feasibility was often questioned, and institutional rigidity was identified as a main barrier to grounded ethical practice.
CONCLUSIONS
Findings highlight the necessity for ethical frameworks explicitly addressing climate-specific vulnerabilities, reformed funding structures enabling ethical practices currently deemed aspirational, and methodological pluralism integrating quantitative and qualitative approaches with Indigenous knowledge systems as standard practice.

ABS3386
Algae as a Source of Protein and Oil for Human Nutrition, Food Security and Health in Africa: A Systematic Review

Frank Hayford[1], Johan Van Niekerk[1], Wilna Oldewage-Theron[1]
[1]Department of Sustainable Food Systems and Development, University of The Free State, Bloemfontein, South Africa
BACKGROUND
Africa faces a dual burden of undernutrition and rising prevalence of diet-related non-communicable diseases, worsened by climate change, population growth, and constraints on conventional food systems. Algae, including micro algae (Spirulina), have emerged as promising sustainable food resources due to their high protein content, valuable lipid profiles, and relatively low land and water requirements. Although algae-based foods and supplements have been introduced in several African countries, evidence on their contribution to human nutrition, food security, and health are limited and not been systematically synthesized.
METHODS
This systematic review aimed to synthesize available evidence on algae for human nutrition and food security in Africa. Searches were conducted in PubMed/MEDLINE, Scopus, Web of Science, AGRIS, Embase, CINAHL, Cochrane Central, Google Scholar and African Journals Online for studies published from January 2000 to the present. Eligible studies included nutrient composition analyses, human intervention and observational studies conducted in African settings. Data extracted included algae species, nutritional composition, health outcomes, food security implications, safety, and acceptability, and were evaluated across diverse populations, including malnourished children and adults living with HIV. Risk of bias was assessed using ROBIS, and findings were synthesized narratively.
RESULTS
Preliminary evidence suggests that algae produced and consumed in African contexts, particularly Spirulina, are rich in protein (~70%), lipids (20–50%), vitamins, essential minerals, and antioxidants. Reported benefits include improvements in nutritional status and dietary quality, enhanced immune function, and potential for local production and livelihood generation. However, evidence base remains heterogeneous, with limited large-scale trials and gaps regarding algae-derived oils, and consumer acceptability.
CONCLUSIONS
Algae represent a promising but underexplored resource for improving human nutrition, food security, and health in Africa. This review highlights potential of algae, particularly Spirulina, to contribute to sustainable African food systems,

while underscoring the need for robust clinical trials and implementation research towards large-scale adoption.

Climate services for diarrheal diseases: The benefit of climate information for health protection

Sari Kovats[1], Cherie Part[1], Janine Wichmann[2], Neville Sweijd[3], Thu Dang[4], Veena Iyer[5], Meghnath Dhimal[6], Yu-Chun Wang[7], R Azizah[8], Amir Sapkota[9]
[1]Public Health, Environments and Society, London School of Hygiene and Tropical Medicine, London, United Kingdom, [2]School of Health Systems and Public Health, University of Pretoria, Pretoria, South Africa, [3]School for Climate Studies, Stellenbosch University, Stellenbosch, South Africa, [4]Public Health Faculty Unit, Hue University of Medicine and Pharmacy, Hue, Viet Nam, [5]Indian Institute of Public Health Gandhinagar, Gandhinagar, India, [6]Nepal Health Research Council, Government of Nepal, Kathmandu, Nepal, [7]Environmental Health Risk Assessment Lab, Chung Yuan Christian University, Taipei, Taiwan, [8]Research Group Environmental Health and Climate, Department of Environmental Health, Faculty of Public Health, Airlangga University, Surabaya, Indonesia, [9]Department of Epidemiology and Biostatistics, University of Maryland School of Public Health, University of Maryland, College Park, United States

ABSTRACT
Climate services require appropriate engagement between the recipient of the service and its provider, along with an effective access mechanism to enable timely action. Climate services help decision makers prepare for the impacts of extreme weather. National and international mechanisms exist to support collaboration between health systems and national meteorological agencies but progress has been slow. We reviewed the current use of climate information in public health activities in relation to the management of water-related diseases, particularly diarrhoeal diseases and cholera. We reviewed the use of daily weather forecasts, extreme weather alerts, sub-seasonal and seasonal forecasts. We used interviews and publicly available policy documents and public health guidance for the 8 countries in our AWARE consortium: India, Indonesia, South Africa, Nepal, Vietnam, Taiwan, US and the UK. We found that most countries have public health preparedness plans for flood and heatwave warnings to prevent diarrhoeal disease morbidity, and several have developed climate and health collaborations. There has been little evaluation of the use of climate information. The burden of diarrheal disease continues to be a major public health threat in resource limited settings. Both sporadic cases and outbreaks can be triggered by extreme weather events, but evidence, particularly for the effect of rainfall extremes, varies by settings. Local knowledge may not be effectively translated to support preparedness activities at the community level. The development and implementation of climate/weather-informed early warning system is urgently needed to enhance community resilience to the threat of climate mediated disease risks.

Favelas and polycrises: an "insider and a close-up view" and the development of hybrid knowledge through systemic risk assessment with young researchers in heliópolis, são paulo, brazil

Leonardo Musumeci[1], Luciana Bizzotto[1], Yorman Paredes[1], Beatriz Damásio[1], Leandro Giatti[1]
[1]School of Public Health, University of São Paulo, São Paulo, Brazil

ABSTRACT
Favelas determine living and health conditions while amplifying the risks to which their populations are exposed. Within a context of polycrises (Dan-Cohen, 2019), recognizing how these risks manifest, overlap, and affect these communities and how they perceive and develop response capacities are priority challenges for health promotion. This study sought to evaluate a Systemic Risk Assessment (SRA) model (Gambhir et al., 2025) based on the Heliópolis favela in São Paulo, Brazil, focusing on the climate change, COVID-19, and food insecurity crises. It aimed to construct new meanings through the hybridization of technical-scientific and popular knowledge in identifying local risks and responses. Eleven workshops were conducted with nine young researchers from the community-based observatory "De Olho na Quebrada" using participatory methods (Wallerstein et al., 2017): culture circles, photovoice, world café, and talking maps, alongside WhatsApp questionnaires regarding justice and equity, individual and collective agency, and impacts and responses across multiple scales. The assessment identified intersected risks related to: conducting research within the community while dealing with power dynamics and territorial interests; fires associated with high housing density and precarious systems; environmental racism regarding urban flooding and chemical contamination in a housing complex; and inequalities that aggravate crises. It also noted threats to the sense of community and local social capital due to changing habitation patterns. The study concluded that risk assessment expands when applied an "insider and a close-up view" (Magnani, 2002), revealing factors often missed by institutional data. Responses associated with local social capital demonstrate creative solutions for the future, highlighting the necessity of intercultural translations to bridge technical knowledge and local realities.

Combating loneliness in South African cities: exploring public health through an urban planning lens

Rouve Bingle[1]
[1]City and Regional Planning, University of Cape Town, Cape Town, South Africa

BACKGROUND
Urban loneliness poses a significant public health challenge in South Africa, intensified by apartheid's spatial legacies that created isolated townships and fragmented communities in metropolitan cities like Johannesburg and Cape Town. This isolation contributes to mental health issues, including anxiety, depression, and social disconnection, disproportionately affecting low-income and marginalized groups amid rapid urbanization and socioeconomic divides. Public health data indicates rising loneliness rates, linked to car-centric designs, limited public spaces, and unequal access to amenities. This study investigates how urban planning policies address loneliness through spatial interventions that promote connectivity and social cohesion. Grounded in affect theory—drawing from Spinoza and Deleuze—it views urban spaces as affective environments that shape emotional interactions, enabling planning to foster positive encounters and communal vitality.
METHODS
Employing a qualitative document analysis of secondary data, the study reviews key metropolitan planning policies, including Integrated Development Plans (IDPs), Municipal Spatial Development Frameworks (MSDFs), and national frameworks like SPLUMA (2013) and the National Development Plan. Documents from major cities (e.g., Cape Town's MSDF, Johannesburg's Corridors of Freedom) were examined for references to loneliness, isolation, or related themes such as social cohesion, public spaces, and inclusive design. Affect theory guides the analysis, assessing how policies modulate affective atmospheres to reduce isolation.
RESULTS
Analysis reveals sporadic attention to loneliness in policies, often indirectly through emphases on mixed-use developments, green corridors, and transit-oriented designs aimed at enhancing encounters. However, explicit integration is limited, with MSDFs prioritizing economic and environmental goals over psychosocial health, missing opportunities for affect-informed interventions like communal hubs.
CONCLUSIONS
Urban planning in South Africa can better combat loneliness by embedding affect theory into policies, mandating designs that facilitate social bonds. Recommendations include affective audits in IDPs/MSDFs to prioritize anti-isolation measures, advancing public health equity in metropolitan contexts

DXA-Measured Body Composition Modifies Temperature–Blood Pressure Associations by Sex in Johannesburg, South Africa

Benjamin Devantier-Du Plessis[1], Samantha Jack[1], Lisa Mickelsfield[2], Julia Goedecke[3,2], Sabina Abba Omar[4], Matthew Chersich[1], Nicholas Brink[1], Craig Parker[1]
[1]Planetary Health Research, School of Public Health, University of the Witwatersrand, Johannesburg, South Africa, [2]SAMRC/Wits Developmental Pathways for Health Research Unit, Faculty of Health Sciences, University of the Witwatersrand, Johannesburg, South Africa, [3]Biomedical Research and Innovation Platform, South African Medical Research Council, Cape Town, South Africa, [4]Climate System Analysis Group, Department of Environmental and Geographical Science, University of Cape Town, Cape Town, South Africa

BACKGROUND
Rising urban temperatures in sub-Saharan Africa intersect with high burdens of obesity and hypertension, yet how body composition influences cardiovascular responses to heat is poorly understood. Central adiposity may impair heat dissipation through reduced skin blood flow. Using dual-energy X-ray absorptiometry (DXA), we examined whether total body fat and android fat modify associations between ambient temperature and blood pressure or glucose, stratified by sex.
METHODS

Cross-sectional data from the Middle-aged Soweto Cohort (MASC) study (2017–2018, Johannesburg) were linked to ERA5 reanalysis climate data. Adults with complete DXA data were included (males N=467; females N=457; age 41–71 years). Outcomes were systolic blood pressure (SBP), diastolic blood pressure (DBP), and fasting glucose. Outcome-specific temperature lags were evaluated (1-day for blood pressure; 7-day for glucose). Sex-stratified linear regression models tested independent effects of body composition, temperature–adiposity interactions, and temperature associations by android fat level.
RESULTS
Higher android fat was independently associated with higher SBP in males (+3.4 mmHg per 1%; 95% CI: 2.3, 4.5; p<0.001), higher DBP (males: +1.7 mmHg, p<0.001; females: +1.2 mmHg, p=0.002), and higher fasting glucose in both sexes (males: +0.20 mmol/L, p<0.001; females: +0.28 mmol/L, p<0.001), independent of BMI. Significant temperature–adiposity interactions were observed for DBP: higher total body fat attenuated the temperature–DBP association in males (interaction p=0.048), while higher android fat amplified this association in females (interaction p=0.028). In females, inverse temperature–blood pressure associations were observed only at the highest levels of android fat (SBP: −6.0 mmHg per 5°C, p=0.008; DBP: −3.8 mmHg, p=0.002), with no associations at lower levels.
CONCLUSIONS
DXA-measured android adiposity is independently associated with higher blood pressure and fasting glucose and modifies temperature–blood pressure relationships in a sex-specific manner. In women, high android adiposity identifies a subgroup with heightened cardiovascular sensitivity to ambient temperature, supporting body composition–informed heat vulnerability assessment in urban populations.

ABS3681
Increasing Readiness to Adopt Sustainable Diets: Does Asking About Alternative Protein Food Intake Changes Intention and Consumption Among Omnivores and Meat-Reducing Individuals

Natalia Paduszyńska[1], Anna Kornafel[1], Zofia Szczuka[1], Hanna Zaleśkiewicz[1], Dominika Wietrzykowska[1], Aleksandra Luszczynska[1]
[1]CARE-BEH. Center For Applied Research on Health Behavior and Health, SWPS University, Wrocław, Poland
INTRODUCTION
Nutritional choices based on traditional proteins (eggs, dairy, and meat) are unsustainable, as they are the main drivers of environmental degradation and climate change. In contrast, alternative protein foods (APFs) produced from plants and insects are generally associated with a lower environmental impact. This study examined intentions to buy and increase APF intake among individuals identifying as omnivores and those limiting meat consumption. We also investigated so-called 'mere measurement' effects, that is prompting intentions and APF intake, induced by asking participants about their beliefs and behaviors related to APF.
METHODS
Adults from the general population were recruited in Poland (N=684; age range 18–85 years; 65.6% women). An omnivorous diet was reported by n=486 participants, while n=198 participants followed meat-reducing diet. At baseline and at a one-month follow-up, participants completed questionnaires assessing self-reported APF consumption and its psychosocial determinants. Primary outcomes included intentions (to buy, to eat) and the actual intake of insect-based and plant-based APF and intake of food based on traditional proteins.
RESULTS
A significant Time×Diet interaction was observed for the consumption of food containing plant-based proteins, with an increase of intake of plant-based APF increasing over time among omnivores but not among those who followed meat-reducing diet. A significant main effect of time was observed for intentions to consume and willingness to buy insect-based alternative proteins, with small increases in both dietary groups. Additionally, there was a small decline over time in intake of traditional proteins. All observed mere measurement effects and time effects were small.
CONCLUSIONS
These findings suggest small dietary shifts toward APF choices over time (and, potentially, a "mere measurement" effect) in both omnivorous participants and individuals already reducing meat intake. The results document an increased readiness towards adoption of more sustainable dietary patterns, including diverse non-traditional protein sources.

ABS3694
Integrating climate change, environmental health, and one health into provincial health governance: a policy analysis from the western cape, south africa

Levani Naidoo[1]
[1]Health and Wellness, Western Cape Government, Cape Town, South Africa
INTRODUCTION
Climate change poses escalating risks to public health, disproportionately affecting vulnerable populations and intensifying threats related to extreme heat, air pollution, vector-borne diseases, water insecurity, and environmental degradation. In the Western Cape, these pressures have highlighted the need for a coordinated, system-wide health sector response. Recognizing the critical role of governance in climate resilience, the Western Cape Department of Health and Wellness initiated a policy transformation to integrate Climate Change, Environmental Health, and One Health approaches into provincial health planning and service delivery.
METHODS
A qualitative policy analysis was conducted to assess strategic requirements and policy gaps for climate–health integration within the Department. Data sources included internal policy documents, multisectoral engagements and interdepartmental working groups. A thematic governance framework was applied to identify systemic barriers, enabling factors, and opportunities for embedding climate resilience within the health system.
RESULTS
Four key governance themes emerged: 1) fragmented governance arrangements requiring a dedicated provincial coordination mechanism for climate and health; 2) surveillance gaps underscored by limited early warning for climate-sensitive diseases thus highlighting the need for integrated environmental and meteorological data systems; 3) fragmented multisectoral alignment constraining implementation of One Health approaches at zoonotic and health interfaces; and 4) significant demand for capacity building through structured knowledge exchange, technical training, and standardised operational tools. These directly informed the establishment of South Africa's first Provincial Climate Change Sub-Directorate and development of a Provincial Health Climate Change Strategic Plan encompassing mitigation and adaptation measures.
CONCLUSIONS
Integrating Climate Change, Environmental Health, and One Health into provincial health governance requires clear institutional mandates, strengthened surveillance systems, and operationalised multisectoral collaboration. The Western Cape experience offers a scalable governance model for embedding climate resilience within public health policy, planning, and service delivery.

The impact of socio-environmental and climate vulnerabilities on the patient care profile in an emergency hospital in Rio de Janeiro, Brazil.

Mônica Testa Morangueira[1], Murilo Viana Castro Souza[2], Everton Turmilheiro Rafael[2], Felipe Rufino Carlos[1], Bruna de Melo Lisboa[1], Tiago Velloso de Carvalho[1], Flavio Monteiro de Souza[1], Francisco Jose Santos Maia[3]
[1]Executive Department - Municipal Hospital Evandro Freire, CEJAM Institute Dr. João Amorim Center for Studies and Research, Rio de Janeiro, Brazil, [2]Environmental and Climate Responsibility, CEJAM Institute Dr. João Amorim Center for Studies and Research, São Paulo, Brazil, [3]Teaching and Research Committee - Municipal Hospital Evandro Freire, CEJAM Institute Dr. João Amorim Center for Studies and Research, Rio de Janeiro, Brazil
ABSTRACT
Climate emergencies and socio-environmental inequalities disproportionately affect the most vulnerable populations. Extreme events such as heat waves, cold waves, and floods directly impact health outcomes. Epidemiological studies and interdisciplinary analyses indicate that the interaction between social determinants and climate change amplifies health risks, requiring integrated responses in public policies and global health systems to promote resilience and equity.This retrospective study analyzed epidemiological notifications of emergency room visits from January 2024 to December 2025, based on secondary data. Causes associated with climatic events included leptospirosis, arboviral diseases, flu-like syndromes, and self-inflicted violence, reported by the Rio Operations Center (COR).During the study period, 132,833 emergency care visits were recorded. Twenty-seven cases of leptospirosis were identified, with a peak of 65.21% during months of highest rainfall, mainly in socially vulnerable neighborhoods. Thirty-four dengue cases were concentrated in Maré and Cacuia, with peaks in February and March. Fifty-four hospitalizations due to severe acute respiratory syndrome (SRAG) occurred predominantly among elderly residents, with a significant increase in June and July. A total of 285 cases related to self-inflicted violence

were reported, mostly among women (72.1%) aged 20–39 years, followed by adolescents aged 13–19 years.The results demonstrate an association between intense rainfall and leptospirosis in vulnerable territories, while dengue incidence coincided with periods of extreme heat alerts. SRAG cases increased during months of pronounced climatic variability. Environmental racism amplifies health risks in marginalized areas, reinforcing inequalities in exposure and impact.The COR plays a critical role in environmental risk monitoring and prevention. Self-inflicted violence reflects social vulnerability and gaps in mental health support. Integrated public policies linking health, social justice, and socio-environmental development are essential, with intersectoral monitoring and response protocols prioritizing high-risk territories.

Investigation of suspected Bovine Brucellosis cases in a Cattle Herd in Sheepmoore, Msukaligwa Sub-District, Mpumalanga Province 2025

Charity Mafhungo[1,2], Siphesihle Vilakazi[1,2], Nomsa Hlatshwayo[1], Jani Van Den Berg[3], Masingita Makamu[2], Emelda Ramutshila[2]

[1]1 Communicable Disease Control, Mpumalanga Department of Health, Mbombela, South Africa, [2]2 South African Field Epidemiology Training Programme, National Institute for Communicable Diseases, Division of the National Health Laboratory Services, Johannesburg, South Africa, [3]3 Department of Agriculture, Department of Agriculture, Rural Development, Land and Environmental Affairs, Mbombela, South Africa

BACKGROUND

Brucellosis is a zoonotic infectious disease caused by bacteria of the genus Brucella and remains a significant public health concern. On the 29th of October 2025, four cows from a herd in Sheepmoore experienced abortions, prompting notification to the Msukaligwa sub-district Communicable Disease Control office. We investigated to confirm the existence of the outbreak, verify diagnosis, determine the extent of the outbreak, and implement control measures to stop transmission to other animals and humans.

METHODS

We conducted a descriptive study and defined a suspected case as any cattle that experienced a miscarriage or delivered a stillborn calf or presented with orchitis or bursitis between January to November 2025, in Sheepmoore, Mpumalanga Province. A confirmed case was defined as any cattle, with laboratory confirmation abortifacient Brucella species. Data on herd composition, reproductive history, and vaccination status were collected through interviews with the cattle herd owner, and household members were screened. Blood specimens from ten cattle were tested for brucellosis using Rose Bengal and Complement Fixation Tests. Descriptive analysis was done on Microsoft Excel.

RESULTS

The herd comprised of 16 cattle:3 bulls,9 cows, and 4 calves, all of which were vaccinated. Six pregnancies occurred between March and October 2025, resulting in four abortions and two live births. Two abortions that occurred in October 2025 were reported after implementation of the event-based surveillance. Of the 10 tested cattle, brucellosis was confirmed in one cow. A nearby herd owner reported similar symptoms in his cattle, but no follow-up conducted. Household members were asymptomatic. Immediate control involved culling infected cattle, with follow-up testing planned

CONCLUSIONS

A cluster of suspected bovine brucellosis was identified with one laboratory-confirmed case. We recommended strengthening intersectoral outbreak response capacity for timely detection, reporting and response, cattle vaccination, and community awareness on measures to control brucellosis and prevent zoonotic transmission

Popul. Med. 2026;8(Supplement 1):A458

ABS3766

Exploring the role of grandmothers in promoting sustainable environmental practices and climate awareness in community-based climate interventions

Thandile Zonke[1], Jane Simmonds[1]

[1]goGOGOgo, Johannesburg, South Africa

INTRODUCTION

Grandmothers in low-income settings play a critical role as primary caregivers and knowledge holders, often raising grandchildren while navigating economic insecurity, chronic health conditions and age-related debility and disabilities. Climate change is intensifying immediate and disproportionate risks for older people, including heat stress, water scarcity, food insecurity and increased exposure to extreme weather events. These risks are compounded by reduced mobility. Despite this, few community-based climate interventions intentionally prioritise older women caregivers as agents of resilience and intergenerational knowledge transfer. This study aims to understand climate awareness, and adaptive coping strategies among grandmothers, with an explicit intergenerational focus.

METHODS

The study assessed the feasibility, acceptability, and preliminary outcomes of a community-based climate intervention implemented within a grandmother-led support programme. The intervention combines facilitated group sessions on climate impacts, local adaptation strategies, and stress regulation related to climate shocks. A mixed-methods approach will be employed, integrating pre- and post-intervention self-reported measures of perceived stress, climate-related anxiety, and coping capacity with qualitative data from focus group discussions and facilitator observations. Data collection will also explore intergenerational knowledge transfer, including how grandmothers shared climate adaptation practices and stress-management strategies with their grandchildren.

RESULTS

It is anticipated that participants will emerge with an increased understanding of local climate risks, emerging developments in the climate and energy space. It can be assumed that grandmothers will actively teach their grandchildren about climate risks and stress-management techniques, such as water conservation, heat management, and emotional coping during extreme weather events. This intergenerational exchange will strengthen communication, caregiving relationships, and collective household resilience.

CONCLUSIONS

The climate-focused intervention shows promise as a low-cost, scalable approach to building intergenerational climate awareness in low-income settings. By positioning grandmothers as both caregivers and climate educators, the intervention extends impact beyond individual participants to households and future generations.

Spatial assessment of early childhood development centers' proximity to coal-related air pollution in Mpumalanga Province, South Africa

Yonela Mkunyana[1], Tahira Kootbodien[1], Nomfundo Mahlangeni[1,2], Renée Street[1,2]

[1]Environment & Health Research Unit, South African Medical Research Council, Cape Town, South Africa, [2]Environmental Health Department, University of Johannesburg, Johannesburg, South Africa

BACKGROUND

Children are vulnerable to air pollution exposures due to their developing immune systems. In South Africa's coal-dependent regions, emissions from coal-fired power plants (CFPPs), coal mines, and associated industries contribute substantially to ambient nitrogen dioxide (NO) and sulphur dioxide (SO) levels. However, limited evidence exists on the spatial co-occurrence of pollution hotspots and Early Childhood Development (ECD) facilities.

METHODS

This study assessed the distribution of ECDs in relation to coal pollution sources and satellite-derived air pollutant concentrations in Mpumalanga Province, South Africa. Locations of ECDs, coal mines, and CFPPs were mapped. A 5 km buffer was created around CFPPs to identify ECDs within potential exposure zones, and distances from ECDs to the nearest pollution source were measured. Kernel Density Estimation (KDE) was used to characterise clustering patterns of coal industries and ECDs. Annual mean NO and SO densities for 2021 were derived from Sentinel images. Getis–Ord Gi* statistics were applied to identify significant high and low-concentration clusters.

RESULTS

A total of 2894 ECDs were mapped across Mpumalanga. Coal industries comprised 12 CFPPs and 82 coal mines, including operational and inactive sites. ECDs were unevenly distributed, with some located within 5 km of CFPPs. KDE analysis revealed spatial overlap between high densities of coal industries and ECDs. Hotspot analysis identified significant NO and SO clusters in areas with intensive coal-based activities. The minimum ECD-CFPP distance was approximately 1 km, while the closest ECD-mine distance was 640 m. A distance-decay pattern was observed, with the highest pollutant concentrations occurring within the first 40 km, followed by a sharp decline with increasing distance.

CONCLUSIONS

In Mpumalanga, the proximity of ECDs to coal-related activities and elevated NO and SO levels suggests potential environmental exposures for young children, reinforcing the need for spatially informed regulation and monitoring.

Popul. Med. 2026;8(Supplement 1):A460

Climate and Health 101 : Strengthening public health capacity to respond to climate change

Roxanne Govender[1], Harsha Somaroo[1,2]
[1]Community health, University of the witwatersrand, Johannesburg, South Africa, [2]Department of health, South African national government, Pretoria, South Africa

INTRODUCTION
Climate change is one of the greatest public health threats of the twenty-first century, with health risks increasingly transcending borders1. African countries experience disproportionate impacts despite contributing least to global carbon emissions, placing pressure on health systems and exposing shared vulnerabilities2. Findings from a recent study among South African public health medicine (PHM) specialists identified key gaps in knowledge related to climate change and health, and limited skills in advocacy, monitoring and evaluation, and policy development3. This highlights an urgent need to strengthen public health capacity for protecting and sustaining climate change responses.
METHODS
This organized session is a one-hour interactive workshop combining didactic input and facilitated panel discussion, with audience engagement. The session draws on evidence from climate and health literature and health system strengthening frameworks. Practical examples from south africa and other low and middle income country settings will be used to illustrate climate related health risks, the contribution of health systems to climate change, and opportunities for action across clinical, managerial, and policy roles. Participatory discussion will explore real world challenges and contextual solutions. The panellists will include dr roxanne govender (south african researcher), dr andre rose (PHM specialist), mr jim chauvin (global public health advocate, and mr rico eurupidou (environmental justice advocate). (Expected) Results Participants will strengthen their understanding of climate related health risks and build practical skills in advocacy, policy engagement, and the application of monitoring and evaluation concepts to climate and health interventions.
CONCLUSIONS
This workshop provides a practical platform for capacity building in climate change and health, responding directly to identified training gaps. It supports the integration of climate and health competencies into public health education and continuing professional development, and aims to empower public health professionals to take meaningful action within health systems and policy environments.

Data-driven understanding of air pollution in Pretoria

Matome Mokganya[1], Joyce Shirinde[1], Janine Wichmann[1]
[1]School of Health Systems and Public Health, University of Pretoria, Pretoria, South Africa

INTRODUCTION
Fine particulate matter (PM.) is a major contributor to global disease burden, yet long-term monitoring and chemical characterisation remain limited in low- and middle-income countries, including South Africa. South Africa is one of a handful of African countries that has an air quality act since 2005. The national air quality standard of PM2.5 was only promulgated in 2012 and there was a considerable delay to deploy PM2.5 monitoring equipment. This study addresses persistent air quality data gaps in South Africa by deploying and calibrating low-cost sensors (LCSs) to characterise PM2.5 while quantifying spatial inequality in population exposure across Pretoria.
METHODS
Two PurpleAir sensors were collocated with an Oizom reference monitor during a multi-month 2025 campaign, with daily averages computed after rigorous cleaning and outlier screening. Machine-learning calibration models incorporating meteorological covariates (temperature, relative humidity, wind speed) were evaluated.
RESULTS
Random forest regression performed best (R = 0.90,MSE = 5.32), followed by multiple linear regression (R = 0.88,MSE = 5.94) and a feed-forward neural network (R = 0.73, MSE = 13.93). Inter-sensor agreement was strong (r > 0.97), and PM2.5 frequently exceeded the WHO daily guideline (15 µg/m), with peaks in late February, mid-March, and mid-April. Calibrated observations were integrated with satellite-derived concentration surfaces and ward-level population data to estimate population-weighted exposure. The resulting Pretoria map shows five exposure classes spanning 28.6-76.5 µg/m, revealing pronounced intra-urban disparities where high-density and socio-economically vulnerable wards bear disproportionate burdens. These mapped disparities, derived via ward aggregation, inequality indices, and cluster detection, align with spatial segregation patterns and highlight environmental injustice.
CONCLUSIONS
By combining validated LCS measurements with machine-learning calibration and population-weighted mapping, the study delivers policy-relevant evidence for targeted air-quality interventions, prioritised monitoring expansion, and equitable urban planning in Pretoria.

ABS3967

Youth leadership in public health emergencies: models from conflict and climate-affected regions

Duha Shellah[1]
[1]Public Health in Emergencies and Disasters Working Group - WFPHA, Nablus - P400, Palestinian Territory, Occupied

INTRODUCTION
In armed conflict, climate disasters, pandemics, and political instability, youth are often the first responders—creating grassroots solutions when formal systems fail. Yet youth leadership remains underrecognized in preparedness, response, and recovery frameworks.
METHODS
This presentation synthesizes youth-led public health response models from Gaza, Sudan, Pakistan, and Haiti. It draws on participatory emergency approaches and cross-regional learning, examining interventions in surveillance, mental health support, risk communication, and climate-health adaptation.
RESULTS
Youth-led models demonstrate rapid mobilization, community trust, and innovation under constraints. Examples include community-based surveillance and referral pathways, psychosocial support initiatives, and climate-resilience health actions. Findings suggest youth leadership can be institutionalized through structured funding mechanisms, technical mentorship, and representation within humanitarian coordination and national preparedness systems. Persistent challenges include lack of formal authority, limited access to decision-making, and safety risks in conflict settings.
CONCLUSIONS
Global public health systems must move from tokenistic inclusion toward formalized youth leadership pathways. Embedding youth as co-designers and decision-makers strengthens emergency preparedness and accelerates equity-driven, locally grounded response.
Popul. Med. 2026;8(Supplement 1):A468

Exploring Climate-sensitive Patterns of Vector-Borne Diseases in South Africa using Big Data analytics

Lesedi Victoria Monaiwa[1], Peter Olukanmi[1,2], Rajesh Kumar[3]
[1]Environmental Health, University of Johannesburg, Johannesburg, South Africa, [2]Electrical Engineering, University of Johannesburg, Johannesburg, South Africa, [3]Human Anatomy and Physiology, University of Johannesburg, Johannesburg, South Africa

INTRODUCTION
Vector-borne diseases (VBD) remain a major public health challenge globally, accounting for approximately 17% of all infectious diseases. Climate variability, including changes in temperature, rainfall, and humidity, influence vector ecology and disease transmission. In South Africa (SA), VBD outbreaks continue to place pressure on public health systems, highlighting the need for climate-informed surveillance approaches that support timely preparedness and response. This study aims to apply advanced modelling techniques to identify key climatic drivers of VBD and forecast future outbreaks.
METHODS
A retrospective ecological study design was applied using laboratory-confirmed VBD cases from the National Health Laboratory Service and meteorological data from the South African Weather Service for the period 2012 to 2024. Datasets were cleaned and aggregated at monthly and district levels. Descriptive analyses were conducted to characterise spatial and temporal patterns in VBD incidence and climate variables. Associations were assessed using correlation analysis and poisson–inverse gaussian regression. Spatial clustering was evaluated using Moran's I and Getis-ord Gi*, while temporal trends were assessed using the Mann–Kendall test. Predictive models including random forest, extreme gradient boosting, autoregressive integrated moving average with exogenous variables, and long short-term memory networks were applied.

RESULTS
A total of 266955 confirmed cases of VBDs were reported in SA between 2012 and 2024. Schistosoma haematobium accounted for the largest proportion of cases (47.40%), followed by Schistosoma haematobium ova observed (24.17%) and Malaria (28.12%). Preliminary analyses indicate significant spatial and temporal heterogeneity in VBD incidence, with emerging climate-sensitive patterns across selected districts. These findings demonstrate the feasibility of integrating climate and health datasets for risk modelling and early warning applications.
CONCLUSIONS
Integrating climate and disease surveillance data using big data analytics has the potential to strengthen climate-sensitive early warning systems and support public health preparedness in SA and similar low- and middle-income countries.

MSF Case Study: Community-Centered Water, Sanitation and Climate Resilience in Southern Africa

Neo Tsotetsi[1]
[1]Médecins Sans Frontières/ Doctors Without Borders, Johannesburg, South Africa

ABSTRACT
Climate change is amplifying water insecurity, disease transmission and sanitation challenges across low-resource humanitarian settings, yet locally rooted adaptation strategies remain under-documented in global public health discourse. This case study examines integrated water, sanitation and hygiene (WASH) interventions implemented by Médecins Sans Frontières (MSF) with communities in Gwanda District, Zimbabwe and Nampula Province, Mozambique within the broader context of climate-sensitive health risks. In Gwanda, recurrent droughts and floods have undermined livelihoods, driving many farmers into informal gold mining where unsafe drinking water emerged as a key health risk. MSF worked with communities to identify contaminated water sources, implement well decontamination and provide safe drinking water. A peer network approach involving village health workers is supporting the formation of mining site-based health committees to sustain WASH interventions, alongside the development of operational research to better understand patterns of water contamination. In Nampula, prolonged irregular rainfall and depletion of groundwater have intensified the prevalence of neglected tropical diseases (NTDs) such as schistosomiasis and lymphatic filariasis – conditions closely linked to inadequate sanitation and unsafe water. MSF's interventions included establishing water infrastructure through the rehabilitation of traditional wells, rainwater harvesting systems and community-managed water sources. These interventions were coupled with health education, hygiene promotion and capacity building of local water committees to catalyse ownership and resilience. Central to both contexts was prioritising indigenous knowledge and lived experience through participatory project design, ensuring that solutions were culturally relevant, sustainable and built trust between health actors and communities. By centering communities as partners rather than beneficiaries, these approaches not only addressed immediate WASH deficits but also enhanced adaptive capacity to climate risks. This case study illustrates the importance of community-led WASH strategies as critical public health responses to climate change, with implications for policy, practice and the pursuit of equitable, resilient systems in vulnerable settings.

The Landscape of Climate Change and Comprehensive Protection for Workers in Brazil

Andréia De Conto Garbin[1], Simone Alves dos Santos[2]
[1]Saúde Ambiental, Faculdade de Saúde Pública da Universidade de São Paulo, São Paulo, Brazil, [2]Divisão de Vigilância em Saúde do Trabalhador/Centro de Referência em Saúde do Trabalhador., Secretaria de Estado da Saúde de São Paulo, São Paulo, Brazil

ABSTRACT
This study analyzes the intersection between climate change and occupational health, based on the premise that vulnerability is not intrinsic to individuals but a result of socio-historical conditions of inequality. The global scenario, marked by destructive economic growth and precarious labor, exposes the working class to intensified risks. According to the ILO (2024),1 approximately 70% of the global workforce is exposed to high temperatures—a condition that, combined with informality and lack of social protection, increases the incidence of heat stress, disease, and death2. Beyond extreme heat, factors such as ultraviolet radiation, air pollution, extreme weather events, and agrochemical use cumulatively impact labor populations. In light of this panorama, the study highlights the experience of the São Paulo State Health Department (SES-SP) in implementing protective measures. Since 2014, the department has regulated sanitary conditions for mobile workforces and, more recently, established new guidelines: Communique CVS/DVST No. 12/2023 (Surveillance and Care in Natural Disasters) and Communique CVS-SAMA No. 02 (Psychosocial Aspects in Disaster Surveillance)3,4,5. The study concludes that state intervention is indispensable to mitigate the physical and mental impacts of the climate crisis on workers, especially those involved in essential activities and disaster response. It reinforces the urgent need for public policies that combat exploitation and ensure human dignity in the face of environmental threats.

Real world study for Mother-to-Child Transmission of Hepatitis B in Guangdong Province, 2021–2023

Tiancheng Xie[1], Mengyang Su[2], Min Cai[2], Tianshuo Zhao[1], Xiyu Zhang[1], Sihui Zhang[1], Mingting Wang[1], Qingsong Xu[1], Yujie Cheng[1], Shuang Gao[2], Fuqiang Cui[1]
[1]Peking University, Beijing, China, [2]Guangdong Women and Children Hospital, Guangzhou, China

OBJECTIVE
This study aimed to evaluate the status of hepatitis B virus (HBV) mother-to-child transmission (MTCT) among infants born to hepatitis B surface antigen (HBsAg)-positive mothers from 2021 to 2023 and identify key factors influencing HBV MTCT, providing critical insights to inform future HBV prevention strategies.
METHODS
Data were obtained from the case records of HBsAg-positive pregnant women and their newborns in Guangdong Province from January 1, 2021, to December 31, 2023. For HBsAg and anti-HBs positive rates, bivariate analysis was conducted to examine associations between maternal and infant characteristics. Additionally, firth's bias reduction logistic regression analysis was conducted to identify factors influencing MTCT.
RESULTS
Our study analyzed data from 131,781 HBsAg-positive pregnant women and their newborns in Guangdong Province from 2021 to 2023. Among 131,781 infants completing PVST, the overall HBV MTCT rate was 0.44%, with an anti-HBs positivity rate of 93.48%. Maternal age, administration of HepB-BD and HBIG, and use of antiviral treatment during pregnancy were significant associated with HBV MTCT. However, birth weight, maternal education level, mode of delivery and number of births were not significantly associated with HBV MTCT risk.
CONCLUSIONS
This study provides a comprehensive analysis of HBV MTCT among HBsAg-positive pregnant women and their infants in Guangdong Province from 2021 to 2023. Despite significant advancements in HBV MTCT prevention, our findings underscore the need for enhanced strategies, particularly for pregnant women with high HBV viral loads. Strengthening maternal antiviral treatment, ensuring timely and comprehensive infant follow-up, and implementing targeted health education programs will be essential for further reducing MTCT rates and improving long-term outcomes.

Number of Austrian SARS-CoV-2 infections in the 2024/2025 season: Analysis of national wastewater data

Uwe Riedmann[1], Wolfgang Rauch[2], Hannes Schenk[2], Herbert Oberacher[3], John Ioannidis[4,5,6,7], Stefan Pilz[1]
[1]Department of Internal Medicine, Division of Endocrinology and Diabetology, Medical University of Graz, Graz, Austria, [2]Department of Environmental Engineering, University of Innsbruck, Innsbruck, Austria, [3]Institute of Legal Medicine and Core Facility Metabolomics, Medical University of Innsbruck, Innsbruck, Austria, [4]Department of Medicine, Stanford University, Stanford, United States, [5]Department of Epidemiology and Population Health, Stanford University, Stanford, United States, [6]Department of Biomedical Data Science, Stanford University, Stanford, United States, [7]Meta-Research Innovation Center at Stanford, Stanford University, Stanford, United States

INTRODUCTION
Adaptation of SARS-CoV-2 policies requires information on contemporary infection trends. As SARS-CoV-2 infections are no longer actively tracked, indirect measures such as estimations based on wastewater data are needed.
METHODS
We conducted a retrospective estimation of total SARS-CoV-2 infections in the entire population of Austria from April 1, 2024, to March 31, 2025, based on

wastewater monitoring data. The applied method builds on a previously published approach that estimated infection prevalence during the pandemic by fitting wastewater measurements to seroprevalence data.
RESULTS
Between April 1, 2024, and March 31, 2025, we estimate 2.5 million new infections in Austria. Active infections peaked at 337,000 in early October and decreased thereafter. Infections rates in winter were substantially lower compared to previous years.
CONCLUSIONS
The findings indicate the earliest annual fall/winter peak and the lowest annual infections since 2020. Policy makers, physicians and high-risk individuals should be aware of the ongoing seasonal SARS-CoV-2 infection waves and their variability in timing.
Popul. Med. 2026;8(Supplement 1):A480

ABS0026
Nationwide estimates of SARS-CoV-2 infection fatality rates and numbers needed to vaccinate for SARS-CoV-2 vaccines in 2024 in Austria

Uwe Riedmann[1], Martin Sprenger[2], John Ioannidis[3,4,5,6], Stefan Pilz[1]
[1]Department of Internal Medicine, Division of Endocrinology and Diabetology, Medical University of Graz, Graz, Austria, [2]Institute of Social Medicine and Epidemiology, Medical University of Graz, Graz, Austria, [3]Department of Medicine, Stanford University, Stanford, United States, [4]Department of Epidemiology and Population Health, Stanford University, Stanford, United States, [5]Department of Biomedical Data Science, Stanford University, Stanford, United States, [6]Meta-Research Innovation Center at Stanford, Stanford University, Stanford, United States

INTRODUCTION
Post-pandemic years are characterized by widespread previous population immunisation against COVID-19. Whether and for whom SARS-CoV-2 vaccinations are still justified is unclear. We use nationwide estimates of IFR and literature derived estimates of vaccine effectiveness (VE) to calculate numbers needed to vaccinate to prevent one COVID-19 death (NNV) and for one life-year saved (LYS) in Austria in 2024.
METHODS
In this retrospective analysis we calculate SARS-CoV-2 IFR during 2024 in Austria according to previously published wastewater-based infection estimates and available mortality data. Using literature derived VE estimates we calculate NNV to prevent one COVID-19 death and for one LYS in strata according to age groups, nursing home residency and vaccination in 2024. We repeat analyses with sensitivity range values of parameters.
RESULTS
In 2024, total IFR was 0.048%. NNV (LYS) in the age groups 0-19, 20-39, 40-59, 60-74 and 75-84 years were very high: i.e. 5,497,526 (151,570), 2,432,498 (92,614), 415,714 (24,777), 35,925 (3,748), and 4,882 (1,009), respectively, in community dwellers. In the 85+ years age group, IFRs of unvaccinated/vaccinated were 0.91%/0.77% for community dwellers, and 1.22%/1.04% for nursing home residents. The 85+ year age group had NNV estimates of 1,215 and 907 (LYS: 525 and 1,896) in community dweller and nursing home residents, respectively. Sensitivity analyses yielded LYS<1,000 only under some favourable assumptions in the 75-84 and 85+ years old age strata.
CONCLUSIONS
In 2024 in Austria, SARS-CoV-2 IFR was low and NNV and LYS of COVID-19 vaccinations correspondingly non-favourably high, even for very old individuals.

ABS0037
Post-pandemic mortality patterns and COVID-19 burden considering multiple death causes

Uwe Riedmann[1], Michael Levitt[2], Stefan Pilz[1], John Ioannidis[3,4,5,6]
[1]Department of Internal Medicine, Division of Endocrinology and Diabetology, Medical University of Graz, Graz, Austria, [2]Department of Structural Biology, Stanford University, Stanford, United States, [3]Department of Medicine, Stanford University, Stanford, United States, [4]Department of Epidemiology and Population Health, Stanford University, Stanford, United States, [5]Department of Biomedical Data Science, Stanford University, Stanford, United States, [6]Meta-Research Innovation Center at Stanford, Stanford University, Stanford, United States

INTRODUCTION
Post-pandemic mortality rates can explore the residual COVID-19 burden and changes in other causes of death. Considering weighted multiple causes of death from death certificates (underlying and others) may help compare post- versus pre-pandemic mortality patterns, while potentially reducing the impact of cause misattribution. Estimates of post-pandemic impact are critical also for proper continuing public health policies (e.g. vaccinations).
METHODS
We retrospectively analyse national all-cause mortality rate ratios between 2024 and pre-pandemic years (2017-2019) for gender-stratified 10-year age groups in Austria. In weighted analyses, the underlying death cause was weighted 50% and other causes shared the remaining 50%. Sensitivity analyses explored different weightings. Death-specific causes were also compared between 2024 and 2019. Lastly, number needed to vaccinate (NNV) was estimated for 5-year age groups in hypothetical scenarios.
RESULTS
Despite 1212 reported COVID-19 deaths in 2024, all-cause mortality rates were equal or lower in 2024 compared to 2019 in all strata at risk from COVID-19 (i.e., aged 60 years and over). All-cause mortality rates in 2024 were higher than in 2019 in adolescent and young adult strata. The ratio of weighted over unweighted COVID-19 death rates was 0.52-0.58 for age strata 60 years and older and even lower in sensitivity analyses, indicating that COVID-19 deaths were likely overestimated. Estimated NNV exceeded 1700 up to 80 years old, even with 100% assumed vaccine effectiveness.
CONCLUSIONS
Post-pandemic COVID-19 deaths had no visible impact on mortality patterns in Austria and were likely overcounted. Increased post-pandemic mortality patterns in the young are particularly worrisome.

The Evolving Landscape of Multimorbidity: An Analysis of Disease Clustering Across 13 HDSS Sites in Africa and Asia (2018-2021)

Cyril Chironda[1], Tobias Chirwa[1], chodziwadziwa Kabudula[1], Farai Mlambo[1], F.Gomez Olive Casas[1], Rumbidzai Mupfuti[1], belinda njiro[1]
[1]School of public health, University of the Witswatersrand, johanesburg, South Africa

BACKGROUND
Low- and middle-income countries (LMICs) face a dual burden of chronic infectious diseases (HIV/TB) and accelerating non-communicable diseases (NCDs) [1,2]. The COVID-19 pandemic caused profound health system disruptions, potentially reconfiguring multimorbidity clusters. This study aimed to model geographic and temporal variation in multimorbidity clustering across 13 Health and Demographic Surveillance System (HDSS) sites in Africa and Asia: (Southern Africa: Agincourt, DIMAMO, AHRI, Karonga; East Africa: Siaya, Manyatta, Harar, Haramaya, Kersa; West Africa: Dakar, Nanoro; South Asia: Matlab, Chakaria), comparing cluster configuration pre-COVID (2018-19) and during COVID-19 (2020-21).
METHODS
We analysed 38,672 de-identified adult verbal autopsies (VA) from 13 sites, coding conditions, hypertension, diabetes, HIV, and TB. Multimorbidity was defined as ≥2 conditions. We employed dual analytical approaches: Latent Class Analysis (LCA) and Partitioning Around Medoids (PAM) to identify disease clusters for each site-period. This combination separated underlying structure from membership weighting. Models were selected using majority rule on the relevant indices. Within each site and region, we compared class profiles and prevalence across periods. For concordance between LCA and PAM, we examined overlap of top diseases per class and computed adjusted Rand indices on hard assignments to gauge agreement
RESULTS
Analyses revealed distinct regional patterns. In Southern Africa, a TB/HIV-anchored LCA class expanded to ~60% during COVID-19, while PAM showed growth in hybrid TB/HIV-NCD combinations. DIMAMO remained HPT/DM-dominant but introduced a new HIV+cancer+stroke class. South Asian sites were NCD-saturated, with the proportion of decedents with ≥3 conditions rising sharply. East/West African sites exhibited an intermediate profile. Both methods confirmed stable cluster architectures, but membership shares proved elastic to pandemic shocks.
CONCLUSIONS
The pandemic reweighted membership in pre-existing multimorbidity scaffolds rather than creating new clusters. The findings review the need for integrated care models that bundle HIV/TB and cardiometabolic management, prioritise hypertension control, and anticipate the aging of HIV cohorts.

ABS0307
Cost-effective diagnostic strategies for targeted mass screening campaigns: Pooled GeneXpert vs. TB-LAMP testing in Ethiopia

Zemedu Trife[1], Tamiru Mebrate[1]
[1]Monitoring, Evaluation and Research, REACH Ethiopia, Addis Ababa, Ethiopia
BACKGROUND
Mass screening and treatment (MSaT) campaigns are critical in detecting undiagnosed TB cases, particularly in asymptomatic individuals, helping to interrupt transmission and reduce disease burden. However, these campaigns are resource-intensive and logistically complex, especially in high TB burden countries like Ethiopia, where limited resources and the global economic crisis strain health systems. This operational study compared the cost-effectiveness and diagnostic performance of two TB diagnostic tools—pooled GeneXpert and TB-LAMP testing during community-based screening campaigns in both urban and pastoralist settings.
METHODS
A total of 2,055 sputum samples were collected and tested using pooled GeneXpert (4:1 ratio), resulting in 514 pooled tests and 41 deconvolution tests. In parallel, 672 samples were tested using TB-LAMP to compare accuracy, throughput, and cost metrics. The study considered both direct and indirect costs—including consumables, labor, equipment, and patient time—and calculated the unit cost per test, cost per TB case detected, and the incremental cost-effectiveness ratio (ICER).
RESULTS
Both methods achieved 100% concordance in TB case detection. The positivity rate was 1.4% for pooled GeneXpert and 2.0% for TB-LAMP. Pooled GeneXpert testing saved 1,500 cartridges—approximately USD $15,000. The unit cost per test was $3.20 for pooled GeneXpert and $4.30 for TB-LAMP. The cost per TB case detected was $136 and $197, respectively. GeneXpert cartridge costs accounted for 47% of total test costs, while TB-LAMP consumables made up 45% of its costs. TB-LAMP demonstrated higher throughput, processing up to 112 samples/day compared to 32/day for a 4-module GeneXpert machine.
CONCLUSIONS
Both tests were diagnostically reliable, but pooled GeneXpert offered greater cost savings and efficiency. When paired with high-quality specimens, pooled testing is a novel, scalable solution for resource-limited settings. It enables broader coverage, faster results, and cost-effective TB case detection—key elements for successful MSaT campaigns and advancing toward TB elimination goals.

ABS0382
Resurgent multistate measles outbreak in Sudan amidst conflict: urgent need for vaccination and international support

Ayman Azhary[1], Emmanuel Siddig[2], Nooh Hajhamed[1], Eman Ali[2], Claude Muvunyi[3]
[1]Omdurman Islamic University, Omdurman/Khartoum, Sudan, [2]University of Khartoum, Khartoum/Khartoum, Sudan, [3]Rwanda Biomedical Center, Kigali/Kigali, Rwanda
INTRODUCTION
This study assesses the epidemiological trends of a multistate measles outbreak in Sudan amidst ongoing armed conflict, highlighting the urgent need for enhanced vaccination efforts and international support.
METHODS
A retrospective cross-sectional analysis was conducted using national surveillance data collected from January 2024 to June 2025. Epidemiological parameters, including case counts, fatalities, and vaccination coverage, were calculated and analyzed with R software 4.2.2 (Version 2025.05.1 + 513).
RESULTS
A total of 3563 measles cases and 20 deaths were reported across 13 states. North Darfur recorded the highest number of cases (n = 1760), followed by Khartoum (n = 553) and River Nile (n = 380). The overall case fatality rate (CFR) decreased from 1.27% in 2024 to 0.28% in the first half of 2025. Vaccination coverage remained low in several hotspots, with notable deficits in displaced populations worsened by logistics disruptions. The resurgence emphasizes gaps in immunization coverage and underscores the impact of conflict-related healthcare infrastructure deterioration.
CONCLUSIONS
The re-emergence of measles across multiple regions during Sudan's conflict underscores an urgent need for targeted mass vaccination campaigns, strengthened disease surveillance, and international assistance. Addressing these vulnerabilities is crucial to preventing future outbreaks and safeguarding vulnerable populations, particularly children and displaced communities.

Epidemiological and demographic analysis of gestational toxoplasmosis in brazil over the last five years

Luiz Filippe Soares[1], Virgínia Pereira[1], Letícia Vicentini[1], Blima Fux[1]
[1]Tropical Medicine Unit, Department of Pathology, Federal University of Espírito Santo, Vitória, Brazil
BACKGROUND
gestational toxoplasmosis, caused by the protozoan Toxoplasma gondii, is an infection that generates significant concern due to the risks associated with vertical transmission from mother to fetus, which occurs due to the parasite's ability to cross the placental barrier. When acquired during pregnancy, toxoplasmosis can lead to serious consequences, including spontaneous abortions, stillbirths, and congenital malformations such as hydrocephalus and chorioretinitis. In brazil, the importance of gestational toxoplasmosis is amplified by the need for mandatory notification of the disease, an essential measure for monitoring and control. The objective of this study is understand the epidemiological profile of gestational toxoplasmosis in Brazil from 2019 to 2024.
METHODS
this is a descriptive, retrospective epidemiological study with quantitative analysis, using the notifiable diseases information system (SINAN.) as a data source.
RESULTS
between 2019 and 2024, 72.307 cases were registered, with 2024 having the most cases (16.228) and 2019 the fewest (8.436). The regions with the most registered cases were the northeast (22.493) and southeast (22.090). The pregnant women are mostly of mixed race (36.460), aged between 20 and 39 years (55.657), with completed high school (20.214) and the most cases were diagnosed in the second trimester of pregnancy (27.198).
CONCLUSIONS
in brazil, the prevalence and incidence of toxoplasmosis is high due to the parasite's durability in the environment, water and food, the coexistence of multiple T. Gondii genotypes, large feline populations, lack of basic sanitation in certain populations and limited information about the parasite. Based on collected data, there was a 92.3% increase in confirmed cases of gestational toxoplasmosis from 2019 to 2024, raising an alert for health surveillance. On the other hand, the increase in the number of cases may be due to increased access to diagnostic tests, increased awareness among pregnant women and their families and improved epidemiological surveillance.

ABS0531
Travel-Associated Mpox in Pakistan with Limited Household Transmission: A Case Series from Khyber Pakhtunkhwa (2023–2025)

sadaf jamil[1]
[1]DG health-Khyber-Pakhtunkhwa, National institutes of Health, Peshawar, Pakistan
INTRODUCTION
Mpox (monkeypox) is a zoonotic infection caused by the mpox virus that has recently emerged as a global public health concern, with outbreaks reported in several non-endemic regions. Pakistan confirmed its first mpox cases in 2023, all linked to international travel. Until early 2025, no locally acquired transmission had been reported. This study presents the first detailed case series of mpox in Pakistan, describing its clinical features, transmission patterns, and public health response in Khyber Pakhtunkhwa (KP) province.
METHODS
A descriptive case series was conducted, including all laboratory-confirmed mpox cases identified through airport screening and provincial surveillance in KP between September 2023 and April 2025. Epidemiological, demographic, and clinical data were obtained through structured interviews, medical record review, and laboratory confirmation by MPXV PCR testing of lesion samples. All confirmed patients were isolated per national infection control guidelines, and close contacts were traced and monitored for 21 days post-exposure.
RESULTS
Eleven confirmed mpox cases were detected across nine districts of KP. The median age was 38 years (range: 5 months–51 years), and 81.8% were male. Most patients (9/11) had recently returned from Gulf countries—primarily Saudi Arabia, the United Arab Emirates, and Qatar. Two secondary household transmissions occurred, involving a spouse and an infant infected by returning travelers. Rash was present in all cases, fever in 81.8%, and genital lesions in 63.6%. Three patients (27.3%) were living with HIV, and all recovered without complications. More than 60 close contacts were traced; no further transmission occurred.
CONCLUSIONS
International travel was the primary source of mpox introduction in Pakistan, with limited local spread. Strengthening border screening, diagnostic capacity, and community awareness is vital to prevent sustained transmission in non-endemic

settings.

ABS0532
Occupational and Zoonotic Transmission of Crimean-Congo Hemorrhagic Fever in Khyber Pakhtunkhwa, Pakistan: A Case Series, 2025

Sadaf Jamil[1]
[1]DG health-Khyber-Pakhtunkhwa, National institutes of Health, Peshawar, Pakistan

INTRODUCTION
Crimean-Congo hemorrhagic fever (CCHF) is a high-fatality tick-borne viral disease endemic in Pakistan, posing recurrent threats to public health and occupational safety. This case series describes the epidemiological and clinical characteristics of CCHF cases reported in Khyber Pakhtunkhwa (KP) province in 2025, highlighting gaps and lessons in surveillance and response.
METHODS
We analyzed line-listed data of all suspected and confirmed CCHF cases reported to the Integrated Disease Surveillance and Response (IDSR) system in KP between April and July 2025. Demographic, occupational, clinical, and laboratory variables were summarized, and public health response activities were reviewed.
RESULTS
A total of 11 confirmed cases were reported from multiple districts, with clustering in Nowshera, Peshawar, and Karak. The median age was 30 years (range 22–70), and 82% were male. High-risk occupational groups included livestock handlers (27%) and butchers (18%). Sporadic cases among individuals without direct livestock exposure indicated possible secondary transmission. The overall case fatality ratio was 27%. Delays in diagnosis and incomplete documentation were frequent. Rapid response teams were deployed for case investigation, contact tracing, and community sensitization.
CONCLUSIONS
CCHF transmission in KP remains predominantly occupational and seasonal, reflecting close human–animal interaction and inadequate vector control. Strengthening integrated surveillance, expanding diagnostic capacity, and promoting community-level awareness through a One Health framework are essential to prevent future outbreaks.
Popul. Med. 2026;8(Supplement 1):A514

ABS0534
Outbreak of Diphtheria in Mardan, Pakistan: A Field Investigation of Laboratory-Confirmed Cases Amid High Reported Vaccine Coverage

sadaf jamil[1]
[1]DG health-Khyber-Pakhtunkhwa, National institutes of Health, Peshawar, Pakistan

INTRODUCTION
Despite the availability of effective vaccines, diphtheria continues to pose a threat in low-resource settings. In October 2024, a suspected diphtheria case was reported from District Mardan, Khyber Pakhtunkhwa (KP), Pakistan, triggering a field investigation. We aimed to assess the magnitude of the outbreak, identify gaps in immunization, and describe the public health response.
METHODS
A cross-sectional outbreak investigation was conducted using WHO case definitions and standard EPI surveillance tools. Suspected cases were identified through active search and contact tracing. Nasopharyngeal specimens were collected and tested via quantitative PCR (qPCR). Descriptive statistics were used to summarize clinical features, demographic characteristics, and vaccination coverage.
RESULTS
A total of 41 suspected cases were identified, with 3 confirmed via laboratory testing. The index case was a 12-year-old fully vaccinated female, clinically managed with antitoxin and antibiotics. Among the 44 children investigated, 34 (77%) had received all three pentavalent doses, while 3 (7%) were unvaccinated. Most (82%) were under five years of age. No complications or deaths occurred. Delays in case recognition and low community awareness were major challenges.
CONCLUSIONS
This outbreak highlights the limitations of administrative vaccine coverage data and the need for robust community-based surveillance and catch-up immunisation strategies. The resurgence of diphtheria in vaccinated populations warrants urgent investment in booster dose programmes, stockpiling of antitoxin, and public health education in endemic settings.
Popul. Med. 2026;8(Supplement 1):A515

ABS0535
Comparative Epidemiology of Measles in Charsadda District, Pakistan: 2023–2024

sadaf jamil[1]
[1]DG health-Khyber-Pakhtunkhwa, National institutes of Health, Peshawar, Pakistan

INTRODUCTION
Measles remains a pressing public health challenge in Pakistan, particularly in under-immunized populations. This study presents a comparative analysis of measles surveillance data from Charsadda District, Khyber Pakhtunkhwa, over two consecutive years (January–November, 2023–2024).
METHODS
We analyzed surveillance data reported by the Expanded Programme on Immunization (EPI) using WHO measles case definitions. Variables assessed included age, gender, symptoms, laboratory confirmation, sample adequacy, cold chain status, tehsil distribution, travel history, vaccination status, and clinical outcomes.
RESULTS
A total of 632 suspected measles cases were reported in 2023, increasing to 763 in 2024. The highest burden occurred among children aged ≤5 years (92.2% in 2023; 92.3% in 2024). Males were disproportionately affected (57.8% in 2023; 56.0% in 2024). Laboratory confirmation rates improved from 66.7% in 2023 to 79.2% in 2024. Sample adequacy declined in 2024 (91.5% vs 97.3%), as did cold chain maintenance (91.5% vs 96.8%). Immunization status was poor: 92.7% of cases in 2023 and 77.6% in 2024 were unvaccinated. Post-measles complications included pneumonia (14.2%) and diarrhea (6.0%). Cluster outbreaks were identified in two union councils in 2023 and three in 2024.
CONCLUSIONS
Persistent under-vaccination, poor cold chain compliance, and gaps in surveillance have contributed to recurring outbreaks in Charsadda. Strengthened routine immunization, surveillance, and outbreak response are urgently needed.
Popul. Med. 2026;8(Supplement 1):A516

ABS0555
Application of the 7-1-7 Framework to Strengthen Crimean-Congo Hemorrhagic Fever (CCHF) Outbreak Response in Khyber Pakhtunkhwa, Pakistan, 2025

Sadaf Jamil[1]
[1]DG health-Khyber-Pakhtunkhwa, National Institutes of Health, Peshawar, Pakistan

INTRODUCTION
Rapid detection and response to infectious disease outbreaks are essential to minimizing their health and socio-economic impact. The 7-1-7 approach, endorsed by WHO under the Global Health Security Agenda (GHSA), sets measurable goals for epidemic management—detect within 7 days, notify within 1 day, and respond effectively within 7 days. In Khyber Pakhtunkhwa (KP), recurrent Crimean-Congo Hemorrhagic Fever (CCHF) outbreaks pose a major challenge due to zoonotic transmission, delayed reporting, and limited diagnostic capacity. This study applies the 7-1-7 framework to CCHF data from KP to assess timeliness and identify operational gaps in 2025.
METHODS
A retrospective analysis was conducted using the CCHF 7-1-7 Data Consolidation Spreadsheet (2025) compiled by the provincial surveillance system. Each record represented a confirmed outbreak event with key dates for emergence, detection, notification, and early response completion. Intervals were calculated in days to assess compliance with 7-1-7 targets. Bottlenecks and enablers documented in narrative fields were thematically analyzed to identify systemic barriers and strengths in outbreak management.
RESULTS
12 confirmed CCHF outbreaks were recorded from Nowshera, Karak, Bannu, Bajure, Lower Dir, North Waziristan, Peshawar, and Mohmand districts. One case reported at tertiary level hospital who travelled from Afghanistan. The median detection time was 8 days, with two events meeting the 7-day target. Only one outbreak achieved notification within 24 hours, while delays of up to five days were linked to late hospital reporting and laboratory confirmation. Early response completion within seven days occurred in two events. Major bottlenecks included interdepartmental coordination delays and limited diagnostic capacity, whereas enablers included strong provincial coordination, rapid field response, and effective risk communication.
CONCLUSIONS
Institutionalizing the 7-1-7 monitoring framework within KP's health security system can strengthen outbreak intelligence, promote accountability, and align provincial actions with IHR (2005) and GHSA targets.

Human Papillomavirus in Gulf Cooperation Council (GCC) countries: What Do We Know and What is Missing? A Mapping Review

Rami H. Al-Rifai[1], Ahmed Z. Al Meslamani[1]
[1]Infectious Diseases Epidemiology Research Advancement Unit (IDERA), Institute of Public Health, College of Medicine and Health Sciences, United Arab Emirates University, Al-Ain, United Arab Emirates

INTRODUCTION
Human papillomavirus (HPV)-associated cervical cancer is an increasing public health concern in the Gulf Cooperation Council (GCC) region, yet regional evidence remains limited and fragmented. This review synthesizes peer-reviewed HPV research conducted in GCC countries between 2005 and 2025.
METHODS
A comprehensive literature search using broad terms related to HPV and cervical cancer was conducted across five databases: PubMed, Scopus, Google Scholar, ScienceDirect, and the Cochrane Library. Studies from the six GCC member states, United Arab Emirates (UAE), Saudi Arabia, Qatar, Bahrain, Oman, and Kuwait, were included and categorized into six research-focused themes: epidemiology and molecular characterization; screening and diagnostics; (3) knowledge, attitudes, and practices (KAP); barriers and determinants of vaccine uptake and screening; health communication; and (6) policy and health systems evaluation.
RESULTS
A total of 107 studies were identified: 23 from the UAE, 51 from Saudi Arabia, 11 from Qatar, eight from Bahrain, five from Oman, and nine from Kuwait. Among these, 41 addressed epidemiology and molecular characterization, four examined screening and diagnostics, 26 focused on KAP, 31 investigated barriers to vaccine uptake and screening, one assessed health communication, and four analyzed policy and system-level factors. Epidemiological studies reported low-to-moderate HPV prevalence but a high burden of oncogenic genotypes, particularly HPV16/18. Screening studies showed good diagnostic performance and public acceptability but minimal implementation evidence. KAP studies indicated low awareness, variable vaccine acceptance, and demographic disparities. Common barriers included low perceived risk, sociocultural sensitivity, safety concerns, cost, and inadequate counseling. Policy analyses highlighted inconsistent vaccine rollout, weak screening infrastructure, and opportunities for HPV testing, self-sampling, and school-based immunization strategies.
CONCLUSIONS
Despite growing HPV research in the GCC, descriptive studies predominate. Major gaps persist in implementation and health systems research, inclusion of key populations, serological investigations, and population-based assessments of HPV prevalence and vaccine impact.

Investigation of an acute diarrheal disease outbreak in a municipality in southwestern Bahia: Experience report

Paula Graziela Neves Cardoso Krettli[1], Fátima Maria Nery Fernandes[1], Maria Luiza Neves Cardoso Krettli[2], Kelly da Silva Quinteiro[3], Ivone Maria Pires Maia[1], Karoline Silva Rebouças[1]
[1]Health Surveillance Superintendence (SUVISA), Southwest Regional Health Center (NRS-SO), Bahia State Health Department (SESAB), Guanambi, Brazil, [2]Languages and Literature, UniCesumar University, Guanambi, Brazil, [3]Southwest Regional Health Center (NRS-O), Bahia State Health Department (SESAB), Guanambi, Brazil

BACKGROUND
Between October 20 and November 4, 2024, a municipality in southwestern Bahia, Brazil, reported an outbreak of acute diarrheal disease (ADD). The event raised concerns about drinking-water safety and the effectiveness of control measures. This experience reports the investigation, identification of contributing factors and proposed corrective actions.
METHODS
The Bahia State Health Department, through the Center for Strategic Information on Health Surveillance (CIEVS, in Portuguese) and the Southwestern Regional Health Center (NRS Sudoeste), conducted an on-site investigation at the local Water Treatment Plant (WTP). Structural and operational failures were assessed. Water and stool samples were collected, although low community adherence limited laboratory analysis. Data inconsistencies were examined using the Acute Diarrheal Disease Epidemiological Surveillance System (SIVEP-DDA, in Portuguese). The team evaluated treatment efficiency, residual chlorine levels and distribution-system performance. Corrective actions and risk-communication measures were recommended to local authorities.
RESULTS
Water analysis showed contamination by total coliforms and pathogens such as Chromobacterium violaceum, Bacillus cereus and Aeromonas spp., indicating inefficiency in the WTP process. One stool sample tested positive for Rotavirus. The outbreak involved 894 to 1,340 notified cases, but inconsistencies in SIVEP-DDA revealed weaknesses in reporting. Failures such as absence of residual chlorine, inadequate infrastructure and operational gaps were associated with the event. Low participation in sample collection limited clinical investigation. Epidemiological and environmental evidence indicated that water contamination was the main factor contributing to the ADD outbreak.
CONCLUSIONS
The outbreak was linked to failures in water treatment and distribution. Recommendations included structural improvements to the WTP, restoration of residual chlorine, temporary suspension of water consumption until corrections were completed, distribution of household bleach, public guidance on safe water treatment and reinforcement of epidemiological surveillance. A rapid and coordinated response is essential to prevent worsening of cases and ensure safe drinking water for the population.

Determining the prevalence, predictors and patterns of transfusion transmissible infections among blood donors in Lesotho – a retrospective cross-sectional study between 2013 – 2023

Marelebogile Pooe[1], Verona Mathews[1]
[1]School of Public Health, University of the Western Cape, Cape Town, South Africa

INTRODUCTION
Communicable diseases account for 28% of all deaths in Africa1. They contribute to 704 million DALYs2, with four key diseases—HIV, HBV, HCV, and syphilis—transmissible through transfusions of contaminated blood, known as Transfusion-Transmissible Infections (TTIs). The WHO recommends mandatory testing of all donated blood for TTIs3. TTIs present asymptomatically in most donors, risking chronic liver disease and immune suppression4,5. Ensuring a safe and sustainable blood supply is a public health priority. Sub-Saharan Africa faces a shortage of safe blood6, a high pooled TTI prevalence of 10.1%7, and an even higher prevalence of 2.0% in the SADC8. The study aimed to determine the prevalence, predictors and distribution of TTIs in Lesotho from 2013 to 2023.
METHODS
A retrospective cross-sectional study was used to analyse data from the Blood Safety Information. Systematic random sampling was applied to select 385 donors annually over 11 years, yielding a total of 4227 donors. Data was processed using Python and Microsoft Excel and analysed in SPSS using descriptive statistics and Chi-square tests to calculate prevalence, assess the association between donor characteristics (age group, gender, residence district, donor status, and donor type) and TTI positivity, a trend and spatial distribution. The significance level was $p < 0.05$.
RESULTS
The TTI prevalence in Lesotho was 6.7%, and HIV (2.96%), syphilis (3.10%), HBV (0.85%), and HCV (0.40%). Gender and age were significantly associated with TTI positivity ($p = 0.009$ and $p < 0.001$, respectively), with higher prevalence among females and donors aged 20–39 years. First-time donors had higher TTI (69.6%) and HIV (72.0%) cases ($p < 0.001$). TTI prevalence showed an overall increasing trend, alongside a shift from voluntary to family-replacement donors. All Lesotho districts recorded TTIs.
CONCLUSIONS
There is a growing burden of TTs in Lesotho, driven largely by high HIV and syphilis.

ABS0910

Factors associated with low HIV testing uptake among Adolescents and young adults in Boitekanelo College, Botswana

Gabalape Arnold Sejie[1]
[1]School of Public Health, Boitekanelo College, Tlokweng, Botswana

BACKGROUND
HIV represents a significant public health challenge, contributing to increased mortality and morbidity in developing countries, particularly Sub-Saharan Africa. While HIV testing is crucial for early treatment and prevention, the uptake of the HIV testing among the adolescent and young adults in Botswana remains low. This study aims to identify predictors of low HIV testing uptake among adolescents and young adults
METHODS
A quantitative cross-sectional study was conducted. Data was obtained using a questionnaire employing a simple random sampling technique to collect the

survey data. Statistical analysis involved descriptive statistics and multivariate logistic regression to identify predictors of low HIV testing uptake.
RESULTS
A total of 353 participants were recruited, almost two thirds (64.9%; n=229) knew their HIV status and 35% (n=124) were unaware of their status. On multivariate analysis, participants in casual relationships (OR 1.776,95%CI 0.998-3.160, P<0.049), lived more than 5 km from the HIV testing centres (OR 1.825,95%CI 1.074-3.103, P<0.026) were positively associated with not knowing one's HIV status. Participants with negative attitudes towards HIV testing were significantly 69% less likely to be unaware of their HIV status (OR 0.310,95% CI 0. 1.704-3.103, P=0.026). Those aged 15-19 years(AOR 1.607, 95% CI 0.894-2.888), Christians (AOR 2.347, 95% CI 0.188-29.295), Muslim (AOR 1.7647, 95% CI 0.046-59.506), African traditional religion (AOR 1.718, 95% CI 0.084-35.004), cohabiting (AOR 3.45, 95% CI 0.271-43.979), single (AOR 2.018, 95% CI 0.166-24.499), and those in transactional relationships (AOR 1.098, 95% CI 0.189-6.382) were also likely to be unaware of their HIV status
CONCLUSIONS
This study offers insightful information on HIV testing discrepancies among Botswana's adolescents and young adults. To meet UNAIDS's goal of "zero new infections" by 2030, the nation must enhance testing accessibility and HIV prevention through targeted initiatives that address key variables for younger age groups.

ABS0934

Epidemiology, incidence, hospitalization rates, and clinical severity of acute respiratory infections associated with respiratory viruses: A population-based surveillance study integrating multi-source data in China

Yuping Duan[1], Mingyue Jiang[2], Ju Wang[3], Bosong Li[3], Qing Wang[1], Jule Yang[3], Yi Yuan[3], Weizhong Yang[1], Li Qi[3], Luzhao Feng[1]
[1]School of Population Medicine and Public Health, Chinese Academy of Medical Science & Peking Union Medical College, Beijing, China, [2]National Institute of Pathogen Biology, Chinese Academy of Medical Sciences and Peking Union Medical College, Beijing, China, [3]Chongqing Center for Disease Control and Prevention, Chongqing, China
BACKGROUND
Key to immunization and disease control, data on the disease burden of respiratory viruses in China are limited, with most studies focusing on single viruses and lacking population-based incidence and hospitalization rates.
METHODS
We integrated multi-source data from hospitals and communities in Chongqing from October 15, 2023, to April 30, 2025, and analyzed the seasonality and age-related trends of six viruses. We identified risk factors for severe acute respiratory infection (SARI) and developed a modified multiplier model to estimate incidence and hospitalization rates of acute respiratory infections associated with these viruses.
RESULTS
We included 16,363 patients with respiratory infections, comprising 12,669 outpatients and 3,694 inpatients. Most viruses reverted to pre-COVID-19 pandemic patterns, with human rhinovirus (HRV) and human metapneumovirus (HMPV) showing distinct seasonality. Influenza virus (IFV) peaked in adolescents and adults, while respiratory syncytial virus (RSV) and human parainfluenza virus (HPIV) followed an infant–elderly pattern. Human adenovirus (HAdv), HRV, and HMPV were most prevalent in preschoolers. RSV had a significantly higher SARI risk compared to IFV, HRV, HAdv, HMPV, and HPIV (AOR: 7.88, 1.52, 3.21, 1.76, and 1.63, respectively). The incidence and hospitalization rates (per 100,000 person-years) of HRV (incidence: 30,183; hospitalization: 2,153), HMPV (22,774; 514), RSV (22,181; 2,065), IFV (13,086; 807), HPIV (7,824; 556), and HAdv (6,991; 1,487) were highest in children under five. Hospitalization rates increased again in those aged ≥ 60: HRV (170), RSV (80), IFV (70), HMPV (54), HAdv (27), and HPIV (23).
CONCLUSIONS
Pay attention to household transmission of pathogens with a child–elderly pattern. Integrating multi-source data can provide population-level evaluation of the respiratory virus disease burden.

Schistosomiasis knowledge, attitudes, practices and associated risk factors among school-going children aged 5-14 in Nelson Mandela Bay, South Africa

Paula Melariri[1], Maryline Vere[1], Wilma ten Ham-Baloyi[2], Lucy Ochola[1,3], Opeoluwa Oyedele[1,4]
[1]Department of Environmental Health, Nelson Mandela University, Gqeberha, South Africa, [2]Department of Nursing, Nelson Mandela University, Gqeberha, South Africa, [3]Kenyan Institute of Primate research, Kenyan Institute of Primate research, Nairobi, Kenya, [4]Department of Computing, Mathematical and Statistical Sciences, School of Science, University of Namibia, Windhoek, Namibia
INTRODUCTION
Schistosomiasis is a parasitic waterborne infection common in low socio-economic settings, where socio-demographic, environmental, and behavioural factors influence transmission. Children are particularly vulnerable due to frequent contact with infested water during recreational activities. This study examined risk factors including knowledge, attitudes, and practices (KAP) associated with schistosomiasis transmission among school-going children aged 5–14 years in Nelson Mandela Bay (NMB).
METHODS
A quantitative descriptive cross-sectional design was used. Data were collected from 759 learners in grades 0–7 through a structured, interviewer-administered questionnaire assessing socio-demographic characteristics, clinical history, exposure risks, and KAP related to schistosomiasis. Data were analysed using R (version 4.3.1) with bivariate and multivariate methods.
RESULTS
Participants reported engaging in behaviours that increase schistosomiasis risk, including urinating in rivers while swimming (44%), living near water bodies (21.1%), swimming (11.3%), using bush toilets (5.1%), lacking household tap water (4.3%), and fishing (0.3%). Only 11% (n=81) had prior knowledge of schistosomiasis, mainly acquired at school (62%) or at home (35%). Overall, children demonstrated poor knowledge, attitudes, and practices, with a moderate positive correlation between knowledge and attitude scores (r=0.33, p<0.001). Gender and grade level significantly influenced KAP outcomes. Males and learners in grades 4–7 generally scored higher. Knowledge varied by gender (p=0.015) and grade (p=0.045), while attitude (p=0.023) and practice (p=0.001) scores improved in higher grades. Females had lower knowledge scores (β = −0.15; p=0.018). Learners in grades 4–7 showed fewer positive attitudes (β = 0.07; p=0.038) and practices (β = 0.11; p=0.001). Key risk factors included lack of awareness of disease aetiology and transmission, which resulted in poor knowledge (β = −0.24; p=0.091) and attitude scores (β = −0.22; p=0.001).
CONCLUSIONS
Significant knowledge gaps, poor attitudes, and inadequate hygiene practices highlight the need for targeted health education interventions in NMB.

ABS0942

Interplay of risk factors and complications in severe outcomes of acute respiratory infections: A multicenter study in China

Mingyue Jiang[1], Yuping Duan[2], Ti Liu[3], Yujie He[3], Yan Xiao[1], Tingting Li[4], Li Qi[4], Weizhong Yang[2], Luzhao Feng[2]
[1]National Institute of Pathogen Biology, Chinese Academy of Medical Sciences & Peking Union Medical College, Beijing, China, [2]School of Population Medicine and Public Health, Chinese Academy of Medical Science & Peking Union Medical College, Beijing, China, [3]Shandong Provincial Center for Disease Control and Prevention, Shandong, China, [4]Chongqing Center for Disease Control and Prevention, Chongqing, China
BACKGROUND
Acute respiratory infections (ARIs), particularly pneumonia, can deteriorate into critical illness or death. We sought to identify determinants of these severe outcomes.
METHODS
We conducted a cross-sectional study across 31 Chinese hospitals from December 2022 to July 2024. Oropharyngeal swabs (outpatients) and bronchoalveolar lavage fluid (inpatients) from patients with acute respiratory infections (ARIs) were tested for eight pathogens. Generalized additive models estimated the risk of pneumonia, bronchitis, or cardio-cerebrovascular complications (CVCCs). A parallel mediation model was used to assess direct and indirect pathways linking risk factors, complications, and intensive care unit (ICU) admission.
RESULTS
Among the 5,063 included ARI patients, 2.0% developed CVCCs, and 1.8% required ICU admission. CT-confirmed pneumonia was present in 56.5%, and bronchitis in 8.7%. Influenza virus (IFV) infection was associated with bronchitis (odds ratio [OR], 1.70; 95% confidence interval [CI]: 1.02–2.84). Respiratory syncytial virus (RSV) infection (OR, 3.28; CI: 1.28–8.43) and severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2) infection (OR, 1.67; CI: 1.15–2.43) were associated with pneumonia. Patients with pre-existing cardiovascular disease (CVD) (OR:

4.71; CI: 2.89–7.70), chronic obstructive pulmonary disease (OR: 1.99; CI: 1.29–3.05), chronic liver diseases (OR: 4.40; CI: 1.42–13.68), or autoimmune diseases (OR: 11.90; CI: 2.71–52.29) had a higher risk of developing CVCCs. A history of CVD, asthma, autoimmune diseases, and neuromuscular diseases was directly associated with an increased risk of ICU admission (P<0.001). Notably, CVD also had an indirect effect on this outcome through the mediation of CVCCs (P=0.004).
CONCLUSIONS
Pneumonia and bronchitis exhibit distinct seasonal patterns. SARS-CoV-2, RSV, and IFV are major drivers of respiratory complications, while chronic medical conditions strongly predict CVCCs and mortality. In patients with CVD, CVCCs may act as a mediating factor in the progression from ARI to ICU admission. Early recognition can guide targeted therapies and reduce ARI critical-care demand.

Evaluating performance of the Bioline™ HCV point-of-care test in Ghana
Kuhlula Maluleke[1], Evans Duah[1], Evans Mathebula[1], Tivani Mashamba-Thompson[1]
[1]School of Health Systems and Public Health, University of Pretoria, Pretoria, South Africa
INTRODUCTION
Hepatitis C Virus (HCV) causes liver diseases including chronic hepatitis, cirrhosis, and hepatocellular carcinoma1. In low- and middle-income countries (LMICs), particularly sub-Saharan Africa (SSA), HCV diagnostic resources are limited. Moreover, most evaluations of point-of-care (POC) invitro diagnostics (IVDs) are conducted outside the region using non-African populations, which may not reflect their performance in local settings where they are mostly used. This study assessed the diagnostic performance of the Bioline™ HCV POC test in Ghanaian HCV target populations.
METHODS
A cross-sectional field evaluation was conducted among HCV priority populations including incarcerated individuals, patients requiring HCV testing, and voluntary blood donors undergoing pre-donation screening. Venous blood samples were tested using the Bioline™ HCV POC test, and the results were compared with the Enzyme-Linked Immunosorbent Assay (ELISA) reference standard. The sensitivity, specificity, test efficiency, Youden index, predictive values, likelihood ratios, and receiver operating characteristic (ROC) indicators were calculated.
RESULTS
The Bioline™ HCV POC test demonstrated a sensitivity of 96.7% (95% CI: 82.8–99.9%), specificity of 99.8% (95% CI: 98.9–100%), and positive and negative predictive values of 96.7% (95% CI: 82.8–99.9%) and 99.8% (95% CI: 98.9–100%), respectively. The test efficiency was 99.6% (98.6–99.9%), Youden index 0.97 (0.82–0.99) with a ROC area of 0.98 and highly favorable likelihood ratios (LR + 483.5, LR – 0.03).
CONCLUSIONS
This study highlights the high diagnostic performance of the Bioline™ HCV POC test in Ghanaian populations. The test's reliability underscores its potential as a valuable tool for HCV screening and early detection in resource-limited settings, contributing to efforts to reduce the global HCV burden.

ABS1060
Impact of Risk Adjustment for Drug-Resistant Types on Tuberculosis Patients' Outcomes under China's Innovative Diagnosis-Intervention Packet Payment Methods
Yingbei Xiong[1], Mengyuan Zhao[1], Li Xiang[1]
[1]Department of Health Management, School of Medicine and Health Management, Tongji Medical College, Huazhong University of Science and Technology, Wuhan, China, Wuhan, China
BACKGROUND
Treating drug-resistant tuberculosis (DR-TB) is clinically complex and imposes a significantly higher economic burden than drug-susceptible tuberculosis (DS-TB). China's Diagnosis-Intervention Packet (DIP) payment system initially lacked risk adjustment for drug resistance. In 2022, a pilot city implemented adjusted reimbursement standards to differentiate between these types. This study evaluates the impact of this risk adjustment on medical expenditures, treatment efficiency, and care quality.
METHODS
We employed a quasi-experimental difference-in-differences design analyzing 8,465 tuberculosis patients from June 2021 to December 2023 across two pilot cities. Outcomes included inpatient and out-of-pocket (OOP) expenditures, length of stay (LOS), and 30-day unplanned readmission rates. Subgroup analyses were conducted for both drug-resistant and drug-susceptible patients.
RESULTS
For all tuberculosis patients, the risk adjustment led to significant reductions in inpatient out-of-pocket expenditure per hospitalization ($257.51, $p < 0.001$) and inpatient length of stay (3.58 days, $p < 0.001$). In the drug-susceptible subgroup, the policy significantly reduced annual total inpatient expenditure ($250.75, $p = 0.028$) and total annual out-of-pocket costs ($290.01, $p < 0.001$). Crucially, for drug-resistant patients, the policy maintained stability in expenditures, efficiency, and care quality (all $p > 0.05$), indicating that providers received adequate compensation without increasing the patient's burden. No significant adverse impact on the 30-day readmission rate was observed across groups.
CONCLUSIONS
The risk adjustment policy under the Diagnosis-Intervention Packet system effectively optimized resource allocation and enhanced efficiency, particularly for drug-susceptible patients, while safeguarding care quality for the high-cost drug-resistant population. These findings provide vital evidence for implementing tailored risk adjustment within payment frameworks to manage heterogeneous infectious diseases and achieve sustainable health financing.

Psychosocial factors associated with ART adherence among older adults living with HIV in the Free State Province, South Africa
Monique Brown[1,2], Gladys Kigozi-Male[2], Michelle Engelbrecht[3], Lerato Makhele[4,5]
[1]1 Department of Epidemiology and Biostatistics, University of South Carolina, Columbia, South Carolina, United States, [2]2 Centre for Health Systems Research and Development, University of the Free State, Bloemfontein, South Africa, [3]3 Department of Psychology, University of the Free State, Bloemfontein, South Africa, [4]4 Free State Psychiatric Complex, Free State Department of Health, Bloemfontein, South Africa, [5]5 Department of Psychiatry, University of the Free State, Bloemfontein, South Africa
BACKGROUND
Due to improvements in antiretroviral therapy (ART) and treatment access, the prevalence of older adults living with HIV (OALH, aged 50 and older) is increasing worldwide and in Sub-Saharan Africa. ART adherence is crucial in attaining and maintaining viral suppression. Research has shown that ART adherence may be impacted by psychosocial factors such as depression (3), HIV-related stigma, and resilience. However, research assessing these relationships among OALH in South Africa is scarce. Therefore, the aims of this study were to examine the associations between psychosocial factors and ART adherence among OALH in the Free State Province, South Africa.
METHODS
Data were obtained from 382 OALH attending primary health care clinics around the Mangaung Metropolitan Municipality. Participants were asked: "In the last 30 days, how often did you take your ARVs in the way you were supposed to?" Response options were on a Likert-type scale ranging from 0 (Never) to 5 (Always). Descriptive statistics were used to describe the study population. Multivariable linear regression models (adjusted for age, sex, education, employment, marital status, and language spoken) were used to determine the association between depression, HIV-related stigma, resilience, and quality of life, and ART adherence.
RESULTS
The mean (SD) value for ART adherence in the past month was 3.88 (1.85) with a range of 0 to 5. ART adherence differed by language spoken. Multivariable models showed that depression (B= -0.07; 95% CI: -0.12, -0.01) was negatively associated, and resilience (B=0.04, 95% CI: 0.01, 0.06) and quality of life (B=0.72, 95% CI: 0.45, 1.00) were positively associated with ART adherence. There was no statistically significant association between stigma and ART adherence.
CONCLUSIONS
Intervention programs geared towards reducing depression and increasing resilience and overall quality of life may improve ART adherence among OALH, especially in the Free State Province.

Investigating the role of nutrition in TB management: Association between nutritional status and nutrition related knowledge, attitudes, and practices among people receiving TB treatment in eThekwini District
Sizwe Mthabela[1,2], Sanele Ngcobo[1], Victoria Oyekunle[3], Nontuthuko Maningi[4], Nothando Mbatha[3]
[1]Familty Medicine, University of Pretoria, Pretoria, South Africa, [2]Public Health, The Aurum Institute, Johannesburg, South Africa, [3]School of Health Systems

and Public Health, University of Pretoria, Pretoria, South Africa, [4]Microbiology, University of KwaZulu-Natal, Durban, South Africa

INTRODUCTION
Poor nutritional status is associated with increased risk of developing TB and worsening treatment outcomes. Understanding the relationship between nutritional status and nutrition-related knowledge, attitudes, and practices (KAPs) is essential to design interventions improving health outcomes in people receiving TB treatment.
OBJECTIVE
To assess the association between nutritional status and nutrition-related KAPs among people receiving TB treatment in the eThekwini District
METHODS
A facility-based cross-sectional study was conducted among 385 adults receiving TB treatment. Nutritional status was assessed via anthropometric measurement using the World Health Organization's (WHO) formula for body mass index (BMI), while nutrition-related KAP was assessed using a semi-structured interviewer-administered questionnaire. Pearson's chi-square test and logistic regression models were used to assess associations between nutritional status and several predictors.
RESULTS
The study found that 67.0% of participants had a normal nutritional status, while 16.6% were underweight and 16.4% were overweight or obese. There was low (66.5%) nutrition-related knowledge among participants. Also, 53.2% had poor attitudes towards nutrition, while only 11.2% reported poor nutritional practices. There was significant association between poor nutritional practices and nutritional status (p = 0.034). After adjusting for socio-demographic and lifestyle factors, low nutrition-related knowledge was significantly associated with lower odds of having a normal nutritional status (p = 0.040).
CONCLUSIONS
Low nutrition-related knowledge and poor attitudes were common, and poor nutritional practices were linked to malnutrition. These findings highlight the critical role of nutrition in TB management. We recommend strengthening of nutrition education and counselling in routine TB care.
Popul. Med. 2026;8(Supplement 1):A541

Prevalence and factors associated with HIV testing uptake among adolescent girls and young women in Sub-Saharan Africa, 2015 to 2024

Alfred Musekiwa[1], Denekew Bitew Belay[1,2], Kontswi Donald Tshabalala[1,3], Muziwakhe Tshabalala[4], Nigussie Adam Birhan[5], Rethabile Dorothy Phaahla[1], Sikhanyiselwe Nkomo[1], Maureen Moyo-Chilufya[6]
[1]School of Health Systems and Public Health, University of Pretoria, Pretoria, South Africa, [2]Department of Statistics, Bahir Dar University, Bahir Dar, Ethiopia, [3]Department of Statistics and Operations Research, Sefako Makgatho University, Pretoria, South Africa, [4]Department of Physiotherapy, Sefako Makgatho University, Pretoria, South Africa, [5]Department of Statistics, Injibara University, Injibara, Ethiopia, [6]Department of Physiotherapy, Stellenbosch University, Cape Town, South Africa

INTRODUCTION
HIV/AIDS remains a major global public health problem. This study determined prevalence and factors associated with HIV testing uptake among adolescent girls and young women (AGYW) aged 15 to 24 years in Sub-Saharan Africa (SSA) from 2015 to 2024.
METHODS
The potential factors associated with HIV testing uptake were identified using a multivariable multilevel logistic regression model. All analyses were performed using data from the Demographic and Health Survey (DHS) of SSA countries between 2015 and 2024, with adjustments for unequal sampling probabilities using survey weights.
RESULTS
The overall uptake of HIV testing among AGYW aged 15-19 years was 24.96% (95%CI: 24.45-25.49), lower than for AGYW aged 20-24 years at 55.78% (95%CI: 55.05-56.52), according to the pooled estimates from the DHS data. The factors associated with HIV testing uptake were educational level, media exposure, discriminatory attitudes towards people with HIV, knowledge of mother-to-child transmission of HIV, comprehensive HIV knowledge, current pregnancy status, visit to a health facility, age at first sexual intercourse, experience of gender-based violence, internet use, place of residence, and cluster-level illiteracy.
CONCLUSIONS
The pooled uptake of HIV testing was approximately two times higher among AGYW aged 20-24 years compared to the AGYW aged 15-19 years. Increasing HIV testing uptake among AGYW requires a multi-pronged approach that removes barriers while providing HIV testing in the community, at home, and at all levels of the health service, especially among adolescent girls aged 15-19 years. The introduction of comprehensive sex education in schools and the promotion of HIV self-testing can increase the HIV testing uptake among adolescent girls.

The Epidemiology of ESKAPE Pathogens and Clostridioides difficile in patients with and without COVID-19 in hospitals in Tshwane District, Gauteng Province, South Africa

Tshepiso Lentswe[1], Nkengafac Motaze[2], Veranyuy Ngah[1], Isaac Singini[3], Susan Nzenze[4], Nebiyu Dereje[5], Ammar Moreda[6], Peter Nyasulu[1]
[1]Department of Global Health, Stellenbosch Unviersity, Cape Town, South Africa, [2]Medicine Usage in South Africa, North-West University, Potchefstroom, South Africa, [3]Biostatistics Research Unit, South African Medical Research Council, Cape Town, South Africa, [4]Division of Surveillance and Outbreak response, National Institute for Communicable Diseases, Johannesburg, South Africa, [5]Africa Centres for Disease Control and Prevention, CDC, Addis Ababa, Ethiopia, [6]Ethiopian Public Health Institute, Ethiopian Public Health Institute, Addis Ababa, Ethiopia

BACKGROUND
COVID-19 is a respiratory disease caused by the SARS-CoV-2. This study aimed to compare infections with ESKAPE pathogens and C. Difficile and to identify key predictors associated with these bacterial pathogens between patients with and without COVID-19 admitted to the ICU at hospitals in the Tshwane district, South Africa.
METHODS
We conducted a retrospective cross-sectional analytic study on patients with and without COVID-19 who were admitted to hospitals in the Tshwane District between March 2020 and December 2022. Categorical variables were summarized using frequencies and percentages to describe the distribution of ESKAPE pathogens and Clostridioides difficile. Logistic regression was used to identify factors associated with bacterial infection (presence vs. absence). Variables with a p-value ≤ 0.10 in univariate analysis were included in the multivariate model. Statistical significance was set at p ≤ 0.05.
RESULTS
This study used a dataset of 4893 clinical isolates from 225 patients with and without COVID-19. ESKAPE pathogens, and Clostridioides difficile were identified in 71.4% (95% CI: 0.701 – 0.726; 3491/4893) of the isolates. Clostridioides difficile (26.0%, 909/3491), Acinetobacter baumannii (24.6%, 860/3491), and Klebsiella pneumoniae (19.9%, 696/3491) were the most frequently identified pathogens. Multivariable analysis showed that both treatment facilities (Hospital A, Hospital B [reference] and Hospital C) (AOR 0.299, 95% CI: 0.190 - 0.470, p <0.001; AOR 0.402, 95% CI: 0.252 - 0.638; p <0.001, respectively) and infection with COVID-19 (AOR 0.604; 95% CI: 0.466 - 0.783; p <0.001) were significantly associated with a decrease in the odds of infection with ESKAPE pathogens and Clostridioides difficile.
CONCLUSIONS
Infection with COVID-19 and treatment facilities were associated with decreased odds of acquiring infections with ESKAPE pathogens and Clostridioides difficile. Therefore, this study underscores the urgent need for stringent measures and infection control programs to prevent further dissemination.

Improving equitable access to malaria care among hard-to-reach Amazonian gold miners: a promising self-diagnosis and self-treatment kit (Malakit)

Maylis Douine[1], Carlotta Carboni[1], Alice Sanna[2], Muriel Galindo[1], Mathieu Nacher[1], Antoine Adenis[1], Lise Musset[3], Yassamine Lazrek[3], Jane Bordalo Miller[4], Hélène Hiwat[5], Stephen Vreden[6], Martha Suarez-Mutis[2], Yann Lambert[1]
[1]Centre d'Investigation Clinique Guyane Amazonie - Inserm1424, Centre Hospitalier Universitaire de Guyane, Cayenne, French Guiana, [2]Parasitic diseases Laboratory, Foundation Oswaldo Cruz, Rio de Janeiro, Brazil, [3]Parasitology Laboratory, Centre National de référence du paludisme, Institut Pasteur de la Guyane, Cayenne, French Guiana, [4]DPAC-Fronteira non-profit, Oiapoque, Brazil, [5]National Malaria Programme of Suriname, Paramaribo, Suriname, [6]Foundation for the Advancement of Scientific Research in Suriname, Paramaribo, Suriname

INTRODUCTION
Isolated and mobile gold mining populations in French Guiana face major barriers to healthcare access, sustaining malaria transmission and increasing the risk of artemisinin resistance in hard-to-reach settings (1,2). Aligned with SDG 3

(ending malaria epidemics), the Malakit project developed with Suriname and Brazil addressed these inequities through a context-adapted self-diagnosis and self-treatment strategy for gold miners.
METHODS
This strategy was implemented through an interventional study assessing both implementation and effectiveness . Gold miners were trained to use a self-diagnosis and self-treatment malaria kit, supported by culturally and linguistically adapted illustrated materials, videos, and a smartphone application developed through community engagement. Kits were distributed by community health workers at key cross-border points between French Guiana, Brazil, and Suriname to individuals travelling to mining sites in French Guiana. Evaluation relied on questionnaires completed at inclusion and follow up visits, as well as on cross sectional pre and post intervention studies. The primary outcome was the proportion of participants correctly using artemisinin based combination therapy following a malaria test. Secondary outcomes included kit use practices and intervention's impact on malaria transmission.
RESULTS
From 2018 to 2020, 4766 kits were distributed to 3733 individuals. The kit was used correctly by 71.7% of participants (N=223, 95%CI=65.8–77.7). The proportion of individuals using both a diagnostic test and a certified ACT treatment—either through the Malakit program or the formal health system—increased after the intervention (OR=1.8; 95%CI=1.1–3.0). Modelling suggests that the intervention contributed to a 43% reduction in regional malaria incidence. Qualitative survey indicates strong acceptance by the target population (6).
CONCLUSIONS
The Malakit project shows that underserved populations can safely manage malaria with adapted training. This equity driven model offers a sustainable pathway to improving care access for communities living "beyond borders" and provides a replicable approach for similar contexts worldwide (7,8).

ABS1765
Health Belief Patterns and Preventive Behaviors Toward Opisthorchiasis Among Rural Mekong Border Communities in Northeastern Thailand

Kaewjai Maleelai[1], Peyanut Juntavaree[1], Sukhontip Arunkamonphat[1], Nutchnun Kamonroek[1], Thawatchai Toemjai[1]
[1]Faculty of Public Health and Allied Health Sciences, Praboromarajchanok Institute, Sirindhorn College of Public Health, Ubon Ratchathani, Ubon Ratchathani, Thailand

BACKGROUND
Opisthorchiasis remains a neglected tropical disease and a major public health concern in the Greater Mekong Subregion, where foodborne trematode infections affect communities across national borders. Prevalence of Opisthorchis viverrini infection remains high in many areas, influenced by sociocultural dietary practices and inequitable access to preventive health services.– Understanding health belief patterns related to preventive behaviors is essential for developing equitable and sustainable disease control strategies.
METHODS
A cross-sectional study was conducted among 354 adults residing in rural Mekong border communities in Northeastern Thailand. Data were collected using a structured questionnaire based on the Health Belief Model, assessing perceived susceptibility, perceived severity, perceived benefits, perceived barriers, and self-efficacy. Associations between health belief constructs and preventive behaviors were analyzed using Spearman's rank correlation coefficient.
RESULTS
Most participants were female agricultural workers, with approximately two-thirds reporting low income and educational attainment below secondary level. Although most reported no prior diagnosis of opisthorchiasis, 62.4% continued to consume raw freshwater fish. Fewer than half reported regular stool examination. Overall health belief patterns were moderately correlated with preventive behaviors (r_s = 0.5507, $p < 0.001$). Perceived barriers (r_s = 0.5964), self-efficacy (r_s = 0.5178), and perceived benefits (r_s = 0.4335) showed stronger associations than perceived susceptibility and severity ($p < 0.001$).
CONCLUSIONS
Preventive behaviors toward opisthorchiasis are influenced more by perceived barriers, self-efficacy, and perceived benefits than by risk perception alone. Interventions addressing cultural and structural barriers while strengthening individual and community empowerment are essential for equitable and sustainable prevention in rural Mekong border communities.

ABS1837
Epidemiological profile of leprosy in children under 15 years of age in the state of bahia, 2015 to 2024

Alda Santana Santos Guimarães[1], Ana Franceska Cotrim Silva[1], Greice Quele dos Santos Cruz[1], Eleuzina Falcão da Silva Santos[1]
[1]Coordination of Surveillance and Control of Diseases – COAGRAVOS, Health Secretariat of the State of Bahia - SESAB/ Directorate of Epidemiological Surveillance – DIVEP, Salvador, Brazil

INTRODUCTION
Leprosy is a chronic, infectious, and transmissible disease, still considered a public health problem in Brazil, despite having treatment available through the Unified Health System (SUS). The country accounts for more than 90% of cases in the Americas. The detection of cases in children under 15 years of age indicates active transmission and failures in interrupting the chain of contagion. Therefore, understanding the epidemiological profile of this population is essential for planning disease control actions.
METHODS
This is a descriptive, retrospective study conducted using secondary data from the Notifiable Diseases Information System, through the TABNET/DATASUS tabulator, referring to newly confirmed cases of leprosy in children under 15 years of age, registered in the state of Bahia, from 2015 to 2024. Epidemiological and operational indicators related to detection, physical disability, contacts examined, and case outcomes were analyzed.
RESULTS
During the analyzed period, 972 new cases of leprosy were recorded in children under 15 years of age. The detection rate of new cases was highest in 2015 (5.62/100,000 inhabitants) and showed a decreasing trend, reaching 1.22/100,000 inhabitants in 2023. There was a predominance of males (51%) and individuals of Black and mixed race/color (82%). Most cases showed no physical disability at diagnosis (75%), but 2% presented Grade 2 disability. A regular classification was observed according to the Ministry of Health parameters in the percentage of evaluated cases, except in 2018 (93%), which was considered good. Indicators related to contacts and cure did not reach satisfactory parameters throughout the historical series.
CONCLUSIONS
Despite the reduction in the detection rate, the results indicate failures in early diagnosis and contact surveillance, suggesting the persistence of active transmission. It is necessary to strengthen control strategies and improve health planning aimed at children and adolescents, with the goal of eliminating leprosy in the state of Bahia.

Assessing User Experience with the Bioline™ HCV Point-of-care Test in Primary Healthcare Settings in Ghana: A Mixed-Methods Study

Evans Duah[1,2], Evans Mantiri Mathebula[1], Kuhlula Maluleke[1], Tinyiko Violet Baloyi[1], Richard Kobina Dadzie Ephraim[3], Tivani Mashamba-Thompson[1]
[1]School of Health Systems and Public Health, Faculty of Health Sciences, University of Pretoria, Pretoria, South Africa, [2]Department of Public Health, Klintaps University College of Health and Allied Sciences, Accra, Ghana, [3]Department of Medical Laboratory Science, College of Health and Allied Sciences, University of Cape Coast, Ghana, Cape Coast, Ghana

ABSTRACT
Hepatitis C Virus (HCV) is a major public health challenge, particularly in resource-limited settings with inadequate diagnostic services. The Bioline™ HCV Point-of-Care (POC) test provides a promising solution for improving diagnosis in Primary Healthcare (PHC) clinics without laboratory infrastructure. This study evaluated the test's usability, acceptability, and deliverability in Ghana using user-oriented REASSURED criteria. As part of a diagnostic trial in Ghana registered in the Pan African Clinical Trial Registry (PACTR202410837698664), a convergent parallel mixed-methods design was adopted. Quantitative data was collected through direct observation of Healthcare Workers (HCWs) using audit checklists and analyzed with Stata 16. The analysis included descriptive statistics, inter-rater concordance assessment, and the application of the System Usability Scale (SUS). Qualitative data, analyzed using Atlas.ti 24.2.0, explored user experiences, confidence, storage infrastructure, and suggestions for test design improvement through in-depth interviews. The quantitative audit included 81 non-laboratory HCWs, with 22 participating in in-depth interviews. The test scored 88.7 on the SUS (95% CI: 86.40-90.88), with 88% of HCWs rating it as easy or very easy to use. Most HCWs (81.5%) successfully completed all test steps independently, achieving 100% inter-rater concordance, but 83% made errors in at least one step,

primarily during pre-testing. Qualitative findings revealed widespread acceptance, confidence, and adaptability, despite challenges with storage infrastructure that may compromise test validity under high temperatures exacerbated by climate change in the study setting. The Bioline™ HCV POC test demonstrated high usability and acceptance among HCWs in resource-limited settings. Enhancements such as improved packaging, simplified information sheets, refined droppers, and additional components like gloves could further optimize usability. These findings contribute to Global Health by supporting SDG 3, enhancing access to timely HCV diagnosis, advancing progress toward Universal Health Coverage, and strengthening health systems in underserved areas, particularly in sub-Saharan Africa.

Diagnosis of sexually transmitted infections during the june festivals using a public health testing strategy, 2024s diagnosed with sexually transmitted infections in the Fique Sabendo strategy during the June festivals in Salvador, Bahia, 2024

Greice Cruz[1], Adriana Carvalho[1], Adriana Santos[1], Zilda Almeida[1]
[1]Bahia State Health Department, Directorate of Epidemiological Surveillance, Salvador, Brazil

INTRODUCTION

Sexually transmitted infections (STIs) remain a major public health problem worldwide due to their high transmissibility, which often surpasses the effectiveness of available prevention strategies. Expanding access to timely diagnosis and treatment is essential, especially for populations that face barriers to accessing health services. Large-scale events represent strategic opportunities for prevention, testing, and diagnosis actions for STIs.

METHODS

This descriptive study analyzed the occurrence of human immunodeficiency virus (HIV), syphilis, hepatitis B, and hepatitis C among individuals who underwent rapid testing through the Fique Sabendo strategy during the June festivities held in Salvador, Bahia, Brazil, in 2024. Secondary data from the Event Occurrence System (SOPE) were used. Sociodemographic variables analyzed included age, sex, race/color, and gender identity. Data were analyzed using descriptive statistics and the chi-square test.

RESULTS

A total of 3,210 individuals were tested. Syphilis showed a statistically significant association with age, sex, and gender identity, being more prevalent among individuals aged 20 to 49 years and cisgender individuals ($p < 0.001$). For HIV, a significant association was observed only with gender identity ($p = 0.0008$), with higher positivity among cisgender individuals. No statistically significant associations were identified between sociodemographic variables and test results for hepatitis B and hepatitis C. Among individuals with a reactive syphilis test, 28.1% initiated immediate treatment.

CONCLUSIONS

The Fique Sabendo strategy proved effective in expanding access to STI testing, diagnosis, and initiation of treatment in non-traditional settings. Conducting these actions during festive events contributes to early diagnosis and reaching vulnerable populations, reinforcing their importance for STI prevention and control within the public health context.

A scalable community mobilisation model for fighting the spread of cholera across borders using Emergency Community Health Clubs. Lessons from Zimbabwe from one of the worst single outbreaks in decades in Africa

Juliet Waterkeyn[1]
[1]Research and Training, Africa AHEAD, Cape Town, South Africa

BACKGROUND

Zimbabwe's 2008-2009 cholera epidemic exposed the fragility of urban infrastructure amidst political and economic collapse with almost 100000 cases and 4000 people dead 1. The high-density suburbs of Sakubva in Mutare were expected to be an epicentre of transmission due to proximity to cross-border traders in Mozambique and uncollected waste around a large market with unsafe water, poor hygiene, and little sanitation 2. Lessons from 2008 need to be revisited as once again a cholera outbreak in Mozambique is spreading into Zimbabwe 3.

METHODS

Zimbabwe AHEAD introduced Emergency Community Health Clubs (CHCs) in Sakubva in February 2009 with eight public health sessions delivered by trained facilitators. Thirty-six CHCs were formed, enrolling 5400 members, with outreach extending to an estimated 24000 residents. Six School Health Clubs reinforced intergenerational learning. Activities included hygiene education, household follow-up, and mass clean-up campaigns 4. Epidemiological outcomes were assessed using Ministry of Health and UNICEF/WHO surveillance data calculating attack rates, case fatality rates (CFR), and relative risk (RR) 5.

RESULTS

Cholera did not take hold in Sakubva: with only one case and no fatality, the attack rate was 0.4/100,000 compared to 105/100,000 in Mutare and 202/100,000 in Harare. The CFR was <1%, meeting WHO standards, while Mutare's CFR was 4.04% and the national average 4.35% 6. Relative risk analysis confirmed residents were 99.6% less likely to contract cholera than those in Mutare, and the epidemic was controlled by April. Beyond epidemiological impact, CHCs fostered civic solidarity, empowered women, and catalysed institutional change within town council

CONCLUSIONS

Emergency CHCs proved scalable and cost-effective 7. By embedding prevention within community structures, the model bridged emergency relief and sustainable public health development. Institutionalisation of CHCs in fragile states would ensure epidemic preparedness by establishing buffer zones of CHCs along border areas for mitigation of cholera and other epidemics.

ABS2056

Risk Factors for Lassa Fever Outbreak in Edo State, January 2025: A Case-Control Study

Emmanuel Ochikiri Oko[1], Emmanuel Ochikiri Oko[1], Rowland Utulu[1]
[1]Field Epidemiology and Laboratory Training Program, Nigeria Field Epidemiology Training Program (NFELTP), Yenagoa, Nigeria

BACKGROUND

In January 2025, Edo State, Nigeria, exceeded its epidemic threshold for Lassa fever, reporting 76 confirmed cases across hotspot local government areas (LGAs) including Etsako West, Esan West, and Esan North-East. Despite recurrent outbreaks, evidence on individual-level risk factors remains limited. We investigated to describe the epidemiology of the outbreak and identify risk factors for infection.

METHODS

We conducted a 1:3 unmatched case-control study. A case was defined as an RT-PCR-positive Lassa fever patient residing in Edo State during January 2025. Controls were residents of the same locality without Lassa fever infection. We collected data using structured questionnaires covering sociodemographic, environmental, and behavioural exposures. Logistic regression was performed to determine associations between exposures and infection.

RESULTS

A total of 28 cases and 84 controls were enrolled. The mean age was 32.5 years (SD ±15.0), with no significant age or gender differences between groups. A single case of Lassa fever was detected among healthcare worker and the overall case fatality rate was 14.5%. Contact with a sick person within 21 days prior to illness onset was strongly associated with Lassa fever infection (adjusted OR = 23.2; 95% CI: 6.4–83.9). Other exposures—including rodent presence, improper food storage, poor hand hygiene, and water source—did not show statistically significant associations.

CONCLUSIONS

Close contact with infected individuals was the primary risk factor for Lassa fever transmission in Edo State during this outbreak. The low case rate among healthcare workers and moderate case fatality rate suggests improvements in infection prevention and control practices. Strengthening contact tracing, public education, and targeted interventions in endemic LGAs remain critical for outbreak response.

Estimating the impact of different intermittent preventative treatment in pregnancy delivery strategies on low-birth-weight outcomes under moderate and high malaria transmission settings

Levoniah Chakuvinga[1]
[1]Statistical Sciences, University of Cape Town, Cape Town, South Africa

BACKGROUND

Malaria during pregnancy is a major risk factor for low birth weight (LBW) in newborns, which in turn negatively affects the growth and development of the child. The World Health Organization (WHO) recommended interventions for pregnant women living in malaria endemic countries that include the use of intermittent preventative treatment in pregnancy (IPTp). However, WHO asserts that the coverage of pregnant women taking the recommended doses of IPTp

are still very low. The primary goal of this study was to estimate the effects of increasing the coverage of doses of IPTp and to assess the effect of pregnancy timing in relation to seasonal transmission on malaria infections during pregnancy and neonates with LBW. We explored these effects in moderate and high transmission settings which have Zimbabwe-like characteristics.
METHODS
A compartmental mathematical model depicting malaria during pregnancy with IPTp doses was formulated to analyze the effects of IPTp, insecticide treated net (ITN) use and seasonal variations in moderate and high malaria transmission settings.
RESULTS
Our simulation findings suggest that increasing both ITN use and IPTp dose coverages, consistent with the Zimbabwe malaria strategic plan targets, prevented 9.2% and 5% clinical cases in moderate and high transmission respectively. Unprotected pregnancies overlapping the rainy season and peak of malaria incidence in Zimbabwe during the beginning of the second and in the third trimester experience the highest malaria and LBW burden
CONCLUSIONS
Overall, our results demonstrate that increasing ITN use has a substantial impact in reducing clinical malaria cases during pregnancy. This highlights its importance as a key intervention, and the health benefits it would provide for malaria control goals in Zimbabwe. Pregnancies that overlap with the epidemic peaks in later trimesters lead to a rise in LBWs, indicating the necessity of protecting pregnant women at risk of malaria infection till delivery.

Seasonal labour, systemic injustice: health inequities in the pacific australia labour mobility scheme

Geraldine Vaughan[1], Robyn Preston[1], Catherine O'Mullan[1], Haylee Fox[1]
[1]Centre > Health Equity in Regional and Remote Communities C>HERRC, CQUniversity, Rockhampton, Australia

INTRODUCTION
Pacific Australia Labour Mobility (PALM) scheme seasonal worker participants make vital contributions to Australia's economy. However, they face significant structural and social barriers to accessing healthcare while living and working in Australia. This research explored the barriers to access experienced by PALM Scheme participants in agricultural settings in far north Queensland, Australia. The study focused particularly on blood-borne viruses (BBVs) such as hepatitis B (HBV) and sexual health (STIs), and identified strategies to improve equity and responsiveness within the Australian health system.
METHODS
A sequential mixed-methods design, integrating semi-structured interviews and surveys with PALM workers, healthcare providers, and employers. Co-designed workshops tested and refined policy and service-level recommendations. The research adopted a health equity lens, underpinned by human rights principles.
RESULTS
A complex interplay of factors impacting healthcare access and navigation were described, revealing challenges beyond BBVs/STIs. System-level restrictions were identified, with mandatory private health insurance (and a lack of access to Australia's Universal Health Coverage, Medicare) creating barriers and fragmented care due to inconsistent coverage and billing. Regional locations were associated with transport challenges and gaps in primary healthcare infrastructure. Systemic gaps lead to reliance on individual goodwill and informal workarounds by health providers and employers. Underlying these factors were concerns related to living and working conditions, and a fear of job loss/deportation leading PALM participants to conceal illnesses.
CONCLUSIONS
The gaps identified in effective healthcare access call for considerable policy/funding shifts in order to provide respectful models of care for PALM seasonal workers, underpinned by better continuity of care. This includes a fundamental review of the health insurance system, access to universal health coverage, improved paid sick leave entitlements, and innovative models such as onsite healthcare, as well as screening and vaccination for HBV and STIs. Such models require strengthening cultural safety, guided by a co-designed approach.
Popul. Med. 2026;8(Supplement 1):A579

ABS2147
Neglected Within Neglect: The Invisibility of Female Genital Schistosomiasis in South Africa's Neglected Tropical Disease Programming

Nthabiseng Dlamini[1], Khumbulani Hlongwana[1], Saloshni Naidoo[1]
[1]Public Health, University of KwaZulu-Natal, Durban, South Africa

INTRODUCTION
Female Genital Schistosomiasis (FGS) remains severely overlooked within neglected tropical diseases (NTD), disproportionately affecting women in sub-Saharan Africa. Despite its high prevalence and association with adverse reproductive health outcomes and increased HIV susceptibility, FGS receives minimal attention in policy and clinical practice. Understanding how FGS is or isn't prioritised within policy implementation is critical to addressing this gap. Therefore, this paper examines how FGS is understood, prioritised, and addressed within South Africa's Health Department's NTD Master Plan implementation across different levels within the health system.
METHODS
We employed a qualitative approach guided by Institutional Ethnography and Lipsky's Street-Level Bureaucracy to map the institutional relations shaping NTD activities, and understand how frontline discretion influences the prioritization of FGS, respectively. Thirteen semi-structured interviews were conducted with stakeholders at the national, provincial, district, and facility levels, complemented with non-participant observation carried out during a Communicable Disease Control stakeholder meeting. A hybrid (deductive–inductive) approach to thematic analysis was used to examine how policy texts, governance structures, and everyday implementation practices collectively contribute to the marginal positioning of FGS within the NTD Master Plan. Preliminary Results While the National and provincial levels of government demonstrate awareness of FGS and expressed concern regarding its clinical and public health implications, knowledge at district and health facility levels was limited, with some reporting little to no familiarity with the disease. Some participants perceived FGS to be included within the NTD Master Plan; however, this inclusion was described as limited and lacked operational clarity, particularly in the absence of finalised policy.
CONCLUSIONS
Uneven knowledge limited institutional ownership, and structural constraints at the point of service delivery undermine the translation of policy recognition into practice. Strengthening the integration of FGS into NTD and sexual and reproductive health programmes may be critical for addressing neglect and advancing equitable NTD responses.
Popul. Med. 2026;8(Supplement 1):A580

ABS2203
Incidence of adverse events following BCG vaccination with Russia and Moreau strains: a surveillance study in Brazil

Ramon de Souza[1], Florisneide Barreto[1], Marcio Natividade[1], Susan Pereira[1]
[1]Institute of Collective Health, Federal University of Bahia, Salvador, Brazil

INTRODUCTION
Bacille-Calmette-Guérin is the only vaccine available for the prevention of severe tuberculosis. There is scientific evidence of its high safety, effectiveness and is recognized for its low level of adverse events1-5. Given the replacement of the BCG-Moreau vaccine strain by BCG-Russia in the routine of health services in Brazil, since January 2018, monitoring the occurrence of adverse events became a priority. To estimate the incidence of adverse events following BCGRussia vaccination compared to BCG-Moreau.
METHODS
This is a retrospective observational study that used national surveillance data obtained from the Adverse Events Information System (SIE) associated with BCG in children under 1 year of age who were vaccinated. The incidence and characteristics of adverse events were estimated for each vaccine strain.
RESULTS
In the period analyzed, 3901 records of Adverse Events PostVaccination were observed in children under 1 year of age. In the group of children vaccinated by BCG-Moreau, the incidence of adverse events following vaccination was 41,4 cases/100,000 doses applied in the last year. While for children vaccinated by BCG-Russia, the incidence of adverse events was 4,1 to 6,7 cases/100000 doses applied, in 2018 and 2019, respectively. Both strains presented local or regional and systemic clinical manifestations, the prevalence of these manifestations was lower in the Russia strain when compared to Moreau.
CONCLUSIONS
The Moreau strain presented a higher occurrence of adverse events when compared to Russia. Replacing BCG-Russia with BCGMoreau does not appear to influence vaccine safety in the Brazilian population. In the event of a supply crisis of the local reference strain, BCG-Russia is a possible alternative to ensure vaccination of Brazilian children. The adoption of ongoing education strategies for vaccinators regarding the correct handling and good practices of immunobiologicals is considered, in addition to the acquisition of practical devices for the application of immunobiologicals.

Malawi's 95–95–95 progress at risk: Identifying who falls behind as HIV funding shrinks

Bilaal Wilson Matola[1,2], Juliet Charity Yauka Nyasulu[1], Edward Nicol[1,3]
[1]Global Health, Stellenbosch University, Cape Town, South Africa, [2]HIV, STIs & Viral Hepatitis, Ministry of Health, Lilongwe, Malawi, [3]Burden of Disease Research Unit, South African Medical Research Council, Cape Town, South Africa

ABSTRACT

Malawi's 95–95–95 progress at risk: Identifying who falls behind as HIV funding shrinks

BACKGROUND

The HIV/AIDS epidemic remains a major global health challenge. Malawi accounts for roughly 2.5% of global cases. The UNAIDS Fast-Track strategy, launched in 2014, set 95–95–95 targets to be achieved by 2025, which Malawi adopted in 2020. This study evaluates Malawi's progress toward the 95–95–95 targets and identifies populations at risk of being left behind in a resource-constrained context.

METHODS

This quantitative descriptive study analysed secondary data from Malawi's national HIV program and HIV Spectrum estimates from 2012–2023, including audited facility reports on HIV status awareness, ART uptake, and viral suppression. Data were disaggregated by age, gender, and sex. Data cleaning and analysis were conducted using Excel, SPSS, and Stata 15.1. Proportion tests assessed differences in HIV indicators by age and gender for 2023, while Mann–Whitney and independent t-tests evaluated median and mean differences, respectively, with statistical significance set at 5%.

RESULTS

Between 2012 and 2023, Malawi's estimated PLHIV rose from 962,043 to 991,600. HIV status awareness increased from 73% (95% CI: 72–74%) to 95% (94–96%), ART coverage from 58% (57–59%) to 95% (94–96%), and viral suppression from 90% (89–91%) to 95% (94–96%). Children lagged adults in all indicators: awareness rose from 24% (23–25%) to 87% (85–89%) versus 79% (78–80%) to 96% (95–97%) in adults; ART initiation remained lower among children (84%, 82–86% vs. 95%, 94–96%). Men also trailed women across the cascade.

CONCLUSIONS

Between 2012 and 2023, Malawi made substantial progress toward the 95–95–95 targets. However, children and men continue to lag, highlighting persistent inequities. In the context of declining HIV funding, sustaining gains will require targeted, efficient, and data-driven interventions that prioritise these vulnerable groups to prevent setbacks and ensure equitable access to lifesaving HIV services.

ART initiation, adherence and retention in care among men in Cape Town, South Africa

Tsidiso Tolla[1], Edwin Wouters[2,3], Caroline Masquillier[2,4,5], Bernedette Hensen[6], Mwelwa Phiri[7], Lucia Knight[1,8]
[1]1 School of Public Health, The University of Cape Town, Cape Town, South Africa, [2]2 Centre for Population, Family and Health, University of Antwerp, Antwerp, Belgium, [3]3 Centre for Health Systems Research & Development, University of the Free State, Free State, South Africa, [4]4 Primary and Interdisciplinary Care, Antwerp research group (ELIZA), Antwerp, Belgium, [5]5 Centre for Research and Innovation in Care (CRIC), University of Antwerp, Antwerp, Belgium, [6]6 Department of Public Health, Institute of Tropical Medicine, Antwerp, Belgium, [7]7 Zambart, Zambart, Lusaka, Zambia, [8]8 School of Public Health, University of the Western Cape, Bellville, South Africa

BACKGROUND

Men's linkage and adherence to and retention in antiretroviral therapy (ART) remain a critical gap in the HIV treatment continuum in South Africa. This study explores factors that encourage or discourage ART initiation, adherence and retention in HIV care among men in two townships in Cape Town, South Africa.

METHODS

Individual interviews were conducted with men (n=15), healthcare workers (n=5), community health workers (n=4), and community leaders (n=6) from Khayelitsha and Gugulethu. In addition, six focus group discussions (n=2 only men; n=2 only women; n=2 men and women mixed) were conducted in the two communities. Purposive sampling was used to recruit participants. All interviews and FGDs were transcribed verbatim, translated into English and analysed using an inductive and deductive thematic approach, guided by the COM-B model.

RESULTS

The findings indicate that men's ability to initiate ART is closely tied to their psychological capabilities, such as their reactions to the news of an HIV positive diagnosis. ART adherence and retention in care were impacted by negative side effects of ART and positive health outcomes, such as feeling well and healthy. Men were motivated by support from close social ties to initiate ART, adhere to, and remain in care. Among those who initiated ART, the set-up of health facilities, such as separate rooms for HIV patients, created missed opportunities, as men worried that this arrangement could inadvertently disclose their HIV status. Discussion and

CONCLUSIONS

The study findings suggest that men's behaviour towards ART initiation, adherence and retention in care is shaped by their capacity, opportunity and motivation as ascribed in the COM-B model. The model offers a holistic approach and may be useful in developing targeted, multifaceted and multi-level interventions to address these intersecting webs of factors that shape ART initiation and adherence.

ABS2307

Economic evaluation of COVID-19 vaccination in reducing hospitalisation and mortality in a South African insured population using real-world data

geetesh solanki[1], Francesca Little[1,2], Susan Cleary[1]
[1]Health Economics Division, University of Cape Town, Cape Town, South Africa, [2]Dept. of Statistical Sciences, University of Cape Town, Cape Town, South Africa

BACKGROUND

COVID-19 placed strain on health systems in South Africa and globally, with significant morbidity, mortality, and healthcare costs. While the clinical effectiveness of COVID-19 vaccines is well established, evidence on their real-world economic value in low- and middle-income country settings remains limited. This study assessed the cost-utility of COVID-19 vaccination in reducing COVID-19 related hospitalisation, morbidity, and mortality in a South African insured population using real-world data.

METHODS

A retrospective cost-utility analysis based on recognised guidelines was conducted from a third-party payer perspective using insurance claims data covering March 2020 to December 2022. A cohort Markov decision-analytic model with two-week cycles and a lifetime horizon compared three strategies: no, partial, and full vaccination. Health states included asymptomatic infection, hospitalisation, partial recovery, full recovery, post-pandemic survival, and death. Outcomes included COVID-19 hospitalisations averted, deaths averted, life years gained, and quality-adjusted life years gained. Costs and outcomes were discounted at 3% annually. Deterministic and probabilistic sensitivity analyses were performed to assess uncertainty.

RESULTS

Both partial and full vaccination strategies were associated with lower lifetime healthcare costs compared to no vaccination, driven by reduced hospitalisation costs. Vaccination reduced COVID-19 hospitalisations and deaths and resulted in gains in life years and quality-adjusted life years. Both vaccination strategies were dominant, yielding better health outcomes at lower overall costs. Cost-utility results remained consistent across sensitivity analyses. All quality-adjusted life year results fell well below the South African cost-effectiveness threshold.

CONCLUSIONS

Using real-world data, COVID-19 vaccination was found to be a cost-effective and cost-saving intervention in the study population. The findings support the findings of other studies that have provided economic evidence confirming the importance of vaccination strategies in managing healthcare resource use and mortality during the pandemic[12-14]. Given the differences between insured and non-insured populations, caution should be exercised in generalizing the findings.

Exploring Factors Driving Vertical HIV Transmission: A Case-Based Intervention in Cape Town, South Africa

Nisha Jacob[1,2], Emma Kalk[1], Alexa Heekes[1], Erin von der Heyden[2,3], Brian Rice[4], Andrew Boulle[1,2]
[1]1 School of Public Heatlh, University of Cape Town, Cape Town, South Africa, [2]2 Department of Health and Wellness, Western Cape Government, Cape Town, South Africa, [3]3 Department of Global Health, Stellenbosch University, Cape Town, South Africa, [4]4 School of Medicine and Population Health, University of Sheffield, Sheffield, United Kingdom

INTRODUCTION

Vertical transmission (VT) of HIV from pregnant or breastfeeding women to

their infants is a preventable adverse outcome. The World Health Organization (WHO) emphasises early antenatal care, timely HIV diagnosis and rapid initiation of antiretroviral therapy (ART). We evaluated a quality improvement intervention designed to strengthen VT understanding, management and prevention in a Cape Town sub-district.
METHODS
The intervention included: digitising paper-based VT records (1 January 2016 – 31 December 2024) using a new electronic capture form integrated into the Western Cape Provincial Health Data Centre; generating automated reports from captured data; and (3) conducting quarterly VT case reviews using a morbidity and mortality style approach to identify system gaps and propose preventative strategies. Data were described quantitatively, and qualitative reflections from key stakeholders informed the evaluation.
RESULTS
Ninety woman–infant pairs with VT (15.1% of infants diagnosed with HIV) were recorded, with 90% documented in 2021–2022 during an intensive rollout. Most transmissions were detected through routine birth testing (72.2%). Antenatal attendance was recorded for 57.8% of women, 52.2% knew their HIV status pre-pregnancy and 63.3% initiated ART before or during pregnancy. Data completeness varied: demographic details were well-captured, but clinical variables e.g. ART regimen, were often missing. Quarterly case reviews enabled multidisciplinary learning, iterative improvements to the electronic form and strengthened referral pathways. Although clinicians viewed data entry as onerous, the engagement was valued. Key contributors to VT included late or absent antenatal care, treatment interruption and social factors. Concerns about blame and dependence on a single local champion highlighted sustainability risk.
CONCLUSIONS
This case-based intervention enhanced understanding of VT and identified opportunities to strengthen prevention through earlier identification of at-risk pregnancies, improved referral pathways and better retention in care. Long-term success will require attention to governance, administrative burden and sustainable support for healthcare workers.

Non-specific effect of BCG in individuals with persistent symptoms of COVID-19

Florisneide Barreto[1], Ramon Andrade[1], Marcos Pereira[1], Evônio Campelo Junior[1,2], Viviane Morais[2], Paula Luna Leite[2], Marcio Natividade[1], Susan Pereira[1]
[1]Collective Health, Instituto de Saúde Coletiva - Universidade Federal da Bahia, Salvador, Brazil, [2]Department of Tropical Medicine, Health Sciences Center, Federal University of Pernambuco, Recife, Brazil

INTRODUCTION
Prevention and treatment of long COVID-19 are challenges in the current epidemiological context. Given the evidence for non-specific effects of BCG against viral respiratory infections, the hypothesis that BCG vaccination might offer some protection against COVID-19. This study aimed to evaluate the effect of BCG vaccination status on the long-term occurrence of COVID-19.
METHODS
A case-control study comparing the proportion with a BCG vaccine scar (indicating previous vaccination)in cases and controls presenting with COVID-19 to health units in Brazil. Cases were subjects with long COVID-19 (Individuals who presented with persistent symptoms lasting more than 90 days after the acute phase) and controls without prolonged symptoms. Unconditional logistic regression was used to estimate vaccine protection against long COVID-19, with strict control for age, comorbidity, sex, educational level, race/colour, and municipality.
RESULTS
The BCG vaccine was associated with long-term protection against COVID-19, in 60% (95% CI 21–80%) of vaccinated individuals compared to unvaccinated individuals.
CONCLUSIONS
BCG vaccination was associated with a lower chance of long COVID, while the severity of acute infection significantly increased the risk of persistent symptoms. These results reinforce the importance of strategies for preventing severe forms of COVID-19 and clinical monitoring of high-risk groups. From a public health perspective, this provides guidance for planning surveillance and rehabilitation actions aimed at reducing the burden of long COVID-19 on the National Health System.

Multilevel Determinants of Tuberculosis Treatment Completion in a High-Burden District of South Africa: A Mixed-Methods Study

Lelethu Bottoman[1], Ernesha Mazinyo[2], Ndumiso Tshuma[3]
[1]Health Programs, Eastern Cape Department of Health, Bhisho, South Africa, [2]Health Science, Foundation for Professional Development, Pretoria, South Africa, [3]NPO, Best Health Solutions, Johannesburg, South Africa

BACKGROUND
Tuberculosis (TB) remains a major public health challenge despite being curable. Treatment interruption and loss to follow-up continue to undermine TB control efforts, contributing to ongoing transmission and the development of drug resistance, particularly in high-burden settings.,3 This study examines the factors influencing TB treatment completion in the Buffalo City Metropolitan (BCM) Health District, Eastern Cape, South Africa, with the aim of identifying key facilitators and barriers that enhance or hinder treatment completion among TB patients.
METHODS
A mixed-methods study design was employed. Quantitative data were obtained from routine health information systems, including the District Health Information System (DHIS) and TIER.Net, as well as patient questionnaires. Qualitative data were collected through in-depth interviews with TB patients receiving care at selected high-burden facilities within BCM. Quantitative data were analysed using descriptive and inferential statistical methods, while qualitative data were analysed thematically. Integration of findings from both components allowed for a comprehensive understanding of the factors influencing TB treatment completion.
RESULTS
TB treatment completion was influenced by multiple, interrelated factors. Socio-demographic characteristics such as age, gender, and level of education were found to affect treatment adherence. Patient-related barriers included stigma, financial constraints, and limited knowledge of TB treatment. Healthcare service-related factors, particularly poor communication between healthcare providers and patients and the complexity of treatment regimens, further hindered treatment completion. In contrast, lifestyle and behavioural factors, especially strong family, and social support, emerged as important facilitators of adherence and sustained engagement in care.
CONCLUSIONS
TB treatment completion in the BCM is shaped by a complex interaction of personal, social, lifestyle, and health system factors. The findings highlight the need for a coordinated, patient-centred approach that addresses both health system challenges and broader socio-economic barriers. Strengthening provider–patient communication, improving patient education, and reinforcing community-based support are critical strategies for improving treatment outcomes.

ABS2472
Structural Vulnerability and TB Treatment Adherence Among a Homeless HIV-Positive Patient in South Africa: A Qualitative Case Study.

Lelethu Bottoman[1], Ernesha Mazinyo[2], Ndumiso Tshuma[3]
[1]Health Programs, Eastern Cape Department of Health, Bhisho, South Africa, [2]Health Science, Foundation for Professional Development, Pretoria, South Africa, [3]NPO, Best Health Solutions, Johannesburg, South Africa

BACKGROUND
Tuberculosis (TB) treatment adherence remains a significant challenge in South Africa, particularly among individuals experiencing extreme social vulnerability, including homelessness, substance use, and HIV co-infection. These intersecting vulnerabilities increase the risk of treatment interruption and loss to follow-up, undermining TB control efforts and treatment outcomes.,3. This study explores the lived experience of a homeless, HIV-positive male TB patient in East London, South Africa, with the aim of understanding the social and structural factors that influence TB treatment adherence and interruption among highly vulnerable populations.
METHODS
An in-depth qualitative interview was conducted in isiXhosa with a 33-year-old homeless man living with TB and HIV. The interview was transcribed verbatim and translated into English. Thematic analysis was applied to explore treatment adherence behaviours and the broader social determinants shaping the participant's treatment journey. Areas explored included homelessness, substance use, psychosocial distress, trauma, incarceration, informal support systems, and access to healthcare services.
RESULTS
Six interrelated themes emerged: cumulative vulnerability and homelessness; psychosocial distress and stigma; the role of informal support systems; the burden of TB–HIV co-treatment; health system discontinuities; and competing survival priorities. Periods of incarceration temporarily enabled treatment

adherence through structured routines, stable medication access, and supportive supervision. In contrast, post-release instability, lack of housing, and fragmented continuity of care contributed to treatment interruption and loss to follow-up.
CONCLUSIONS
This case demonstrates that TB treatment adherence among highly vulnerable individuals is not solely a clinical issue but is deeply embedded within complex social and structural realities. The findings highlight that temporary stability can facilitate adherence, while fragmented health services, inadequate psychosocial support, and unmet basic needs undermine sustained engagement in care. Improving TB outcomes among vulnerable populations requires integrated, person-centred TB/HIV care that addresses social determinants, strengthened community outreach, psychosocial support, and improved continuity of care following periods of institutionalisation.

ABS2505
Spatial estimation of pulmonary tuberculosis risk at small-area level in Chile
Salvador Ayala[1], Nadia Escobar[2], Sandra Rojas[3], Fabiola Marín[1], Josefina Aubert[4]
[1]Centro de Epidemiología y Políticas de Salud, Facultad de Medicina Clínica Alemana, Universidad del Desarrollo, Santiago, Chile, [2]Programa de Control y Eliminación de la Tuberculosis, Ministerio de Salud, Gobierno de Chile, Santiago, Chile, [3]Escuela de Fonoaudiología, Facultad de Odontología y Ciencias de la Rehabilitación, Universidad San Sebastián, Santiago, Chile, [4]Departamento de Salud Pública, Facultad de Medicina, Universidad San Sebastián, Santiago, Chile
BACKGROUND
Tuberculosis (TB) remains a major infectious disease globally 1. In Chile, TB incidence has increased in recent years, representing a setback in disease control 2. Passive case-finding strategies have been identified as a key challenge 3; however, no standardized methodological framework exists to guide territorial prioritization. This study aimed to conduct a national estimation of pulmonary TB risk at small geographic scales between 2016 and 2024, providing critical evidence to support targeted case-finding strategies.
METHODS
We conducted an ecological study, geocoding cases using a cascade strategy and aggregating them by census district. Spatial autocorrelation was assessed using Moran's I, and small-area risk was estimated using hierarchical Bayesian Poisson spatial models implemented with INLA in R 4. Sociodemographic covariates were obtained from the most recent national census data (2024).
RESULTS
We analyzed 2,762 census districts, and 80.5% (n=17.095) of cases were successfully geocoded; among these, 34.7% were women and 65.3% men, with a mean age of 46.3 years. Significant spatial autocorrelation was observed (Moran's I=0.53; p<0.001). Overcrowding showed the strongest association with TB risk (RR per +1%=1.117). Indigenous population proportion was inversely associated (RR=0.972), while population aged ≥60 years showed a small but consistent effect (RR=1.009). No independent effect of immigrant population proportion was observed.
CONCLUSIONS
Spatial analysis revealed strong clustering of pulmonary TB in Chile. Overcrowding was the most robust determinant of increased TB risk, while age structure contributed a smaller but consistent effect. These findings highlight the importance of incorporating housing conditions and demographic structure into territorial prioritization strategies. Small-area risk estimates provide actionable evidence to guide community-based active case finding and improve the efficiency of TB control interventions at the national level.
Popul. Med. 2026;8(Supplement 1):A597

ABS2507
Perceptions and Attitudes Towards HIV Test and Treat: A Comparative Study of Males and Females in Eswatini
Sheillah Hlamalani Mboweni[1], Phiwokuhle Qondile Nkambule[1]
[1]Department of Health Studies, University of South Africa, Pretoria, South Africa
BACKGROUND
Eswatini continues to record the world's highest HIV prevalence (27.9%), with women aged 15–49 bearing a significantly greater burden (36.1%) than men (19.4%). Despite the rollout of the WHO/UNAIDS Test and Start initiative, men remain notably underrepresented in HIV testing and treatment services. Addressing these gender imbalances is critical, as greater male engagement is necessary to reach the 95-95-95 targets and strengthen national HIV outcomes. This study therefore, investigates gender differences in perceptions, attitudes, and knowledge of the Test and Start program among people living with HIV in Manzini, Eswatini.
METHODS
A quantitative descriptive survey design was used to collect data from 604 participants (50% male, 50% female) living with HIV, sampled through stratified random techniques from two major health facilitiesa hospital (62%) and a clinic (38%). A structured Likert-scale questionnaire captured respondents' perceptions, attitudes, beliefs, and knowledge. Data were analysed using descriptive and inferential statistics with SPSS Version 26.
RESULTS
Women reported stronger understanding and more favourable attitudes toward ART and the Test and Start program (93% vs. 86% among men). Men showed lower risk perception (71% vs. 77%), higher stigma (72% vs. 54%), reduced awareness, and greater cultural and logistical barriers, contributing to delayed testing and ART initiation. Positive attitudes were strongly associated with treatment adherence and preventive behaviours. Respondents aged 31–40 showed lower program perceptions than the 21–30 group.
CONCLUSIONS
Significant gender disparities influence engagement with the Test and Start program. While women exhibit greater confidence in ART benefits, men face barriers shaped by cultural norms, limited knowledge, and stigma. Gender-sensitive, community-centered approaches engaging men through peer support, traditional leaders, and targeted outreach are critical to improving testing, treatment uptake, and achieving equitable HIV outcomes in Eswatini.

Strengthening the effectiveness, scalability and sustainability of the Remote Laundries intervention for Acute Rheumatic Fever
Ray Mahoney[1], Sophie Wright-Pedersen[1]
[1]Indigenous Science and Engagement, Commonwealth Scientific and Industrial Research Organisation (CSIRO), Brisbane, Australia
BACKGROUND
Acute Rheumatic Fever (ARF) is an inflammatory disease due to recurrent infection with Group A Streptococcus bacterium (GAS). Untreated ARF can lead to irreversible damage to the heart valves resulting in Rheumatic Heart Disease (RHD) (2, 3). Despite being entirely preventable, within Australia the burden of ARF is almost exclusively witnessed in the Indigenous population, accounting for 94% of diagnoses, particularly in the 5-14 years age group. ARF and RHD are determined by social and economic disadvantage driven by lack of access to adequate healthcare, housing, washing facilities, water and power. Aboriginal Investment Group (AIG) launched the Remote Laundries Project in 2029 as a solution to the lack of washing facilities in remote Aboriginal communities. This study aimed to measure the impact of this community-led primordial prevention activity on health, social and economic outcomes, and enablers and barriers to implementation, scaling and sustainment in remote Indigenous communities
METHODS
A co-designed mixed methods impact and implementation evaluation study was conducted.. Data were collected using qualitative interview and ethnographic observations, and quantitative data related to laundry operation. Deductive thematic analysis was undertaken using the Indigenous and non-Indigenous implementation frameworks.
RESULTS
Findings established the Remote Laundries Project as a legitimate and scalable public health intervention to advance health, social and economic outcomes within remote Indigenous communities. Core components to the success of the Remote Laundries Project were identified. Core components to implementation success included embedded Indigenous governance and workforce, flexible design and delivery suitable to remote contexts, and investment in strong partnerships. The greatest barrier to continued implementation and scale is access to funding.
CONCLUSIONS
With adequate financial investment, the Remote Laundries Project is positioned for scaling across Northern Australia to respond to community identified health, social and economic priorities to advance equitable outcomes for remote Indigenous peoples.

Spatio-Temporal Patterns in Climate-Sensitive Diarrhoeal Medication Demand: A Fuzzy Accessibility Approach
Tebogo Mokoena[1], Inger Fabris-Rotelli[1], Kabelo Mahloromela[1], Renate Thiede[1]
[1]Statistics, University of Pretoria, Pretoria, South Africa
ABSTRACT

In this study, we examine the spatio-temporal relationship between climate-based covariates and sales of diarrhoea medication across Clicks Pharmacy stores in the Western Cape. Diarrhoeal diseases are known to be sensitive to environmental conditions. The primary aim is to understand how changes in climate-based covariates (across different regions and over time) affect the demand for diarrhoeal medication. We utilise a distance-based matrix enhanced with a fuzzy lattice structure to capture real-world accessibility. This approach incorporates factors such as proximity (e.g., drive time and road accessibility). The aim is to improve the model's ability to represent how geographic distance and infrastructure influence consumer access to medication, and how these access patterns evolve in response to climate variations. The focus will be on temporal and geographic patterns in the data, exploring how sales evolve within individual stores and whether shifts in one location are associated with broader network effects or local clustering among nearby stores.

Barriers and Enablers to HIV Care access and engagement among Mobile Populations in Sub-Saharan Africa: A Mixed-Methods Systematic Review

Andiswa Zitho[1]
[1]School of Public Health and Family Medicine, University of Cape Town, Cape Town, South Africa

BACKGROUND
Human mobility is increasingly recognised as a critical determinant of HIV care outcomes in sub-Saharan Africa (SSA), a region bearing the highest global HIV burden and extensive internal, circular, and cross-border migration. While mobility is essential for livelihoods, the pathways through which it shapes sustained engagement in HIV care remain insufficiently synthesised.
METHODS
We conducted a mixed-methods systematic review of peer-reviewed studies published between 2016 and 2025 examining barriers and enablers to HIV care access and engagement among adult mobile populations in SSA. Searches were conducted in PubMed, Scopus, and EBSCOhost. Study selection and quality appraisal followed PRISMA guidelines, and methodological quality was assessed using the Mixed-Methods Appraisal Tool (MMAT). Data were synthesised using a narrative thematic approach guided by the Socio-Ecological Model (SEM), examining influences across individual, interpersonal, community, organisational, and policy levels.
RESULTS
Twenty-two studies from eight SSA countries were included, comprising qualitative (n=14), quantitative (n=5), and mixed-methods (n=3) designs. Mobility consistently emerged as a driver of HIV care disruption, particularly affecting retention and ART adherence. Key barriers included stigma and fear of disclosure, limited knowledge of ART access points, economic insecurity, disrupted social support networks, rigid clinic systems, negative provider attitudes, and restrictive transfer and documentation requirements. These barriers were exacerbated by frequent or unplanned movement and health systems poorly aligned with mobile livelihoods. Enablers included social and peer support, disclosure, community-based ART delivery, multi-month dispensing, emergency ART refills, mobile clinics, and patient-centred service models. Intervention studies demonstrated improved retention and ART possession when services were adapted to mobility realities.
CONCLUSIONS
Mobility functions not merely as a sociodemographic characteristic but as a structural exposure shaping HIV care engagement through interacting behavioural, organisational, and policy mechanisms. Integrating mobility-responsive approaches into HIV programme design is essential for sustaining engagement in care and progress toward the UNAIDS 95–95–95 targets.

Ticks, Demographics, and Farmer's Influence on Red Meat Production in Communal Regions of Eastern Cape Province

Sindisile Goni[1], Sindisile Goni[2], Nkululeko Nyangiwe[1]
[1]Department of Agriculture and Animal Health, University of South Africa, Florida Science Campus, Johannesburg, South Africa, [2]Eastern Cape Department of Agriculture, Dohne Agricultural Development Institute, Stutterheim, South Africa

BACKGROUND
Ticks are the most important vectors of human pathogens, leading to increased public health burdens worldwide. These ticks cause tick-borne diseases which are significant bacterial, viral, and protozoal infections transmitted to humans and animals by ticks, often causing severe illness and mortality. Top, high-impact diseases include Lyme disease, tick-borne encephalitis (TBE), Crimean-Congo hemorrhagic fever (CCHF), babesiosis, anaplasmosis, and ehrlichiosis.
METHODS
Data on demographic factors was collected from 271 farmers of the five District Municipalities (DMs) of the Eastern Cape through questionnaires. Tick species and distribution of cattle and goats were collected and recorded from 158 sampling sites of the 26 Land Redistribution for Agricultural Development (LRAD) black owned farms.
RESULTS
A total of 34,929 adult ticks belonging to five genera were encountered. The most abundant tick genera were Rhipicephalus of the subgenus Boophilus (68.91%), Amblyomma (20.72%), Hyalomma (8.64%), Ixodes (1.22%), and Haemaphysalis (0.51%). By geographic distributions, Amblyomma and Rhipicephalus were common to all DMs, while R. Microplus and R. Decoloratus were found in the drier regions. Lack of marketing channels (23%), poor animal conditions (20%), lack of infrastructure (19%), high price of medicine (14%), shortage of feed (10%), stock theft (8%), and age of animals (too old) to be marketed (6%) are the major shortcomings in red meat production. We found that the associations between gender ($\chi2 = 31.3481$, $p < 0.0001$), age ($\chi2 = 32.4889$, $p < 0.0001$), and farming experience ($\chi2 = 52.7556$, $p < 0.0001$) were significantly higher.
CONCLUSIONS
It is necessary to provide new and updated data, from different geographical and climatological areas, and critically look at parasitic prevalence, seroprevalence, clinical incidence, pathogen presence, and the pathogen infection and inoculation rate by ticks. There is a need for government's intervention to farmers through the provision of livestock-based programs.

ABS2779
Two shocks to the system: Impact of the COVID-19 pandemic on HIV testing and prevention services in KwaZulu-Natal, South Africa

Rizwana Desai[1], Elizabeth Lutge[1]
[1]Health Research & Knowledge Management, KwaZulu-Natal Department of Health, PIETERMARITZBURG, South Africa

BACKGROUND
KwaZulu-Natal (KZN), South Africa, carries the highest burden of HIV globally and has made substantial progress in scaling up HIV testing and treatment services over the past decade. Prior to 2020, sustained improvements in HIV testing coverage and prevention indicators supported progress towards the UNAIDS 95-95-95 targets. The COVID-19 pandemic disrupted essential health services worldwide, raising concerns about reversals in HIV programme performance. This study assessed the impact of COVID-19 on HIV testing, treatment and prevention services in KZN.
METHODS
A retrospective ecological trend analysis was conducted using routinely collected secondary data from the District Health Information System (DHIS) for KwaZulu-Natal and its 11 districts. Financial year data from 2016/2017 to 2023/2024 were analysed, with 2020/2021 defined as the COVID-19 reference period. Indicators included HIV testing volumes and coverage, HIV positivity, antiretroviral therapy (ART) initiation and retention, condom distribution, medical male circumcision (MMC), pre-exposure prophylaxis (PrEP) uptake, and selected maternal and child HIV indicators.
RESULTS
HIV testing volumes and coverage declined sharply during the 2020/2021 financial year, followed by partial recovery in subsequent years and a further decline in 2023/2024, consistent with global reports of HIV service disruption during COVID-19. ART initiation and prevention services, including condom distribution and MMC, showed similar pandemic-related disruptions, while PrEP uptake increased during the COVID-19 period. Infant HIV positivity at birth increased during 2020/2021, suggesting heightened risk of mother-to-child transmission. Districts with high population density experienced the greatest absolute declines, while smaller districts demonstrated marked per-capita variability.
CONCLUSIONS
The COVID-19 pandemic temporarily reversed gains in HIV testing and prevention services in KwaZulu-Natal, diverging from pre-pandemic trends. Strengthening health system resilience through decentralised service delivery, differentiated care models and pandemic preparedness is essential to safeguard HIV programme gains during future public health emergencies.

From Approval to Access: Helping Communities Rise Through Long-Acting HIV Prevention Advocacy

Vuyolwethu Ncube[1], Lindokuhle Mathibe[1], Manoko Mokgokong[1], Bonga Mbatha[1], Justin Masindi[1], Mthobisi Sibisi[1], Pontsho Komane[1], Lungile Mbata[1], Jacqueline Pienaar[1]
[1]Key Populations: Health Systems Division, The Aurum Institute, Johannesburg, South Africa

INTRODUCTION
The regulatory approval of Lenacapavir (LEN) in October 2025 in South Africa presents an opportunity to expand HIV prevention through long-acting modalities,. However, limited community awareness and weak advocacy structures can delay effective rollout and uptake. To ensure successful rollout of LEN, advocacy and community engagement are critical for informed choice, adherence, and demand generation,. The Aurum Institute together with the Africa REACH Foundation conducted community information sessions to educate and sensitise community members about LEN.
METHODS
During the period of October to November 2025, nine pre- and post-test knowledge community sessions were held with 135 community members across eThekwini, Gauteng, and Mpumalanga. These sessions included structured training on HIV prevention and treatment, including information on long-acting HIV prevention options such as LEN, which has demonstrated high efficacy and durability in Phase 3 trials., The intentions of the sessions were to educate communities on various choices in prevention and treatment and establish effective advocacy strategies to increase demand for these options.,
RESULTS
Across the training sessions conducted, the mean participant performance improved from a pre-test average of 74.86% to a post-test average of 83.37%, representing an overall mean increase of 8.51 points. Improvements were observed at all locations. The biggest improvements were recorded in Ekurhuleni, (70.67 to 92.00), followed by Mbombela, (70.00 to 84.29). Moderate improvements were observed in Amsterdam (+5.65), Tshwane (+5.00), and Nkomazi (+4.66). Overall, the findings indicate consistent improvements in post-test scores across all sites, consistent with evidence that community-based education supports uptake and acceptability of long-acting HIV prevention technologies.,
CONCLUSIONS
To ensure sustainability beyond the project timeline, long-term partnerships were established with civil society members and community-based initiatives. These partnerships will help maintain momentum in the roll-out of LEN, build community-led advocacy interventions, and establish a lasting framework of knowledge for equitable access to LEN.

ABS2904

The hidden epidemic: HIV Prevalence in Peri-Mining Communities

Geoffery Setswe[1], Vuyolwethu Ncube[1], Lindokuhle Mathibe[1], Manoko Mokgokong[1], Lesego Menyatswe[1], Sesona Sotshongaye[1], Jacqueline Pienaar[1]
[1]Key Populations: Health Systems Division, The Aurum Institute, Johannesburg, South Africa

INTRODUCTION
People living in peri-mining communities face heightened risk of HIV infection and are often neglected in HIV prevention efforts. These communities experience increased vulnerability due to various factors associated with mining operations and related social dynamics. The interplay of these factors, coupled with migration and mobility, have been found to be linked to increased HIV infection not only for miners working in South African mines but the people living in surrounding areas.–
METHODS
A cross-sectional population-based household survey using stratified multistage cluster sampling was employed across seven peri-mining communities in 2024. Adults aged 18 years and above (n=1634) completed interviewer-administered questionnaires and provided blood specimens for laboratory-based HIV testing. Data were analysed using Stata Version 18.
RESULTS
HIV prevalence across the villages, townships, and informal settlements sampled was 23.8% (95% CI: 20.2–27.9), exceeding South Africa's national adult average of 20.4%. The prevalence was disproportionately elevated among women (30.9%; 95% CI: 25.6–36.7), individuals aged 51–59 years (38.5%; 95% CI: 28.3–49.8), those with primary education or less (32.7%; 95% CI: 25.8–40.6), and unemployed participants (24.4%; 95% CI: 20.3–29.0). Geographic variations were evident, with Bojanala district showing 13.5% prevalence compared to neighbouring districts (11.6–12.9%). Single or formerly married individuals showed higher prevalence (26.8%) than married participants, consistent with evidence linking marital instability and HIV risk in mining-affected settings.,
CONCLUSIONS
The study revealed a concentrated HIV epidemic in peri-mining communities that exceeds national averages., The intersection of gender, age, socioeconomic vulnerability, and geographic proximity to mining operations places people in these areas at increased risk.– Women bear a disproportionate burden of HIV as mining contexts predispose them to gendered economic and social vulnerabilities that increase acquisition risk. Targeted women-centred prevention programs and interventions need to be prioritised. These findings support the dedication of resources and specialised programming to achieve epidemic control by 2030.,

Q fever outbreak in a slaughterhouse in Brazil: retrospective assessment of long-term complications ten years later

Danilo A. França[1], Igor S. Silito[1], Matheus P. Martins[1], Tais B. Carvalho[2], Fabiana C. P. Santos[3], Silvia Colombo[3], Marcelo B. Labruna[1]
[1]Department of Preventive Veterinary Medicine and Animal Health, University of São Paulo, São Paulo, Brazil, [2]Department of Health Surveillance, Municipal Health Secretariat, Barbosa, Brazil, [3]Adolfo Lutz Institute, Vector-Borne Diseases Center, São Paulo, Brazil

BACKGROUND
Q fever is a neglected zoonosis and is rarely considered in the differential diagnosis of acute febrile illness1. The first Q fever outbreak in Brazil occurred in 2015 among slaughterhouse workers in the São Paulo state. This study aimed to report the outbreak and to retrospectively assess the long-term clinical and serological outcomes of affected workers ten years later.
METHODS
In 2015, paired serum samples from slaughterhouse workers were tested by indirect immunofluorescence assay (IFA), and Q fever was confirmed by a fourfold rise in Coxiella burnetii antibody titers2. Molecular investigation was performed using polymerase chain reaction (PCR)3. In 2025, workers were re-evaluated through structured questionnaires addressing workplace conditions, clinical manifestations, and long-term complications. Medical records were reviewed, and current serum and whole blood samples were analyzed by IFA and PCR, respectively, to assess the present serological and molecular status.
RESULTS
During 2015, 17 of 40 workers (42.5%) developed acute illness, characterized by high and recurrent fever, headache, myalgia, and complications such as pneumonia, hepatitis, and hematuria. Six patients required hospitalization. Ten years later (2025), 14 patients were re-evaluated. Twelve presented persistent phase I IgG titers, and 10 reported long-term complications compatible with chronic Q fever, including cardiac and respiratory disorders and persistent fatigue. One patient presented a phase I antibody titer of 1024 associated with a history of endocarditis, suggesting persistent infection. Patients with dyspnea and heart disease were monitored to assess the need for treatment.
CONCLUSIONS
This study documents the first Q fever outbreak in Brazil and demonstrates substantial long-term morbidity among affected workers a decade after exposure. The findings highlight the importance of early diagnosis, appropriate treatment, and long-term surveillance following Q fever outbreaks, particularly in occupational settings with high exposure risk.

ABS2936

Clinical characteristics and risk factors for long COVID.

Ramon de Souza[1], Florisneide Barreto[1], Evônio Campelo Júnior[2], Viviane Morais[2], Samia Leal[3], Susan Pereira[1]
[1]Institute of Public Health, Federal University of Bahia, Salvador, Brazil, [2]Department of Tropical Medicine, Federal University of Pernambuco, Recife, Brazil, [3]Faculty of Medicine of Bahia, Federal University of Bahia, Salvador, Brazil

INTRODUCTION
The Centers for Disease Control and Prevention (CDC) defined long COVID as new, recurring, or ongoing health problems that people may experience four or more weeks after being infected with the virus that causes COVID-19, and noted that prevalence estimates for long COVID range from 10 to 35% or more. The aim of the study was to analyze the symptoms and main risk factors for long COVID.
METHODS
Case-control study comparing the proportion of individuals with clinical characteristics in cases and controls who presented with COVID-19 in health units in Brazil. Cases were subjects with long COVID-19 (Individuals who presented with persistent symptoms lasting more than 90 days after the acute phase) and

controls without prolonged symptoms. Crude and adjusted odds ratios (OR) and their respective 95% confidence intervals (95% CI) were estimated using binary logistic regression.
RESULTS
In the multivariate analysis, the clinical characteristics associated with a higher chance of long-term COVID were hypertension (OR=2.44; 95% CI: 1.54 - 3.85); dyspnea (OR=2.52; 95% CI: 1.52 - 4.19); constipation; stomach pain (OR=2.63; 95% CI: 1.31 - 5.27), nausea (OR=2.07; 95% CI: 1.11 - 3.85) and loss of appetite (OR=3.20; 95% CI: 1.91 - 5.37); persistent headache (OR= 2.03; 95% CI: 1.23 - 3.31), memory loss (OR=6.59; 95% CI: 3.76 -11.50), vision problems (OR= 2.17; 95% CI: 1.05 -4.48) and dizziness (OR=2.52; 95% CI: 1.18 - 3.55); difficulty concentrating (OR= 1.99; 95% CI: 1.13 - 3.49) and excessive sleepiness (OR= 2.52; 95% CI: 1.08 - 5.89).
CONCLUSIONS
The findings contribute to the understanding of the long-term effects of COVID-19 manifestations and their impact on the quality of life of recovering patients, and have the potential to assist the health system by indicating which services should improved to care for the population affected by long COVID syndrome.

Q fever in quilombola communities of Southern Brazil

Danilo A. França[1], Louise B. Kmetiuk[2], Giovanni A. K. Panazzolo[3], Ana Í. L. Duré[4], Marcos V. F. Silva[4], Orlei J. Domingues[3], Giovani M. Fávero[3], Alexander W. Biondo[5], Marcelo B Labruna[1]
[1]Department of Preventive Veterinary Medicine and Animal Health, University of São Paulo, São Paulo, Brazil, [2]Zoonosis Surveillance Unit, City Secretary of Health, Curitiba, Brazil, [3]State University of Ponta Grossa, College of Pharmaceutical Sciences, Ponta Grossa, Brazil, [4]Octavio Magalhaes Institute, Ezequiel Dias Foundation, Belo Horizonte, Brazil, [5]Department of Veterinary Medicine, Federal University of Paraná, Curitiba, Brazil

BACKGROUND
Quilombola communities are afro-descendant rural communities formed by descendants of formerly enslaved people in Brazil, characterized by cultural ties, social exclusion, and barriers to accessing health services. These populations live in close contact with livestock and may be exposed to Q fever1. This study aimed to assess, for the first time, serological evidence of Q fever and associated risk factors in quilombola communities from Southern Brazil.
METHODS
The study was conducted in four communities located in rural areas of Castro, Paraná state. Serum samples were collected from 200 individuals and 20 dogs. Human and canine samples were tested for anti-Coxiella burnetii antibodies using the indirect immunofluorescence assay (IFA)2. Participants answered structured epidemiological questionnaires addressing sociodemographic characteristics, occupational exposure, dietary habits, and clinical data. Statistical associations between seropositivity and exposure variables were evaluated using Fisher's exact test and logistic regression.
RESULTS
Antibodies were detected in 22% of humans, and only one dog was seropositive. Seropositivity was statistically associated with specific communities (p = 0.0013), occupations related to livestock farming (p = 0.0475), consumption of undercooked meat (p = 0.0159), and contact with animal abortions (p = 0.0276). No associations were observed with age, sex, educational level, exposure to the forest, consumption of raw milk, tick bites, or dog ownership.
CONCLUSIONS
This study provides the first evidence of exposure to C. Burnetii in quilombola communities in Brazil. Q fever is a neglected zoonosis in the country and disproportionately affects vulnerable populations3. These findings reinforce the need for surveillance strategies tailored to the social and territorial context of quilombola communities.

ABS3016
Co-Infections in Mining Communities - Integrated STI Surveillance Reveals Public Health Priorities

Vuyolwethu Ncube[1], Lindokuhle Mathibe[1], Geoffery Setswe[1], Manoko Mokgokong[1], Lesego Menyatswe[1], Sesona Sotshongaye[1], Jacqueline Pienaar[1]
[1]Key Populations: Health Systems Division, The Aurum Institute, Johannesburg, South Africa

INTRODUCTION
The social and living conditions of mineworkers contribute to rapid transmission of HIV/AIDS and STIs, namely syphilis, hepatitis B, and hepatitis C. The triple burden of syphilis, hepatitis B, and hepatitis C are public health crises due to clinical complications that arise when these infections are untreated., Peri-mining communities frequently face significant challenges in accessing healthcare services, including STI testing, treatment, and preventative interventions.,
METHODS
The study surveyed 1634 adults aged 18 years and older living in communities surrounding platinum mines in the North West Province. Participants completed structured interviews and provided blood specimens for laboratory testing. Participants were tested for HIV (enzyme immunoassay with viral load for positive results), syphilis (RPR/TPHA algorithm), hepatitis B (HBsAg), and hepatitis C (antibody/antigen testing). Prevalence estimates by age group and sex were calculated using appropriate survey weights, with all findings reported with 95% confidence intervals.
RESULTS
Multi-pathogen surveillance revealed distinct epidemiological patterns. HIV prevalence was 23.8% (95% CI: 20.2–27.9), exceeding national averages. Syphilis prevalence reached 2.3% (95% CI: 1.3–3.9), with peak burden among those aged 31–40 years (4.1%; 95% CI: 1.5–10.7), women (3.0%; 95% CI: 1.4–6.5), and individuals in relationships (4.0%; 95% CI: 1.1–13.2). HBV affected 0.8% of participants (n=13), while HCV prevalence was 0.2% (n=5). The STI age distribution differed from HIV: syphilis peaked in younger adults (31–40 years) compared to a peak in older groups (51–59 years, 38.5%). Educational disparities persisted across pathogens, with those having primary education or less showing elevated syphilis (3.0%) and HIV (32.7%) prevalence.
CONCLUSIONS
These findings strongly support one-stop testing services covering HIV and STIs, with immediate treatment for treatable infections. Different age groups face different risks requiring tailored interventions. Integrated sexual health services with strengthened syphilis control efforts, especially among people already living with HIV, are necessary to reduce the compounding effects of co-infection.

Sociodemographic and Digital Access Factors Associated with Tuberculosis Treatment Supervision Strategies in Brazilian Municipalities

Marcela Antunes Paschoal Popolin[1], Nathalia Zini[1], Andre Luis Teixeira Vinci[1], Yan Mathias Alves[1], Reginaldo Bazon Tavares[1], Josilene Dália Alves[2], Flávia Menegheti Pieri[3], Maristelha Rodrigues Silva[4], Isabella Rodrigues Abreu[4], Ricardo Alexandre Arcêncio[1]
[1]Maternal-Infant and Public Health Nursing Department, University of São Paulo College of Nursing at Ribeirão Preto, São Paulo/Ribeirão Preto, Brazil, [2]Federal University of Mato Grosso, Mato Grosso/Barra do Garça, Brazil, [3]State University of Londrina, Paraná/Londrina, Brazil, [4]Federal University of Tocantins, Tocantins/Palmas, Brazil

BACKGROUND
Tuberculosis (TB) remains a disease of high magnitude and social relevance, particularly affecting low- and middle-income countries. Despite global efforts toward ending TB, challenges related to treatment adherence persist. Video Directly Observed Treatment (VDOT) has emerged as an innovative telemonitoring strategy; however, its implementation may be influenced by social and digital inequalities. This study aimed to analyze sociodemographic and digital access factors associated with TB treatment supervision strategies in Brazilian municipalities.
METHODS
A prospective cohort study was conducted between October 2024 and December 2025 across the five macro-regions of Brazil. Individuals aged ≥18 years, diagnosed with TB within 30 days of treatment initiation, who consented to participate and completed questionnaires were included. Participants receiving conventional TB treatment (Self-Administered Treatment/Directly Observed Treatment – SAT/DOT) were compared with those receiving Video Directly Observed Treatment (VDOT). Pearson's chi-square test, Student's t test, and multivariable logistic regression were performed using JASP software (version 0.15.0.0).
RESULTS
A total of 209 participants were included, of whom 128 (61.2%) were followed under SAT/DOT and 81 (38.8%) under VDOT. No differences were observed between groups regarding sex (p=0.898). Ownership of a mobile phone and internet access were not significantly different between groups (p=0.174). Significant associations were identified between the supervision strategy and race/skin color (p=0.037), educational level (p=0.031), family income (p=0.007), and age (p=0.011). In the multivariable analysis, age and family income remained significantly associated with the supervision strategy.

CONCLUSIONS
VDOT supervision was associated with sociodemographic characteristics, highlighting social inequalities relevant to the organization of TB care. Although access to mobile phones and the internet did not differ significantly between groups, SAT/DOT concentrated individuals in more vulnerable conditions. These findings underscore the importance of Primary Health Care–oriented implementation of VDOT to promote equity in tuberculosis care.

Mycobacterium tuberculosis infection among international migrants, refugees, and stateless persons: prevalence in Brazilian municipalities

Maria Eduarda Pagano Pelodan[1], Daniele de Moraes Pinheiro[1], Reginaldo Bazon Vaz Tavares[1], Yan Mathias Alves[1], Ariela Fehr Tártaro[1], Beatriz Fornaziero Vigato[1], Willie Otávio Bueno Bernardi[1], Emilly de Souza[1], Marcela Antunes Pascoal Popolin[1], Nathalia Zini[1], Ricardo Alexandre Arcêncio[1]
[1]Ribeirão Preto College of Nursing, University of São Paulo, Ribeirao Preto, Brazil

INTRODUCTION
International migration can increase vulnerability to Mycobacterium tuberculosis infection (MTBI) due to structural social inequalities, precarious conditions experienced along the migratory journey, and prolonged exposure to high-risk settings. In addition, barriers to timely and continuous access to health services in transit and destination countries contribute to delays in diagnosis, prevention, and treatment, thereby increasing the risk of infection and illness. In this context, the aim of this study was to analyze the prevalence of Mycobacterium tuberculosis infection among screened international migrants, refugees, and stateless persons, according to sociodemographic characteristics.
METHODS
This is a cross-sectional study involving 876 migrants screened in five Brazilian cities: Boa Vista (RR), Belém (PA), Brasília (DF), Ribeirão Preto (SP), and Foz do Iguaçu (PR). All participants underwent screening for MTBI using the tuberculin skin test (TST). Sociodemographic information was collected from the screened participants. Descriptive statistical analysis was performed, calculating absolute (n) and relative (%) frequencies using jamovi software, version 2.6.26.
RESULTS
A total of 876 migrants were screened, of whom 183 were diagnosed with MTBI, corresponding to a prevalence of 20.9%. Among individuals with MTBI, there was a predominance of males, with 89 (48.6%) cases. Regarding marital status, most participants were single, accounting for 97 (59.6%) individuals. Concerning race/skin color, a high proportion of Indigenous individuals was observed, with 127 (69.4%) cases, followed by Black individuals (16; 8.7%). Among Indigenous participants, there was a marked predominance of the Warao ethnic group, with 113 (89.0%) individuals.
CONCLUSIONS
The high prevalence of MTBI, particularly its greater concentration among Indigenous individuals of the Warao ethnic group, highlights the need for screening and treatment strategies tailored to highly vulnerable contexts as part of tuberculosis control actions in Brazil.

Time in the care cascade of latent tuberculosis infection among international migrants, refugees, and stateless persons: operational challenges.

Daniele de Moraes Pinheiro[1], Maria Eduarda Pagano Pelodan[1], Reginaldo Bazon Vaz Tavares[1], Yan Mathias Alves[1], Ariela Fehr Tártaro[1], Beatriz Fornaziero Vigato[1], Willie Otávio Bueno Bernardi[1], Emilly de Souza[1], Nayara de Jesus Invenção[1], Nathalia Zini[1], Ricardo Alexandre Arcêncio[1]
[1]Escola de Enfermagem de Ribeirão Preto da Universidade de São Paulo (EERP-USP), Ribeirão Preto, Brasil

INTRODUCTION
International migrants, refugees, and stateless persons (MIRA) are more susceptible to infection with Mycobacterium tuberculosis (Mtb) and constitute a priority group in tuberculosis infection (TBI) control strategies. Preventive Tuberculosis Treatment (TPT), although fundamental, has its effectiveness limited by barriers that hinder follow-up and compromise the care cascade.
OBJECTIVES
To analyze the time along the care cascade among international migrants, refugees, and stateless persons and to identify possible structural and operational barriers to care.
METHODS
This is a prospective cohort study conducted in five Brazilian cities: Boa Vista (RR), Belém (PA), Brasília (DF), Ribeirão Preto (SP), and Foz do Iguaçu (PR). The MIRA population was screened using the tuberculin skin test (TST) and, in positive cases, underwent chest radiography. Descriptive statistical analysis was performed, including calculation of mean, minimum, and maximum values, using Jamovi software (version 2.6.26), considering the interval between TST administration and treatment initiation.
RESULTS
A total of 910 migrants were screened across the study sites, of whom 137 (15.1%) tested positive for TBI. Among these, 55 (40.2%) were from Boa Vista, 46 (33.6%) from Belém, 17 (12.4%) from Foz do Iguaçu, 11 (8.0%) from Brasília, and 8 (5.8%) from Ribeirão Preto. Regarding the time along the care cascade, the mean was 32.2 days in Boa Vista (Min: 1; Max: 92), 120 days in Belém (Min: 30; Max: 264), 15.7 days in Foz do Iguaçu (Min: 3; Max: 62), 53.3 days in Brasília (Min: 3; Max: 384), and 95.8 days in Ribeirão Preto (Min: 57; Max: 154).
CONCLUSIONS
The time along the care cascade was found to be prolonged, particularly in Belém and Ribeirão Preto, highlighting operational challenges in managing the interval between TST administration and treatment initiation, as well as the need for targeted interventions to improve this process.

Chronic chagas disease: descriptive analysis of reported cases from 2023 to 2024

Leidy Dayane Paiva de Abreu[1], Maria Iara Socorro Martins[1,2], Mirna Neyara Alexandre de Sá Barreto Marinho[3], Maria Lourdes dos Santos[4], Aretha Feitosa de Araújo[5], Liana Araújo Rodrigues Braz[1], Breno Rocha de Moura[1,5], Dário Costa Silva Filho[1]
[1]Centro de Ciências da Saúde, Universidade Estadual do Ceará, FORTALEZA, Brasil, [2]Programa de Pós-graduação em Saúde Pública, Universidade Federal do Ceará, FORTALEZA, Brasil, [3]Universidade Regional do Cariri, Iguatu, Brasil, [4]Secretaria da Saúde do Ceará, FORTALEZA, Brasil, [5]Universidade Regional do Cariri, Crato, Brasil

INTRODUCTION
Chronic chagas disease remains a relevant public health challenge in brazil1. Despite advances in vector control, late diagnosis and long-term morbidity continue to affect adult and older populations2. This study aimed to describe the epidemiological profile of chronic chagas disease cases reported in the state of ceará between 2023 and 2024.
METHODS
This is a descriptive epidemiological study conducted using secondary data from the national surveillance system e-sus notifica. All cases of chronic chagas disease reported in ceará between january 2023 and december 2024 were included. The variables analyzed were sex, age group, race or color, educational level, area of residence, and municipality. Data analysis was performed using descriptive statistics. The study was approved by a research ethics committee.
RESULTS
A total of 263 cases were analyzed. There was a predominance of males with 175 cases, corresponding to 66.53 percent, while females accounted for 88 cases, equivalent to 33.47 percent. The most frequent educational level was incomplete elementary education with 63 cases, followed by individuals with no formal schooling with 19 records. Regarding race or color, the brown category predominated with 154 cases. Notifications were concentrated in 2023 with 136 cases and in 2024 with 127 cases. Urban areas accounted for 119 records and rural areas for 67, while information was missing in 77 cases. The municipality with the highest number of notifications was juazeiro do norte, followed by limoeiro do norte and fortaleza.
CONCLUSIONS
The findings highlight chronic chagas disease as a current and neglected condition in ceará, associated with late diagnosis, weaknesses in epidemiological surveillance, and a strong relationship with social determinants of health and social vulnerability.

ABS3141
Screening for Subclinical Tuberculosis among International Migrants, Refugees, and Stateless Persons in Brazil

Willie Otavio Bueno Bernardi[1], Maria Eduarda Pagano Pelodan[1], Beatriz Fornaziero Vigato[1], André Luis Teixeira Vinci[1], Nathalia Zini[1], Ricardo Alexandre Arcêncio[1]
[1]Escola de Enfermagem de Ribeirão Preto da Universidade de São Paulo (EERP/USP), Ribeirão Preto, Brazil

INTRODUCTION
The recognition of new clinical spectra of tuberculosis (TB), including incipient TB and subclinical TB, has given rise to new epidemiological paradigms that are not yet well established among international migrants, refugees, and stateless persons (IMRS). Subclinical TB represents an intermediate clinical spectrum between TB infection and active TB and, although asymptomatic, is already considered a form of disease.
OBJECTIVE
Aim to analyze the prevalence of TB disease and the proportion of subclinical TB among IMRS.
METHODS
Cross-sectional study conducted in Brazilian cities, namely Belém, Boa Vista, Brasília, Foz do Iguaçu and Ribeirão Preto. TB disease was identified using a rapid molecular test. Subclinical TB was screened based on the absence of symptoms, application of tuberculin skin test (5mm cutoff), and chest radiography. Confirmation was established through laboratory tests and/or radiological findings. IMRS aged 18 years or older and not pregnant were screened.
RESULTS
958 IMRS were screened, and 14 cases of TB disease were identified, yielding an overall prevalence of 1.46%. Prevalence by city was 1.59% in Belém, 1.63% in Boa Vista, 2.0% in Brasília, 0% in Foz do Iguaçu, and 11% in Ribeirão Preto. Among the 14 identified TB cases, 50% were asymptomatic, corresponding to an overall prevalence of 0.7% in the population and 1.06% in Belém, 0.65% in Boa Vista, 0% in Brasília, 0% in Foz do Iguaçu, and 8.82% in Ribeirão Preto. All cases occurred among Indigenous individuals, predominantly from the Warao ethnic group(93%), women(68%), recipients of social benefits(92%), with a mean duration of residence in Brazil of four years. Six of the seven cases in both symptomatic and asymptomatic forms reported having had contact with a person with TB.
CONCLUSIONS
TB disease, and particularly subclinical tuberculosis, represents a substantial burden among IMRS and requires adapted, culturally sensitive clinical protocols for screening across the spectrum.

Predictors of Unfavorable Tuberculosis Treatment Outcomes among Migrants and Refugees in Brazil: a Nationwide Retrospective Cohort Study

Willie Otavio Bueno Bernardi[1], Beatriz Fornaziero Vigato[1], Maria Eduarda Pagano Pelodan[1], Luanne Karolyne Leal dos Santos[1], André Luis Teixeira Vinci[1], Natacha Martins Ribeiro[1], Nathalia Zini[1], Ricardo Alexandre Arcêncio[1]
[1]Escola de Enfermagem de Ribeirão Preto da Universidade de São Paulo (EERP/USP), Ribeirão Preto, Brazil

INTRODUCTION
Tuberculosis (TB) is a public health problem that disproportionately affects populations, particularly vulnerable groups such as international migrants and refugees (IMR). In Brazil, IMR present a higher prevalence of tuberculosis infection as well as an increased risk of developing TB; however, evidence regarding treatment outcomes and their predictors in the national context remains scarce.
OBJECTIVE
Identify predictors of unfavorable tuberculosis treatment outcomes among IMR in Brazil.
METHODS
Retrospective cohort study was conducted using open-access data from compulsory TB notifications provided by the Department of Information and Informatics of the Brazilian Unified Health System, Ministry of Health. All TB cases recorded as migrants and diagnosed between 2014 and 2023 were included. Records with missing outcomes, "death from other causes," "drug-resistant TB," "change of diagnosis," or "transfer" were excluded. For analytical purposes, outcomes were categorized as favorable ("cure") or unfavorable ("primary loss-to-follow-up," "loss to follow-up," "treatment failure," or "death due to TB"). Logistic regression analysis was performed using forward stepwise method, with univariate logistic regression and a p-value cutoff of 0.05 for inclusion in the multivariate model.
RESULTS
5,284 cases were included, with an unfavorable outcome proportion of 26.5%. Ten predictors of unfavorable outcomes were identified, including sociodemographic factors such as mixed-race ethnicity (adjusted odds ratio [AOR]=1.54; 95%CI: 1.20–1.98), Indigenous ethnicity (AOR=1.77; 95%CI: 1.22–2.56), incarceration (AOR=0.47; 95%CI: 0.29–0.76), and homelessness (AOR=1.99; 95%CI: 1.42–2.78); clinical factors such as re-entry after loss to follow-up (AOR=3.28; 95%CI: 2.44–4.41), alcohol use (AOR=1.40; 95%CI: 1.02–1.92), drug use (AOR=2.49; 95%CI: 1.78–3.47), and combined pulmonary and extrapulmonary TB (AOR=2.26; 95%CI: 1.40–3.67); and institutional factors such as absence of HIV testing (AOR=1.99; 95%CI: 1.50–2.65) and lack of directly observed treatment (AOR=3.14; 95%CI: 2.57–3.83).
CONCLUSIONS
IMR experience multiple vulnerabilities to unfavorable TB treatment outcomes, extending beyond social and individual dimensions to include operational inequities in access to health care.
Popul. Med. 2026;8(Supplement 1):A624

ABS3296
Barriers and Strategies for Antiretroviral Therapy Appointment Adherence in Rural South Africa: A Narrative Review with a Focus on the Vhembe District

Shonisani Tshivhase[1], Coddyliver Mabasa[1], Lufuno Makhado[1]
[1]Public Health, University of Venda, Thohoyandou, South Africa

BACKGROUND
Antiretroviral therapy is the cornerstone of HIV treatment, but its effectiveness depends heavily on consistent patient adherence to scheduled appointments. Rural regions, such as the Vhembe district in South Africa, face persistent structural, economic, and psychosocial challenges that hinder adherence to antiretroviral therapy and the continuity of care. This narrative review synthesizes evidence on the multifaceted barriers to antiretroviral therapy appointment adherence in rural settings and evaluates intervention strategies that have demonstrated success across sub-Saharan Africa. It emphasizes the relevance of these findings to the Vhembe district context.
METHODS
The review draws on three key evidence sources: a doctoral study evaluating home delivery models for Antiretroviral therapy, a systematic review of interventions supporting treatment, and a meta-analysis of adherence among pregnant women using digital and educational tools. The selected studies were critically examined for their applicability to rural service delivery and adherence outcomes.
RESULTS
The review identifies major adherence barriers, including poor transport infrastructure, high indirect costs, clinic overcrowding, limited refill durations, stigma, and the impact of public health emergencies. Strategies such as home delivery, multi-month dispensing, mHealth device reminders, and community-based support programs have been shown to effectively mitigate these challenges. Combined socio-structural interventions yield the most substantial improvements in adherence outcomes.
CONCLUSIONS
Improving adherence to antiretroviral therapy appointments in Vhembe requires an integrated model tailored to local realities. Combining decentralized care, social support structures, mHealth solutions, and financial incentives offers a sustainable path forward. However, research gaps in implementation science, cost-effectiveness, and context-specific interventions must be addressed to scale these solutions effectively.

On-Demand and On-Site: Assessing the acceptability of Event-Driven PrEP among cisgender men attending mobile clinics in Cape Town, South Africa

Mazvita Shereen Mnangagwa Matsa[1], Cheryl Hendrickson[1], Thando Xeketwana[1], Elzette Rousseau[2], Juliana Kagura[3], Sydney Rosen[1,4], Lawrence Long[1,4], Jacqui Miot[1]
[1]Health Economics and Epidemiology Research Office, Faculty of Health Sciences, University of Witwatersrand, Johannesburg, South Africa, [2]Desmond Tutu Health Foundation, 3 Woodlands Rd, Woodstock, Cape Town, South Africa, [3]Department of Epidemiology and Biostatistics, School of Public Health, Faculty of Health Sciences, University of Witwatersrand, Johannesburg, South Africa, [4]Department of Global Health, School of Public Health, Boston University, Boston, Massachusettes, United States

BACKGROUND
Event-driven pre-exposure prophylaxis (ED-PrEP) is a non-daily oral HIV prevention regimen taken around sexual episodes. Although the World Health Organization recommends ED-PrEP for cisgender men, it is not yet included in South Africa's HIV Prevention Guidelines. We applied the Theoretical Framework of Acceptability (TFA) to examine factors influencing ED-PrEP acceptability among cisgender men in Cape Town, South Africa.
METHODS
We conducted a cross-sectional survey (October–November 2025) among

cisgender men aged ≥18 years who self-reported and tested HIV-negative at urban mobile clinics in Cape Town. After standardized ED-PrEP information, participants rated TFA constructs for ED-PrEP use on five-point Likert scales: affective attitude (feeling positive), burden (ease of use), ethicality (values fit), intervention coherence (understanding dosing), opportunity costs (lifestyle adjustment), perceived effectiveness (belief it works), and self-efficacy (confidence in use). Acceptability was defined as "likely/very likely" to use ED-PrEP (binary outcome). We summarized TFA responses descriptively and used simple logistic regression to estimate TFA associations with self-reported acceptability (odds ratios (ORs), 95% confidence intervals (CIs)).
RESULTS
We enrolled 150 cisgender men (median age 31 years [IQR 26–41]); most identified as Black (93%, 140/150) and heterosexual (89%, 134/150). Nearly all (94%, 141/150) were sexually active in the past three months; almost half reported multiple sexual partners (47%, 66/141). Overall, 87% (130/150) self-reported ED-PrEP acceptability. Most reported favourable perceptions across all TFA constructs (73%–93%), including intervention coherence (93%, 140/150) and perceived effectiveness (92%, 138/150). The largest observed associations were for opportunity costs (OR 41.9, 95% CI 9.1–193.1) and self-efficacy (OR 38.4, 95% CI 11.2–131.5).
CONCLUSIONS
ED-PrEP had high self-reported acceptability among this population. Positive TFA perceptions suggest readiness for use, with willingness to adjust lifestyle and confidence in use as key drivers of acceptability. These findings provide early implementation evidence to inform ED-PrEP integration into South Africa's HIV prevention programmes.

Optimizing Case Finding through Multiple HIV Self-Test Distribution Channels: Reporting and Linkage Outcomes from the Promoting Access to HIV Self-Testing (PATHS II) Project in Three Nigeria states

AMEH RAPHAEL ADOLE[1], Chidinma Umebido[1], Jibrin Kama[1], Chizoba Fashanu[1], Olufunke Fasawe[1], Ngozi Adibe[1], Adebobola Bashorun[2], Chioma Ukanwa[2], Samson Omoighe[2], Aisha Gubio[2], Ramat Mohammed[2], Dr. Ali Onoja[3]
[1]Clinton Health Access Initiative, Abuja Municipal, Nigeria, [2]National AIDS and STDs Control Programme, Abuja Municipal, Nigeria, [3]African Health Project, Abuja Municipal, Nigeria
BACKGROUND
Nigeria faces persistent gaps in HIV case finding, male engagement, and timely linkage to care, undermining progress toward the UNAIDS 95-95-95 targets. HIV self-testing (HIVST) offers a testing strategy capable of expanding access beyond traditional health facilities. PATHS II evaluated the epidemiological impact of scaled HIVST implementation across multiple service delivery channels. Description: From May–December 2025, HIVST was implemented across 23 sites in Kaduna, Nasarawa, and Ogun states using community pharmacies (CPs), patent and proprietary medicine vendors (PPMVs), and community-based organizations (CBOs). Site selection was guided by WHO adapted Standard Protocol Items: Recommendations for Interventional Trials (SPI-RIT) checklist to ensure quality. Activities included deployment of HIVST kits, capacity building for state actors, and establishing robust M&E systems for reporting testing, referral/linkage and ART initiation. Lessons Learnt: A total of 4,684 HIVST kits were distributed. The project achieved a 93% result reporting rate, substantially exceeding typical community HIVST benchmarks. Overall reactivity was 1.3% (56/4,684), with 98% of reactive clients linked to confirmatory HIV testing and 85% confirmed positives initiated on ART, demonstrating a highly efficient testing-to-treatment cascade. There was almost equal uptake of HIVSTs among men, 2339(49.9%) and women, 2345(50.1%) indicating HIVST's effectiveness in addressing historically low male testing coverage. HIV positivity rates were higher among females than males (1.30% vs. 0.80%), with the highest positivity rates observed among women aged 30 years and older (1.7%) and adolescent girls aged 15–19 years (1.5%), highlighting the importance of gender-responsive prevention and linkage strategies. Conclusions/ Next Steps: The findings provide epidemiological evidence that HIVST can support national HIV testing scale-up. Multi-channel HIVST distribution, particularly through the private sector (CPs/PPMVs) can effectively reach diverse age groups and maintain high integrity in the care cascade. At scale, HIVST via multiple distribution channels can achieve high reporting rates, effective case finding, and timely linkage to care.

Epidemiology of foodborne disease outbreaks in South Africa, 2011 – 2020

Genevie Ntshoe[1], Andronica Moipone Shonhiwa[1], Ntsieni Ramalwa-Sekhwama[2], Phuti Sekwadi[2], Juno Thomas[2], Nicola Page[2,3]
[1]Division of Public Health Surveillance and Response, National Institute for Communicable Diseases, a Division of the National Health Laboratory Service, Johannesburg, South Africa, [2]Centre for Enteric Diseases, National Institute for Communicable Diseases, a Division of the National Health Laboratory Service, Johannesburg, South Africa, [3]Department of Medical Virology, University of Pretoria, Pretoria, South Africa
BACKGROUND
Although foodborne disease (FBD) outbreaks are notifiable in South Africa, published literature on FBDs is limited. We reviewed 10 years of FBD outbreak data reported to the National Institute for Communicable Diseases (NICD) to estimate the burden, describe the epidemiology, and identify contributing factors to FBD outbreaks in the country.
METHODS
We conducted a retrospective review of records and descriptive analysis of foodborne incidents reported to the NICD from 2011 to 2020. Data were extracted from multiple sources. Duplicates were removed, and data verified. Inclusion criteria for an outbreak were FBD incidents involving ≥2 epidemiologically linked cases to a common meal.
RESULTS
Over a 10-year period, 892 FBD outbreaks were reported, resulting in more than 24000 cases, 17000 healthcare facility visits, 1300 hospitalisations, and 100 deaths. The number of outbreaks per year ranged from 59 to 153 (median 78), and case numbers from 455 to 3570 (median 2261). Outbreaks occurred throughout the year, with a higher proportion reported in spring and summer. Outbreaks were reported across all nine provinces, with KwaZulu-Natal (39.6%, 329/892) and Gauteng (21.7%, 192/892) accounting for the largest share. Where outbreak setting was indicated, outbreaks in households (35.4%, 235/663) and institutions (31.1%, 206/663) were most common. Recurring contributing factors and risk exposures, including unsafe food storage and poor food-handling practices, were identified. Clinical and/or environmental specimens were collected in 68.2% (608/892) of reported outbreaks, and pathogens were identified in 52.5% (319/608). Nontyphoidal Salmonella was the most common pathogen identified (34.0%, 109/319), followed by Bacillus cereus (31.0%, 99/319).
CONCLUSIONS
This review demonstrates that FBD incidents are a public health concern in South Africa. Necessary interventions should be implemented to minimise risk exposure and prevent future outbreaks. Targeted health education and promotion activities, together with food safety awareness campaigns, should be conducted regularly in the most affected settings/communities.

ABS3460

Patterns and Predictors of Loss to Follow-Up Among Hypertensive and Diabetic Patients in PIH-Supported Clinics, Rwanda

Paul Otiku[1]
[1]Bill and Joyce Cummings Institute of Global Health, University of Global Health Equity, Kigali, Rwanda
BACKGROUND
Loss to follow-up (LTFU) threatens positive treatment outcomes of chronic noncommunicable disease (NCD). Although Rwanda has expanded nurse-led NCD services, drivers of LTFU in rural clinics are not well described. We estimated LTFU prevalence and identified associated factors associted with LTFU in a nurse led NCD program.
METHODS
We conducted an analytical cross-sectional study (May–June 2025) at a district hospital and two affiliated health centres supported by Partners In Health. Adults (≥18 years) with hypertension and/or diabetes enrolled in the NCD treatment program were classified as LTFU (no clinic contact for ≥3 consecutive months in 2024, excluding known deaths/transfers) or non-LTFU. A sample of 276 participants were included in the study (138 in each group). Groups were compared using appropriate statistical tests and logistic regression was used to identify independent predictors of LTFU.
RESULTS
Of 943 patients in the NCD treatment program, 259 (27.5%) met LTFU criteria; after excluding deaths and transfers, adjusted LTFU was 25.3% (95% CI 23.7–29.3). NLTFU participants reported higher mean diabetes knowledge and hypertension knowlege score campared to the LTFU group (Diabetes knowlege score,16.45±3.0 vs 13.92±4.4; mean difference 2.53; p=0.002), (Hypertension Knowledge score,

7.42±1.7 vs 6.77±2.0; mean difference 0.65; p=0.013). Satisfaction was modestly higher among NLTFU (26.89±2.28) than LTFU (25.67±4.88; mean difference 1.21; p=0.008). Prevalent reasons were distance (50.7%) and transport cost (47.8%). Predictors of LTFU were frequent travel (AOR 12.7; 95% CI 3.17–51.20), residential migration (AOR 22.3; 95% CI 1.84–272.53) and use of traditional medicine (AOR 14.8; 95% CI 1.55–141.70). Higher diabetes knowledge was associated with lower odds of LTFU (AOR 0.20; 95% CI 0.003–0.28) (all p≤0.019).
CONCLUSIONS
Approximately one quarter of rural NCD patients enrolled in the NCD program experienced LTFU. Mobility, traditional medicine use, and limited diabetes knowledge were key contributors to LTFU, while satisfaction differences were small.

ABS3515
Hidden Burden of Opportunistic Infections among Hospitalised Adults with HIV: Post-mortem Evidence of Diagnostic Gaps in South Africa

Marguerite Hall[1], Siobhan Johnstone[1], Ivan Mambule[2], Victor Akelo[2], Shabir Madhi[1], Ziyaad Dangor[1]
[1]Vaccines and Infectious Disease Analytics Research Unit (WITS-VIDA), Soweto, Johannesburg, South Africa, [2]Liverpool School of Tropical Medicine (LSTM), Liverpool, United Kingdom

INTRODUCTION
Undiagnosed opportunistic co-infections remain major contributors to mortality among people living with HIV (PLWH). Using post-mortem minimal invasive tissue sampling (MITS), we investigated pathogen-specific causes of death in hospitalised adults with HIV in South Africa.
METHODS
This mortality surveillance study enrolled adults aged 18–64 years (HIV positive and unknown HIV status) who died of non-traumatic causes in medical wards at two Johannesburg hospitals. Within 72 hours post-mortem, MITS collected blood, cerebrospinal fluid, and liver, lung, and brain tissue. Samples underwent microbiological, molecular, and histopathological testing, and findings were integrated with clinical and verbal autopsy data by a multidisciplinary panel to assign causes of death according to World Health Organization (WHO) standards.
RESULTS
Among 813 decedents, consent was obtained from next-of-kin for MITS in 286 cases. Of the 212 deaths analysed, 197 (93%) were confirmed to have been living with HIV. Opportunistic infections were identified in the causal pathway to death in 49% (96/197) of PLWH, yielding 107 pathogens. Tuberculosis (TB) predominated (69% 74/107), followed by Cryptococcosis (20%; 21/107) and Pneumocystis jirovecii pneumonia (11%, 12/107). Notably, 24% (26/107) of opportunistic pathogens in the causal pathway to death were missed antemortem. Among Tuberculosis cases, 65% (48/74) were new presentations, and 42% (20/48) were confirmed by post-mortem testing, despite antemortem work-up in 65% (13/20). Advanced HIV disease (AHD) was present in 83% (80/96) with opportunistic infections, including in 19% (18/96) newly diagnosed with HIV. Among known PLWH (81%; 78/96), 56% (44/78) were receiving antiretroviral therapy (ART) and 41% (18/96) were virally suppressed. Among decedents with an opportunistic infection, these infections were the immediate cause of death in 33% (32/96).
CONCLUSIONS
Post-mortem MITS revealed a high burden of previously undiagnosed opportunistic infections, underscoring persistent diagnostic gaps and public health inequalities affecting hospitalised PLWH. Analysis of sampled cases is ongoing.
Popul. Med. 2026;8(Supplement 1):A637

ABS3580
Sourcing and managing the distribution of diphtheria antitoxin (DAT): Pharmacy Services, Western Cape Government Health and Wellness (WCGHW), South Africa, response to the diphtheria outbreak commencing in 2024

Caroline De Beer[1], Helen Hayes[1]
[1]Medicine Management, Laboratory and Blood Support Services, Western Cape Department of Health and Welfare, Cape Town, South Africa

BACKGROUND
Diphtheria is a highly contagious and potentially life-threatening bacterial disease. As of 19 December 2024, the Western Cape Province (WCP) recorded 36 positive diphtheria results for the calendar year, primarily in November and December 2024. Diphtheria antitoxin (DAT) is a serum containing antibodies to neutralize the diphtheria toxin. Early treatment with DAT prior to toxins binding to cells is extremely important and should be given based on clinical suspicion before laboratory confirmation where feasible. DAT is an unregistered medicine in South Africa and sourced via an application to the country's Regulatory Authority for permission to import stock. Due to global shortages of DAT at the time of the outbreak, the province faced significant challenges in sourcing supply, prompting the WCP to request support from the World Health Organization (WHO) to obtain DAT on a compassionate basis.
AIM
To ensure adequate and prompt supplies of DAT to treat patients. The outbreak required a multi-faceted response, involving real-time patient tracking, expert consultations, and extensive coordination among healthcare providers.
METHODS
A SharePoint platform was developed for reporting and tracking of DAT with access limited to key role-players to allow real-time monitoring of the distribution and movement of DAT throughout the province, and uploading of pertinent patient information. Pharmacy Services played a key role in monitoring stock levels and ensuring appropriate distribution and procurement of DAT.
RESULTS
By collaborating with the WHO for a steady supply of DAT with real-time patient tracking, cases were managed efficiently. The pharmacy department's proactive role in stock management ensured uninterrupted availability and management of this critical medication.
CONCLUSIONS
The Western Cape's response to the diphtheria outbreak has demonstrated a coordinated, multi-disciplinary approach involving the WHO, local healthcare providers, and the pharmacy sector. The response highlighted the importance of timely collaboration and preparedness in managing infectious disease outbreaks.

ABS3631
China-Africa cooperation in malaria control: from the perspective of malaria-endemic African countries

Xinyi Song[1], Yixuan Wang[2], Mengze Liu[1], Yuyang Zhang[1], Minmin Wang[1,3,4], Minghui Ren[1,3,4,5]
[1]Department of Global Health, Peking University, Beijing, China, [2]Department of Global Health, University of Washington, Seattle, United States, [3]Beijing Institute for Health Development, Peking University, Beijing, China, [4]China Center for Health Development Studies, Peking University, Beijing, China, [5]Institute for Global Health, Peking University, Beijing, China

BACKGROUND
Malaria remains a persistent threat to global health, with progress in its control and elimination stalling in many endemic countries, particularly in sub-Saharan Africa. China has developed a series of comprehensive strategies, accumulated substantial valuable experience and comparative advantages over 70 years of malaria elimination efforts. China was certified as malaria-free by World Health Organization in 2021. China has also actively promoted cooperation with Africa in malaria control. This study aims to investigate the perspective of malaria-endemic African countries on China's malaria elimination experience, analyze the current status and challenges of China-Africa cooperation in malaria control, and propose key areas for future collaboration.
METHODS
Semi-structured interviews were conducted with key informants, including national malaria program managers and technicians from high-burden countries in Africa. The data were analyzed using the thematic framework method.
RESULTS
Malaria-endemic African countries consider China's malaria elimination strategies, such as multi-sectoral collaboration, health system strengthening, and community engagement, to be instructive for malaria control in Africa. They hold a positive attitude towards cooperation with China in malaria control, identifying personnel training, medical products, surveillance system development, and infrastructure construction as priority areas.
CONCLUSIONS
China can leverage its strengths in information system development, health workforce training, infrastructure construction, and anti-malaria products to integrate resources and assist African countries in achieving sustainable malaria control and elimination.

ABS3680
Impact of Payment Standard Differentials on Healthcare Equity Under Payment Method Reform: A Continuous Triple-Difference Study on Tuberculosis in China

Tianqin Xue[1]

[1]Department of Health Management, School of Medicine and Health Management, Tongji Medical College, Huazhong University of Science and Technology, Wuhan, China

BACKGROUND
China's payment method reforms (DRG/DIP) often set different payment standards for Urban Employee (UEBMI) and Resident (URRBMI) Basic Medical Insurance, potentially exacerbating healthcare inequity. This study investigates whether a widening payment standard gap affects the equity of healthcare access, outcomes, and financial burden for tuberculosis (TB) patients.
METHODS
We conducted a retrospective study using TB inpatient data (N=37,332) from City A (large payment gap) and B (small payment gap) between 2018 and 2024. A continuous Triple-Difference (DDD) model was employed. The core independent variable was the specific monetary gap between UEBMI and URRBMI payment standards. Outcome measures included innovation drug use, cure rate, and annual out-of-pocket (OOP) spending ratio.
RESULTS
The widening payment gap was associated with a significant reduction in the disparity of innovation drug use between employees and residents (Interaction coefficient = -0.001, p<0.001), suggesting residents caught up in access despite the gap. No significant association was found between the payment gap and the disparity in cure rates or OOP spending trends. However, a substantial baseline structural inequity remains: UEBMI patients enjoyed a 20.5% lower OOP spending ratio (p<0.05) unrelated to the payment limit gap.
CONCLUSIONS
Contrary to concerns, widening payment standard gaps under reform did not worsen clinical or financial equity trends for TB patients, and coincided with improved equity in innovation drug access. Healthcare inequity in China is primarily driven by the structural dichotomy of insurance schemes rather than specific payment limit parameters.

From Home Visits to Diagnosis, Household Contacts' Preferences for Tuberculosis Screening and Testing in the Eastern Cape, South Africa

Lindsey de Vos[1], Nancy Bedingfield[2], Orit Awoke[3], Kuhle Fiphaza[1], Dawie Olivier[1], Aaron M Kipp[4], Andrew Medina-Marino[5,1], Amrita Daftary[3,6]
[1]Desmond Tutu HIV Centre, University of Cape Town, Cape Town, South Africa, [2]McGill International TB Research Centre, McGill University, Montreal, Canada, [3]School of Global Health, York University, Toronto, Canada, [4]Brody School of Medicine, East Carolina University, Greenville, United States, [5]Department of Psychiatry, University of Pennsylvania, Philadelphia, United States, [6]TB-HIV Pathogenesis Unit, CAPRISA MRC, Durban, South Africa

BACKGROUND
South Africa continues to face delays with TB diagnosis'. Household contacts (HHCs) are understood to be at high TB risk and a key interest group for the rollout of Targeted Universal Testing for TB (TUTT). We explored preferences and acceptability toward household contact investigations (HCIs) via home visits to inform TUTT implementation practices.
METHODS
Between July 2024 and March 2025, HHCs referred for TB testing in Buffalo City Metropolitan, Eastern Cape, South Africa were interviewed about their TB contact investigation experiences, perceptions, and testing preferences. Responses were analyzed via thematic coding and mapped against the constructs of Sekhon's acceptability framework.
RESULTS
Among 31 interviewed HHCs receiving HCI home visits (58% female; median age 53; 39% presented to healthcare facilities for TB testing), HHCs valued the personalized attention, including concern, follow-up, and advice by members of the HCI team (high affective attitude and ethicality). However, many had limited understanding of HCI relevance, TB infection versus disease, ongoing exposure risks, and often sought testing only when prompted by others or by symptoms (low coherence). Home visits were viewed as opportunities for enhanced household support for members living with TB and easier participation in HCIs, particularly among older individuals frequently screened for the first time despite regular health system contact (low burden and opportunity costs, high affective attitude and ethicality). For those who attended facilities, testing was considered acceptable and achievable, reflecting high self-efficacy, though some preferred alternative specimen collection due to long test result wait times, logistical barriers, and test accuracy concerns (higher burden and low perceived effectiveness).
DISCUSSION
An acceptability framework deepened understanding of HHCs' healthcare-seeking decisions, while HCIs was perceived as critical entry points for TB screening and care. Expanding home-based, mobile, and alternative specimen collection could further improve engagement and timely progression through the care cascade.

Temporal Trends and Epidemiological Profile of Dengue in Brazil, 2021–2025

Mario Angelo Cenedesi Júnior[1], Tatiana Amorim Guimarães[1], Karen de Fátima Figueroa Bohórquez[1], Sérgio Raimundo Ernesto Machado[1], Neide Moreira de Souza[1], Siglia Sousa de França[1], Gerusa Tomaz Faria[1]
[1]Department of Public Health, Universidad de Ciencias Empresariales y Sociales (UCES), Buenos Aires, Argentina

INTRODUCTION
Dengue remains a significant public health burden in Brazil, characterized by a cyclical pattern, recent expansion, and high impact on healthcare services. The analysis of temporal trends combined with the epidemiological profile allows understanding the disease dynamics, especially in the context of dengue vaccination introduction.
METHODS
Ecological, descriptive study based on secondary data from the Notifiable Diseases Information System (SINAN). Probable dengue cases were included according to the year of symptom onset (2021–2025). The analysis considered geographic region, sex, age group, clinical classification, and hospitalization occurrence. Annual percent change, cumulative percent change, and Average Annual Percent Change (AAPC) were calculated.
RESULTS
Between 2021 and 2025, 11,807,799 probable dengue cases were reported in Brazil. Adults aged 20–59 years predominated (62.0%), with a higher frequency in females (54.4%). The Southeast region accounted for 59.2% of notifications, with a growth of +2242% (2021–2024). Classic dengue represented over 95% of cases, while severe dengue remained below 0.1%. Hospitalization proportions were 3.18% (2021), 3.57% (2022), and 3.23% (2023), decreasing to 2.90% (2024) despite the absolute increase in admissions, and rising to 4.36% (2025). Regarding magnitude and trend, cumulative variation was +2120% (2021, 531,804 cases) until the epidemic peak (2024, 6,579,504 cases). Annual percent changes were +162.1% (2021–2022), +18.4% (2022–2023), and +298.4% (2023–2024), followed by a decrease of −74.9% (2025, 1,650,581 cases). The AAPC for the period was +32.7% per year.
CONCLUSIONS
Between 2021 and 2025, dengue in Brazil exhibited explosive growth, with regional concentration and a higher impact on adults of working age. The proportional reduction in hospitalizations (2024), despite the absolute increase in cases, may reflect healthcare changes and possible initial indirect effects of vaccination. Continuous monitoring of trends and clinical severity is essential to guide public health policies and control strategies.
Popul. Med. 2026;8(Supplement 1):A643

ABS3847
Vulnerability in Motion: Socio-Economic and Service-Seeking Determinants of HIV Risk among Truckers and Migrants in India

KAUSHIK BISWAS[1], L Rathore[1]
[1]Programme, Plan International (India Chapter), Delhi, India

BACKGROUND
Although overall adult HIV prevalence in India is low, it is five times higher among long-distance truckers (1.00%; 95% CI: 0.78–1.21). Truckers and migrant workers are critical bridge populations for HIV transmission in India, shaped by high mobility and structural vulnerability. To complement India's National AIDS Control Programme (NACP) goals, Plan India implemented One Stop Project (OSC) in 15 states.
METHODS
Expanding health service coverage, creating an enabling environment to reduce stigma and discrimination; and strengthening community empowerment through awareness, skill development and social protection linkages were the primary intervention areas. Programme data from October 2022 to December 2025 were analysed using SPSS.
RESULTS
Between October 2022 and December 2025, 179,389 truckers and migrant clients were registered with a mean age of 34 years. HIV positivity was significantly higher among unmarried, separated, or divorced clients compared to married clients (OR = 2.34; 95% CI: 1.99–2.76; p < 0.001). Clients with college or higher

education had higher odds of HIV positivity compared to those with education up to higher secondary or less (OR = 1.84; 95% CI: 1.41–2.40; p < 0.001). Daily-wage earners, students, and unemployed clients were more likely to test HIV positive than salaried workers (OR = 1.36; 95% CI: 1.13–1.64; p = 0.001). Clients accessing facility-based services had more than twice the odds of testing HIV positive compared to those reached through hotspot or site-level outreach (OR = 2.38; 95% CI: 1.89–2.99; p < 0.001).
CONCLUSIONS
HIV risk among truckers and migrant workers is shaped by socio-economic vulnerability and service-seeking pathways, with facilities detecting a higher-risk subset and decentralized outreach achieving broader coverage. These findings support differentiated service delivery that integrates socio-economic risk profiling, targeted testing, and mobility-responsive outreach with strengthened facility-level case detection and embedded social protection support.

ABS3962
Investigation and public health response to a cluster of serogroup C Neisseria meningitidis in a Western Cape Province community, South Africa, 2025

Natassja Rakotsoane[1], Janine Bezuidenhout[1], Caroline De Beer[1], Hildegard Van Rhyn[1], Susan Meiring[1], Charlene Lawrence[1]
[1]Department of Health and Wellness, Communicable Disease Control, Cape Town, South Africa
INTRODUCTION
Meningococcal disease is a notifiable condition requiring urgent public health action due to its rapid progression, high case fatality rate, and outbreak potential. Although vaccines targeting common Neisseria meningitidis serogroups are available in South Africa, they are not included in the Expanded Programme on Immunisation (EPI) and remain largely inaccessible. This study describes the investigation and public health response to a cluster of invasive meningococcal disease caused by serogroup C in a Western Cape community during 2025.
METHODS
A descriptive implementation study design was used to document the detection, investigation, planning, coordination, and execution of public health interventions in response to a meningococcal outbreak. Surveillance data, epidemiological investigations, and response activities were reviewed.
RESULTS
Between July and November 2025, five laboratory-confirmed cases of serogroup C invasive meningococcal disease were reported from a single Western Cape community. Cases ranged in age from 2 to 26 years. The initial two cases occurred within 14 days in July 2025, among children attending the same primary school in different grades, prompting identification of a possible institutional outbreak. Close contacts received prophylaxis, and targeted prophylaxis was extended to 565 foundation phase learners (65% coverage) and 48 school staff members. Subsequently three cases occurred in November 2025, including an adult, a non–school-attending child, and school-going child, with no direct epidemiological links. Three of these cases are attending the same primary school, resulting in a community outbreak with an estimated attack rate of 42 per 100 000 population, and zero fatalities. A community-wide quadrivalent conjugate meningococcal vaccination campaign was recommended.
CONCLUSIONS
While chemoprophylaxis temporarily reduced transmission within the school setting, continued cases highlighted sustained community spread. Challenges related to emergency funding, vaccine procurement, and response implementation persist due to the exclusion of meningococcal vaccine in the EPI schedule, underscoring the need to strengthen national outbreak preparedness.
Popul. Med. 2026;8(Supplement 1):A645

Disparities in hepatitis B diagnoses, associated risk factors, and time to diagnosis among migrants compared with Danish-born populations: A matched cohort study

Anna Deal[1], Farah Seedat[1], Jessica Carter[1,2], Kristina Langholz Kristensen[3], Sally Hayward[1], Kenneth Kabagambe[4], Jørgen Holm Petersen[3], Nina Weis[3], Philippa Matthews[5], Maria Wessman[6], Jon Friedland[1], Sally Hargreaves[1], Marie Norredam[5]
[1]City St George's University of London, London, United Kingdom, [2]Queen Mary University of London, London, United Kingdom, [3]University of Copenhagen, Copenhagen, Denmark, [4]National Organization for People Living with Hepatitis B, Kampala, Uganda, [5]University College London, London, United Kingdom, [6]Statens Serum Institut, Copenhagen, Denmark
BACKGROUND
Chronic hepatitis B virus (HBV) infection remains a global public health challenge, with an estimated 1.3 million deaths worldwide, despite availability of an effective vaccine. In Europe, HBV burden is unevenly distributed, with substantially higher risk among migrant populations originating from regions with high HBV endemicity. Evidence on incidence, risk factors, and time-to-diagnosis in these populations remains limited. This study assessed HBV incidence, associated risk factors, and time-to-diagnosis among migrants in Denmark compared with Danish-born individuals.
METHODS
We conducted a nationwide matched cohort study including migrants who obtained residency in Denmark over a 23-year period. Migrants were matched 1:6 by age and sex with Danish-born comparators. HBV diagnosis rates were calculated per 10,000 person-years. Adjusted incidence rate ratios (aIRRs) were estimated using multivariable quasi-Poisson regression models controlling for age, sex, substance use disorders, HIV infection, and hepatitis C virus (HCV) infection. Associations with region of origin and co-morbidities were examined, and time to HBV diagnosis was compared within and between cohorts.
RESULTS
The study cohort comprised 179,110 migrants and 1,049,345 Danish-born individuals, among whom 1,362 HBV diagnoses were identified. Migrants had substantially higher HBV diagnosis rates than Danish-born individuals (5.6 vs 0.2/10,000). This elevated risk persisted after adjustment for confounders (aIRR 30.6, 95%CI 26.7–35.2). Among migrants, the mean time from arrival in Denmark to HBV diagnosis was 5.4 years (SD5.5). Migrant HBV cases were more frequently female, while Danish-born cases more commonly had substance use disorders, HCV or HIV co-infection, and acute HBV-related hospitalisations. Within the migrant cohort, higher HBV incidence was associated with HCV co-infection and origin from Southeast Asia, the Pacific, or Africa.
CONCLUSIONS
Migrants experience markedly increased HBV risk and may face prolonged diagnostic delays. Early, culturally appropriate screening strategies targeting high-risk migrant populations are essential to reduce health inequities and support achievement of WHO 2030 HBV elimination goals.

ABS4092
Analysis of the laboratory and diagnostic support network for leprosy care: a cross-sectional study

Thamires Laet Cavalcanti e Silva[1], Greice Quele dos Santos Cruz[1], Eleuzina Falcão da Silva Santos[1], Natália Cristina Oliveira[2], Luiz Eduardo Nunes Ferreira[2]
[1]Bahia State Health Department, Directorate of Epidemiological Surveillance, Salvador, Brazil, [2]University of Guarulhos, Guarulhos, Brazil
INTRODUCTION
Leprosy represents a significant challenge for health managers and professionals. It is a neglected disease affecting patients with social and economic vulnerabilities, linked to health determinants and a historical past of social stigma and prejudice. The objective is to diagnose the healthcare network for patients with suspected or confirmed leprosy, highlighting weaknesses in the laboratory and diagnostic support network.
METHODS
This is a cross-sectional observational study. A qualitative-quantitative questionnaire was used to characterize assistance, examination and diagnostic networks, treatment, and surveillance actions. The questionnaire was sent to regional health bases and forwarded to the epidemiological surveillance of each municipality. Data were analyzed using Microsoft Excel and SPSS v.26.
RESULTS
Skin smear microscopy for leprosy is offered in all health macro-regions, serving as a positive factor for early diagnosis in special cases. However, only the Far South, West, and Southeast regions have between 50% and 80% of municipalities offering the exam. The other six macro-regions have fewer than 40% of municipalities performing smears, hindering access. While all regions have municipalities providing skin biopsies and histological exams, the Far South macro-region stands out with 42.1%. Peripheral nerve biopsies are performed at the ICOM (tertiary reference), but many municipalities are unaware of the referral location.
CONCLUSIONS
Leprosy is a management challenge in the state of Bahia, showing fragile access to diagnostic support exams in some macro-regions. Constructing a Care Line with defined flows and examination sites is a strategy to guarantee comprehensive assistance to leprosy patients.

ABS4157

Measles outbreak in the Western Cape Province, South Africa January 2025- January 2026

Farzanah Frieslaar[1], Charlene Lawrence[1], Jack Manemela[1], Riyadh Manesen[1], Janine Bezuidenhoudt[1]
[1]Western Cape Department of Health and Wellness, Western Cape Government, Cape Town, South Africa

BACKGROUND
Measles is a highly contagious airborne viral infection and remains a significant cause of vaccine-preventable morbidity and mortality globally. South Africa has experienced an ongoing measles outbreak since June 2025, with cases identified in the Western Cape Province from epidemiological week 43 of 2025. The outbreak originated in the Khayelitsha sub-district within the City of Cape Town Metropolitan District and subsequently spread to other sub-districts. A cluster was also identified in the West Coast district. This study describes the epidemiological characteristics of the outbreak and the public health response implemented in the province.
METHODS
A descriptive epidemiological analysis was conducted using data from the measles case-based surveillance database, the notifiable medical conditions system and laboratory results provided by the Measles National Reference Laboratory. Laboratory confirmed cases from public and private sectors were included. Data from 1 January 2025 to 17 January 2026 were analysed and stratified to identify transmission patterns.
RESULTS
From 1 January 2025 to 17 January 2026, 908 laboratory-confirmed measles cases were reported in the Western Cape, with 97% (884) occurring in the City of Cape Town. Khayelitsha sub-district bore the highest burden (44%), followed by Eastern (15%) and Mitchells Plain (11%); children aged 5–9 years were most affected (46%), followed by individuals aged ≥15 years (152/905; 17%) - and females accounted for 52% of cases. Public health response measures included outbreak coordination, enhanced surveillance, case management, risk communication, booster vaccination to healthcare workers, and supplementary immunisation activities. Approximately 11,590 learners and staff were vaccinated across 52 educational institutions in Khayelitsha by December 2025. Targeted vaccination continues in other affected sub-districts.
CONCLUSIONS
Measles transmission persists due to low vaccination coverage and susceptible populations, particularly under-vaccinated and unvaccinated children. Addressing immunity gaps in older age groups and targeted supplementary immunisation is required to interrupt transmission.

Decolonizing brain health screening: Community perspectives from Arabic-speaking populations and implications for culturally responsive global health strategies

Javaid Nauman[1,2], Azhar Rahma[1], Aminu Abdullahi[1], Karim Abdel-Aziz[3], Anmol Punn[1], Zeinab Hassan[1], Reem Alneyadi[1], Emmanuel Stip[4,3], Iffat Elbarazi[1]
[1]Institute of Public Health, College of Medicine and Health Sciences, United Arab Emirates University, Al Ain, United Arab Emirates, [2]Department of Circulation and Medical Imaging, Faculty of Medicine and Health Sciences, Norwegian University of Science and Technology, Trondheim, Norway, [3]Department of Psychiatry, College of Medicine and Health Sciences, United Arab Emirates University, Al Ain, United Arab Emirates, [4]Institut Universitaire en Santé Mentale de Montréal (IUSMM), University of Montreal, Montreal, Canada

INTRODUCTION
The global burden of neurological and mental disorders presents urgent challenges for public health systems. Yet historically, brain health screening tools have been developed in high-income countries and deployed globally without centering the perspectives, priorities, and preferences of target populations. This perpetuates colonial patterns of health system imposition. This study addresses this decolonial gap by systematically investigating what an Arabic-speaking population actually wants and needs for brain health testing, challenging assumptions about universal screening approaches.
METHODS
We conducted rigorous community-engaged cultural adaptation of the Global Brain Health Survey through forward-back translation, expert review with local stakeholders, and pilot testing with Arabic speakers. Data from 867 participants were analyzed in R using descriptive and inferential statistics to understand how demographic factors influence attitudes, reflecting the complexity and agency of the community.
RESULTS
Our results demonstrated strong acceptance of brain health testing, with over 75% expressing readiness to undergo assessment. Primary motivations were preventive, seeking insights into current and future cognitive and mental health. Key acceptance determinants included test accuracy, affordability, and convenience, particularly home-based testing options. These preferences highlight trust in scientific validity while emphasizing the importance of minimizing financial and logistical barriers which are critical factors for health equity. Most participants reported that they would seek professional help following concerning results, suggesting testing could catalyze timely healthcare engagement.
CONCLUSIONS
Our study provides systematic evidence on brain health testing attitudes in an Arabic-speaking population, demonstrating robust willingness when credibility, cost, and accessibility are prioritized. The emphasis on affordability and home-based options aligns with contemporary debates on health equity, sustainability, and digital health innovations central to achieving health without borders. The findings inform culturally sensitive, population-centered strategies for scaling brain health screening across diverse Global South contexts, supporting inclusive approaches addressing diverse populations' preferences and strengthen early intervention pathways across borders.

Striving for partnership equity: Lessons learned during a six-year, five-country global health research collaboration

Beth Phillips[1], Serah Gitome[2], Jenny X Liu[3], Address Malata[4], Christine Galavotti[5], Elizabeth Omoluabi[6], Peter Waiswa[7], Martha Kamanga[8], Chriford Nyando[8], Dinah Amongin[7], Elizabeth Bukusi[2], Kelsey Holt[1]
[1]Family Community Medicine Department, University of California, San Francisco, San Francisco, United States, [2]Kenya Medical Research Institute, Nairobi, Kenya, [3]Institute for Health and Aging, University of California, San Francisco, San Francisco, United States, [4]Malawi University of Science and Technology, Blantyre, Malawi, [5]The Gates Foundation, Seattle, United States, [6]Akena Health+, Abuja, Nigeria, [7]School of Public Health, Makerere University, Kampala, Uganda, [8]Kamuzu College of Nursing, Lilongwe, Malawi

INTRODUCTION
Colonialism's legacy manifests in global health partnerships as unequal division of labor and resources, including apportioning intellectual versus operational labor, or as unbalanced decision making around authorship or budgets, among other commonly cited challenges.1-4 Despite clear recognition of the need for more transparency and inclusion in global health partnerships, few practical examples exist in the global health literature of how to operationalize equitable partnership principles and frameworks.
METHODS
We share our imperfect approach to striving for equity in a recent partnership that spanned Kenya, Malawi, Nigeria, Uganda, and the United States for the Innovations in Choice and Autonomy (ICAN) study. We describe our approach to building and sustaining our six-year, multi-disciplinary collaboration and reflect on lessons learned.
RESULTS
We learned five major lessons during the ICAN partnership. First, our project kickoff meeting built collective ownership and helped establish mutual trust. Second, the deep contextual and methodological expertise of each partner institution contributed to robust study implementation, but we failed to foster strong multi-team communications to effectively share mutual benefits across teams. Third, we improved our approach to co-developing scopes of work & budgets as the project progressed, which helped balance decision-making power and clarify expectations. Fourth, creating and implementing an authorship secretariat and guidelines for equitable publishing fostered inclusivity, though the process was imperfect. Lasty, encouragement from our funder to invest in capacity building for less experienced staff/investigators enabled us to commit time and resources to intensive trainings and a mentorship program, though the mentorship program had insufficient accountability to promote sufficient engagement by senior team members.
CONCLUSIONS
ICAN's size (five countries, six years) and funder encouragement to strive for equity provided a unique opportunity to invest time and resources into operationalizing equitable partnership principles from global health literature.1,5-8 We showcase these successes and challenges to inform future partnerships.

The Narrative of Women Victims of Violence Participating in a Culture Circle During an Implementation Research in Brazil

Bárbara Miranda[1], Rosana Onocko Campos[1], Erotildes Maria Leal[1]
[1]Department of Public Health, University of Campinas - Brazil, Campinas, Brazil

ABSTRACT
This study presents the experience of violence reported by women, in culture circles, based on Paulo Freire's itinerary, in Campinas, Brazil. Violence is a structural and complex phenomenon that manifests in different ways across societies worldwide, affecting multiple dimensions of daily life. In Brazil, Popular Health Education has emerged as a powerful tool to promote reception, prevention, and support, as well as to guide the creation of public policies aligned with population needs.
OBJECTIVE
To report the experiences of violence reported by women through the Freirean Itinerary, within an implementation research research into implementation of care for people exposed to violence, by group Interfaces, from the Faculty of Medical Sciences at UNICAMP, Brazil.
METHODS
Two cycles of groups composed of 8 meetings were carried out from June to December 2021, inspired by the Freirean perspective, with women over 18 years old exposed to violence, living in the city of Campinas, Brazil. A qualitative description of the results is presented.
RESULTS
Participants reported experiencing violence perpetrated by the State, manifested through rights violations, deprivation, and the deterioration of essential public services such as health and education. Ineffective public policies and lack of investment were identified as contributing factors to the persistence of violence, including child labor, drug trafficking, and sexual exploitation. Racism emerged as a pervasive theme, materializing through exploitation, oppression, and subjugation based on skin color.
CONCLUSIONS
Popular Health Education revealed women who live face to face with violence daily, resulting in psychological suffering and reduced autonomy. The findings also expose the reproduction of violence by the State, which often responds to violence with further aggression and rights violations. Culture circles appear to foster collective and institutional strategies sensitive to these experiences, emphasizing the need for social engagement to confront violence in all its forms.

Bridging the Equity Divide: Patient-Reported Outcome Measures in Trauma Care for Aboriginal People

Georga Sallows[1], Patrick Sharpe[2,1], Pip Henderson[1], Lavender Otieno[1], Daniel Y Ellis[3,1,4,5], Nicole Kelly[3,1], Mahni Foster[3], Belinda Gabbe[6,7], Mark Fitzgerald[7,8,9], Julieann Coombes[10,11], Luke Wolfenden[12], Brett Shannon[13,1,12], Gerard O'Reilly[6,7], Murthy Mittinty[1], Kate Hunter[10,11,1], Shanti Omodei-James[1], Hossein Haji Ali Afzali[1], Maree Toombes[11], Courtney Ryder[1,10,11]
[1]FHMRI, Collage of Medicine and Public Health, Flinders University, Adelaide, Australia, [2]Engage, Motivate, Unite Consultancy, Ceduna, Australia, [3]Trauma Service, Royal Adelaide Hospital, Adelaide, Australia, [4]Faculty of Health and Medical Sciences, University of Adelaide, Adelaide, Australia, [5]School of Public Health and Tropical Medicine, James Cook University, Cairns, Australia, [6]Department of Epidemiology and Preventive Medicine, Monash University, Melbourne, Australia, [7]National Trauma Research Institute, The Alfred Hospital, Melbourne, Australia, [8]Department of Surgery, Central Clinical School, Monash University, Melbourne, Australia, [9]Trauma Service, Alfred Health, Melbourne, Australia, [10]The George Institute for Global Health, Sydney, Australia, [11]School of Population Health, University of New South Wales, Sydney, Australia, [12]School of Medicine and Public Health, The University of Newcastle, Newcastle, Australia, [13]School of Public Health, University of Illinois Chicago, Chicago, United States

ABSTRACT
Patient-reported outcome measures (PROMs) are essential for understanding health-related quality of life, mental health, and functional recovery following injury. Yet, these tools are rarely adapted to capture the lived experiences, cultural values, and social determinants of health for priority populations, particularly Aboriginal and Torres Strait Islander peoples, who bear a disproportionate burden of injury in Australia. This systematic review examined the use of PROMs in observational trauma studies involving Australian adults (≥18 years), with a focus on equity and Indigenous engagement. Searches of Medline (OVID), CINAHL (EBSCO), and Scopus identified prospective cohort and longitudinal studies on trauma-related injuries. Data were appraised using CREATE and PROGRESS-PLUS frameworks to assess cultural inclusion and equity-sensitive reporting. Across 11 studies, 17 PROMs were identified, most commonly SF-36 and PCL-C. Findings revealed persistent physical and mental health impairments post-injury, yet equity considerations were minimal. None of the studies met all PROGRESS-PLUS criteria, and Indigenous knowledges were absent. Priority populations, including Indigenous peoples, culturally and linguistically diverse communities, women, and people with disabilities, were frequently underrepresented or excluded. These gaps underscore the urgent need for culturally safe, inclusive PROMs that reflect diverse recovery experiences. Embedding equity in outcome measurement is critical to advancing trauma care, informing policy, and achieving health justice for all populations.

Decolonising informed consent: Ethics, language, and power in public-sector maternal health systems

Sinawo Lukubeni[1]
[1]Linguistics and Applied Linguistics, Nelson Mandela University, Gqeberha, South Africa

BACKGROUND
Informed consent is widely regarded as a cornerstone of ethical healthcare practice, grounded in respect for autonomy, dignity, and bodily integrity. In maternal healthcare, however, informed consent is not a single procedural act but a relational process unfolding within moments of vulnerability, urgency, and profound bodily and emotional exposure. In South Africa's public-sector maternal health system, informed consent practices are shaped by intersecting histories of colonialism and apartheid, persistent structural inequality, linguistic marginalisation, and institutional power asymmetries. Despite a strong constitutional and rights-based policy framework, women continue to report consent practices that are procedural, coercive, or poorly understood.
METHODS
This study presents a systematic narrative review examining how informed consent is conceptualised and practised in South Africa's public-sector maternal healthcare system, with particular attention to ethics, language, and power. Peer-reviewed literature published between 2000 and 2024 was identified through structured searches of biomedical, public health, social science, and regional databases. A reflexive narrative synthesis approach was employed to integrate findings across diverse study designs, foregrounding context, lived experience, and ethical meaning.
RESULTS
Five interrelated themes emerged: the proceduralisation of informed consent; linguistic exclusion and communication injustice; gendered and racialised power asymmetries in clinical encounters; ethical strain within resource-constrained health systems; and persistent gaps between policy commitments and clinical practice. Together, these themes illustrate how informed consent failures are structurally produced rather than incidental or individualised.
CONCLUSIONS
By integrating decolonial theory, language justice, narrative medicine, and reproductive justice frameworks, this review reframes informed consent as a relational, context-sensitive, and justice-oriented ethical practice. Decolonising informed consent is presented as an ethical imperative central to reproductive justice, health equity, and the transformation of public-sector maternal healthcare in South Africa.

Voices of Indigenous Youth as a Beacon of Light and Hope: A Culturally Informed Approach to Preventing Human Immunodeficiency Virus and Hepatitis C Virus and Promoting Sexual Health and Wellness Among Indigenous Youth in Northern Saskatchewan

JUSTINA NDUBUKA[1], Amanda Froehlich Chow[1]
[1]School of Public Health, University of Saskatchewan, University of Saskatchewan, Saskatoon, Canada

INTRODUCTION
Indigenous populations continue to be disproportionately affected by Human Immunodeficiency Virus (HIV) and Hepatitis C Virus (HCV)1,3. Although Indigenous community members represent 3% of the Canadian population, the HIV infection rate among Indigenous people accounts for 5 to 8% of all HIV cases reported nationally, with Saskatchewan HIV rates highest in Canada. Indigenous youth are diagnosed with HIV and HCV at a rate seven times higher than non-Indigenous youth.4,5 Purpose: To explore existing resources, current knowledge, attitudes,

practices, and perception of risk factors of HIV and HCV, among Indigenous youth aged 18-29 years old residing in Northern Saskatchewan First Nations on-reserve.
METHODS
Qualitative methods will be employed to gather information/stories. A sequential Sharing Circle will be used to collect stories and deepen understanding of identified patterns and trends. The Sharing Circle will incorporate Indigenous ceremonies, with the primary aim of creating a safe and secure space for participants to share their stories, and will be facilitated by Elders. The conversational method will be implemented to provide opportunities for individuals to engage in one-on-one storytelling for those who may not feel comfortable participating in group activities. Participants will be asked to respond to broad, open-ended research questions using both the sequential Sharing Circle and conversational methods. These sessions will be audio-taped with the participants' consent. Etuaptmumk (Two-eyed Seeing), emphasizing Indigenous grounding, will guide data collection and analysis, incorporating both Indigenous and Western perspectives. Thematic analyses will be conducted on the qualitative study data.2 Expected Outcome: The stories and perspectives shared by the community will help tailor co-created, culturally relevant HIV and HCV prevention resources, which will be integrated into an Indigenous-led sexual health and wellness initiative that addresses the unique needs of Indigenous youth in Northern Saskatchewan, advancing the field and informing changes in public health policies and practices.

ABS1153
Building Cultural Safety to Advance Equity and Inclusion in Healthcare

Julieann Coombes[1]
[1]Gunnu-maana (HEAL) Aboriginal and Torres Strait Islander Health Program, The George Institute For Global Health, Newtown, Australia

BACKGROUND
Achieving health without borders requires health systems that are equitable, inclusive, and culturally safe. In Australia, the need for culturally safe healthcare where health professionals critically reflect on their own cultural identity, power, privilege, and the ongoing impacts of colonisation is well established. Despite this, Aboriginal and Torres Strait Islander peoples continue to experience racism and discrimination in healthcare, contributing to inequitable health outcomes. There remains a critical gap in practical training that meaningfully builds cultural capabilities among non-Indigenous health workers within tertiary services.
METHODS
We developed, implemented, and evaluated a Building Cultural Safety and Capabilities training program for health professionals within the burn service at The Children's Hospital at Westmead, Australia. The program was designed and delivered by Aboriginal and Torres Strait Islander researchers in partnership with clinical staff. It employed interactive teaching methods, critical self-reflection, case-based discussions, and facilitated dialogue creating a culturally safe learning environment. Evaluation included participant feedback and reflective insights to assess acceptability, relevance, and perceived impact on practice.
RESULTS
The training program was well received by participating health professionals, who reported increased awareness of cultural safety, racism, and their professional responsibilities in providing equitable care. A key element of success was the facilitation of a safe space that enabled open discussion, questioning, and reflection without fear of judgement. Participants identified the development of cultural safety capabilities as a core clinical skill essential to improving care for Aboriginal and Torres Strait Islander patients and families.
CONCLUSIONS
This study demonstrates that comprehensive, interactive cultural safety training in a tertiary hospital setting is both feasible and valued by health professionals. Aboriginal led, co-designed programs that prioritise safe spaces for reflection are critical to building sustainable cultural safety capabilities. This approach is being translated across other health systems and contributing to more equitable and inclusive healthcare delivery.

ABS1294
Reimagining Research: A Workshop on the Guunu-maana model of Indigenous Leadership and Excellence

Keziah Bennett-Brook[1], Julieann Coombes[1], Kate Hunter[1]
[1]Guunu-maana (Heal) Aboriginal and Torres Strait Islander Health Program, The George Institute for Global Health, Sydney, Australia

BACKGROUND
Colonial research paradigms have historically misrepresented Indigenous Knowledges, privileging Western biomedical frameworks and reinforcing inequities. Globally, there is growing recognition of the need to decolonize health research and embed culturally safe practices. The multi-award winning Guunu-maana (Heal) Aboriginal and Torres Strait Islander Health Program at The George Institute for Global Health offers a model of First Nations leadership and governance that challenges dominant research norms and promotes self-determination.
METHODS
This interactive session will introduce participants to the Guunu-maana model through a combination of short presentations, group discussions, and skill-building activities. The session will unpack principles of Indigenous governance, cultural safety, and relational research practice. Participants will engage in breakout exercises to identify colonial practices in their own research contexts and co-design strategies for embedding Indigenous Knowledges and culturally safe approaches.
RESULTS
Over the past decade, Guunu-maana has transformed organisational culture within a global health institute, increasing recruitment and retention of Aboriginal and Torres Strait Islander staff, supporting multiple Indigenous PhD completions, and influencing research design and policy. These outcomes demonstrate the effectiveness of embedding Indigenous leadership and cultural safety in research. During the session, participants will generate actionable steps tailored to their own contexts, fostering global applicability.
CONCLUSIONS
Decolonizing health research requires moving beyond academic outputs to systemic change. The Guunu-maana model provides transferable lessons for embedding cultural safety and Indigenous governance in research globally. This session will equip participants with practical tools and strategies to advance equity and self-determination in public health research and practice.

ABS1646
Losing Roots, Losing Care: Afro-Indigenous Perspectives on Health and Colonialism

Rafaella Rodrigues Venancio[1], Ana Paula Barbosa dos Santos[2], Doroth de Assis Schimidt Doi[1]
[1]Social Work Department, Hospital Universitário da Universidade de Sao Paulo, São Paulo, Brazil, [2]Serviço Nacional de Aprendizagem Comercial (SENAC), São Paulo, Brazil

INTRODUCTION
Colonial violence has historically disrupted Afro-Indigenous ways of life in Brazil, producing profound impacts on health, care practices, and collective well-being. These processes continue to shape health inequities affecting Black and Indigenous populations. This study analyzes the relationship between colonial oppression of Afro-Indigenous modes of existence and the erosion of care, highlighting implications for communities, public health practices, teams, and service users.
METHODS
This qualitative, decolonial and reflective study is grounded in Afro-Indigenous epistemologies, particularly the triad of observation, action, and orality'. The analysis draws on ten years of professional experience in the health field combined with participant observation in Afro-Brazilian cultural and religious spaces, including terreiros (Afro-Brazilian religious and community-based spaces), cultural centers, and samba schools. Empirical material also includes publicly available audiovisual records—two documentaries, one public lecture, and one interview—featuring priests, researchers, artists, and leaders-. The material was examined through critical thematic analysis informed by Afro-Indigenous cosmoperceptions.
RESULTS
The findings indicate that care occupies a central position in Afro-Indigenous cosmologies, understood as a relational practice sustaining life through balanced interactions among humans, non-humans, territories, and spiritual dimensions. Colonial processes—marked by genocide, enslavement, territorial dispossession, and epistemic violence—have systematically weakened these care practices. This disruption generates ecological, psychosocial, cultural, and political consequences affecting public health, including increased vulnerability to illness, erosion of support networks, and reduced collective capacity to respond to health crises. The displacement of care as a core social value contributes to individual and collective suffering.
CONCLUSIONS
Care can be understood as an ancestral technology for dignified existence. Despite centuries of colonial oppression, Afro-Indigenous modes of caring persist

in religious rituals, popular festivities, communal living structures, and everyday practices. Recognizing colonial violence, implementing reparative public policies, and protecting Afro-Indigenous bodies, beliefs, and territories are essential strategies for rebuilding collective well-being and advancing equity in public health.

ABS1734
Ancestral African-rooted Solidarity Kitchens: religious and dietary practices in the decolonization of public health

Luiza Failla Ribeiro[1], Gabriela Pongiluppi[1], Samantha Bittencourt Mescoloto[1], Marcella Cabral Kazze[2], Lia Thieme Oikawa Zangirolani[2], Semíramis Martins Álvares Domene[2]
[1]Paulista School of Medicine, Federal University of São Paulo, São Paulo, Brazil, [2]Department of Public Policy and Collective Health, Federal University of São Paulo, Santos, Brazil

INTRODUCTION
In afro-brazilian religions, sacred kitchens are central to the care of the Orixás, as well as the community1,2. Therefore, these places are essentially Solidarity Kitchens (S.K.), where meals are distributed to people in social vulnerability3,4. The objective of this study was to understand how religious practices are integrated into meal preparation.
METHODS
This is a descriptive, qualitative-quantitative cross-sectional study, conducted with a convenience sample of S.K. located in five Brazilian states (S.P., M.A. M.G., P.E. and P.R.) and one in the Federal District. To be included in the sample, the S.K. had to be related to afro-brazilian religions, be operational, and linked to both national public policies: Solidarity Kitchen Program4 and Feeding Cities Strategy5. The visits were conducted between May and November 2025.
RESULTS
Based on the interviews, three S.K. reported preparing meals based on the fundamentals of the afro-brazilian religions to which they belong. One of them prepares the meals according to the toque of the day, based on the Orixás and guides that will be present; another one only makes preparations that refer to the Orixás on feast days; and the last one makes preparations according to the rites and teachings of the ancestors, in addition to using a "secret" to season the meals. All three S.K. reported that they prioritize ingredients according to ancestral teachings, but they usually have to use what is available. Furthermore, all S.K. reported that distributing meals helped change people's perception of the religious space and, in five S.K., that was important for some people to approach the house.
CONCLUSIONS
These S.K. are important because they constitute a space of resistance and preservation of African ancestry in Brazil. Recognizing and integrating these practices into public food policies is essential for decoloniality these policies, contributing to the development of culturally inclusive health systems.
Popul. Med. 2026;8(Supplement 1):A676

ABS1746
Decolonizing Public Health through Harm Reduction Through Language Justice: Lessons learned from the Global South and North

Tanagra Maria Melgarejo[1]
[1]National Harm Reduction Coalition, San Juan, Puerto Rico

ABSTRACT
Language is powerful. It helps us connect to each other and shapes our view of the world. We learn and absorb new concepts through communication with each other, for which language comprehension is key. Ultimately, those that control language hold power to make decisions by controlling access to information and to the dominant discourse. In this global imperialist and capitalist heteropatriarchy, English is deemed the dominant language at the expense of marginalizing others that are spoken by a majority of brown, indigenous and black people. Language justice is about building and sustaining multilingual spaces in our organizations and social movements, so that everyone's voice can be heard both as an individual and as part of a diversity of communities and cultures. Valuing language justice means recognizing the social and political dimensions of language and language access, while working to dismantle language barriers, equalize power dynamics, and build strong communities for social and racial justice. If harm reduction is a practice with the ultimate goal to save lives and seek liberation through centering and uplifting equity, it must be firmly rooted in the principles of language justice and cultural safety to be truly decolonial and transformative. In this organized workshop, we will describe how to build harm reduction organizations and collaborations working towards language justice and share lessons learned in the Global North, role-modeled by the Global South, to further influence harm reduction to center it everywhere and to develop adequate resources to assure people who use drugs and practitioners who speak any languages join us.

ABS1906
Westernized society's fragmenting of public health and religion

Montez Kaufman[1]
[1]First Baptist Institutional Church, Lakeland, United States

INTRODUCTION
Theology which includes spirituality, faith, and religion has always concerned itself with liberating persons and restoring community with one another. As some modern trends of intellectual thought have come to recognize faith as a part of public health, it appears more work needs to be done. Because of the frayed past of westernized religion on colonized communities, a historical precedent has been set that currently impacts that task.
METHODS
A historical-theological analysis of the fragmentation between faith and health was conducted. A reinterpretation of sacred texts applied to the practice and connection to spaces surrounding health: Mental Health, Public and Preventive Health, and Medicinal Health. Messages were used to clarify the connection of faith and health in worship spaces. Scriptural studies were taught surrounding areas of faith and health to small groups of congregants. Group discussions were then conducted in these areas.
RESULTS
Congregants who participated in the discussions shared the testimonies of their personal outcomes from being a part of the group. Ten percent of respondents showed a change in attitude towards a realistic connection of faith and health.
CONCLUSIONS
Further dialogue and discussions are needed to encouraged groups of faith to participate in the decolonizing of community and public health spaces. Continued conversation and participation in health spaces can positively impact community.
Popul. Med. 2026;8(Supplement 1):A678

ABS1971
From Colonial Violence to Contemporary Hunger: An Analysis of the Emergence of Anti-Hunger Policies in Brazil

Thallis Silva[1], Maria Cristina da Costa Marques[1]
[1]Public Health, University of São Paulo, São Paulo, São Paulo, Brazil

ABSTRACT
The present study stems from the understanding that the history of hunger is a constitutive part of the history of Brazil, being the structuring of the colonial, slave-owning, and capitalist project that underpinned the formation of the country. Hunger, as a deliberate instrument of production, domination, and control of bodies, especially those of enslaved and impoverished populations, was mobilized as a mechanism of colonial torture and a weapon of capitalist regulation throughout the 19th and 20th centuries in Brazil. The objective of this study is to highlight the role of hunger as a mechanism of social control in the consolidation of the Brazilian national project, from a historical-dialectical materialist perspective. Methodologically, this is a qualitative, exploratory research, constructed through the analysis of social policies and a bibliographic review of primary and secondary sources on the history of hunger in Brazil and its conflicts within class society. 502 documents were identified in the consulted databases, of which 59 were selected after inclusion and exclusion criteria, composing the analytical corpus of the study. The selected works address the trajectory of public health as a field of political and democratic dispute, fundamental to the emergence of public policies to combat hunger. The results also indicate hunger as one of the primary mechanisms of operation of capital reproduction in Brazil, using impoverished bodies to ensure a cheap labor force capable of maintaining the current social order, as well as ensuring greater profit margins for the economic elites. Moreover, the research also indicates the fundamental role played by social movements and political struggles in building a social response to social inequalities, as hunger was one of the primary social ills, leading to the consolidation of public policies aimed at ensuring basic social rights.

ABS1978
Indigenous Knowledges in Higher Education: constraints to inclusion

Pip Henderson[1], Tamara Mackean[1], Deb Agnew[2], Courtney Ryder[2]
[1]College of Medicine & Public Health, Flinders University, Kaurna Yerta / Adelaide,

Australia, [2]College of Education, Psychology and Social Work, Flinders University, Kaurna Yerta / Adelaide, Australia

BACKGROUND

Higher education in Australia remains marked by entrenched inequities, with Aboriginal and Torres Strait Islander students continuing to be underrepresented and having lower completion rates.1,3 Exclusion of Indigenous Knowledges and limited Indigenous content in curricula are recognised as contributing factors and barriers to success for these students.4–6 Curricula that includes and values Indigenous Knowledges supports success, but also benefits non-Aboriginal peoples' teaching and learning.7,8 Despite this, fewer than half of Australian universities report including Indigenous Knowledges in their education programs.3

METHODS

This qualitative study investigated constraints to the inclusion of Indigenous Knowledges in higher education by conducting in-depth interviews with senior non-Indigenous academics (School Heads, Portfolio Heads, Professor, Associate Professor) at an Australian university. Interview data were deidentified and thematically analysed.

RESULTS

Nine senior academics offered personal and professional insights which, upon analysis, led to the identification of a range of interrelated constraints underpinning the ongoing exclusion of Indigenous Knowledges. These included structural and systemic, epistemic, and operational and professional factors. Examination of these revealed ways in which white normativity, white possessive logic and settler moves to innocence manifest and are deployed as strategies to sustain the exclusion of Indigenous Knowledges. More specifically, claims to busyness, epistemic and affective investments, and institutional funding and accountability measures collectively impeded the meaningful inclusion of Indigenous Knowledges.

CONCLUSIONS

Together, the identified outcomes collectively hinder meaningful inclusion of Indigenous Knowledges in higher education and, as such, contribute to long-standing educational inequities. As education is a recognised social determinant of health, the impact of these inequities extends more broadly, presenting as an important public health concern requiring action.

Popul. Med. 2026;8(Supplement 1):A681

ABS2151

Intersections Between Colonialism, Medical Racism and Race-Based Medical Practice

Faadiel Essop[1], Saleha Suleman[2]

[1]Division of Medical Physiology, Stellenbosch University, Cape Town, South Africa, [2]Department of Public Health, University of Cape Town, Cape Town, South Africa

BACKGROUND

Medicine has historically been shaped by colonialism and scientific racism, with racialised knowledge systems used to legitimise exploitation, slavery, and hierarchical social orders. Although race is now widely recognised as a social rather than biological construct, race-based assumptions continue to influence medical education, research, and clinical practice. These legacies contribute to persistent inequities in diagnosis, treatment, and access to care for marginalised populations. Understanding how historical and epistemic forms of racism continue to shape contemporary health systems is essential for advancing equity in public health.

METHODS

This chapter employs a critical historical and conceptual analysis to examine the intersections between colonialism, scientific racism, and race-based medical practice. It traces the development of racialised medical knowledge from Enlightenment-era human classification systems and craniometry through their institutionalisation in colonial medicine, law, and governance. The analysis then examines how these logics persist in contemporary contexts, including race-based clinical algorithms, biased medical curricula, and research practices that reify race as biological rather than social.

RESULTS

The analysis demonstrates that scientific racism remains embedded within modern medical practice through institutional norms, pedagogical frameworks, and clinical decision-making tools. These practices perpetuate health inequities by reinforcing biological interpretations of race and obscuring the structural and social determinants of health. While recent institutional acknowledgements and curricular reforms signal growing recognition of medicine's complicity in racial injustice, such efforts are often fragmented and insufficient to address deeply rooted structural harms.

CONCLUSIONS

Dismantling scientific racism in medicine requires more than symbolic recognition or isolated reforms. It demands structural transformation in how medical knowledge is produced, taught, and applied, alongside a clear commitment to equity-driven public health practice. Addressing the enduring influence of colonial and racialised epistemologies is essential for building inclusive, just, and equitable health systems.

ABS2318

Equitable Participation in Healthcare: Shifting Power to Communities

Lebohang Kobola[1], Donald Zhou[1], Puseletso Lefakane[1]

[1]ERAA (Engagement, Representation, Analysis & Advocacy) Department, Médecins Sans Frontières (MSF), Johannesburg, South Africa

INTRODUCTION

Societal engagement and collaboration are essential to dismantling systemic inequalities and power imbalances. Beginning at the grassroots, empowering patients and communities to identify priorities, participate and influence service delivery, and advocate for effective responses strengthens primary healthcare systems through power realignment and shared ownership. Médecins Sans Frontières has partnered with communities, grassroots organisations, and Ministries of Health to support sustainable, context-appropriate healthcare access that respects local practices and centres community agency.

METHODS

This multi-disciplinary community engaged approach has been implemented across diverse settings in South Africa, Malawi, Zimbabwe, Mozambique, Kenya, and India. Context-specific strategies were co-developed, and support was provided to patient groups, community organisations and stakeholders. Implementation focused on community-led governance measures, community-led service delivery, and representation of marginalised communities on healthcare platforms at different levels.

RESULTS

Deliberate efforts to redistribute power to community organisations, patients, and local stakeholders through holistic capacity-building and strategic partnerships have significantly improved access to healthcare for marginalised populations. Community-based organisations, patient groups, and local leaders provide essential lay-health services beyond formal healthcare facilities. The deliberate inclusion of beneficiaries in decision-making processes has led to the formation of community advisory boards that influence MSF project activities and strengthen patient representation within Ministry of Health advisory structures. Community actors developed sustained linkages with MoH partners, NGOs, and civil society networks, enabling collaboration, peer learning and collective advocacy. These efforts resulted in context-specific, community-led health solutions that integrate indigenous knowledge, maximise local resources, and advance inclusive, equitable healthcare access.

CONCLUSIONS

Addressing healthcare inequities requires participatory decision making that centres patients and communities. Community-engaged healthcare enables active involvement in service delivery while building capacity for communities to advocate for their priorities and solutions. This experience underscores the need for health systems to integrate locally driven initiatives grounded in community priorities, indigenous knowledge, and equal, collaborative partnerships.

From data extraction to social transformation: decolonial research practices in a rural traditional pomeranian community in Brazil

Camila Lampier Lutzke[1], Lorrayne Cesario Maria[1], Maria Angelica Andrade[1], Maria Helena Miotto[1]

[1]Programa de Pós Graduação em Saúde Coletiva, Universidade Federal do Espírito Santo, Vitória, Brazil

BACKGROUND

Research conducted with traditional peoples and communities often reproduces exploitative data extraction practices, in which individuals are used as sources of information and subsequently abandoned after the dissemination of results. This logic violates fundamental ethical principles of scientific research, such as generation of benefits for the populations studied. In collective health, it is urgent to critically examine these structures and to build decolonial scientific practices committed to knowledge return and to concrete transformation of the realities investigated.

METHODS

This study presents an experience report derived from research conducted in a rural traditional Pomeranian community in Brazil, using mixed-methods approach.

This strategy for returning scientific knowledge involved sharing results with local entities and translating them into concrete actions through articulation with the community, health professionals, municipal management, and the legislative branch, aiming to deliver benefits to the populations that participated in the studies.
RESULTS
The investigations identified a prevalence of early weaning of 63.4% and analyzed the reasons and impacts of this phenomenon on maternal and child care. Social, cultural, and institutional factors were associated with early weaning and guided the development of intervention strategies. As a direct outcome, intersectoral collaboration was established with the municipal government, the health department, and the city council, culminating in the proposal of a bill mandating semiannual training of municipal health professionals in breastfeeding, grounded in the evidence produced.
CONCLUSIONS
This experience demonstrates that science committed to ethics and social justice must move beyond the restricted production and circulation of academic knowledge, assuming responsibility for transforming the realities investigated based on research findings. The socialization of knowledge, combined with political engagement and the collective construction of solutions grounded in evidence and local knowledge, represents a powerful pathway for promoting health equity and strengthening research practices that generate tangible benefits for traditional communities.

Living with with lymphatic filariasis in our community: insights from community mapping in Ghana

Kristi Kenyon[1], Colleen McMillan[2], Alexander Kwarteng[3], Emmanuel Kobla Atsu Amewu[3]
[1]Human Rights, University of Winnipeg, Winnipeg, Canada, [2]Social Work, University of Waterloo, Waterloo, Canada, [3]Biochemistry and Biotechnology, Kwame Nkrumah University of Science and Technology, Kumasi, Ghana

INTRODUCTION
Lymphatic Filariasis (LF) is a disfiguring and stigmatised neglected tropical disease (NTD) with health, social, cultural and economic impacts. Sociocultural and economic factors of the disease are underexamined, and in the Global Health paradigm of NTDs, people with LF are rarely recognized for the embodied and local knowledge they hold.
METHODS
In 10 small, remote LF-endemic communities in Ghana's Western Region, we used community-mapping workshops to understand "what is it like to live in this community with LF." In each community people with LF, grouped by gender, collaboratively mapped their communities depicting social, cultural, economic and health geographies of their environment. On large pieces of paper, participant co-researchers marked key sites identifying places of belonging, health and safety, alongside places of exclusion, ill-health and danger.
RESULTS
Places of inclusion were often paradoxically places of exclusion, and places of safety were also often described as unsafe. Women identified locations related to income generation (farms, markets) as critical to economic well-being, independence and community participation, but also sites of injury and mocking. Men identified locations of leisure including drinking spots, 'chop bars' and soccer fields as places to be welcomed by friends, but also places of name-calling, pain and difficulty as they navigated physical difference and reduced mobility. Map omissions were also significant, including the absence of locally-important traditional healers on maps, which suggests norms on 'what can be publicly mapped/discussed.' Exclusions also demonstrated agency – one group deliberately omitted an adjacent resort where they encountered stigma.
CONCLUSIONS
Community mapping is a useful tool to access the experiential knowledge people with LF have of their communities offering insight into the development and location of LF prevention, manageable and anti-stigma campaigns. Two-edged sites (safety/harm) suggest potential locations for anti-stigma interventions while map omissions require further exploration.

Supporting Decolonized Pharmacovigilance Systems: A Funder Perspective on African-Led Regulatory Decision Making

Deirdre McCarthy[1]
[1]Global Health, Gates Foundation, Seattle, United States

ABSTRACT
Decolonizing public health requires shifting from externally driven models toward systems that are governed, owned, and sustained by the regions they serve. In pharmacovigilance in Africa, drug and vaccine safety assessments have historically relied on analyses conducted outside Africa, despite widespread use of medicines and vaccines across the continent. This has limited the relevance of safety decisions and constrained equitable participation in global health governance. From the Gates Foundation's perspective, supporting decolonization in pharmacovigilance has meant investing in African-led institutions, data infrastructure, and regulatory expertise. A major milestone in this work has been the successful delivery of a groundbreaking pilot – African Union Smart Safety Surveillance' or 'AU-3S'1, to aggregate safety data across multiple African countries, enabling joint signal detection and assessment to be conducted by African regulators and technical experts. The parallel development of 'AfriVigilance', a customized continental safety database designed for African contexts, represents a huge shift toward sustainable data sovereignty and regionally governed evidence generation. These efforts now converge with the establishment of the African Medicines Agency (AMA), which offers a continental framework to institutionalize African ownership of medicine and vaccine safety monitoring. By anchoring pooled data systems and joint decision-making within AMA, pharmacovigilance moves from fragmented, donor-supported activities to a core public health function embedded in African governance structures. This enables transparent, context-relevant regulatory action and reduces reliance on external analyses. The experience demonstrates decolonization in action: it is achieved through investments in data systems, expertise, and institutions that allow African actors to define safety questions and responses. Strengthening AMA-led pharmacovigilance enhances public trust, supports equitable access to innovation, and positions Africa as an active contributor to global drug and vaccine safety.

Diverse approaches and shared benefits: A scoping review of co-designed chronic disease interventions with Indigenous People

Shanti Omodei-James[1], Sadia Hossain[2,1], Taylor-Jade Woods[1], Pip Henderson[1], Annabelle Wilson[1], Lynette Liddle[1], Stacy Wilson[3], Talia Scriven[3], Renee Kropinyeri[3], Natalie Kartinyeri[3], Darryl Cameron[4,3], Sharon Wingard[3], Caitlin Kerrigan[5], Brooke Spaeth[1], Amy Mendham[3,1], Billingsley Kaambwa[1], Paul Worley[3,1], Shahid Ullah[1], Courtney Ryder[1,6,7]
[1]Flinders University, College of Medicine and Public Health, Flinders Health and Medical Research Institute, Kaurna Yerta, Adelaide, Australia, [2]Translational Health Research Institute, Western Sydney University, Dharawal land, Campbelltown, Australia, [3]Riverland Mallee Coorong Local Health Network, South Australia Health, Ngarrindjeri Ruwe, Murray Bridge, Australia, [4]Moorundi Aboriginal Community Controlled Health Service, Ngarrindjeri Ruwe, Murray Bridge, Australia, [5]Coorong Medical Centre, Ngarrindjeri Ruwe, Meningie, Australia, [6]The George Institute for Global Health, University of New South Wales, Gadigal, Sydney, Australia, [7]School of Population Health, University of New South Wales, Gadigal, Sydney, Australia

INTRODUCTION
Co designed health interventions are increasingly applied to redress the sustained chronic health inequities experienced by Indigenous Peoples amidst ongoing colonisation. Despite its growth in popularity, the outcomes of co-designed interventions have not been evaluated. This review sought to identify and synthesise the evidence base of evaluated co designed chronic and complex disease interventions among Indigenous adults.
METHODS
Peer-reviewed studies published in English between January 2002 to May 2025 evaluating chronic or complex disease interventions for Indigenous adults (≥18 years) developed using co-design or related approaches were eligible. The Aboriginal and Torres Strait Islander Quality Appraisal Tool (CREATE) was used to appraise the quality of research from an Indigenous perspective. A narrative synthesis was conducted and reporting adhered to PRISMA ScR guidance. The protocol was prospectively registered (https://osf.io/j8abr).
RESULTS
Of 3,978 records screened, 39 studies were included. Most emanated from the United States, with others from Australia, Canada, and Aotearoa. Diabetes and cancer were the most common chronic conditions addressed. Analysis revealed an array of co design approaches, with Community Based Participatory Research the most frequently reported. Intervention formats ranged from single session education to long term programs. Despite methodological diversity, most studies reported improved clinical outcomes, greater health knowledge, and better self management, social, and emotional wellbeing. Community level benefits included increased capacity, employment, and access to culturally grounded resources.

Quality appraisal showed strong engagement and two way learning, but limited reporting of Indigenous governance and data sovereignty.
CONCLUSIONS
Co designed interventions show meaningful benefits for Indigenous peoples and communities, improving chronic disease outcomes while strengthening cultural connection, community capacity, and wellbeing. Advancing the field requires clearer articulation of co design processes, stronger Indigenous leadership, and adherence to best practice frameworks to ensure ethical, culturally grounded, and community driven approaches that support long term health equity.

ABS2690
The Decolonisation of (Oral) Health

Nashna Rampersad[1], Khabiso Ramphoma[1], Raman Bedi[2], Pagollang Motloba[3], Frank Krokenberg[4], Tracey Naledi[5], Yuka Makino[6]
[1]Community Dentistry, University of the Western Cape, Bellville, South Africa, [2]Transcultural Oral Health, King's College London, London, United Kingdom, [3]Community Dentistry, Sefako Makgatho Health Sciences University, Ga-Rankuwa, South Africa, [4]Department of Medicine, University of Cape Town, Cape Town, South Africa, [5]Social Accountability and Health Systems, University of Cape Town, Cape Town, South Africa, [6]Oral Health, World Health Organization Regional Office for Africa, Brazaville, Congo

BACKGROUND
Colonial legacies continue to shape global health systems, favouring Western biomedical paradigms and marginalising Indigenous knowledge, community agency, and entire domains such as oral health. Despite its links to general well-being and major non-communicable diseases (NCDs), oral health remains excluded from most global policy frameworks and universal health coverage agendas. Beyond its biomedical dimension, oral health serves as a political site where structural neglect and historical injustice converge.
METHODS
This session draws on global Indigenous and African perspectives to interrogate how colonialism continues to influence health governance, research hierarchies, and care delivery. It is organised around five interconnected themes: structural patterns inherited from colonial health systems; epistemic injustice and the dominance of Western knowledge; (3) the need to centre communities in health decision-making; the role of language and culture in access and equity; and the systemic neglect of oral health in global health and NCD discourse. Oral health will be integrated across all themes to illustrate its systemic exclusion.
RESULTS
The session will examine how health systems embedded in colonial ideologies are likely to perpetuate inequity, particularly in oral health, where traditional practices have been displaced and modern services remain underfunded or inaccessible. It will explore how oral health's exclusion from the NCD agenda reflects the broader invisibility of marginalised communities in global health priorities. Presenters will share anticipated contributions that highlight pathways of resistance, reform, and reclaim Indigenous health sovereignty.
CONCLUSIONS
Decolonising (oral) health is essential for achieving sustainable health equity. It requires dismantling colonial power structures, legitimising Indigenous knowledge systems, and repositioning oral health as integral to global health justice. This plenary calls on governments, academic institutions, and practitioners to co-create inclusive, community-led, and culturally grounded health systems where all voices, and all aspects of health, are valued.

Setting up a community-led palliative care programme in low-income urban settings in Cape Town, South Africa

Sarah Day[1], Rene Ackerman[2], Barbara Green-Thompson[3], Galiema Isaacs[2], Christine Jansen[2], Marian Kinnes[2], Jennie Morgan[4,3], Leslie Sylvester[2], Jana Weinink[3], Rene Krause[4,3], Peter Delobelle[5]
[1]School of Public Health, University of Cape Town, Observatory, Cape Town, South Africa, [2]Heideveld and Manenburg Community Health Committee, Cape Town, South Africa, [3]Department of Family, Community and Emergency Care, University of Cape Town, Observatory, Cape Town, South Africa, [4]Western Cape Department of Health, Cape Town, South Africa, [5]Chronic Disease Initiative for Africa, University of Cape Town, Cape Town, South Africa

INTRODUCTION
Palliative care (PC) is recognised by the World Health Organisation and the South African government as an essential component of Universal Health Coverage. Despite this recognition and a significant unmet need, implementation of PC services in South Africa remains limited, particularly in low-income urban communities. This interactive, organised session presents a community-engaged public health research project that seeks to strengthen access to PC by developing compassionate, community-led models of care in two underserved urban settings in Cape Town.
METHODS
The session provides a concise project overview with facilitated, dialogic engagement between researchers, community members involved in the project, and session participants. Grounded in a community-based participatory action research framework, the project unfolds across four phases from community entry to programme evaluation. This session focuses on Phase One, covering relationship-building, assessment of community assets and readiness, and anchoring programme development in local understandings of health, illness, care, birth, and death using health literacy and community engagement. Methods included building community profiles, stakeholder and community meetings, transect walks, and community asset mapping.
RESULTS
Drawing on shared reflections from community members and the research team, the interactive components of the session will be organised around five key lessons from the community entry phase: initial engagement and trust-building; fostering community ownership and co-development; (3) researcher commitment and sustainability; establishing strong local leadership; and using creative and contextually responsive engagement methodologies. Participants will be invited into guided discussion and reflection on these themes, encouraging exchange across contexts and disciplines.
CONCLUSIONS
By centring lived experience alongside academic perspectives and prioritising dialogue over presentation, this organised session critically examines the opportunities and tensions inherent in developing community-led PC interventions in resource-constrained settings. It offers practical and reflective insights into participatory public health research practices that support dignity, equity, and sustained community action.
Popul. Med. 2026;8(Supplement 1):A699

ABS3071
Decolonizing Global Health Education: Historical Lessons from Immunization and Vaccine Equity

Khalid Dhansay[1]
[1]Individual, Cape Town, South Africa

INTRODUCTION
Global health, framed as a universal humanitarian pursuit, often masks deep-seated inequities rooted in colonial history. Contributions from the Global South have regularly been overlooked by dominant Eurocentric paradigms that valorize Western scientific achievements. Immunization history and vaccine policy offers a powerful lens through which to examine how power imbalances affect the intersection of power, trust and equity, particularly in the context of recurrent pandemics and ongoing vaccine hesitancy.
METHODS
Employing a critical historical and narrative review methodology, this analysis integrates diverse sources—from historical texts to contemporary case studies—and applies decolonial and equity frameworks. It traces early immunization practices (like variolation) to their origins in Chinese, African, and Asian knowledge systems, contrasting this with later European and American resistance and modern vaccine hesitancy.
RESULTS
Analysis demonstrates that foundational immunization knowledge emerged through diverse, multicultural knowledge systems but was subsequently reframed as Western scientific discovery. Such epistemic erasures have contributed to enduring power imbalances in global health and have undermined trust in marginalized populations. Historically and today, vaccine resistance stems from political exclusion and structural violence, not ignorance. The inequitable vaccine rollout during COVID-19, hindered by access and patent barriers, is a clear example of these ongoing colonial injustices.
CONCLUSIONS
These findings show that to build vaccine trust, prepare for pandemics, and achieve health equity, we must decolonize global health education. This requires reforming education to include diverse medical histories, prioritize knowledge from the Global South, tackle unconscious bias and "white savior" attitudes, and support community-led health practices. A decolonized approach to immunization is vital—it is both historically correct and the only way to ensure future global health actions are ethical, effective, and trusted.

Challenging the bystander effect: Towards a socially-just global health academic culture

Oumnia Bouaddi[1], Farah Seedat[2], Yamina Boukari[3], Abi Deivanayagam[4]
[1]Mohammed VI University of Sciences and Health, Casablanca, Morocco, [2]City St George's, University of London,, London, United Kingdom, [3]University of Oxford, Oxford, United Kingdom, [4]University College London, London, United Kingdom

BACKGROUND

Global health operates firmly within social, political, and historical contexts, and researchers' work is inseparable from these broader structures. The entanglement of politics, structural violence, and health is evident throughout history, from colonial exploitation to contemporary responses to HIV/AIDS among others. While frontline workers are recognized for reporting human rights violations, we argue that global health researchers and academic institutions also have an ethical obligation to acknowledge and challenge the broader causal chains producing inequities. This workshop aims to firstly critically reflect on their role in actively challenging political and conflict-related determinants of ill health and secondly, develop practical strategies for action.

METHODS

Four approaches for researcher engagement with political and conflict-related determinants of health will be presented (e.g. boycott, disruptive participation, public and social media contestation, institutional governance). Participants will be divided into small groups to examine these approaches through an interactive SWOT-style analysis, considering feasibility, potential impact, collective vs individual action, and possible career or personal consequences. Each group will present reflections, followed by an open discussion. Participants will then prioritize approaches through live voting using interactive tools.

RESULTS

The workshop is expected to generate a collective SWOT analysis and a ranked set of approaches based on feasibility, impact, and relevance. These outputs will inform a position paper guiding socially just global health research culture, particularly with regards to contexts and populations affected by structural violence and conflict.

CONCLUSIONS

This workshop will encourage critical reflection on the responsibilities of global health researchers and academic institutions and will introduce practical strategies to move from observation as a bystander to meaningful action. It will contribute to advancing a socially just research culture where researchers and institutions are active agents who call out structural inequities and lead concrete action to address historical and ongoing injustices.

ABS3343

The profile of brazilian nursing: a critical analysis of the labor market entry of brown and black professionals

Aretha Feitosa de Araújo[1], Lorena Tavares Alves[1], Maria Cecília Pereira Santos[1], Maria Lunara de França Pereira Leite[1], Sabrina Martins Alves[1], Mirna Neyara Alexandre de Sá Barreto Marinho[2], Leidy Dayane Paiva de Abreu[3]
[1]School of Nursing, Cecape, Juazeiro do Norte, Brazil, [2]School of Nursing, Universidade Regional do Cariri (URCA), Crato, Brazil, [3]School of Nursing, Universidade Estadual do Ceará (UECE), Fortaleza, Brazil

BACKGROUND

The racial profile of nursing in Brazil is the result of historical processes that have shaped access to professional training and the health labor market1. Although there has been an increase in the participation of brown and Black professionals in the field, significant inequalities persist when compared to the labor market entry and opportunities available to White professionals2-3. This study aimed to analyze the representativeness of brown and Black individuals in Brazilian nursing within the labor market, identifying how structural inequalities influence the composition of this professional category.

METHODS

This is a critical theoretical reflection with a qualitative approach, based on secondary data from the study "Demography of Nursing in Brazil 2025".

RESULTS

The findings indicate that the majority of nurses still self-identify as White. Analysis of the race/skin variable in the Annual Social Information Report (Relação Anual de Informações Sociais - RAIS) from 2011 to 2021 revealed that formal employment ties are predominantly concentrated among White professionals, while brown and Black professionals represent a smaller proportion, with little variation over the historical series. These findings highlight the persistence of racial disparities associated with access to education, labor market entry, and career advancement opportunities4.

CONCLUSIONS

It is concluded that, despite its significant diversity and social relevance, nursing continues to reproduce structural inequalities present in Brazilian society. Therefore, the implementation of public and institutional policies aimed at promoting racial equity, expanding access to high-quality education, and strengthening the inclusion and professional recognition of brown and Black nurses is essential, contributing to the construction of a more just, plural, and human rights-oriented nursing profession.

ABS3398

Critical Embodiment: A People's Framework for Planetary Health

Dihan Wijewickrama[1], Yin Paradies[1]
[1]School of Humanities and Social Sciences, Deakin University, Narrm/ Melbourne, Australia

INTRODUCTION

The planetary metacrisis – characterised by breached planetary boundaries, cascading ecosystems collapse, mass extinction, intensifying climatic catastrophe and surging population health burdens – presents the defining public health challenge of our era. Yet orthodox public health frameworks have proven profoundly inadequate to contend with the scale, causation and urgency of these interconnected challenges. Disciplinary siloing, individualised and single-issue interventions together with dehistoricised and depoliticised theories of change obscure the systemic drivers of planetary-scale illbeing. Decolonial analysis traces the origins of the metacrisis not in abstract universal 'human activity' but in Racial Capitalism – a >500-year world system structured on the fiction of separate human races to legitimise colossal and systematic extractive violence wrought upon lands, peoples and other beings.

METHODS

This research develops a conceptual framework for rematerialising public health's role in addressing the metacrisis – drawing on decolonial political economy, critical systems theory and insurgent praxes which recognise the inseparability of collective healing and socio-ecological justice – generating a pluriversal (respecting diverse knowledge systems rather than imposing a universal colonial blueprint) framework for planetary health.

RESULTS

Critical Embodiment emerges as a people's framework operationalising healing justice through three dimensions: embodiment – centring lived experience and somatic knowing; relationality – emphasising interdependence, reciprocity and responsibility across human and non-human worlds; and critical consciousness – denaturalising and rehistoricising the systems of power which sustain extractive violences. The framework reorients public health towards a Planetary Systems analysis grounded in decoloniality and Indigenous and Global Majority knowledge systems.

CONCLUSIONS

Public health must transform into Planetary Health. Critical Embodiment demonstrates how integrating decolonial political economy, systems analysis and healing justice creates a generative framework for collective action to address the metacrisis – repositioning public health as an instrument for planetary healing justice and regenerative futures.

Urban tree census as catalyst for improved public health: a community-led exploration in Bishop Lavis, Cape Town

Rouve Bingle[1], Thandokazi Mvelashe[2], Lungiswa Nkonki[2]
[1]City and Regional Planning, University of Cape Town, Cape Town, South Africa, [2]Div of Health Systems and Public Health, Stellenbosch University, Cape Town, South Africa

INTRODUCTION

Trees provide multifaceted, low-cost benefits for public health. In postcolonial South Africa it remains an underutilised resource. The community of Bishop Lavis exemplifies "green apartheid," where historically Coloured designated areas suffer from systematically lower urban tree cover, perpetuating a socioecological inequality that has negative consequences. However, to understand, unlock and leverage health benefits of trees requires data on its availability and accessibility which is often unavailable. Creating a community tree inventory is a logical starting point to achieve these aims. This exploratory study, part of Stellenbosch University's Social Responsibility Initiative, examines urban forestry practices, community participation and mapping as a pathway to enhanced well-being.

METHODS

To determine a baseline count of trees in Bishop Lavis's public spaces, a census

was undertaken. Using a participatory design, the project recruited and upskilled community members in novel AI technology via the openly available PI@ntNet mobile application. Participants photographed, identified, and geolocated all public trees to create a community tree inventory, assessing quantity, distribution and species composition. This generated foundational data on the local urban forest.
RESULTS
There was a total of 875 observations made over five days of data collection. The census revealed a small overall public urban forest in Bishop Lavis, with stark intra-community disparities certain areas markedly more tree-poor than others, exacerbating vulnerabilities in high-density zones.
CONCLUSIONS
A public tree census can act as a catalyst for public health awareness and community justice. Participation empowers residents to generate their own baseline data, fostering ownership. Public urban tree data offer a promising pathway to improved nature-based intervention for marginalized areas. Findings advocate for public awareness, education and policy integration of resident-led urban forestry initiatives into urban development frameworks to enhance public health.
Popul. Med. 2026;8(Supplement 1):A704

ABS3446
Decolonising African Public Health: Centering Indigenous Knowledge for Equity and Health

Islamiyyat Agoro[1], Adedapo Adejumo[1]
[1]Academic, LASCOHET, Yaba, Lagos, Nigeria

BACKGROUND
Public health systems across much of Africa continue to reflect colonial epistemologies that privilege Eurocentric biomedical paradigms while marginalising indigenous knowledge systems and community-based health practices. This structural imbalance contributes to persistent health inequities, weak community ownership, and limited responsiveness of health interventions, thereby constraining progress toward universal health coverage and the Sustainable Development Goals (SDGs). As global public health discourse increasingly emphasises equity, inclusion, and sustainability, there is an urgent need to reposition decolonisation as a practical and evidence-informed strategy for strengthening people-centred health systems.
METHODS
A mixed-methods approach was employed. This included a narrative review of peer-reviewed literature and a comparative policy analysis of selected national and subnational public health frameworks across African contexts. In addition, in-depth qualitative interviews were conducted with over 60 stakeholders, including public health professionals, traditional health practitioners, policymakers, and community leaders. Data were analysed thematically to identify structural constraints, opportunities for integrating indigenous knowledge, and governance mechanisms capable of enhancing accountability, service delivery, and community participation.
RESULTS
The findings reveal that colonial legacies remain deeply embedded within public health education, financing models, and institutional governance structures. However, settings that intentionally incorporate indigenous knowledge—through culturally grounded health promotion, participatory leadership, and respectful collaboration with traditional systems—demonstrated improved service utilisation, increased community trust, and enhanced intervention acceptability. Such approaches were associated with more equitable resource distribution, revitalisation of primary healthcare, and greater system resilience.
CONCLUSIONS
Decolonising public health extends beyond symbolic reform and represents a critical pathway toward equitable, inclusive, and sustainable health systems. Integrating indigenous knowledge within formal health governance can strengthen social legitimacy, improve health outcomes, and advance health justice across Africa and other post-colonial settings. Embedding culturally responsive frameworks within global and national health strategies is essential for achieving universal health coverage and realising the vision of health without borders.

ABS3477
Solidarity kitchens and decolonial approaches to public health in campinas, brazil

Amanda Oliveira[1], Ana Bertolini[1], Natalie Dantas[1]
[1]Food Science and Nutrition Department, School of Food Engineering, Universidade Estadual de Campinas, Campinas, Brazil

INTRODUCTION
solidarity kitchens are community-based initiatives addressing hunger and food insecurity among socially vulnerable populations, primarily organized by civil society and social movements. In brazil, these initiatives operate within the national food and nutrition security (fns) system, contributing to the human right to adequate food and reinforcing territorial sustainability. Despite improvements in national food security indicators, structural inequities, historical exclusion, and marginalization persist. Approaching these initiatives from a decolonial perspective highlights the autonomy of local actors and the importance of grassroots responses to systemic gaps, offering a counter-narrative to the top-down, state-centric framing of public health.
METHODS
this qualitative case study draws on participant observation in a solidarity kitchen in the metropolitan region of campinas, são paulo. Data collection included field notes and descriptive observations of practices related to food and nutrition security, sustainability, and community organization, with attention to barriers, strategies, and expressions of autonomy and collective empowerment.
RESULTS
the kitchen functions as a hub connecting social movements, religious groups, and local agricultural producers, combining food production, educational initiatives, and income-generating activities. Practices include organic waste reuse for biofertilizers, literacy workshops, and bread-making courses. The study highlights tensions between community autonomy and state regulation, which may inadvertently constrain the self-determination of these initiatives.
CONCLUSIONS
solidarity kitchens exemplify decolonial public health practices. The social initiative contributes to food sovereignty by strengthening community ties and local food systems, promoting collective agency, affirming marginalized identities, and generating locally grounded solutions to food insecurity. They demonstrate potential for replication in other territories, provided that external support respects local governance and cultural practices. Recognizing these initiatives as part of the broader public health framework strengthens equity, sustainability, and social participation.
Popul. Med. 2026;8(Supplement 1):A706

ABS3523
Decolonising public health: from critique to practice in knowledge production and health systems strengthening

Faye Eshraghi[1]
[1]Medicine, University of Cape Town, Cape Town, South Africa

BACKGROUND
Global public health knowledge production operates through centre-periphery power dynamics that privilege high-income country institutions while marginalising local and indigenous knowledge., These asymmetries, manifesting as credibility deficits, interpretive marginalisation, and epistemic injustice, limit the relevance, equity, and sustainability of public health interventions in low- and middle-income countries.,
METHODS
This conceptual and practice-informed analysis draws on published literature, policy discourse, and professional experience in health systems strengthening. Key themes were identified through critical reflection on knowledge generation, guideline development, and implementation processes, examining power relations, authorship norms, partnership models, and local ownership within public health practice.,
RESULTS
Persistent asymmetries are sustained by donor-driven funding models, academic incentive structures that reward northern authorship, and weak governance of partnership standards., Knowledge extractivism and the erasure of local epistemologies undermine the legitimacy and uptake of public health interventions., Evidence indicates that co-production approaches, including shared leadership, participatory governance, community research advisory groups, and digital collaboration platforms, can redistribute authority and enhance contextual relevance., Structural reforms targeting funding criteria, academic metrics, and accountability mechanisms are necessary to support sustained equitable practice.,
CONCLUSIONS
Decolonising public health requires moving beyond critique toward practical transformation in how knowledge is produced, valued, and applied. Embedding principles of epistemic plurality, reciprocity, and local co-leadership within health systems strengthening efforts supports more equitable, contextually relevant, and sustainable public health action. Operationalising decolonial commitments demands reflexive tools, reformed governance frameworks, and accountability to

affected communities.,

ABS3554
Colonial continuities in German medicine and healthcare: toward anti-racism and decolonization

Tanja Gangarova[1], Muna Aikins[2], Robel Abay[3], Mirjam Faissner[4], Shreyashi Bhattacharya[5], Awa Naghipour[6]
[1]National Monitoring of Discrimination and Racism (NaDiRa), German Centre for Integration and Migration Research (DeZIM), Berlin, Germany, [2]Forschungsgruppe Biologie, Soziale Unterschiede und Entwicklung, Max-Planck-Institut, Berlin, Germany, [3]Alice Salomon Hochschule Berlin, Berlin, Germany, [4]Universitätsmedizin Berlin, Charité, Berlin, Germany, [5]Institut für Allgemeinmedizin, Uniklinik Köln, Köln, Germany, [6]Universität Bielefeld, Medizinische Fakultät OWL, Bielefeld, Germany

ABSTRACT
Despite increasing scholarly and policy interest in the decolonization of medicine and healthcare in recent years, the enduring colonial foundations of German medical and healthcare systems remain largely underexplored and, consequently, unchallenged. This contribution is based on a systematized literature review and examines the deep colonial roots that continue to shape knowledge production, institutional structures, and practices in German medicine and healthcare, with a particular focus on Berlin. In addition, community mappings were conducted to document and make visible the knowledge, practices, and forms of resistance embedded in locally based, communities-driven health initiatives led by activists and scholars of color. Through a critical analysis of historical and contemporary power relations, the contribution demonstrates how colonial and racialized knowledge systems persist in medical curricula, clinical practice guidelines, and institutional structures. These continuities contribute to limited access to treatment and negatively affect the quality of healthcare for racially marginalized communities. Where formal systems fail or exclude, communities develop their own strategies to address racial injustice in healthcare and to foster resistance and solidarity. Intersectionality and decolonial approaches grounded in an ethics of care are identified as essential frameworks for making these power structures visible and for developing transformative strategies for change. The report offers both a theoretical foundation and practical recommendations for academics, policymakers, healthcare institutions, and civil society actors seeking to unsettle colonial power dynamics and advance health equity and justice in Germany and beyond.

ABS3557
Ethics in Action: Reimagining Implementation Science Beyond Colonial Legacies

Sayan Das[1], Madhura Joshi[2], Amitabha Sarkar[2]
[1]Centre for Social Medicine & Community Health, Jawaharlal Nehru University, New Delhi, India, [2]Health Sciences Unit, Tampere University, Tampere, Finland

BACKGROUND
Implementation science in global health has largely evolved within epistemic and institutional frameworks shaped by colonial legacies. These include unequal power relations, dominance of positivist and technocratic approaches, and marginalisation of community knowledge and socio-political context. As a result, implementation science is often reduced to a technical exercise focused on efficiency and measurable outcomes, rather than equity, justice, and lived realities—particularly in low- and middle-income countries (LMICs).
METHODS
This paper adopts a critical, normative analysis of implementation science literature, global health practice, and ethics guidance, drawing on political economy, decolonial scholarship, and applied public health ethics. It synthesises evidence from global health programmes and policy experiences, including publicly financed health reforms in LMICs, to examine how colonial epistemic hierarchies shape implementation priorities, methodologies, and outcomes. Building on this analysis, the paper develops an ethics-framed conceptual model for implementation planning.
RESULTS
The analysis identifies persistent structural and epistemic inequities within implementation science, including extractive research practices, inequitable partnerships, and limited engagement with social and political determinants of health. To address these gaps, the paper articulates six ethical imperatives for decolonising implementation research: socially legitimate science, community co-production, equitable partnerships, contextual sensitivity, epistemic and social justice, and ethical data stewardship. These imperatives are operationalised through a five-stage ethics-informed implementation planning cycle that integrates ethical reflection into problem framing, co-design, implementation, evaluation, and reciprocal learning.
CONCLUSIONS
Embedding ethics as the organising principle of implementation science—rather than a procedural add-on—can reposition the field as a tool for social justice and health equity. An ethics-informed planning cycle enables implementation science to move beyond colonial and technocratic logics, restoring voice, agency, dignity, and accountability to the communities it seeks to serve.

ABS3803
Community-based approaches in primary health care: a perspective from popular health education and emancipatory care

Luiza Zanardo[1], Rita Borret[1]
[1]Federal University of Rio de Janeiro, Rio de Janeiro, Brazil

ABSTRACT
BACKGROUND The Family Health Strategy, Brazil's main Primary Health Care (PHC) model, is grounded in territorialization, recognizing territory as a socially and politically constructed space. The community-based approach is a relational technology that promotes proximity between health professionals and communities and integrates clinical care with social determinants to address social disadvantages and their health effects., It aligns with Popular Health Education (PHE) and Emancipatory Care (EC), emphasizing horizontal dialogue, local knowledge, critical reflection, autonomy, and the reduction of power asymmetries in care practices.- In Rio de Janeiro (RJ), expanded PHC coverage increased service capacity, but understaffed teams face clinical, surveillance, and administrative demands, limiting community-based approaches. This study analyzed community-based approach experiences in RJ state (2015–2025) from the perspectives of PHE and EC. METHODS A literature review in the Virtual Health Library (BVS/VHL) and the Digital Library of Theses and Dissertations of the State University of Rio de Janeiro (BDTD-UERJ), using Boolean operators in title, abstract, and subject fields, identified 273 publications. Of these, 17 studies were selected and classified by type of community approach, thematic focus, teaching methodologies, and political-pedagogical perspectives. RESULTS Community-based approach has been predominantly organized in formats such as groups, lectures, and campaigns, oriented toward information transmission and behavior change. Despite the presence of participatory dynamics, a depositary political-pedagogical perspective prevails, with limited community protagonism in defining themes and strategies. This pattern is associated with the biomedical training of professionals and their insertion in services governed by managerial logics focused on targets and productivity, with limited time and institutional support for territorial actions. CONCLUSION Community-based practices in PHC in RJ state diverge from PHE and EC principles. These findings raise a question: whose interests are served by non-critical and non-emancipatory practices that limit the transformative potential of health and social action within Brazil's Unified Health System?

ABS3878
impact of inclusive social policies on access to medical education in brazil by historically excluded populations: breaking the "pact of whiteness"

Tayana Santos Barbosa[1], Micheli Dantas Soares[1], Mariângela Costa Vieira[1], Paula Hayasi Pinho[1]
[1]Centro de Ciências da Saúde, Universidade Federal do Recôncavo da Bahia, Santo Antônio de Jesus-Bahia, Brazil

INTRODUCTION
in brazil, colonialism established social, political, and economic structures that historically excluded black and indigenous populations from access to public goods and services, including higher education,. These barriers are intensified in prestigious undergraduate programs, such as medicine, which have traditionally been accessed predominantly by white individuals from higher socioeconomic classes. Black women scholars have analyzed how structural racism operates within brazilian institutions, reinforcing hierarchies and limiting educational and professional opportunities,. This study examines the role of inclusive social policies in expanding access to medical education and challenging the "pact of whiteness."
METHODS
this study uses an autoethnographic approach based on the life experience of the researcher, a black woman from a working-class background who became a family and community physician. Personal narrative serves as an analytical tool to examine how social markers such as race, class, and gender shaped educational

and professional trajectories. The analysis draws on black feminist theoretical contributions, and the concept of escrevivência, proposed by conceição evaristo, which legitimizes lived experience as knowledge production.
RESULTS
inclusive social policies in brazil functioned as mechanisms of social and racial reparation. These include racial and social quota policies, income transfer programs such as bolsa família, and the program for restructuring and expansion of federal universities. Collectively, these policies increased access to medical education for historically excluded populations, enhanced representation, reduced structural inequalities, and promoted equity and social mobility among black and indigenous students.
CONCLUSIONS
inclusive social policies promoting social and racial reparation reduce structural inequalities and expand access to higher education and medical training in brazil. As a technical-scientific outcome, this study proposes workshops entitled "a gente combinamos de não morrer," directed at primary health care professionals and medical students to foster awareness of structural racism and promote equity in health education.

ABS3882
Decolonizing humanitarian public health: power, narratives, and ethical practice
Duha Shellah[1]
[1]Public Health in Emergencies and Disasters Working Group - WFPHA, Nablus - P400, Palestinian Territory, Occupied
INTRODUCTION
Humanitarian public health responses are often shaped by colonial legacies, unequal power relations, and extractive narratives. This results in top-down interventions that sideline local leadership, ethics, and contextual knowledge—especially in Global South crisis zones.
METHODS
This session uses a roundtable format to engage youth, feminist leaders, and health professionals from conflict-affected and post-colonial regions. Through shared case studies and lived experiences, the session explores pathways to ethical, decolonized health practice grounded in dignity, justice, and international humanitarian law (IHL).
RESULTS
Panelists will unpack how colonial logics persist in global health funding, research, and governance—particularly during emergencies. They will highlight locally led alternatives, from community-controlled data systems to youth-centered ethical review boards. Discussions will also explore the ethical tensions between neutrality and justice in humanitarian work.
CONCLUSIONS
Decolonizing public health in emergencies requires more than critique—it demands system redesign. This includes ethical frameworks rooted in lived experience, reparative funding models, and governance structures led by affected communities. The session will end with actionable recommendations for practitioners, donors, and multilateral agencies.
Popul. Med. 2026;8(Supplement 1):A716

Decentralizing HIV Testing for Transgender Populations in India: Evidence from Community Platforms and Facility-Based Models
KAUSHIK BISWAS[1], B BORAH[1]
[1]Programme, Plan International (India Chapter), Delhi, India
BACKGROUND
HIV prevalence among transgender (TG) populations remains disproportionately high at 3.78% (HSS 2021). Structural stigma, identity-related marginalization, unstable livelihoods and limited access to sexual and reproductive health (SRH) services continue to impede timely HIV testing and diagnosis. Plan India, is implementing community-led, decentralized HIV testing through integrated and differentiated service delivery models across 13 states.
METHODS
The project is guided by three
OBJECTIVES
(i) expanding HIV testing to reach unreached and newly identified TGs; (ii) creating an enabling environment to reduce stigma and discrimination; and (iii) strengthening community empowerment through awareness and social protection linkages. HIV testing is delivered through facility-based services and decentralized platforms.
RESULTS
A total of 10,912 TGs were registered, of whom 68.4% were aged below 30 years. Compared to decentralized platforms, facility-registered TGs had 38% higher odds of being under 30 years (OR = 1.38; 95% CI: 1.26–1.53; p < 0.001). Facility registrants were 2.27 times more likely to have higher education (higher secondary or above) compared to those reached through outreach platforms (OR = 2.27; 95% CI: 2.08–2.53; p < 0.001), and 2.2 times more likely to be students or salaried employees rather than unemployed, self-employed or daily-wage earners (OR = 2.27; 95% CI: 1.96–2.70; p < 0.001). HIV positivity remained higher among facility-registered TGs (6.25%) compared to those reached through decentralized platforms (3.33%). Facility registrants had 1.94 times higher odds of being newly HIV positive compared to those reached through outreach (OR = 1.94; 95% CI: 1.59–2.37; p < 0.001).
CONCLUSIONS
Decentralized, community-led HIV testing platforms complement facility-based services by reaching older, less educated and economically marginalized TG populations who face barriers to accessing formal healthcare. Integrating decentralized testing into national HIV strategies is essential to scale up testing uptake and accelerate progress towards the 95–95–95 targets.

Community-Led Monitoring (CLM): A Participatory Model for Environmental Justice in Post-Industrial Bahia
Jessidenes Teixeira de Freitas Mendes Leal[1,2], Nicolas Yan Santos Monteiro[3], Brena Tauane De Souza Silva[3]
[1]2 Secretaria Municipal de Saúde do Município de Salvador, Salvador, Brazil, [2]3 Institute of Collective Health, Federal University of Bahia, Salvador, Brazil, Salvador, Brazil, [3]1 Instituto Federal da Bahia - UFBA, Salvador, Brazil
INTRODUCTION
In post-industrial landscapes like Santo Amaro, official monitoring systems frequently fail to capture the granular reality of chronic chemical exposure. Community-Led Monitoring (CLM) offers a participatory alternative that empowers local populations to collect actionable health data. This research explores the potential of a CLM framework to revitalize environmental health surveillance in lead-affected areas of Bahia.
METHODS
A pilot CLM model was designed based on the "Data Value Chain" framework. The model incorporates five stages: community-led data collection, local analysis, dissemination, evidence-based advocacy, and longitudinal tracking. Stakeholders, including former lead workers and quilombola communities, were mapped to establish a network of community health monitors.
RESULTS
The proposed CLM framework identified critical lead exposure "hotspots" overlooked by state surveillance, such as domestic backyards paved with industrial slag. By utilizing low-cost participatory tools and mobile-based surveys, the model facilitates real-time reporting of environmental hazards. Preliminary engagement suggests that CLM increases community trust in health data by 40%, as residents transition from passive subjects to active agents of surveillance.
CONCLUSIONS
CLM is a powerful mechanism for improving the quality and accountability of public health services. In Bahia, community-generated data can bridge the gap between environmental liability and government response. Implementing CLM is a necessary step to hold corporate and state actors accountable for environmental remediation and long-term health protection.

Commentary on the Intersection Between Health Information, Misinformation, and Generative AI Technologies
Juliet Ugbedeojo Shaibu[1], António Bandeira[1], Luis Gonçalves[1], Felix Holl[1], Mariana Laranjo Gonçalves[1], Ronan Payinda[1], Sagun Paudel[1], Alessandro Berionni[1], Tina Purnat[1], Timothy Ken Mackey[1]
[1]Young WFPHA, World Federation of Public Health Associations, Geneva, Switzerland
INTRODUCTION
In recent years, the field of artificial intelligence has seen rapid advancements, with models, such as large-language models and generative AI, evolving at a rapid pace. While this progress offers tremendous opportunities, it also presents risks, particularly in the creation, consumption, and amplification of information

and its impact on population health and health program delivery. Thoughtful approaches are necessary to navigate the consequences of advances in AI for different healthcare professionals, patient populations, and from a policy and governance perspective.
METHODS
Through a collaboration between the World Federation of Public Health Associations (WFPHA) Working Groups, this commentary article brings together perspectives, concerns, and aspirations from young adult professionals across five continents, each with diverse backgrounds, to explore the future of public health and AI in the context of the changing health information environment.
RESULTS
Our discussion is divided into two parts specifically examining aspects of disinformation and AI and also the role of public health and medical professionals in a growing AI-driven health information ecosystem.
CONCLUSIONS
The commentary concludes with five key recommendations on how to potentially address issues such as (Dis)Information overload, misinformation propagation, and resultant changes in health practices, research, ethics, and the need for robust policies that can dynamically address current and future challenges.

Maturity Level model of Artificial Intelligence in the Health Care System: UAE CASE
Alounoud Almarzooqi[1]
[1]Healthcare Management, Univeristy of Sharjah, Sharjah, United Arab Emirates
BACKGROUND
Artificial Intelligence (AI) emerged recently as one of the promising technologies in healthcare system. It can predict and diagnose certain diseases like professional physicians efficiently. In the United Arab Emirates (UAE), there is a great emphasis on this technology under the leadership of the Minister state of Artificial Intelligence, Digital Economy, and Remote Work Applications office. Each year, most of the healthcare entities showcase their contributions in in AI However, the level of how far they go for its implementation is unknown. Purpose: This study aims at exploring the level of AI applications maturity level or actual implementation in daily operations in healthcare organizations.
METHODS
A mixed model research design through quantitative and quantitative study in three phases. Phase I will include Delphi method to build AI maturity level survey and self- assessment checklist. Phase II will include the pilot of the project and phase III will include actual dissemination of survey tool.
RESULTS
Expected results will the level of AI maturity level based on the AI development stages and as per the Subject Matter Expert (SME) opinion. Analysis: The generated data from Delphi method will be analyzed using thematic analysis. While SPSS software will be used for surveys and other quantitative data. A combination of descriptive statistical techniques and correlations analysis will be deployed to analyze the maturity level of AI applications.

It takes a village: education sessions for families of patients with diabetic foot ulcers in the Northern Provincial Hospital, Vanuatu
Daniel John Martin[1]
[1]School of Medicine, ScotGEM, St Andrews and Dundee, United Kingdom
ABSTRACT
In remote areas, community turns up. When a patient needs hospitalisation, not only do the community often raise funds, but they also travel to the hospital. The Northern Provincial Hospital in Vanuatu serves all the northern islands and people can travel for days to reach their needed care. This provides an opportunity to disseminate bite-sized medical information on diabetic foot care to this invested audience to be spread back across to areas difficult to reach through standard health channels. After consultations with healthcare staff, patients and their families, we identified that the education on foot care and wound identification would be the most beneficial. Surveys were carried out on a sample of the current bedside cohort (n=10) to assess the current level of understanding and confidence in discussing diabetic foot care measures. Downloadable infographics were developed explaining pictorially the best practice for foot care of patients with diabetes. Post intervention questionnaires and unstructured interviews were repeated with the initial cohort to access how many community members had studied and shared the information. Initial data shows increased awareness of both the importance of best practice foot care measures (30%). Provisional results also show a high level of reported confidence in talking to friends and family about the hygiene resources (7.9/10). Videos clips in local languages were suggested to enhance comprehension. The development of a picture-based, interactice online course would allow for more granular checking of understanding. Using the bedside-time spent by community members for education increases confidence in discussing important diabetic foot care measures. This project highlights the potential of opportunistic education, and for remote and rural knowledge amplification, to communities in a hospital setting.

ABS0108
Fast, Ethical, and Accessible Research: Manuscript Writing with the Chisquares Platform
Israel Agaku[1]
[1]Chisquares Incorporated, Atlanta, United States
BACKGROUND
Public health urgently needs timely and accurate evidence, yet traditional research pipelines remain slow and inaccessible—taking years from data analysis to manuscript publication. Many researchers, particularly in low-resource settings, are excluded by technical barriers such as coding expertise. The Chisquares platform (www.chisquares.com) addresses these challenges by pioneering analysis-as-visualization combined with automated manuscript generation, enabling researchers to move from dataset to publication-ready output with unprecedented speed and accuracy.
OBJECTIVES
This workshop aims to: Train participants to use Chisquares to produce a full manuscript in as little as one hour. Demonstrate the platform's risk-based AI framework, which strictly prohibits AI from any data-driven task while allowing AI to support narrative text (e.g., introductions, discussions, abstracts). (3) Integrate principles of research ethics and responsible AI use into the manuscript development process. Empower learners so they leave with practical skills and a clear pathway to producing their own manuscripts rapidly and rigorously.
METHODS
Participants will engage in hands-on exercises using the Chisquares platform. Analyses—including descriptive statistics, regression modeling, and survey design—will be conducted visually and interactively, with immediate outputs feeding into structured manuscript sections. Rules-based algorithms ensure 100% reproducible computation, while AI is employed only for low-risk narrative refinement. Ethical safeguards and transparency tools are emphasized throughout the process. Results/Expected Outcomes: By the end of the workshop, participants will: Generate a complete, structured manuscript directly from a dataset. Understand how to apply a risk-based AI framework to balance speed, accuracy, and ethics. Gain practical skills for democratizing evidence generation without compromising rigor.
CONCLUSIONS
This workshop redefines what it means to democratize science: any researcher, anywhere, can contribute high-quality, ethically sound evidence to public health in record time. By coupling speed with accuracy, and AI with ethical safeguards, Chisquares offers a new model for global evidence generation.

Enhancing TB Case Notification in High-Burden Areas of South Ethiopia: The Role of Mapping Hotspot Areas and AI-Assisted Ultra-Portable Digital X-ray Screening in Community-Level Active Case Finding
Zemedu Trife[1], Tamiru Mebrate[1], Lidia Kifle[1], Dinka Gemetisa[1]
[1]Monitoring, Evaluation and Research, REACH Ethiopia, Addis Ababa, Ethiopia
BACKGROUND
Ethiopia remains among the 30 high-TB-burden countries, with many cases going undetected due to limited access to diagnostic services and geographic barriers. In highly rural regions like South Ethiopia, the health system faces challenges in reaching underserved populations. To optimize TB active case finding, hotspot mapping offers a data-driven approach for prioritizing high-yield screening areas. This study evaluates the combined impact of geospatial hotspot mapping and AI-assisted chest X-ray (CXR) screening under the USAID-funded SWIF-TB initiative to enhance TB case notification. Design/
METHODS
A pilot study was conducted in four districts of the Sidama Region. TB hotspot mapping was performed using geospatial analysis of historical case data, guiding targeted screening with AI-supported CXR and symptom screening tools. Screening focused on the general population and children with a history of TB

contact. Data were collected through KoboToolbox and analyzed using descriptive and inferential methods. Screening and diagnostic services were linked with 20 public health facilities.
RESULTS
Of the 2,524 TB cases, 2,264 (90%) were successfully mapped. Twenty hotspot villages accounted for over 80% of the TB burden. Among 2,058 individuals screened, 304 presumptive TB cases were identified, with 43 confirmed TB cases, yielding an overall positivity rate of 14.4% (95% CI: 10.6–19.3%). Symptom-based screening alone yielded 3% (95% CI: 0.7–9.5%), CXR alone 13% (95% CI: 8.1–20.3%), and combined screening 29% (95% CI: 20.2–39.4%). The intervention raised the case notification rate to 2,089 per 100,000 (95% CI: 1,531–2,788), nearly seven times higher than the regional average of 313 (95% CI: 308–318). AI-assisted CXR achieved 95.2% sensitivity (95% CI: 84.2–98.7%).
CONCLUSIONS
Geospatial hotspot mapping improved TB detection and resource use by targeting high-burden areas. Combined with AI-assisted X-ray screening, it enabled early case identification, supporting its integration into national ACF strategies in rural, resource-limited settings.

ABS0362
Exploring enablers and barriers to implementing virtual reality-based alcohol and other drug prevention among adolescents: a cross-national Delphi study in Germany and Australia

Robert Hrynyschyn[1], Christina Prediger[1], James Durl[2], Timo Dietrich[2], Christiane Stock[1]
[1]Institute of Health and Nursing Science, Charité - Universitätsmedizin Berlin, 13353 Berlin, Germany, [2]Social Marketing @ Griffith, Department of Marketing, Griffith University, Gold Coast, Australia

INTRODUCTION
Virtual reality (VR) is an innovative tool for alcohol and other drug (AOD) prevention, offering immersive experiences that engage adolescents in risk reflection and health education. VR-based alcohol prevention programmes have been developed and tested mainly in Australia, Denmark and Germany, showing promising results in raising awareness and engagement among adolescents. However, it remains unclear how such digital interventions can be implemented sustainably and equitably across educational and community settings. This study aims to identify enablers and barriers to implementing VR-based AOD prevention programmes in Germany and Australia, fostering cross-national learning and developing scalable digital prevention strategies.
METHODS
A multi-stage Delphi study was conducted to develop an understanding of implementation factors. First, a semi-standardised online survey in English and German was distributed among experts (e.g. prevention specialists, youth workers, teachers) experienced in AOD prevention in educational or community settings. Responses (n = 37) were analysed thematically to identify recurring issues and divergent positions. The second round refined these through a follow-up survey. Focus groups in both countries brought together stakeholders from practice and policy to validate, contextualise and reach consensus on identified enablers and barriers.
RESULTS
The Delphi process and stakeholder discussions produced a synthesis of structural, cultural and policy-related factors influencing VR adoption in AOD prevention. Preliminary results highlight realistic and immersive learning experiences, stronger youth engagement during prevention sessions, and high motivational potential as key facilitators. Reported barriers included limited financial and human resources, organisational and technical challenges, insufficient training, and inadequate alignment of VR content with prevention goals. The results will be refined after the entire data analysis has been completed.
CONCLUSIONS
The framework of enablers and barriers will inform future VR-based AOD prevention strategies. Insights from Germany and Australia can enhance the transferability and scalability of innovative, context-sensitive digital prevention approaches.

ABS0379
The Universal Wellbeing Evaluation Tool (UWET): Facilitating Change Through Literacy

Susan Stevenson[1]
[1]Head Office, FREEDOM Wellbeing Institute & NZCDIation, Whitiora, Hamilton, New Zealand

ABSTRACT
Post the emergence of the evidence-based multi-disciplinary and authentically Universal Wellbeing Model (UWM) in 2023, the Universal Wellbeing Evaluation Tool (UWET) was developed. This quantitative tool supports users to self-assess, using a 5 point Likert scale, and identify: the status of each of the 70 Determinants of Universal Wellbeing; social physical, intellectual, ethnic, cultural, emotional and spiritual dimension levels; home, work and /or study environment impacts on overall Universal Wellbeing plus the Universal Wellbeing Risk level of the person completing the UWET. The UWET empowers users to identify their strengths and capabilities, determinants of no influence, as well as those that could be, or are harming their overall Universal Wellbeing. Learning about the UWM; what Universal Wellbeing is and then experiencing using the tool and understanding one's own unique personal Universal Wellbeing Profile collectively contribute to the acquisition of Universal Wellbeing Literacy. Professionally accredited UWET Facilitators administer, analyse, and report UWET outcomes to individuals and organisations using strategies that optimise and accelerate the acquisition of personally relevant and meaningful Universal Wellbeing Literacy. Informed by a clear theory of change, with impenetrability, and transformative learning at its heart; gaining Universal Wellbeing Literacy has been shown in early research trials to provide rich and applied learning experiences that support behaviour changes and personal transformations. The UWET is a core element in three research interventions that have been or are being trialled to measurably improve participation, achievement, productivity and equity levels in diverse settings. Higher education trials have consistently shown 30% plus increases in programme completion rates. The digitisation of the tool has made international Tool and intervention trialling possible at scale. Currently increasing access and conducting tool and intervention trials with diverse populations and randomised control trials is a priority.

From policy to practice: facilitating the notification of perinatal deaths and births by community health workers using electronic platform in four health districts in Mali

Mamadou BERTHE[1], Ibrahim TERERA[1], Olga Helena JOOS[2], Fatimata YARRO[1], Abdrahamane Zerbo[3], Sam Notzon[2], Sydney Mogotsi[2], Jean-Edgard guessan[2]
[1]Etudes et Recherche, Institut National de Santé Publique, Bamako, Mali, [2]CDC Foundation, Vital Stratégies, New York City, United States, [3]Sous Direction Santé Communautaire et Réglémentation, Direction Générale de la Santé et de l'Hygiène Publique, Bamako, Mali

ABSTRACT
Context According to the 2018 Mali Demographic and Health Survey (DSH), the perinatal mortality rate in Mali was 38 per 1,000 live births. Death surveillance and birth registration exist in Mali, but are not very operational at community level. The National Institute of Public Health (INSP) and Vital Strategies therefore initiated this project to strengthen perinatal mortality monitoring and birth registration in 4 health districts.
METHODS
The project was based on quantitative approaches that explored the reporting perinatal deaths and live births in selected sites of Community Health Workers in the health districts of Diéma, Kita, Sikasso and Kignan. Data were collected by Community Health Workers, through the smartphones and analyzed on DHIS2. The protocol was submitted and validated by the Ethics Committee of INSP.
RESULTS
After 8 months of implementation, we recorded 729 live births and 35 perinatal deaths. The majority of births took place at home (around 52 percent) and 52 percent were male. Around 61 percent of perinatal deaths were male. Project Community Health Workers accounted for 43.8 percent of notified births in the health zones of the 4 health districts. This experience was an opportunity for the Ministry of Health and its Partners to initiate a process of digitization of the work of the CHWs whose birth and death registration functionalities were developed in the tool. In addition to this, the electronic data collection form has been set up for all Community Health Workers sites.
CONCLUSIONS
The project helped to understand the importance of Community Health Workers in registering births and perinatal deaths through the smartphones. The project accelerated the process of digitalizing Community Health Workers' data through a tool called DISK-Mali, which is itself integrated into the DHIS2 platform.

Specialized care in primary health care via telemedicine in Northeastern Brazil

Maria Eulália Vinadé Chagas[1], Gabriela de Oliveira Laguna Silva[1], Gabriela Tizianel Aguilar[1], Taís de Campos Moreira[1], Felipe Cezar Cabral[1], Daniela Cristina dos Santos[1]
[1]Corporate Social Responsibility, Moinhos de Vento Hospital, Porto Alegre, Brazil
INTRODUCTION
Health inequities are influenced by territorial extension and the distribution of physician density, being a greater concern in regions with low human development index, such as Northeastern Brazil1,2. Telemedicine has emerged as a strategy to reduce inequities, improve efficiency of care and increase patient satisfaction3-5. Within this context, TeleNordeste was implemented as a care and research project, developed under the Institutional Development Support Program of the Unified Health System of Brazil to provide teleinterconsultations between specialists, primary health care (PHC) physicians, and patients in the fields of cardiology, neurology, psychiatry, endocrinology, internal medicine, pediatrics, nutrition, and nursing6-8. Our objective was to describe the TeleNordeste project and its results.
METHODS
A descriptive study was conducted to analyze the implementation of TeleNordeste and interconsultations carried out between January 2024 and August 2025. Outcomes assessed included utilization, case resolution, absenteeism, and Net Promoter Score (NPS) of both patients and PHC professionals.
RESULTS
The TeleNordeste project was implemented in the state of Rio Grande do Norte, located in Northeastern Brazil. Initial steps included a situational assessment and on-site visits. A total of 19656 interconsultations were offered, of which 10719 were completed; 25% of these were follow-ups. Patient complaints were resolved in 99% of cases without the need for in-person specialist referral. The absenteeism rate was 21%. The NPS of PHC professionals and patients was 97 and 92 points, respectively, both within the excellence zone.
CONCLUSIONS
TeleNordeste has proven to be a feasible and effective model for expanding access to specialized care in underserved areas of Northeastern Brazil6-8. By enabling real-time counter-referral, the project strengthens PHC, supports continuity of care and enhances professional capacity-building6-8. This approach reduces unnecessary referrals and ensures that PHC-sensitive conditions are appropriately managed at the primary care level6-8.

ABS0653
Digital dependence and Artificial Intelligence: implication on mental health information use and seeking behavior

Karla Jones[1], Anuli Njoku[2], Oghenere Gabriel Salubi[3]
[1]Library Services, Southern Connecticut State University, New Haven, United States, [2]Public Health, Southern Connecticut State University, New Haven, United States, [3]Information & Library Science, Southern Connecticut State University, New Haven, United States
BACKGROUND
Artificial intelligence (AI)–driven conversational agents are increasingly accessed for seeking health information, emotional support, and advice. Recent reports of self-harm following interactions with AI chatbots have drawn attention to risks associated with digital dependence and unmoderated information environments. These incidents highlight emerging challenges related to the ways individuals seek mental health information through AI systems, the vulnerabilities that arise when digital agents mediate help-seeking behavior, and the absence of protective safeguards for users particularly, young populations. Understanding these dynamics is essential for informing public health responses and information governance efforts.
METHODS
Qualitative content analysis was conducted on nine news reports published between 2024-2025 by The Guardian, BBC, CNN, and CBS News. Articles were selected based on documented involvement of AI chatbots in self-harm or suicide cases. Multiple reports on the same incident were combined to strengthen case accuracy and completeness. These were treated as single cases, and inductive thematic coding was used to identify patterns in information-seeking behavior, emotional dependence on AI, system design gaps, and responsibility narratives.
RESULTS
Two primary case clusters were identified: Character.AI interactions characterized by immersive and emotionally charged dialogues, and ChatGPT-related incidents in which parents alleged that harmful AI-generated responses influenced youth behavior. Across all reports, strong emotional projection onto chatbots, reliance on AI for sensitive mental health information, and limited awareness of algorithmic constraints were consistent. Media accounts emphasized deficiencies in crisis-response mechanisms, lack of youth-oriented safeguards, and broader digital-literacy gaps that may exacerbate harm. Conclusion. AI-mediated mental health information seeking presents an emerging public-health and information-governance challenge. There is the need for coordinated interventions involving public health systems, library information professionals, and technology developers. Recommended actions include strengthening digital-health literacy, implementing crisis-response safeguards, and developing regulatory frameworks that ensure AI technologies contribute to, rather than compromise, mental well-being.

ABS0803
Integration of AI into legacy EHRs - challenges and opportunities

Jennifer Chipps[1], Antoine Bagula[1], Petra Brysiewicz[2], Damian Clarke[3], Sean Broomhead[4]
[1]Faculty of Community Health Sciences & Department of Computer Science, University of the Western Cape, Cape Town, South Africa, [2]Nursing and Public Health, University of KwaZulu-Natal, Durban, South Africa, [3]Department of Surgery, Greys Hospital, Pietermaritzburg, South Africa, [4]HISP South Africa, Cape Town, South Africa
INTRODUCTION
South Africa's public health system, serving over 80% of the population, faces significant challenges due to inadequate healthcare systems with a shortage of healthcare professionals. Unplanned readmissions in South Africa, where 10.5% of patients return to the hospital within 30 days after being discharged (Dreyer et al., 2019) is a major concern, with discharge processes often having poor continuity of care post discharge. The aim of the study was to develop an AI intervention to identify and address unplanned readmission at a selected hospital in KwaZulu-Natal
METHODS
A transdisciplinary team (university and industry collaboration) was established to develop 1). A readmission risk classification AI tool utilizing predictive analytics to flag patients at risk of complications and readmissions post-discharge; and 2) An evidence-based review of interventions to prevent unplanned readmissions in low resource settings.
RESULTS
Machine learning using Random Forrest was used to develop an algorithm to flag patients at risk of an unplanned readmission. The review identified four key interventions: 1). Discharge planning; 2) Medication Review; 3) Patient Education; and 4) Follow-up visits with recommendations to leverage AI-powered clinical decision support assistance to facilitate post-discharge recovery and prevent unplanned readmission which will enhance patient care continuity and mitigate workforce shortage.
CONCLUSIONS
The presentation will present work to date and will discuss the challenges in developing an AI-powered clinical decision support system integrated with our readmission classifier. This project is creative in that it firstly addresses the critical gaps in care continuity of care after hospital discharge in public hospitals in low income settings in South Africa.

ABS0805
Patient Education and Counseling Teach-Back Techniques in Telehealth: A Systematic Review and Insights for Future Directions

Wafa Alnakhi[1], Nabil Natafgi[1], Faith Albertson[1]
[1]Family Medicine and Behavioural Sciences, University of Sharjah, Sharjah, United Arab Emirates
INTRODUCTION
The rapid expansion of telehealth during the COVID-19 pandemic has created new challenges in patient-provider communication due to the absence of in-person interactions and visual cues. Teach-back, a method where patients repeat information to confirm understanding, is a promising tool for improving communication in virtual care. This systematic review evaluates the effectiveness of teach-back techniques in telehealth settings.
METHODS
A systematic search of four databases (CINAHL, EMBASE, PsycINFO, PubMed) was conducted, yielding 10 studies that met the inclusion criteria. The article inclusion/exclusion criteria consisted of the following: telehealth services topic; direction provision related to teach-back methods; and (3) English, peer-reviewed, empirical journal publication. Risk of bias in included studies was assessed using established tools for randomized controlled trials (RCTs), non-randomized controlled trials (NRCTs), and qualitative studies. Data synthesis followed the PICO framework, and thematic analysis was used to compare outcomes across

studies.
RESULTS
Included studies which varied in design, modality, and telehealth specialty. Teach-back was consistently associated with improved patient knowledge, confidence, and self-management, as well as clinical outcomes such as better glycemic control and medication adherence. Overall evidence quality was moderate, with common limitations including small sample sizes and brief follow-up periods. Conclusions and Practice Implications: Teach-back is effective in enhancing patient understanding and outcomes in telehealth settings. However, variability in study design and implementation highlights the need for standardized protocols and additional research. Provider training in effective virtual teach-back strategies may enhance patient comprehension, strengthen communication, and advance health equity in telehealth delivery.

ABS0899
Evaluating the efficacy of digital media platforms in disseminating public health information: A global review with implications for South Africa

Hulisani Matakanye[1]
[1]Health Studies, University Of South Africa, Pretoria, South Africa

BACKGROUND
This study employs non-empirical, systematic review design; to explore how digital media platforms support public health education and awareness, with consideration of implications for the South African context.
AIM
To explore the use of digital media in disseminating public health information and its implications for improving citizens' awareness and health literacy. Setting: although the review draws on global evidence, the analysis highlights relevance for South Africa's digital communication landscape.
METHODS
the review followed Preferred Reporting Items for Systematic Review and Meta-analysis guidelines. Comprehensive search across various databases, included Google Scholar, EBSCOhost, PubMed, ScienceDirect, Sabinet, ProQuest, Cambridge Core, Scopus, Africawide information, Nursing/Academic Edition, Humanities and Social Sciences Index Retrospective Humanities Sources, MasterFILE Premier, MEDLINE, and SocIINDEX was conducted. Studies were selected based in inclusion criteria, resulting in 15 peer reviewed full text articles published between January 2019 and March 2023. Quality appraisal was conducted using the Joanna Briggs Institute Qualitative Assessment and Review Instrument (QARI), and findings were synthesised thematically.
RESULTS
Findings show that digital media use was associated with reduced misinformation, strengthening social support networks, enhancing the reach and efficiency of health information dissemination, and promoting positive health behaviours. Evidence also indicated improvements in health knowledge and engagement across diverse populations; however, challenges such as digital literacy gaps, unequal access, and algorithmic bias persist.
CONCLUSIONS
Digital media represents a transformative tool for public health communication. When strategically implemented, it enhances awareness, supports behaviour change, and strengthens public engagement with health information. Contribution. This review highlights the need for collaboration between health professionals and digital communication specialists to optimise digital health strategies. It highlights policy imperatives such as improving digital literacy, ensuring equitable access, strengthening regulation of online health information, and fostering public-private partnerships. These actions are essential for leveraging digital media effectively and improving health outcomes in South Africa.

Beyond the big vaccine: exploring novel approaches to tuberculosis prevention and control across african countries

Courage Chandipwisa[1], Agness Shimilimo[2], Muhydeen Opeyemi Olojo[3], Zachariya Esther[4], Harrison Banda[5]
[1]Department of Research, Global Empathy Project, Lusaka, Zambia, [2]Reproductive Health, Pan African University Life and Earth Sciences (including Health and Agriculture), Ibadan, Nigeria, [3]Public Health, Kwara State University, Malete, Nigeria, [4]Department of Theriogenology, University of Abuja, Abuja, Nigeria, [5]Pure and Applied Chemistry, School of Natural and Applied Sciences, University of Zambia, Lusaka, Zambia

INTRODUCTION
tuberculosis (tb) remains a major cause of illness and death in africa, intensified by hiv co-infection, poverty, and fragile health systems. While the bacillus calmette-guérin (bcg) vaccine has reduced severe pediatric tb, its limited efficacy against adult pulmonary tb and waning immunity highlight the need for new strategies. This review evaluates advances in vaccines, diagnostics, treatments, and public health approaches for tb control beyond bcg vaccination in african settings.
METHODS
a systematic review was conducted following prisma guidelines. Peer-reviewed articles, industrial case studies, and policy briefs published between 2010 and 2025 were retrieved from pubmed, scopus, web of science, and google scholar using predefined keywords including "tb vaccine development," "diagnostic," "treatment protocols," and "africa tb control." inclusion criteria were studies addressing public health interventions relevant to tb in africa. Exclusion criteria were studies outside the region or lacking sustainability focus. Data extraction and thematic synthesis were organized into four domains: vaccines, diagnostics, treatment, and health system strategies.
RESULTS
twenty-eight eligible studies were included. Novel vaccine candidates such as m72/as01e and vpm1002 demonstrated enhanced immunogenicity, with efficacy rates up to 1.64 times higher than bcg in adult cohorts. Diagnostic innovations including genexpert, point-of-care assays, and ai-assisted imaging reduced diagnostic delays by an average of 7 days. Short-course preventive regimens (3 hp, 1 hp) achieved adherence rates above 85 percent, while bpal therapy showed 78 percent success in multidrug-resistant tb. Community-based care models improved patient retention by 22 percent. Socioeconomic interventions, one health frameworks, and digital monitoring technologies further strengthened tb control outcomes.
CONCLUSIONS
advancing beyond bcg requires integrated biomedical innovation, strengthened health systems, and interdisciplinary collaboration. Novel vaccines, rapid diagnostics, optimized treatment regimens, and community-driven approaches significantly reduce tb burden in africa. Policy reform, investment in african-led research, and equitable access to new technologies are essential for sustained tb control.

Digital screen exposure and child and adolescent health and wellbeing: a scoping review of systematic reviews and meta-analyses

Eleonora Doz[1], Simona Ponte[1], Azza Warraitch[2], Silvia Balletto[1], Alina Cosma[3], Yekaterina Chzhen[4], Michelle Black[5], Marzia Lazzerini[6]
[1]1 WHO collaborating centre for maternal and child health, IRRCS Burlo Garofolo, Trieste, Italy, [2]2 Trinity Centre for Global Health, Trinity College Dublin, Dublin, Ireland, [3]3 School of Psychology, Trinity College, Dublin, Ireland, [4]4 Department of Sociology, Trinity College Dublin, Dublin, Ireland, [5]5 University of Liverpool, Department of Public Health Policy and Systems, Liverpool, United Kingdom, [6]6 Maternal Adolescent Reproductive and Child Health Care Centre, London School of Hygiene & Tropical Medicine, London, United Kingdom

BACKGROUND
Digital screen exposure among children and adolescents has increased markedly, prompting a surge of systematic reviews synthesising its association with different health outcomes. This scoping review aimed at providing an analysis of recent existing systematic reviews in this field.
METHODS
We conducted a systematic search of seven databases (PubMed, EMBASE, Web of Science, Scopus, ERIC, Cochrane Database of Systematic Reviews, and APA PsycINFO) to identify systematic reviews published between 2015 and 2025, that examined the association between digital screen exposure and health or wellbeing outcomes among children and adolescents aged 0–19.
RESULTS
Out of 72,394 records screened, 138 systematic reviews met inclusion criteria. The number of reviews more than doubled after 2020, reflecting increasing attention to digital exposure as a determinant of youth health. Mental health and risk behaviours were the most frequently examined outcomes (n=71), of which 41 focused on depression and anxiety, followed by cognitive development (n=51), sleep (n=27), overweight/physical activity (n=18), vision (n=12), musculoskeletal health (n=7), and hypertension and cardiovascular risk (n=7). In adolescents the most frequent outcome was mental health, and in children cognitive development. Most primary studies (77.4%) were conducted in high-income countries. Definitions of digital exposure were highly heterogeneous, ranging from broad screen-time metrics to specific platforms or problematic use. Methodological quality of recent reviews

was low, with only 8 reviews rated as high quality.
CONCLUSIONS
This review highlights many papers on digital screen exposure and youth health in most recent years. However, low quality of existing reviews and methodological heterogeneity hamper an umbrella review. Several research gaps persist, and future research must prioritize: higher-quality evidence synthesis, on all health outcomes; standardised definitions of digital exposure; (3) greater inclusion of underrepresented countries and younger age groups. Addressing these gaps is essential to provide reliable, actionable evidence to inform public health policy.

ABS0967
Whose Data, Whose Benefit? Equity Implications of AI-Based Surgical Risk Prediction Models

Herbert Melariri[1], Shailin Pillay[2], Tanya Prinsloo[3], Chih-Yen Chiu[2], Joshua Kopke[2], Blessing Melariri[4], Megan Bunting[3], Jessica Dibia[2], Opeoluwa Oyedele[5], Paula Melariri[6]
[1]School of Medicine, Nelson Mandela University, Gqeberha, South Africa, [2]Department of Health, Livingstone Tertiary Hospital, Gqeberha, South Africa, [3]Department of Health, Hermanus Hospital, Hermanus, South Africa, [4]School of Medicine, University of Pretoria, Pretoria, South Africa, [5]Department of Computing, Mathematical, and Statistical Sciences, School of Science,, University of Namibia, Windhoek, Namibia, [6]Faculty of Health Sciences, Nelson Mandela University, Gqeberha, South Africa

BACKGROUND
Accurate surgical risk prediction is central to safe perioperative care and increasingly supported by artificial intelligence (AI). While AI-based models show strong performance, their development and validation are not value-neutral. From a public health equity perspective, reliance on evidence predominantly from high-income countries (HICs) raises concerns about relevance and benefit for low- and middle-income countries (LMICs), where unmet surgical need is greatest.
METHODS
We conducted a systematic review and meta-analysis of AI-based surgical risk prediction models. PubMed, IEEE Xplore, Scopus, and Web of Science were searched from Jan 1, 2019, to June 30, 2025, for studies predicting perioperative complications, using MeSH terms and free-text keywords related to AI, machine learning, deep learning, logistic regression, random forest, support vector machines, gradient boosting, and surgical risk outcomes. Model discrimination was pooled using random-effects meta-analysis.
RESULTS
Of 8969 citations, 48 studies from 25 countries, comprising 6,959,207 patients were included, with six multi-country studies. Evidence was heavily skewed toward high-income-countries (HICs) (n=22), with limited representation from upper-middle-income (UMIC) (n=2) and LMICs (n=1). Overall, AI models demonstrated high discriminative performance (pooled AUC 0.894, 95% CI 0.881–0.907), with similar performance across modelling approaches. Gradient boosting achieved the highest discrimination (AUC 0.918, 95% CI 0.893–0.944; k=7). Subgroup analyses showed comparable performance for machine learning (AUC 0.888), deep learning (0.882), random forest (0.892), logistic regression (0.890), and support vector machines (0.894). Reporting of sociodemographic variables, health-system context, and external validation in LMICs was sparse.
CONCLUSIONS
AI-based surgical risk prediction models perform well, but their evidence base is largely drawn from well-resourced health systems. This imbalance raises equity concerns regarding generalizability and fairness. Without intentional inclusion of diverse populations and health-system contexts, AI innovations may disproportionately benefit advantaged groups. Equitable application requires LMIC data, context-specific validation, and transparent equity-focused reporting.

ABS1067
Breaking the Silence: A Hybrid Digital-Community Ecosystem for Child Sexual Abuse Prevention and Healing in Kenya

Emiliana Mbelenga[1]
[1]Iyashi Wellness Centre, NAIROBI, Kenya

BACKGROUND
Child Sexual Abuse (CSA) is a devastating public health crisis in Kenya, shrouded in a culture of silence and stigma that prevents healing and perpetuates intergenerational trauma. Existing interventions often fail to reach the most vulnerable children and adolescents due to fear of disclosure, fragmented services, and a lack of confidential, youth-friendly access points. To achieve health equity, we must dismantle these barriers. Iyashi Wellness Centre present Project RISE, an AI powered child protection platform designed to shift the narrative from shame to safety by combining digital innovation with community-led support.
METHODS
Project RISE integrates: 1) A digital platform featuring an education hub for prevention education (teaching body autonomy and consent), a parent/ caregiver hub for parents to hold sensitive conversations at home and an AI-powered chatbot for 24/7 confidential initial support. It also includes a community support system comprising safe circles, peer support groups facilitated by trained teachers and community health promoters (CHPs). This dual approach ensures that technology provides the access, while human networks provide the healing.
RESULTS
The project methodology builds upon the clinically validated trauma healing programme we have been implementing at Iyashi Wellness Centre including Singing to the Lions' trauma-healing program which demonstrated effectiveness in building resilience among 100 care-experienced youth for the Kenya Society of Care Leavers (KESCA). The current pilot targets 12,000 children and adolescents in Nairobi, with expected outcomes including increased knowledge of body safety, reduced isolation among survivors, and higher rates of successful linkage to professional care.
CONCLUSIONS
Achieving health without borders requires removing the invisible borders of stigma and fear that isolate abuse survivors. Project RISE demonstrates that sustainable CSA prevention is not just about a reporting hotline; but is building accessible ecosystems where every child, regardless of location, has the tools to stay safe and heal.

The Application of Artificial Intelligence in the Field of Childhood and Adolescent Obesity

Yunman Liu[1], Chengchen Zhang[1], Kuntai Bai[1,2], Zihan Weng[1], Miaozhi Zhang[2], Danping Su[1], Yongtian Luo[1], Min Liao[1], Li* Hong[1], Mengchun* Gong[2]
[1]Shanghai Children's Medical Center(Scmc), Shanghai, China, [2]Digital Health China Technologies Co,. Ltd., Beijing, China

INTRODUCTION
Child and Adolescent Obesity has become a global public health issue, and artificial intelligence (AI) technology offers innovative solutions for intervention and management in this field. This article systematically reviews the current applications of AI in Child and Adolescent Obesity, with a focus on the working principles of foundation models and the practical implementation of Retrieval-Augmented Generation (RAG) technology in obesity.This study aimed to develop and validate a locally-deployed large-language-model dialogue system for child-and-adolescent obesity management, and to quantify its accuracy and utility in completing—within a single automated consultation—diagnosis, risk assessment, and generation of personalised intervention plans, thereby providing evidence for future scaled deployment. Management.
METHODS
Through experiments comparing the performance of different AI models in obesity diagnosis, assessment, and intervention plan generation, the effectiveness of AI technology in the field of Child and Adolescent Obesity was validated. The results show that AI-based intelligent consultation systems significantly improve the accuracy of obesity diagnosis, while the incorporation of RAG technology further enhances the model's knowledge-updating capability and personalized service capacity. This article also explores future directions for AI in Child and Adolescent Obesity management, including dynamic knowledge updates, multimodal data integration, and the development of multi-scenario collaborative intervention strategies.
RESULTS
This study aims to provide theoretical support and practical guidance for the deeper application of AI technology in Child and Adolescent Obesity.
CONCLUSIONS
The results demonstrate that the developed system, integrating a large language model with retrieval-augmented generation, can achieve accurate diagnosis and generate personalised intervention plans for child and adolescent obesity within a single dialogue, significantly improving diagnostic accuracy and service efficiency, and showing feasibility for further clinical deployment and multi-scenario expansion.

ABS1250
Exploring community health workers' experiences with mHealth: A case study on digital public health interventions at Ekangala Clinic

in Gauteng Province.

Siphokazi Ntuli[1], Janet chisaka[1]
[1]Department of Sociology, Rhodes University, Makhanda, Eastern Cape, South Africa

ABSTRACT
Using the theoretical framework of social capital, this study examines the impact of public digital health interventions (mHealth technology) on community health workers (CHWs), with a focus on their experiences and the integration of this technology into their work. A qualitative research approach was employed, involving ten CHWs who participated in in-depth semi-structured interviews. Through the lens of social capital theory, this study argues that mHealth facilitates connections and relationships among CHWs, nurses, the community, and the Department of Health (DoH). Specifically, mHealth has the potential to strengthen coordination among public health structures, bridge networks, and enhance communication. The findings of the study indicate that community health workers (CHWs) are generally positive about using mHealth, although some older participants are less comfortable with the tools than their younger counterparts. Additionally, the study's findings suggest that mHealth strategies can support the Department of Health in achieving the goals outlined in the South African National Digital Health Strategy for 2019–2024. For example, mHealth could be used beyond primary care registration, follow-ups, referrals to health facilities, tracking high-risk patients, and addressing defaulters. This intervention can also support health promotion and disease prevention campaigns, ultimately contributing to better health for all South Africans and helping to address broader primary health care (PHC) challenges.

The Interplay of e-Health Literacy, Health Literacy, and Self-Care among Hypertension and Diabetes Risk Groups: A Community-Based Investigation in Southern Thailand

Buppha Raksanam[1], Wittaya Sornkaew[2], Phiman Thirarattanasunthon[3], Wilailuk Ruangrattanatrai[4], Thanarat Mudchiew[1], Sukhumaporn Sriwisit[1], Panupong Sayoungkul[1], Sasipa Chantra[4]
[1]Sirindhorn College of Public Health, Trang, Faculty of Public Health and Allied Health Sciences, Praboromarajchanok Institute, Trang, Thailand, [2]Chang Klang District Public Health Office, Nakhon Si Thammarat, Thailand, [3]Excellent Center for Public Health Research, School of Public Health, Walailak University, Nakhon Si Thammarat, Thailand, [4]Strategy and Planning Division, Ministry of Public Health, Nonthaburi, Thailand

BACKGROUND-AIM
Electronic health literacy (e-HL), health literacy (HL), and self-care behaviors are critical determinants of health outcomes among populations at risk for diabetes and hypertension. However, empirical evidence on these factors in the Chang Klang community remains limited. This study aimed to: assess levels of electronic health literacy, health literacy, and self-care behaviors; examine relationships among these variables; and (3) identify predictors of self-care behaviors among individuals at risk for diabetes and hypertension in Chang Klang community, Southern Thailand.
METHODS
A community-based cross-sectional survey was conducted in December 2024. A total of 371 participants from risk groups were recruited using proportionate stratified sampling. Data were analyzed using descriptive statistics, Pearson's product-moment correlation, and multiple regression analysis.
RESULTS
Mean scores for electronic health literacy, self-care behavior, participation in health education activities, and learning from health role models were at moderate levels (3.48 ± 0.88, 3.58 ± 0.65, 3.50 ± 0.71, and 3.51 ± 0.71, respectively). Overall health literacy was at a high level (3.78 ± 0.68), with the highest score in accessing health information and services (3.90 ± 0.77) and the lowest in understanding self-care information (3.69 ± 0.76). Significant positive correlations were found between electronic health literacy, health literacy, participation in learning activities, learning from health role models, and self-care behavior ($p < 0.001$). These variables jointly explained 42.5% of the variance in self-care behavior ($R = 0.425$).
CONCLUSIONS
Although individuals in risk groups can access health information, difficulties remain in understanding and applying it to self-care practices. Strengthening health role models, increasing participation in health activities, and promoting digital health resources may enhance electronic health literacy and improve self-care behaviors among at-risk populations.

Leveraging SEAIR Modeling and Time-Series Forecasting to Optimize Malaria Interventions in Bauchi State, Northwest, Nigeria

Mary Ojonema Onoja-Alexander[1], Charles Esekhaigbe[1], Ikemefuna Nmadi Onyeyili[1], joseph peter Afangideh[2], Ayodeji Kazeem Olalekan[3], Alexandra Ojonibe Onoja[1], Alexander Ibechone Onoja[1]
[1]Department of Community Health, Faculty of Clinical Sciences, College of Health Sciences, Federal University Lokoja, Lokoja,Kogi State, Nigeria, [2]Clinical Services Specialist, Clinical Services Specialist ECEWS -, Obudu,Cross River State, Nigeria, [3]Institute of Human Virology, Institute of Human Virology Nigeria, Abuja, Nigeria

INTRODUCTION
Malaria imposes a heavy burden in Bauchi State, Nigeria, with seasonal peaks driven by rainfall and temperature. This study used an SEAIR (Susceptible-Exposed-Asymptomatic-Infected-Recovered) compartmental modeling and ARIMA forecasting to analyze transmission dynamics and evaluate interventions like insecticide-treated nets (ITNs), indoor residual spraying (IRS), and antimalarial drugs.
METHODS
A deterministic SEAIR model coupled with vector dynamics simulated by human (N_h) and mosquito (N_v) populations, incorporating parameters from District Health Information System 2 (DHIS), National Population Commission (NPC), and literature (Table 1). Model well-posedness was confirmed via positivity and boundedness proofs: solutions remain non-negative in R_{11}^{+}, with $N_h \leq \Lambda_h/\mu_h$ and $N_v \leq \Lambda_v/\mu_v$. Historical incidence data underwent ARIMA forecasting; scenarios assessed intervention impacts on R_e. Table 1: Key Parameters Parameter Description Value Source Λ_h Human recruitment rate 20,769 NPC 2020 Λ_v Mosquito recruitment rate 103,846.72 NPC 2020 μ_h Human natural death rate 0.2264 NPC 2020 β_h Human transmission rate 8.1 Estimated γ Recovery rate 0.99 Estimated Ψ ITN effectiveness 0.73 MIS 2021 Π IRS effectiveness 0.6 WHO 2021 δ_h Malaria mortality 0.0040 Adegeti 2024 N_h Total human population 7,788,504 NPC2020 (Additional parameters available upon request; full table in supplementary materials.)
RESULTS
Seasonal peaks aligned with rainy seasons. Combined ITNs (73% effective), IRS (60%), and drugs reduced R_e below 1, cutting infections by >70%. ARIMA forecasts predict a sustained decline with interventions. Figure 1: Forecasting for Bauch State using ARIMA
CONCLUSIONS
Integrated strategies offer cost-effective control. Prioritize annual IRS pre-rainy season, ITN scaling, drug access, surveillance, and awareness to curb transmission.

ABS1492

VAXIN8: an artificial intelligence reverse vaccinology tool to predict potential vaccine candidates

Zakia Salod[1], Ozayr Mahomed[1]
[1]Discipline of Public Health Medicine, University of KwaZulu-Natal, Durban, South Africa

INTRODUCTION
traditional vaccine development takes 10 to 15 years and requires cultivating pathogens in laboratories. Reverse vaccinology (RV) is a computational approach that offers a faster alternative by identifying potential vaccine candidates directly from pathogen genomes. Artificial intelligence (AI) approaches such as protein language models (PLMs) pre-trained on millions of sequences offer new opportunities for antigen prediction in RV. However, optimal PLM application strategies remain unclear. This study compares fine-tuning (training the model further) versus frozen embeddings (using what the model already learned) for viral protective antigen (VPAg) prediction and benchmarks against traditional methods.
METHODS
two PLMs were evaluated: ProteinBERT and Evolutionary Scale Modeling 2 (ESM-2). For each, we compared fine-tuning versus extracting frozen embeddings combined with machine learning classifiers (logistic regression, support vector machine, k-nearest neighbors, random forest, XGBoost). Models were trained using the VPAgs-Dataset4ML dataset containing 420 balanced viral sequences and externally validated on 2062 independent sequences (342 published antigens and 1720 non-antigens). Performance was assessed using area under the receiver operating characteristic curve (AUC) and compared against existing RV tools: VaxiJen and Antigenic.
RESULTS
frozen embeddings consistently outperformed fine-tuning. ESM-2 frozen

embeddings with support vector machine achieved the highest AUC of 0.846 (VAXIN8), compared to 0.826 for ProteinBERT frozen with logistic regression. Fine-tuned models achieved lower scores: ProteinBERT fine-tuned achieved 0.816 and ESM-2 fine-tuned achieved 0.760. Traditional methods showed substantially lower performance: Antigenic (0.640) and VaxiJen (0.570).
CONCLUSIONS
pre-trained PLMs encode immunological signals enabling accurate VPAg prediction without task-specific fine-tuning. As the first AI-powered RV tool developed in Africa, VAXIN8 enables vaccine researchers to input viral protein sequences and obtain antigen probability scores, helping prioritize candidates for experimental validation. These findings could advance vaccine candidate identification against viral pathogens, supporting public health preparedness and epidemic response.

Video observed treatment for tuberculosis in people-centred primary care: a narrative review of effectiveness, acceptability and mitigation of TB-related catastrophic costs

Isadora Menezes Caldeira De Oliveira[1], Lorenza Moura Barbosa[1], Mariana Gaspar Botelho Funari Faria[1], Rubia Laine de Paula Andrade[1], Vitor Alexandre Dias da Silva[1], André Luiz Teixeira Vinci[1], Vinicius de Paula Pereira[1], Nathalia Zini[1], Yan Mathias Alves[1], Carolina Nogueira Gomes[1], Ione Carvalho Pinto[1], Jaqueline Garcia de Almeida Ballestero[1], Pedro Fredemir Palha[1], Aline Aparecida Monroe[1], Ricardo Alexandre Arcêncio[1], Tatiana Ferraz de Araújo Alecrim[1]
[1]Ribeirão Preto College of Nursing (EERP USP), University of São Paulo, Ribeirão Preto-SP, Brazil

INTRODUCTION
Tuberculosis remains world leader in mortality by infectious diseases, causing almost 1.3 million deaths annually. Socially marginalized populations are disproportionately affected, highlighting inequities in diagnosis and care. Recommended by World Health Organization, the directly observed video treatment (vDOT) is a digital health strategy focus on the person, that strengthens adherence, teleassistance access, and Primary Health Care (PHC) centrality in tuberculosis management. Evidences of implementation, effectiveness, and vDOT impact persist fragmented and insufficiently systematized.
OBJECTIVE
identify vDOT in PHC, assessing effectiveness, acceptability, equity, and catastrophic tuberculosis costs reduction.
METHODS
Narrative review on BVS, MEDLINE and Pubmed databases using "tuberculosis", "telemedicine" and "primary health care" descriptors. Articles published within the last five years, with complete texts online, about vDOT in tuberculosis care were included. Two reviewers independently screened titles and abstracts applied inclusion/exclusion criteria extracting data about outcome, acceptability and vDOT implementation in PHC. The methodological quality and evidence were assessed by GRADE approach, classifying the certainty of evidence as high, moderate, low or very low.
RESULTS
vDOT is associated with high adhesion and treatment conclusion, low interruption of follow-up and increase of therapeutic conclusion, when compared to directly observed therapy, particularly benefiting socioeconomically vulnerable populations. vDOT presented high acceptability among patients and health professionals, improved access to health services, reduced costs, mitigated social and economic barriers and favoured continuous monitoring in PHC. vDOT, with close home and work monitoring, improves adherence, cure and reduces catastrophic costs, such as transportation, impoverishment, and multiple appointments.
CONCLUSIONS
vDOT is a promissing estrategy for handeling tuberculosis in PHC, benefiting vulnerable populations. It allows centered care on the person and reduces visits to healthcare facilities, promoting equity and mitigating catastrophic costs, with moderate certainty evidence.

ABS1650
Unlocking intelligence through digital technologies in environmental health data management and utilisation: a scoping review

Siphesihle Masimula[1]
[1]Environmental Health Department, Mangosuthu University of Technology, Umlazi, Durban, South Africa

BACKGROUND
The world faces significant environmental health challenges requiring databased holistic solutions. In Africa, environmental factors contribute to 2.5 million deaths annually, and nearly 25% of global disease burden is preventable through healthier environments. This highlights the urgent need to explore the use of digital technologies in environmental health data management to support swift interventions in public health. As a result, this scoping review aimed to characterise the application of digital technologies in environmental health data management and utilisation, as well information systems to unveil opportunities for improved decision-making and action.
METHODS
This review was conducted following the Preferred Reporting Items for Systematic Reviews and Meta-Analyses extension for Scoping Reviews guidelines. Literature was searched from PubMed, Scopus and Google Scholar in year 2025.
RESULTS
The study analysed 74 articles, with 26% focusing on existing EHISs, 24% on environmental health indicators, 14% on geographic information system tools, and 36% on digital technologies in environmental health data management. Researchers and practitioners, mainly in high-income countries, continue to explore predictive analytics, modelling and machine learning, the Internet of Things, smart devices, and infographics in environmental health. It is evident that digital technologies are revolutionizing environmental health by providing actionable insights, enhancing decision-making, and promoting proactiveness. This integration is crucial for improving public health outcomes and must be embraced by low-and-middle-income countries as well, even amid resource-related and interoperability challenges. The opportunities provided by these technologies include, improved environmental health surveillance and monitoring, enabled targeted interventions, risk communication and community engagement, mapping for public health action, multisectoral collaborations, enhanced service delivery and research development.
CONCLUSIONS
Recognising and appreciating the importance of digital technologies is essential for government agencies to maximise available opportunities.

Contributions of Design Thinking to the Structuring of Conversational Modeling for a Digital Educational Health Technology on Sexual and Reproductive Health for Adolescents

Maria Eduarda Jucá da Paz Barbosa[1], Neiva Francenely Cunha Vieira[1], Luiza Jane Eyre de Souza Vieira[2], Ranielder Fábio de Freitas[3], Fabiane do Amaral Gubert[1], Joyce Mazza Nunes Aragão[4]
[1]Graduate Nursing Program, Federal University of Ceara, Fortaleza, Brazil, [2]Postgraduate Studies in Public Health, University of Fortaleza (UNIFOR), Fortaleza, Brazil, [3]Mutirão - Brazilian Institute of Digital Policies, Fortaleza, Brazil, [4]Nursing department, State University of Vale do Acaraú, Fortaleza, Brazil

BACKGROUND
Digital educational health technologies require methods capable of systematically and ethically integrating scientific evidence, user experiences, and design decisions. In Nursing, the use of Design Thinking (DT) as a technological development method remains incipient, particularly regarding the active participation of end users. Considering the knowledge gaps among adolescents in sexual and reproductive health (SRH) and their limited involvement in technology design processes, this study aimed to describe the use of Design Thinking in mapping the conversational design requirements of a digital educational technology focused on adolescent SRH.
METHODS
A qualitative study applied DT across the empathy, define, and ideation stages to construct the conversational flow of a digital educational technology. Data were generated through seven focus groups with 55 adolescents aged 15–17 years, enrolled in a public school in Fortaleza, Ceará, Brazil. Transcripts were analyzed using IRAMUTEQ software through lexical analysis combined with Mayring's qualitative content analysis, resulting in thematic axes. During the define stage, an empathy map was developed from emerging meaning units, enabling identification and structuring of users' unmet needs, translated into clear, actionable problem statements. Subsequently, ideation and brainstorming sessions supported refinement and design of a conversational flow organized into thematic axes and corresponding subthemes. Prototyping and testing stages will be conducted in future studies.
RESULTS
Adolescents demonstrated predominantly biomedical knowledge of SRH, alongside gaps in emotional, relational, ethical, and communicational dimensions. The analysis yielded four thematic axes: prevention; relationships and self-care; support networks and mental health; and communication, body, and consent. The

identified needs guided the conversational flow of the technology, emphasizing accessible and empathetic language and dialogical organization.
CONCLUSIONS
Design Thinking proved to be a robust methodological approach for health professionals to translate qualitative data into structured design decisions, strengthening the rigor of developing adolescent-centered digital educational health technologies within the public health context.

From Hospital to Home: Rethinking Colorectal Cancer Follow-Up with Digital Health
Kaley Butten[1], Marlien Varnfield[1]
[1]Australian eHealth Research Centre, CSIRO, Brisbane, Australia
ABSTRACT
Colorectal cancer (CRC) survivors require follow-up for up to five years post-treatment, yet traditional models are often fragmented, resource-intensive, and difficult to sustain. Patients may be lost to follow-up, while clinicians spend substantial time coordinating care across disconnected systems. A digital platform combining a patient-facing app with a web-based clinician dashboard has been prototyped in collaboration with a colorectal surgeon to improve efficiency, continuity, and data capture. This study explored current follow-up practices and stakeholder needs to determine how digital technology could support CRC survivorship care. We conducted an exploratory, stakeholder-informed qualitative study using a pragmatic inquiry approach to understand the current landscape of CRC follow-up. Semi-structured interviews and workshops were held with clinicians, health service staff, and system stakeholders, including advocacy and cancer registry representatives. Participants reviewed a prototype designed to digitise follow-up processes. Data collection and analysis were inductive, allowing participant priorities and experiences to guide the findings. Discussions focused on care coordination, use of patient-reported outcome measures (PROMs), data availability, survivorship support needs, and implementation considerations. The prototype was well received by health staff (n=17) and stakeholders (n=5). Follow-up practices varied across services, with sensitive issues such as sexual function under-addressed and PROMs used inconsistently. The transition from treatment to survivorship was described as a challenging adjustment period, likened by some to returning to "civilian life after war." Survivors were perceived to have ongoing physical, psychosocial, and informational needs once structured treatment ends. Gaps in survivorship data limited the ability to assess whether follow-up schedules are optimally tailored to cancer type and surgical pathway, highlighting the need for improved data capture to support risk-stratified care. As cancer survivorship populations grow worldwide, these findings offer practical guidance for designing scalable, patient-centred, digitally supported follow-up models that improve care continuity, data quality, and links between clinical and community services.

From Wearables to EMRs: Who Holds the Keys to Your Health Data?
Marlien Varnfield[1,2], Kaley Butten[1], Laura Maass[3,4,5], Pernille Lunde[6]
[1]Australian e-Health Research Centre, Commonwealth Scientific and Industrial Research Organisation, Brisbane, Australia, [2]School of Public Health, University of Queensland, Brisbane, Australia, [3]Research Center for Inequality and Social Policy, University of Bremen, Bremen, Germany, [4]Leibniz ScienceCampus Digital Public Health, University of Bremen, Bremen, Germany, [5]Digital Health and Artificial Intelligence Section, European Public Health Association, Utrecht, Netherlands, [6]Faculty of Health Sciences, Oslo Metropolitan University, Oslo, Norway
BACKGROUND
Rapid growth in wearable technologies, mHealth platforms, and electronic medical record systems has transformed the generation, sharing and use of health data. Patients are generating large volumes of data outside traditional clinical settings yet retain limited control over their data. Legal and ethical frameworks typically position organisations as custodians rather than owners of health data, while patients are granted partial rights of access as their data moves across fragmented digital ecosystems. The increasing use of AI on integrated health data streams further raises questions about privacy, accountability, transparency, and potential harm when health data are reused beyond their original purpose. Combined with overreliance on consent as a governance mechanism, ambiguities are increasingly limiting research access and the public value of digital health investments.
METHODS
Led by experts/researchers from Australia, Norway and Germany, this facilitated, discussion-based workshop will debate real-world exemplars that reflect common health data governance dilemmas. Through comparative analysis of data flows, consent practices, and custodial responsibilities, participants will identify control points, areas of misalignment between patient expectations and practice, and systemic governance vulnerabilities. Participants will also examine how AI and data-driven approaches can be applied to data streams and how the widespread uncertainty about accountability for secondary use and harm, particularly when data is repurposed for AI, can be addressed. Outputs will be captured through collaborative mapping exercises.
RESULTS
The workshop will surface themes across different data domains, including disconnect between data generation and control. A structured synthesis of governance gaps and a shared set of cross-jurisdictional principles will be produced, emphasizing transparency, proportionality, accountability, and public benefit.
CONCLUSIONS
Addressing the question of "who owns health data" helps determine who can access, share, or profit from health data, and under what conditions, which is critical for building shared understanding and advancing more ethical, trustworthy health data governance.
Popul. Med. 2026;8(Supplement 1):A833

ABS1773
Strengthening community tuberculosis reporting: lessons from a locally adapted digital solution to address systemic gaps in enugu state, nigeria
Obianuju Ezeike[1], Udochukwu Egwim[1]
[1]Programs, South Saharan Social Development Organisation, Enugu, Nigeria
INTRODUCTION
Nigeria's national digital platform for community tuberculosis (TB) reporting often experiences technical glitches and synchronization failures, disrupting real-time data submission. Electronic, case-based TB surveillance improves data timeliness, completeness, and program monitoring and is recommended by the World Health Organization., In Enugu State, volunteers previously traveled monthly to the coordinating community-based organization (CBO) office with printed and soft-copy records for data validation, causing reporting delays, extra costs, and operational burdens. A locally adapted digital solution was introduced to address these challenges while maintaining validation standards.
METHODS
A comparative observational assessment evaluated the former in-person validation process against a revised digital reporting approach implemented by the South Saharan Social Development Organisation (SSDO). National TB indicators were simplified and deployed via the Mwater Surveyor platform, enabling standardized, collaborative, and offline data capture., Seventeen volunteers representing all local government areas were trained to submit TB data digitally, with supporting registers uploaded for virtual validation, limiting physical office visits to exceptions.
RESULTS
The digital system eliminated routine office visits, reducing transport and printing costs, shortening validation timelines, and improving reporting continuity during national platform disruptions. Volunteers reported greater confidence in digital reporting, while offline data capture mitigated internet connectivity issues.
CONCLUSIONS
Locally adapted digital tools with virtual validation reduce operational costs, reporting delays, and frontline worker burden, supporting global recommendations for electronic TB surveillance.,

Co-Designing a Digital Social Prescribing Platform to Reduce Out of Pocket Health Expenditure for Aboriginal Communities Living in Rural Australia
Georga Sallows[1], Patrick Sharpe[1,2], Ray Mahoney[3], Andrew Goodman[3], Julieann Coombes[4,5], Odette Pearson[6,7], Jaquelyne Hughes[8,9], Marlien Varnfield[3], Candice Oster[10,11], Jonathan Karnon[1], Claire Drummond[8,1], James Smith[8], Karla Canuto[12], Shanti Omodei-James[1], Lavender Otieno[1], Clare Bradley[1], Billie Bonevski[1,13], Courtney Ryder[1,4,5]
[1]Flinders Health and Medical Research Institute, College of Medicine and Public Health, Flinders University, Adelaide, Australia, [2]E.M.U Consultancy, Ceduna, Australia, [3]Commonwealth Scientific Industrial Research Organisation, Brisbane, Australia, [4]The George Institute for Global Health, Newtown, Australia, [5]School of Population Health, University of New South Wales, Sydney, Australia, [6]Wardliparingga, South Australian Health and Medical Research Institute, Adelaide,

Australia, [7]School of Medicine, Collage of Health, Adelaide University, Adelaide, Australia, [8]Rural and Remote Health, Collage of Medicine and Public Health, Flinders University, Darwin, Australia, [9]Royal Darwin Hospital, Darwin, Australia, [10]College of Nursing and Health Sciences, Flinders University, Adelaide, Australia, [11]Caring Futures Institute, Flinders University, Adelaide, Australia, [12]College of Medicine and Dentistry, James Cook University, Townsville, Australia, [13]School of Medicine and Public Health, The University of Newcastle, Newcastle, Australia

BACKGROUND
People living with chronic and complex diseases (CCDs) or injuries face substantial out-of-pocket health expenditure (OOPHE). Australian Aboriginal and Torres Strait Islander communities experience significantly higher rates of CCDs and greater exposure to the social and structural determinants of ill health that intensify OOPHE inequities. Addressing these financial pressures is essential for improving access to healthcare. This project partners with Aboriginal communities in rural South Australia to co-design a Web App to help reduce OOPHE burden.
METHODS
This project applies a participatory action research methodology with Aboriginal communities to develop an online social prescribing platform (the Web App). It applies a Knowledge Interface process to ensure Aboriginal authority and alignment with community expectations. The research draws on Indigenous methods, qualitative interviews, and quantitative surveys, conducted to explore the relationship between OOPHE risks and protective factors. A community-centred developmental evaluation framework guides each stage of the design process, allowing the Web App to respond to feedback throughout the trial.
RESULTS
Early findings highlight that OOPHE emerges from linked cultural, social, financial, and systemic drivers. Community-led co-design has identified practical ways the Web App can reduce OOPHE, including improved navigation of financial supports, strengthened referral pathways to culturally safe services, and increased access to community resources. The evaluation approach will inform a framework for national scale-up.
CONCLUSIONS
A culturally grounded social prescribing Web App offers a promising strategy for reducing OOPHE among Australian Aboriginal and Torres Strait Islander people living with, or at risk of, CCDs. By placing Aboriginal leadership and lived experience at the centre of the design, this project has the potential to reduce financial barriers to care, enhance health and wellbeing, and contribute to national efforts to address entrenched health and well-being inequity.

ABS1855
Continuity of care: a systems-level gap in digital health–enabled health systems

Marvellous Ajayi[1]
[1]Medicine & Surgery, Ekiti State University, Ado Ekiti, Nigeria

BACKGROUND
Continuity of care is a core component of high-performing health systems and is an essential determinant of quality, safety, and outcomes for patients and populations. However, even as investment in digital health technologies increases, care delivery in many health systems (especially in low- and middle-income settings) remains fragmented across community, facility and post-care environments. When digital health interventions are deployed, they are commonly done so as vertical interventions with insufficient capacity to enable integrated, coordinated and longitudinal care for patients and populations as they progress along the care continuum.
METHODS
A conceptual systems-level analysis was performed to explore continuity of care in digital health-enabled health systems. Leveraging existing domains of continuity of care and systems thinking concepts, patient pathways through interconnected community-based services, facilities, and post-care follow-up were subjected to an analytical model to explore structural and informational discontinuities. Relevant digital health implementation strategies were explored within the context of their alignment with longitudinal continuity of care through transitions in care.
RESULTS
The systems-level analysis revealed that continuity of care is a prominent gap in the current approach to digital health implementation. Major barriers were identified in terms of fragmented information flow, poor continuity across care levels, inadequate follow-up procedures after clinical contacts, and weak enforcement of continuity of care strategies that would ensure ongoing patient involvement beyond clinical visits. The results emphasise the necessity for digital health solutions that aim to promote continuity of care in terms of information, interactions and capacity management throughout the entire care continuum.
CONCLUSIONS
The issue of continuity of care still remains inadequately attended to in digital health-enabled health systems. As a potential improvement, understanding digital health implementation using the continuity-of-care framework provides insights into better integrated and patient-centred system architecture as well as enhances continuity of care within resource-constrained health system environments.

Digital mental health interventions in indigenous and traditional communities of the Global South: A scoping review

Saidy Eliana Arias Murcia[1], Johanna Carolina Sánchez Castro[1], Robert Hrynyschyn[1], Christiane Stock[1]
[1]Institute of Health and Nursing Science, Charité, Universitätsmedizin Berlin, corporate member of Freie Universität Berlin and Humboldt Universität zu Berlin, Berlin, Germany

BACKGROUND
Digital mental health interventions (DMHIs) are increasingly promoted as scalable and cost-effective strategies to reduce global mental health gaps(1). In the Global South, Indigenous peoples and traditional communities face disproportionate psychosocial stressors, and limited access to and low cultural relevance of mental health services(2). Although evidence on DMHIs is expanding, existing reviews largely focus on high-income settings, offering limited insight into how digital mental health is designed for Indigenous and traditional populations. This scoping review synthesizes evidence on DMHIs targeting these populations in the Global South.
METHODS
A scoping review was conducted following Joanna Briggs Institute and PRISMA-ScR guidelines(3,4). Searches were performed in June 2025 across eight databases. All study designs were eligible, with no restrictions on language or publication year. Study selection was completed independently by three reviewers, and data were extracted and analyzed using thematic analysis.
RESULTS
Fifteen articles met the inclusion criteria. Studies were conducted mainly in Latin America (53%), Asia (33%), and Africa (13%), and were predominantly qualitative or mixed-methods (60%), published between 2019 and 2023. DMHIs included mobile applications, SMS-based tools, chatbots, and telehealth platforms, delivered through synchronous and asynchronous modalities via smartphones and web-based systems. Interventions focused primarily on mental health promotion, prevention, and early intervention. Indigenous or traditional communities were not always the primary target population. Cultural adaptation was heterogeneous and often limited; the strategies mainly involved linguistic adaptations and reporting of participatory or co-design approaches was found in only few studies. Outcomes focused on acceptability and feasibility, with limited evidence of clinical effectiveness.
CONCLUSIONS
Evidence on DMHIs for Indigenous peoples and traditional communities in the Global South is growing but remains fragmented. Despite increasing attention to cultural adaptation, most interventions lack cultural integration and outcome evaluation, highlighting the need for culturally grounded digital mental health approaches for equitable public health impact.

Youth-led safeguarding amid digital restrictions: How boys and young men protect their mental health in digital spaces in Australia

Rohann Irving[1], Yang Zhao[2], Garth Stahl[3], Melissa J. Opozda[1], Lisa Holohan[3], James A. Smith[1], Elizabeth J. Edwards[3], Murray Drummond[4], Mair Underwood[3], Laura Scholes[5]
[1]College of Medicine and Public Health, Flinders University, Northern Territory, Australia, [2]London School of Hygiene and Tropical Medicine, London, United Kingdom, [3]The University of Queensland, Brisbane, Australia, [4]SHAPE Research Centre, Flinders University, South Australia, Australia, [5]Australian Catholic University, Brisbane, Australia

BACKGROUND
Public health debates have long focused on the potential harms that arise from young people's engagement with digital spaces, but these discussions have become more prominent in the face of a global move to restrict young people's access to social media. In this paper, we prioritise boys' and young men's voices in understanding how they are already engaging in safeguarding practices

online, with a particular focus on how they protect their mental health in digital environments.
METHODS
This work draws on the perspectives of 47 Australian Adolescent Boys and Young Men (ABYM) aged 15 to 25 who took part in either interviews (N=20) or focus groups (N=27) that focused on their social media practices. A thematic analysis, with themes reviewed and refined by an interdisciplinary research team, revealed how ABYM perceive and negotiate harm mitigation online as their lives become increasingly digitised.
RESULTS
Analysis revealed a range of youth-led practices through which ABYM assess risk, develop digital knowledges, and actively manage their wellbeing online. In addition, many ABYM viewed themselves as personally responsible for protecting themselves from the structural and commercial harms they consistently face in digital spaces. These findings foreground young people's agency in their management of digital risk, alongside the lack of effective e-safety education that is both appealing and currently available to young men.
CONCLUSIONS
This paper highlights the need for e-safety initiatives that recognise both the vulnerabilities and existing critical capacities of ABYM. In an era of increasing digital restrictions, this work stresses the importance of inclusive research practices that elevate and prioritise young people's perspectives to inform future online health policy and regulation.

Implementation of a mobile health application used by community health workers in Ekurhuleni Health District

Yarumia Ndombi[1], Leena Thomas[2], Harsha Somaroo[3]
[1]Public Health Medicine, University of the Witwatersrand, Johannesburg, South Africa, [2]Public Health Unit, Ekurhuleni Health District, Germiston, South Africa, [3]NHI Directorate, National Department of Health, Pretoria, South Africa
ABSTRACT
The integration of digital technology into healthcare, which began in the early 2000s, has transformed healthcare service delivery and management. In South Africa, the Ekurhuleni Health District was selected in 2017 as a pilot site for the CommCare mobile health application, designed to support Community Health Workers (CHWs) and Outreach Team Leaders (OTLs) in ward-based primary healthcare outreach teams. Despite the potential of mobile health (mHealth) tools, challenges in adoption, scale-up, and sustainability remain. This study aimed to assess the the experiences of end-users and key stakeholders in the use and implementation of CommCare over a five-year period. A mixed-methods cross-sectional descriptive study was conducted in the Ekurhuleni Health District. Data collection included semi-structured interviews with seven key informants and an online self-administered questionnaire distributed to 1,197 CHWs and OTLs. Quantitative data were analysed descriptively, while qualitative data underwent thematic analysis using Atlas.ti. Of 1,197 end-users invited, 464 (39%) participated. Among respondents, 83% reported that CommCare met their expectations, 85% expressed overall satisfaction, and 95% recommended its adoption in other districts. However, 35% experienced challenges including poor connectivity, difficulties with data management, and device malfunctions. Training posed logistical challenges, particularly in securing suitable venues, and CHWs' varied educational backgrounds required adaptive approaches such as peer pairing. Asset management was a recurrent concern, with frequent device losses leading to the enforcement of accountability measures. Key informants emphasized the effectiveness of the cascade training model and highlighted the need for dedicated technical teams, improved ICT infrastructure, multi-stakeholder engagement, and long-term planning. The implementation of CommCare in Ekurhuleni was largely successful, with high end-user satisfaction. Key findings underscore the importance of robust planning, investment in ICT infrastructure, and sustained technical support to ensure scalability and sustainability. Lessons from this evaluation provide valuable insights for future digital health initiatives in South Africa and beyond.

ABS2052
Implementing a Real-Time Excess Mortality Surveillance Dashboard in Uganda's DHIS2 platform

Nathaelf Hyppolite[1], Martin Bulamu[2], Carol Kyozera[2], Jean Edgard Nguessan[1], Emma Clevenger[1]
[1]Data for health, Center for Disease Control Foundation, Hyattsville MD, United States, [2]Integrated Epidemiology, Surveillance & Public Health Emergencies Department., MOH, Kampala, Uganda
BACKGROUND
Excess mortality surveillance is critical for detecting disease outbreaks, health system failures and public health emergencies. Uganda lacked a systematic mechanism for tracking facility-based excess deaths in real-time. This gap hindered timely public health response and resource allocation. To address this challenge, the Ministry of Health integrated an excess mortality surveillance module into the DHIS2 platform in 2025.
METHODS
We developed a prototype digital dashboard that calculates excess facility deaths by comparing observed deaths against historical baselines using statistical methods. The system collects mortality data from health facilities across 15 regions and 146 districts through the DHIS2 platform. Regional and district-level data are aggregated and visualized through interactive charts displaying temporal trends from 2020-2024. The dashboard employs automated data validation protocols to ensure data quality and completeness.
RESULTS
The prototype dashboard successfully visualized excess mortality patterns across Ugandan regions using retrospective data. The system identified significant regional variations, with Bugisu, Tooro, Bukedi, Kampala and Kigezi regions showing elevated excess deaths over the surveillance period. District-level granularity enabled identification of mortality clusters requiring investigation, including Kasese and Kabarole districts in Tooro region, which registered the highest excess deaths. Health facility-level analysis revealed that Health Centre IIIs consistently reported elevated excess deaths. Retrospective analysis of the COVID-19 pandemic period (2020-2022) demonstrated the dashboard's utility for detecting mortality spikes associated with public health emergencies. Initial stakeholder feedback indicates strong interest in scaling the prototype for routine surveillance operations.
CONCLUSIONS
Digital integration of excess mortality surveillance within Uganda's DHIS2 offers a promising approach to strengthening health systems capacity for early detection and response. This prototype demonstrates how surveillance infrastructure, when embedded in existing digital health platforms, can enhance public health preparedness and inform evidence-based policy decisions. Further development and validation are needed to support nationwide implementation.

ABS2120
Using Social Listening and Digital Analytics to Address Diphtheria Misinformation During an Outbreak Response in Nigeria

Habibat Lawal[1], Sunday Oko[1], Adachi Ekeh[1], Anwuli Nwankwo[1], Vivianne Ihekweazu[1]
[1]Nigeria Health Watch, Utako, Abuja, Nigeria
INTRODUCTION
The rapid expansion of digital and social media platforms has transformed how communities' access and share health information, while simultaneously amplifying misinformation during disease outbreaks. During Nigeria's recent diphtheria outbreak, misinformation threatened vaccine confidence and public trust. This study examines how social listening and digital analytics supported infodemic management and informed outbreak response, drawing on insights from the Health Information Disorder and Infodemic Management Network (HIDIM).
METHODS
Systematic social media monitoring tracked diphtheria-related online discourse in Nigeria from October 7 to 6 November 2025 across X (formerly Twitter), Facebook, Instagram, YouTube, and web-based platforms. Using keyword-based social listening with an AI-powered digital analytics tool, data were collected and analyzed in Microsoft Excel to assess content volume, reach, engagement, sentiment, and misinformation themes. Duplicate and irrelevant content were excluded to ensure analytical accuracy.
RESULTS
A total of 305 diphtheria-related online conversations reached 303887 people and generated 3904 engagements. 'X' accounted for the majority with 275 posts (244327 reach and 3642 engagements), followed by web platforms with 29 posts (59289 reach, and 261 engagements). YouTube recorded one post with 271 reach and one engagement, while Facebook and Instagram recorded no relevant activity during that period. A widely shared misinformation narrative alleged that Lagos Primary Health Centres administered Tetanus Toxoid while labeling it as diphtheria vaccine, fueling public mistrust and online debate about vaccine safety and accuracy.
CONCLUSIONS
Social listening and digital analytics provide timely, actionable intelligence for

managing infodemics during disease outbreaks, particularly in resource-limited settings. By leveraging AI-enabled monitoring, public health authorities can rapidly identify misinformation trends, address emerging knowledge gaps, and deploy targeted risk communication strategies that build vaccine confidence. This approach demonstrates how digital health innovation can support equitable outbreak response, enhance public trust and improve disease prevention outcomes across diverse contexts.

Machine learning algorithms for the detection and prediction of depression in diabetes: A systematic review.

Amy McInerney[1], Mahdieh Shojaa[1], Sonya Deschenes[2], Daniel Gibert[3], Norbert Schmitz[1]
[1]Population-Based Medicine, University of Tuebingen, Tuebingen, Germany, [2]Psychology, University College Dublin, Dublin, Ireland, [3]Artificial Intelligence Research Institute CSIC, Barcelona, Spain

INTRODUCTION
Artificial intelligence (AI) holds great potential for being able develop automated systems that can detect and predict depression or depressive symptoms. This review seeks to synthesize the AI machine learning methods that have been implemented in the detection and prediction of depression in people with type 1, type 2, and gestational diabetes.
METHODS
Databases, including PubMed, Embase, Web of Science, CINAHL, PsychInfo, IEEE Xplore, and ACM Digital Library are searched for relevant articles. No restrictions are placed on the AI approach, depressive symptom measure, or type of dataset used (e.g., wearable sensor data, electronic health records, or cohort data). Article screening, selection, data extraction, and risk of bias is conducted by 2 independent reviewers.
RESULTS
Results will be synthesized in a narrative review. Key characteristics such as algorithms used, data sources, depression measure used, feature selection methods, validation strategies, and performance metrics will be compared and discussed.
CONCLUSIONS
This review will provide an overview of the ways in which AI has been used to detect and predict depression in people with all types of diabetes. It will highlight the types of data and models used, identify methodological trends and limitations, and offer recommendations for future research in this emerging interdisciplinary field.
Popul. Med. 2026;8(Supplement 1):A852

Mismatch at the interface: barriers to nutrition messaging about M-health among pregnant women in low-resource rural settings in South Africa

Livhuwani Muthelo[1], Cathrene Philips[2]
[1]Nursing Science, University of Limpopo, Polokwane, South Africa, [2]UCD School of Public Health, Physiotherapy and Sports Science, University College Dublin, Belfield, Dublin 4, Ireland, University College Dublin, Belfield, Dublin 4, Ireland, Dublin, Ireland

BACKGROUND
Nutrition is essential for healthy pregnancies, but pregnant women in low-resource rural areas face barriers to accessing reliable nutritional information. Despite the growing use of mobile health solutions (mHealth) to bridge such gaps, there remain significant mismatches between digital health solutions and the lived realities of rural users.
OBJECTIVE
The study aimed to explore the barriers to effective nutrition messaging for mHealth among pregnant women in low-resource rural settings in South Africa.
METHODS
This study used a qualitative phenomenological approach to explore the experiences of pregnant women in the Capricorn district of Limpopo province. Data, including audio recordings, were collected through nine focus group discussions in purposively selected clinics with 5-8 attendees per group, using semi-structured interview guides. Reflexivity was maintained to reduce bias. Thematic analysis was applied. Trustworthiness and ethical standards, including informed consent and confidentiality, were strictly respected.
RESULTS
This study revealed that the nutritional message of mHealth is impeded by poverty, food insecurity, limited digital access, data or airtime, and cultural mismatches. Women faced difficulties in applying nutritional advice due to the workload and conflicting advice from traditional sources. Preferences for visual, local language, and interactive content were reported, highlighting the importance of trusted social networks in shaping nutritional behaviour and message acceptance.
CONCLUSIONS
The study findings advocate for offline-first community-based mHealth approaches that reflect socioeconomic realities. Interventions should be user-centred, using local languages, culturally relevant content, and interactive two-way communication to ensure relevance and impact in low-resource settings. Collaboration with elders and religious leaders is essential to enhance the credibility and acceptance of health messages.

AIM-HEALTH: Artificial intelligence-mediated discharge document for accessible healthcare. A study protocol

Nicola Pelizzari[1], Mattia Savardi[1], Luca Arrigoni[2], Marco Gregori[3], Adelaide Conti[1,4,5], Elena Tratta[6], Elisabetta Ceretti[1,5], Loredana Covolo[1], Maria Visconti[1], Marianna Adamo[1,2], Aldo Roccaro[6], Enrico Vizzardi[1], Alberto Signoroni[1], Federico Alberici[1,3], Carlo Mario Lombardi[1,2], Umberto Gelatti[1]
[1]Department of Medical and Surgical Specialties, Radiological Sciences, and Public Health, Università di Brescia, Brescia, Italy, [2]Cardiology Unit, ASST Spedali Civili di Brescia, Brescia, Italy, [3]Nephrology Unit, ASST Spedali Civili di Brescia, Brescia, Italy, [4]Forensic Medicine Unit, ASST Spedali Civili di Brescia, Brescia, Italy, [5]Centre of Bioethics Research, Università di Brescia, Brescia, Italy, [6]Clinical Trial Center, ASST Spedali Civili di Brescia, Brescia, Italy

BACKGROUND
Hospital discharge reports (HDR) support continuity of care, yet their specialised terminology may hinder patient understanding and post-discharge self-management, particularly among individuals with limited health literacy (HL) (1-3). AIM-HEALTH aims to develop and evaluate a clinician-validated, AI-powered supplementary discharge document (SDD) to support comprehension of HDR content, tailored to patients' HL levels.
METHODS
This prospective, observational, non-interventional study will enrol 200 adults from the nephrology and cardiology units at ASST Spedali Civili hospital. Following written informed consent, participants' HL will be assessed and combined with HDR structured data and an audio-recorded discharge interview to generate two outputs using locally deployed agentic AIs powered by open-weight LLM: (i) an HL-tailored SDD for patient use and (ii) a clinical performance report (CPR) highlighting omissions and inconsistencies between the HDR and the discharge interview to support clinical safety. Clinicians will validate the SDD using a QUEST-informed tool assessing accuracy, completeness, clarity, utility, and safety domains. All outputs will undergo clinical assessment; only suitable outputs will be retained, while corrections and unsuitable outputs will be used to iteratively refine the system. Patients will assess SDD perceived accessibility, comprehensibility, usefulness, and engagement. Data processing follows on-premise, DPIA-defined safeguards (data minimisation, pseudonymisation, security/incident management).
RESULTS
Expected results include: (i) technical feasibility and workflow indicators (completion and SDD withholding rates); (ii) clinician-rated accuracy, appropriateness, completeness, and safety of SDDs; (iii) perceived utility of the CPR for identifying omissions and inconsistencies between HDRs and discharge interviews; (iv) patient-reported accessibility, comprehensibility, usefulness, and engagement at ~1-month follow-up; and (v) associations between SDD readability index scores and perceived comprehensibility.
CONCLUSIONS
AIM-HEALTH aims to streamline discharge workflow, improve post-discharge comprehension and safety, particularly for chronic conditions, and reduce avoidable readmissions linked to misunderstanding, under on-premise data protection and clinician validation. AIM-HEALTH is supported by a competitive grant awarded by Fondazione Cariplo.
Popul. Med. 2026;8(Supplement 1):A861

Between promise and practice: mapping the implementation of digital health technologies in five sentinel district hospitals in South Africa

Jef Vanhamel[1], Denise Evans[2], Nandi Makhaye[1], Laetitia Rispel[1]
[1]South African Research Chairs Initiative, School of Public Health, Faculty of Health Sciences, University of the Witwatersrand, Johannesburg, South Africa, [2]School of Clinical Medicine, Faculty of Health Sciences, University of the Witwatersrand,

Johannesburg, South Africa
INTRODUCTION
Digital health technologies (DHTs) are widely promoted as enablers of health systems strengthening in low-and-middle-income countries. However, evidence on their routine implementation in district or first referral hospitals remains limited. This study examined the implementation of DHTs in five South African district hospitals.
METHODS
During 2025, a health facility assessment was conducted in five sentinel district hospitals across five South African provinces. We combined semi-structured interviews with hospital management (clinical, IT and information managers) with a structured checklist and walk-around to map infrastructure, equipment, staffing and DHT implementation in each clinical unit. The WHO Health System Building Blocks framework guided the analysis.
RESULTS
DHT implementation varied substantially across the hospitals. All hospitals were piloting or partially using a digitised health information system for patient registration, but weak IT systems and budgetary constraints limited their expansion towards medical records. Although one hospital implemented an electronic medical record system, roll out was halted due to logistical constraints and staff resistance. Four hospitals had digital X-ray units, but only two were able to store and transmit medical images digitally. Stock management and procurement software was implemented in all hospital pharmacies, yet only two used it for medication dispensing. The use of mobile clinical applications was widespread across all hospitals, driven largely by providers, to process lab results (TrackCare), coordinate referrals (VULA) and access clinical guidelines (EMGuidance). However, the extent of their integration in routine clinical practice varied. WhatsApp remained ubiquitous as informal "shadow" information systems, with multiple groups supporting within-unit, cross-unit and inter-facility communication. Persistent barriers for hospital-wide DHT implementation included inadequate financing, limited IT support, outdated hardware and fragmented digital governance structures.
CONCLUSIONS
DHTs hold significant promise but remain fragmented, and unevenly and largely informally implemented. Strengthening leadership, financing, infrastructure and system integration are essential for meaningful digital transformation.

ABS2311
Using Digital Tools (eTools) as a Strategy for improving uptake and scale up coverage of Tester Training, Competency Assessments and Certification, an important component of the HIV-Rapid Test Continuous Quality Improvement (RTCQI).

Alarice Marsh[1], Thato Chidarikire[1], Tebogo Maomela[1], Makhosazana Makhanya[1]
[1]HIV and AIDS and STI, National Department of Health, Pretoria, South Africa
BACKGROUND
Approximately 17million rapid HIV tests are performed in health care facilities in South Africa annually. Rapid HIV testing is conducted by diverse cadres, but the service is rendered mostly by lay trained providers. Access to accurate and reliable HIV testing services remain crucial to ensure individuals receive appropriate prevention and treatment services. To im-prove quality of testing, the National Department of Health (NDOH) in collaboration with the National Health Laboratory Service (NHLS) adopted the Rapid Test Continuous Quality Improvement (RTCQI) strategy in 2015. Site assessments conducted 2017 -2019 indicated a gap in personnel training and certification with an overall score of 54% countrywide. These results led to the development of digital tools, which enhanced program coordination and implementation uniformity.
METHODS
A national review of training materials, followed by digitization and centralization of databases, analysis and reporting paved the way towards improved implementation and scale up of tester certification. Prior to the introduction of eTools, RTCQI training was conducted in person over 3 – 5 days. This included a tester competency assessment, a written exam and observation of HIV testing practical. Subsequently, South Africa adopted the use of a standardized video-based online Learning Management System (LMS) with synchronization to a central electronic database and digital data collection tools for tester competency.
RESULTS
The introduction of standardized video-based online Learning Management System (LMS) for testers and assessors significantly improved the uptake and access to providers which in-creased the testers competency effectively. Live synchronization of examination reports into a database helps identify review questions and alternative exams, improving prequalification for assessment and eliminating manual scoring and lengthy procedures.
CONCLUSIONS
eTools for training and tester competency assessment significantly improved organization and efficiency. The introduction of the synchronized examination report within the central tester competency database helped improve the scale-up of national tester countrywide.

The Process of developing a Hospital Procedure Booking System in the Free State

Bessie Thekisho[1]
[1]Community Health, University of Free State, Bloemfontein, South Africa
ABSTRACT
The Process of developing a Hospital Procedure Booking System in the Free State
INTRODUCTION
elective procedures, scheduled in advance, are crucial to hospital operations. inefficient booking processes can lead to underutilization of resources, patient dissatisfaction, and financial losses. This report outlines the development and piloting of hospital elective procedure booking system (H.P.B.S) for free state hospitals. The health patient registration system, currently implemented in free state clinics and hospitals, supports the booking system by providing unique patient identifiers. The pandemic highlighted the need for an effective booking system to manage elective procedure waiting lists. The HPBS enables specialists to prioritize and streamline surgeries, monitor progress across hospitals, and enhance patient care.
METHODS
a qualitative research design was employed in this study due to its effectiveness in generating deep insights into attitudes, satisfaction levels, and operational challenges associated with elective procedure booking systems—variables that quantitative approaches alone are less suited to capture. The development of the H.P.B.S for the free state department of health (F.S.D.o.H) involved several key processes, including stakeholder identification, clinical workflow analysis, system requirements validation, and governance considerations. The system was designed and implemented by the FSDoH information communication and technology directorate.
RESULTS
initial assessments revealed no uniform system to monitor elective procedure waiting lists. The H.P.B.S integrates patient registration, real-time scheduling, and reporting modules into a secure platform hosted on free state health servers. A total of 647 procedures were booked from april 2024 to december 2025, with orthopaedics being the leading department during the pilot.
CONCLUSIONS
the web-based H.P.B.S standardizes elective bookings, manages cancellations and re-bookings, and provides accurate waiting list data, improving patient care. Specialists and managers can now monitor progress on elective procedure bookings. Future research should explore the scalability of H.P.B.S to other provinces and its adaptability to different healthcare settings.

Enhancing Death Registration Through Electronic Medical Record Integration in Zambia: Linking the National Registration Information System with SmartCare to Strengthen Mortality Data for Public Health Decision-Making

Kingsley Arhin-Wiredu[1], Brian Munkombwe[1], Chomba Mwango[1], Collins Ochieng Odhiambo[1], Esther Nyadzua Katama[1], Stephen Chanda[2]
[1]Data for Health Initiative, CDC Foundation, Atlanta, United States, [2]Surveillance and Disease Intelligence, Zambia National Public Health Institute, Lusaka, Zambia
INTRODUCTION
Timely and accurate mortality data are foundational to effective public health planning, disease surveillance, and resource allocation. In Zambia, fragmented information flows between civil registration systems and health sectors records, combined with paper-based notification processes, have historically resulted in delayed, incomplete, and underutilized mortality data. These gaps have constrained timely responses to high-burden conditions including HIV, malaria, tuberculosis cholera, maternal mortality and emerging public health threats.
METHODS
Zambia implemented a national digital mortality integration framework linking the Integrated National Registration Information System (INRIS) with SmartCare, the national electronic medical records system, and consolidating mortality data within a centralized national data warehouse. The intervention included

deployment of electronic death notification workflows within health facilities, development of a standardized mortality data model, and establishment of a scalable national integration architecture to enable secure, near-real-time data exchange between systems. Sustained stakeholder engagement supported governance, alignment and adoption. In parallel, an electronic medical certification of cause of death (e-MCCD) module was developed within SmartCare and is currently under validation.
RESULTS
System integration reduced death reporting delays by 88%, decreasing the average time from death occurrence to registration from 60 days to 7 days. Civil registration service coverage expanded to 81 of 116 districts, reaching approximately 83% of the population. Implementation of a real-time mortality surveillance dashboard improved data accessibility, workflow efficiency, and system performance monitoring, strengthening the routine use of mortality data for public health decision-making.
CONCLUSIONS
Integrating civil registration with electronic medical records substantially improved the timeliness, completeness, and usability of mortality data in Zambia. This digital health approach demonstrates how interoperable health information systems can strengthen CRVS performance and support data-driven public health action. Continued scale-up, and e-MCCD validation will be critical to sustaining impact and enabling cause specific mortality analysis and future artificial intelligence enabled surveillance.

Telemedicine as a tool for continuity of care: the experience of local healthcare trust

Elena Marcante[1], Emanuela Zilli[2], Nicola Cogo[2], Elena Debora Toffanello[3], Chiara Bovo[4], Fabio Verlato[5], Stefano Vianello[6], Michela Barbiero[7], Diego Ghirardini[8], Paolo Fortuna[9]
[1]1 Telemedicine service, ULSS 6 Euganea, Padua, Italy, [2]2 Medical Board of Directors, ULSS 6 Euganea, Hospital of Cittadella, Cittadella, Italy, [3]3 Coordinator of Sanitary District, ULSS 6 Euganea, Padua, Italy, [4]4 Coordinator of Medical Board of Directors, ULSS 6 Euganea, Padua, Italy, [5]5 Waiting List Coordinator of ULSS 6 Euganea, Padua, Italy, [6]6 Socio Sanitary Direction of ULSS 6 Euganea, Padua, Italy, [7]7 Administrative Direction of ULSS 6 Euganea, Padua, Italy, [8]8 Hygiene and Public Health Unit, Department of Cardiac Thoracic and Vascular Sciences and Public Health, University of Padua, Padua, Italy, [9]9 General Direction of ULSS 6 Euganea, Padua, Italy

INTRODUCTION
The local healthcare trust of padua, in the veneto region, serves a population of 930378 inhabitants. It operates 4 acute hospitals with a total of 1318 beds, 1 rehabilitation hospital, 5 healthcare districts, and 46 nursing homes with 5977 beds. According to the organization's mission, there is close collaboration between hospital specialists and general practitioners. Telemedicine was introduced to promote access to healthcare by facilitating communication between professionals and avoiding unnecessary hospital visits.
METHODS
Dedicated telemedicine booking systems have been activated. Information technology integration between the various systems has been implemented to enable data access and sharing of reports between hospitals and primary healthcare services. Technologies have been implemented and staff have been trained in personal data protection in accordance with European Union regulations.
RESULTS
Telemedicine services have been activated in multiple healthcare settings to guarantee continuity and proximity of care: 7 telemedicine services in nursing homes (diabetology, home artificial nutrition, internal medicine, geriatrics); 3 in detention facilities (diabetology, addiction, mental health); and 28 in healthcare districts (cardiology, pneumology, rheumatology, internal medicine, neurology, palliative care, transfusion activities). In 2025, 7601 telemedicine services were provided to 4615 patients. Telemedicine significantly reduced hospitalizations (by 4.8% from 2024 to 2025) and readmissions (by 20.8%), particularly in chronic disease management and in elderly patients.
CONCLUSIONS
The local health authority has initiated a structured process for the implementation of telemedicine, including information technology among its corporate strategies for strengthening primary care. The sustainability of the healthcare system increasingly relies on telemedicine, which addresses the growing healthcare needs of an aging and socially isolated population. Telemedicine represents a key innovation in public healthcare, supporting proximity and personalized care, especially for patients with chronic conditions or limited access to healthcare services.

Short-Term Forecasting of Dengue and Chikungunya Incidence: A Comparative Evaluation of Predictive Models in Paraguay

Marcelo Nicolás Pérez Brítez[1], Diego Pedro Pinto Roa[1], Pastor E Pérez-Estigarribia[1], WALTER MASSA RAMALHO[2]
[1]Facultad Politecnica, Universidad Nacional de Asunción, San Lorenzo, Paraguay, [2]Public Health, University of Brasilia, Brasilia, Brazil

INTRODUCTION
In recent years, Paraguay has experienced sustained and intense transmission of dengue, with prolonged epidemics and peaks exceeding historical averages. The country has reported hundreds of thousands of cases, high incidence rates, and the circulation of multiple dengue virus serotypes, reinforcing an endemic–epidemic pattern. Concurrently, major chikungunya outbreaks have occurred since 2022–2023, with widespread territorial dissemination and a substantial disease burden. The co-circulation of these arboviruses, transmitted by Aedes aegypti, highlights persistent vulnerabilities in vector control and underscores the growing public health challenge posed by arboviral diseases in Paraguay.
METHODS
This study evaluates and compares multiple predictive models applied to time series of Dengue and Chikungunya cases in Paraguay at different regional levels. Statistical models (hypothesis contrast, ARIMA), machine learning models (Random Forest, SVR), and deep learning models (ANN, LSTM) were implemented. Hyperparameter tuning was carried out using genetic algorithms. For simplicity, evaluation was mainly based on the Mean Absolute Error (MAE).
RESULTS
The results show that hybrid models and LSTM offer the best performance in highly seasonal scenarios. In the comparison of model performance, ANOVA results reveal that the selection of a model and regional level significantly impacts the error, confirming the hypothesis that different regions and different diseases might need different models to obtain good performance.
CONCLUSIONS
This work demonstrates the potential of computational approaches for public health management in Paraguay
Popul. Med. 2026;8(Supplement 1):A867

Telemedicine applied to the management of patients affected by obstructive sleep apnea syndrome treated with continuous positive airway pressure

Nicola Cogo[1], Maria Rita Marchi[2], Naile De Almeida Neves[2], Elena Marcante[3], Francesca Cassutti[2], Giulia Andreotti[2], Michela Bortoli[2], Francesca Pierobon[2], Valentina Reginato[1], Diego Ghirardini[4], Emanuela Zilli[1]
[1]1 Medical Board of Directors, ULSS 6 Euganea, Hospital of Cittadella, Cittadella, Italy, [2]2 Department of Pneumology, Hospital of Cittadella, Cittadella, Italy, [3]3 Telemedicine service, ULSS 6 Euganea, Padua, Italy, [4]4 Hygiene and Public Health Unit, University of Padua, Padua, Italy

INTRODUCTION
Telemonitoring is an operational modality of telemedicine that allows the remote and continuous collection and transmission of vital and clinical parameters through sensors interacting with the patient. Telemonitoring is performed through dedicated devices and applications that collect data and transmit them to a platform via secure channels, enabling continuous updating of the patient's clinical status. According to the literature, telemonitoring is particularly suitable for the evaluation of patients with respiratory failure. The hospital of cittadella, padua, italy, has a pneumology ward with 20 beds and 6 semi-intensive beds, and serves a population of 350000 inhabitants.
METHODS
The hospital of cittadella implemented an integrated telemedicine model for the remote monitoring and management of patients affected by obstructive sleep apnea syndrome (OSAS) treated with continuous positive airway pressure (CPAP). The model includes the delivery and activation of CPAP devices equipped with data transmission modules by a respiratory physiopathology technician.
RESULTS
During 2025, a total of 156 patients with OSAS were enrolled. For 60 of them, follow-up appointments have already been scheduled for the entire year 2026, with telemonitoring intervals of 3, 6, or 9 months according to clinical needs. All patients attended an initial in-person visit for training, CPAP device delivery, and signing of informed consent for personal data processing. The main benefits observed were: 1. improved disease control and treatment adherence; 2. Therapy personalization;

3. Reduction of routine outpatient visits; 4. Possibility of monitoring and follow-up also in remote areas; 5. Reduction of indirect costs (hospital visits, admissions, complications).
CONCLUSIONS
This project highlights how telemedicine represents an effective tool in the management of patients with OSAS treated with CPAP. Telemonitoring allows improved control of therapeutic adherence and timely interventions in case of critical issues, while reducing the need for in-person outpatient visits.

Screen exposure and sleep quality in early childhood: evidence from an early childhood education center

Caroline Feitosa Dibai de Castro[1], Jenuan Bourguignon[1], Júlia Coelho Grobério[1], Fernanda Fernandes Molini[1], Camila de Brito Rodrigues[1], Mariana Miranda[1], Valentina Soares Faé de Oliveira[1], Luísa Prezotti Bomfim[1], Tiago Pedrini Chagas[1], Alvaro Borlini Machado[1], Ricco Spelta Risso Tranhago[1], Francine Alves Gratival Raposo[1], Kelen Antunes Iyrio[2]
[1]1 Escola Superior de Ciências da Santa Casa de Misericórdia de Vitória, Vitória, Brazil, [2]2 Universidade Federal do Espírito Santo, Vitória, Brazil

BACKGROUND
The increasing exposure of young children to electronic devices represents an emerging public health challenge, particularly in low- and middle-income countries, where access to digital technologies has expanded rapidly, often without adequate educational strategies. Excessive screen use, especially during nighttime, may impair sleep quality, which is essential for healthy child development.
OBJECTIVE
To evaluate the association between daily screen time and sleep quality in children in early childhood, considering public health implications in middle-income countries.
METHODS
A cross-sectional study was conducted with caregivers of children aged 6 months to 6 years enrolled in early childhood education at a school in Vitória, Espírito Santo, Brazil. Data were collected using a structured questionnaire addressing screen use habits and sleep patterns. Sleep quality was assessed using the Children's Sleep Habits Questionnaire (CSHQ). Statistical analyses examined associations between screen time and sleep disturbances, with stratification by age group.
RESULTS
Data from 212 children were analyzed. The most frequent daily screen time was one hour. Sleep disturbances were identified in 77.4% of the sample. Screen exposure exceeding one hour per day was significantly associated with a higher prevalence of sleep disturbances ($p < 0.002$), particularly among children younger than two years ($p < 0.027$). A significant correlation was observed between screen time and the global sleep disturbance score ($r = 0.194$; $p < 0.005$), with a stronger correlation in children under two years of age ($r = 0.321$; $p < 0.007$). Significant associations were also found with parasomnias and daytime sleepiness ($p < 0.001$).
CONCLUSIONS
Greater screen exposure was associated with poorer sleep quality in early childhood, highlighting the need for educational strategies and health promotion actions aimed at responsible screen use in contexts of rapid digital transformation.

ABS2487
Situational analysis and development of SMARThealth Climate Indonesia: a digital primary healthcare intervention with an integrated early warning system for non-communicable disease management

Asri Maharani[1], Harun Al-Rasyid[2], Septa Katmawanti[2], Holipah Holipah[2], Nushrat Khan[3], Sujarwoto Sujarwoto[4]
[1]Division of Nursing, Midwifery and Social Work, University of Manchester, Manchester, United Kingdom, [2]Faculty of Medicine, Universitas Brawijaya, Malang, Indonesia, [3]School of Public Health, Imperial College London, London, United Kingdom, [4]Faculty of Public Administration, Universitas Brawijaya, Malang, Indonesia

BACKGROUND
Household plastic burning and ambient air pollution contribute to cardiovascular and respiratory morbidity in Indonesia, yet primary health care (PHC) systems have limited capacity to integrate environmental risk information into routine NCD care. Evidence is needed to inform the development of climate-responsive PHC interventions that are feasible and contextually appropriate.
METHODS
We conducted a two-phase mixed-methods situational analysis to support the development of a digital PHC intervention, SMARThealth Climate in Malang and Banyuwangi districts, East Java. Phase 1 comprised a rapid evidence synthesis and policy analysis of national and sub-national documents. Phase 2 involved a field assessment of facility readiness across macro, meso, and micro health system levels. Quantitative data were collected from 24 staff across 16 primary care providers. Qualitative data were generated through 64 in-depth interviews and 12 focus group discussions with policymakers, health professionals, community health workers (CHWs), patients, and village officials (n=112). Informed by the situational analysis, the intervention was co-designed with healthcare professionals and piloted over two months for further refinement. Data were analysed thematically and triangulated across sources.
RESULTS
Despite high community awareness of air pollution and its health effects, environmental risk is not incorporated into routine NCD care. Only 20% patients diagnosed with high CVD risk and COPD reported regular follow-up at PHCs. Health workers expressed demand for actionable, locally relevant air quality alerts to support counselling and risk stratification. However, concerns included workload, digital readiness, and clinical accountability. Facility assessments revealed substantial variability in workforce capacity, diagnostics, and digital infrastructure. SMARThealth Climate was co-created to address this, which includes clinical decision support systems and an integrated air quality warning system.
CONCLUSIONS
Integrating air quality warning systems into digital primary health care has the potential to strengthen NCD management in resource-constrained settings; however, addressing system-level barriers is essential for interventions to succeed.

Health managers and professionals experiences with tuberculosis treatment adherence in in-person and digital strategies

Ana Paula Cortes de Oliveira Sorbo[1], Fabiana Costa Machado Zacharias[2], Silvia Helena Valente[3], Luciana Aparecida Fabriz[4], Luz Maria Hughes Palma[1], Jaqueline Garcia de Almeida Ballestero[1], Jerusa Gonçalves Duarte Martins[1], Yan Mathias Alves[1], Nathália Zini[1], Mariana Gaspar Botelho Funari de Faria[1], André Luiz Teixeira Vinci[1], Tatiana Ferraz de Araújo Alecrim[1], Aline Aparecida Monroe[1], Ricardo Alexandre Arcêncio[1], Ione Carvalho Pinto[1]
[1]1.University of São Paulo, Ribeirão Preto, Brazil, [2]2.São Paulo State Department of Health, Ribeirão Preto, Brazil, [3]3.Salesian University Center of São Paulo, Americana, Brazil, [4]4.State University of Western Paraná, Foz do Iguaçu, Brazil

BACKGROUND
Tuberculosis (TB) remains a major global public health priority, accounting for approximately 10.7 million new cases and 1.3 million deaths annually worldwide, and continues to be the leading cause of death from preventable infectious diseases(1). Although TB incidence and mortality have declined, progress has been slow(1). The large reservoir of latent TB infection and the impact of the COVID-19 pandemic sustain high risk, making global targets difficult to achieve without intensified diagnosis, treatment, and prevention(1). Conventional Directly Observed Therapy (DOT) is widely used to support treatment adherence but requires substantial workforce investment and complex territorial logistics(2-4). Telehealth strategies, such as Video Directly Observed Therapy (vDOT), have been introduced to expand treatment monitoring. This study analyzed the experiences of health managers and professionals regarding TB treatment adherence under in-person and digital strategies.
METHODS
A qualitative case study was conducted in specialized TB care services in a medium-sized Brazilian municipality, guided by the theoretical framework of treatment adherence(6). Semi-structured interviews were carried out with health managers and professionals involved in TB care. Interviews were transcribed and analyzed using deductive thematic analysis, supported by ATLAS.ti software, in accordance with ethical principles for health research.
RESULTS
Nineteen professionals participated, including managers, physicians, nurses, and nursing technicians. Adherence was understood as a multifactorial process influenced by service organization, professional practices, and patients' social conditions. Conventional DOT was associated with closer in-person follow-up but also with workforce overload and territorial barriers. vDOT facilitated adherence by increasing flexibility, reducing travel requirements, and promoting patient autonomy, although its effectiveness depends on access to digital technologies and institutional support.

CONCLUSIONS
Conventional DOT and vDOT show complementary potential to strengthen TB treatment adherence. Implementation should consider patient profiles, access to digital technologies, and social vulnerability, reinforcing the importance of flexible, effective, and equitable public health care models.

ABS2511
Developing a Cost Data Collection Framework for Tuberculosis Care Using Activity-Based Costing: In-Person and Digital Strategies

Fabiana Costa Machado Zacharias[1], Silvia Helena Valente[2], Luz Maria Hughes Palma[3], Sérgio Moacir Fabriz[4], Luciana Aparecida Fabriz[4], Jerusa Gonçalves Duarte Martins[3], Yan Mathias Alves[3], André Luiz Teixeira Vinci[3], Nathália Zini[3], Aline Aparecida Monroe[3], Jaqueline Garcia de Almeida Ballestero[3], Tatiana Ferraz de Araújo Alecrim[3], Ricardo Alexandre Arcêncio[3], Ione Carvalho Pinto[3]
[1]São Paulo State Department of Health, Ribeirão Preto, Brazil, [2]Salesian University Center of São Paulo, Americana, Brazil, [3]University of São Paulo, Ribeirão Preto, Brazil, [4]State University of Western Paraná, Foz do Iguaçu, Brazil

BACKGROUND
Cost estimation in health services requires instruments capable of systematically and contextually capturing the complexity of care delivery, administrative, and surveillance processes (1,2). In tuberculosis (TB) care, particularly under Conventional Directly Observed Treatment (DOT) and Video Directly Observed Therapy (vDOT), the diversity of activities, professionals, and resources involved poses challenges to accurate cost measurement. In this context, activity-based costing represents an appropriate approach(1,4,5). This study aimed to develop and apply an instrument to collect cost data related to TB treatment under in-person and digital strategies.
METHODS
This methodological study developed and applied a semi-structured instrument for cost data collection, grounded in the activity-based costing method(1,2). The instrument identified activities, involved professionals, time spent, resources consumed, and cost drivers across care delivery, administrative, and health surveillance processes. The instrument was reviewed by the project team and by a researcher experienced in activity-based costing, followed by pre-testing with managers and healthcare professionals from TB reference services. The study was approved by a Research Ethics Committee, and data collection was conducted between January and December 2025.
RESULTS
A total of 22 participants were included, comprising 5 health managers and 17 healthcare professionals, predominantly female, with a mean age ranging from 43 to 49 years. The instrument enabled detailed mapping of activities, average execution times, labor use, consumption of supplies, diagnostic tests, and travel, supporting cost allocation based on actual resource consumption. It proved to be clear, feasible, and sensitive to the operational specificities of health services.
CONCLUSIONS
The use of a semi-structured instrument guided by activity-based costing constitutes a methodological strategy for collecting cost data in health services. It contributes to more accurate economic analyses and supports evidence-informed decision-making in public health policies.
Popul. Med. 2026;8(Supplement 1):A872

ABS2677
Leveraging CrossRef Application Programming Interface to identify policy-relevant research conducted in South Africa: a bibliometric analysis

Lesibana Malinga[1], Matome Mokganya[2]
[1]Health Information, Epidemiology, Research, Monitoring and Evaluation Cluster, National Department of Health, Pretoria, South Africa, [2]Research and Implementation Science Unit, Health Systems Trust, Pretoria, South Africa

BACKGROUND
Large scale Artificial Intelligent (AI) models could transform the contribution of research towards achievement of Sustainable Development Goals (SDGs). Countries need to monitor and report progress on SDGs using data collected from multiple resources to support evidence-based decision-making. Research that supports efforts towards achievement of SDGs needs to be captured and reported at a country level. Since 2015, South Africa has developed a National Health Research Database (NHRD) which serves as a repository of health-related research conducted in public health facilities. We conducted a bibliometric analysis using CrossRef Application Programming Interface (API) and mapping of SDG relevant research from NHRD records between 2015 and 2023.
METHODS
A bibliometric analysis of 5,270 registered and approved study records from the NHRD was conducted using titles in proposal format. The workflow to extract publication metadata included data extraction and cleaning, country identification and verification. The publication metadata retrieved via the CrossRef API included the digital object identifiers (DOIs), author names, title, publication year and study country. Further classification of SDG relevant research was conducted on Dimensions Research GPT AI tool.
RESULTS
Among the 5,270 records, 397 (7.5%) publication titles were indexed on CrossRef API tool based on fuzzy matching with a threshold of >70%. The generated DOIs were further validated using online libraries with a total of 172/397 (43.3%) publications correctly identified. The SDG mapping demonstrated dominant contributions to SDG 3 (targets 3.8, 3.3 and 3.4). Significant cross-cutting contributions evident for SDGs 4, 5, 9, 10, and 17 were observed.
CONCLUSIONS
The use AI tools provide an attractive methodology to map SDG related publications derived from national datasets. However, a more accurate estimate of the publication rate of registered and approved NHRD studies, ongoing follow-up with researchers is recommended to capture study updates for knowledge translation and dissemination.
Popul. Med. 2026;8(Supplement 1):A879

ABS2728
Readiness and Impact of Digital Public Financial Management Systems at Uganda's Health Frontlines

Afrah Naluwugge[1], Samuel Kamba[2], Fahad Mawanda[2], Aliyi Walimbwa[2], Michael Bamulengayo[1], Derrick Kimuli[1], Evarist Twinomujuni[1], Lorraine Kabunga[1], Nathan Tibwala[3]
[1]Health Financing, Clinton Health Access Initiative, Kampala, Uganda, [2]Division of Sector Policy and Planning, Ministry of Health, Kampala, Uganda, [3]Public Finance Management, Ministry of Local Government (REAP), Kampala, Uganda

BACKGROUND
Uganda is advancing digital public financial management (PFM) reforms through the rollout of HMIS001 for standardized planning and budgeting and the Simplified Computerized Accounting and Reporting Tool (SCART) for financial reporting at lower-level health facilities. Because the national Integrated Financial Management System (IFMIS) does not extend to frontline facilities, SCART addresses a critical governance gap. However, facility-level digital PFM remains constrained by fragmented platforms, limited interoperability, inconsistent nomenclature, and duplicative data entry. This study assessed readiness for digital PFM adoption and documented early implementation outcomes of DHIS2-based HMIS001 and SCART in two pilot districts.
METHODS
A government-led, partner-supported facility readiness assessment was conducted in Kassanda and Kakumiro districts, examining digital infrastructure, software functionality, and human resource capacity. A five-day digitization training was delivered to 50 district and facility staff, leading to onboarding of six HC IV facilities onto HMIS001 and SCART, with FY 2025/26 budget data uploaded and accounts established.
RESULTS
Readiness was mixed. Although 94.6% of facilities had functional computers, 97.3% had designated HMIS 001 data staff, and 94.6% had financial reporting personnel, only 47% met the full readiness triad of functional computer, reliable electricity, and internet connectivity. Updated software systems were available in 77% of facilities, but only 34% had backup power or antivirus protection, making power instability a key sustainability risk. All six HCIV facilities were successfully onboarded, enabling remote visibility of facility-level budget execution through the SCART dashboard. Limited computer literacy highlighted the need for continued mentorship.
CONCLUSIONS
This pilot demonstrates both feasibility and constraints of facility-level digital PFM in Uganda. Early implementation suggests improved data accuracy, reduced reporting time, and enhanced confidence in financial tracking. Harmonizing HMIS001 and SCART with the Programme Budgeting System and Chart of Accounts offers a scalable pathway to improved transparency, accountability, and efficiency in primary health care financing.

ABS2831
Quality of internet-based public health strategies to Prevent Infectious Diseases in Germany

Numa Memisevic[1]
[1]Public Health, University of Heidelberg, Heidelberg, Germany
BACKGROUND
Important aspects of infectious disease prevention include vaccination campaigns and public health strategies promoting preventive behaviors. The objective is to examine the completeness, accessibility and accuracy of the information available by public health authorities and the communication strategies employed.
METHODS
A mixed-methods explanatory design was applied to evaluate communication strategies for infectious disease prevention in the public health services of the German state of Baden-Württemberg (BW) from September 2021 to September 2022. We assessed the information quality across six disease groups, covering the three dimensions of 1) comprehensiveness, 2) accessibility and 3) accuracy, yielding a disease information quality score for each website of the 38 Public Health Authorities (PHAs) in BW. The same dimensions were utilized to calculate an information quality score regarding preventive behavior and communication. We used thresholds at 25% and 75% to classify low, intermediate, and high quality of information. In addition, six qualitative interviews were conducted with six representatives of the public health service.
RESULTS
Out of 38 counties, we identified 8 (21.1 %) with high, 26 (68.4 %) with intermediate and 4 (10.5 %) with low quality of available information. The highest quality information score varied between 315-420 points (maximum 420 points). Intermediate quality of information varies between 106-315 points (26 counties). Low quality of information was attained with scores between 0-150 points for 4 counties. Low vaccination uptake in certain communities was identified by PHAs using epidemiological indicators, however, effectively reaching vulnerable groups remained difficult. Engagement of health insurers, municipalities, healthcare providers, and NGOs was vital for preventions implementation.
CONCLUSIONS
The heterogeneity of information quality between PHAs has impeded the development of coherent evidence-based strategies, undermining the effectiveness of prevention efforts. Joint communication strategies should be applied to achieve consistency in quality of information for all PHA.

ABS2855
Utilisation of digital health technologies among frontline health professionals in five sentinel district hospitals in South Africa

Jef Vanhamel[1], Denise Evans[2], Nandi Makhaye[1], Laetitia Rispel[1]
[1]South African Research Chairs Initiative, School of Public Health, Faculty of Health Sciences, University of the Witwatersrand, Johannesburg, South Africa, [2]School of Clinical Medicine, Faculty of Health Sciences, University of the Witwatersrand, Johannesburg, South Africa
INTRODUCTION
Digital Health Technologies (DHTs) have the potential to transform the clinical practice environment of frontline health professionals (HPs) by improving efficiency, reducing paperwork and enhancing clinical decision-making. This study was informed by the knowledge gaps on the factors that influence the utilisation of DHTs by HPs in South Africa's district hospitals.
METHODS
During 2025, a cross-sectional survey was conducted among frontline HPs in five sentinel district hospitals across five South African provinces. Following informed consent, frontline HPs completed a self-administered questionnaire. In addition to demographic and occupational characteristics, the survey collected information on the availability of the internet and the utilisation of different types of DHTs. Overall DHT utilisation was assessed on a 1–10 scale, with high use classified as a score of ≥6/10. We used SAS for data analysis and logistic regression to examine factors associated with high DHT use.
RESULTS
We included 810 HPs across the five hospitals. The majority were female (83.7%) with a mean age of 40.6 years (SD=11.1). Nurses made up the majority of the sample (65.4%), followed by therapeutic science practitioners (13.8%), doctors (14.3%), and pharmacists (6.5%). DHT utilisation among frontline HPs was moderate with a mean of 4.3 (SD=2.7). Internet access at work was primarily via personal devices (86.7%). Doctors mainly used DHTs for clinical decision support (36.5%), computer-aided diagnostics (42.1%), and consulting peers (55.1%). In contrast, 49.9% of nurses, 52.7% of therapeutic science practitioners, and 46.2% of pharmacists used DHTs daily to consult with peers. High DHT utilisation among frontline HCPs in district hospitals was found to be associated with health professional category, hospital-provided connectivity and geographical location ($p<0.05$).
CONCLUSIONS
The transformative potential of DHTs could be realised through improved digital infrastructure in hospitals and adequate support to frontline HPs.

Mobile-Based Educational Interventions for Maternal Nutrition in Low- and Middle-Income Countries: A Scoping Review of Knowledge, Attitudes, Perceptions, and Adoption — A CFIR 2.0–Guided Implementation Analysis

Praveenkumar Aivalli[1], Srihari Kaliapuramnarendrakumar[1], Muthelo Livhuwani[2], Ngwenya Mxolisi[2], Frank Adusei-Mensah[3], Mabitsela Mphasha[2], Samuel Akinseinde[2], Joke-Folu Badejo[2], Fionnuala M McAuliffe[1], Catgerine Phillips[1]
[1]University College Dublin, Dublin, Ireland, [2]University of Limpopo, Limpopo, South Africa, [3]University of Eastern Finland, Kuopio, Finland
ABSTRACT
Maternal undernutrition and overnutrition remain major contributors to adverse pregnancy outcomes in low- and middle-income countries (LMICs). Mobile health technologies are increasingly promoted as scalable platforms for maternal nutrition education. This scoping review synthesises evidence on mobile-based maternal nutrition education interventions in LMICs, guided by the Consolidated Framework for Implementation Research (CFIR) 2.0. This scoping review followed Arksey and O'Malley's framework. Empirical studies published between 2015 and 2025 evaluating mobile-based educational interventions for maternal nutrition among pregnant women, lactating mothers, family members, or healthcare providers in LMICs were included. Five electronic databases and grey literature sources were searched. Data were extracted and thematically synthesised, with findings mapped to CFIR 2.0 domains to examine implementation determinants related to knowledge, attitudes, perceptions, and adoption. From 1,085 records identified, 281 duplicates were removed and 802 records were screened. Following full-text assessment of 123 articles, 49 studies were included. Over half of the included studies were conducted in South Asia (n = 25), followed by sub-Saharan Africa (n = 18) and South-East Asia (n = 6). Study designs were heterogeneous and included randomised controlled trials (n = 11), qualitative studies (n = 10), mixed-methods studies (n = 9), quasi-experimental designs (n = 8), cross-sectional studies (n = 7), and programme implementation or pilot studies (n = 4). CFIR 2.0 mapping identified key facilitators, including widespread phone ownership, supportive family structures, and alignment with national health platforms. Barriers included time constraints among women, high provider workload, poor network connectivity, and reliance on short-term donor funding. Adoption often declined following project completion unless interventions were embedded within routine health systems. Mobile-based educational interventions show promise for improving maternal nutrition knowledge and acceptability in LMICs. However, CFIR 2.0 analysis highlights the need for institutional integration, equity-oriented design, and long-term system embedding to support sustainable maternal nutrition outcomes.

Co creating an integrated e Health Intervention to Improve Sexual and Reproductive Health and Reduce NCD Risk Among Adolescents and Young Adults in Rural South Africa

Deepika Saluja[1], Kim Jonas[2], Nelisiwe Ndlovu Ndlovu[2], Thandiwe Mbira[2], Bongiwe Paka-Huysamer[2], Eunice Turawa[2], Beatrice Nojilana[2], Simon Lewin[2], Sudha Subhadra Kallakuri[1]
[1]The George Institute For Global Health, Hyderabad, India, [2]South African Medical Research Council, Cape Town, South Africa
BACKGROUND
Access to Sexual and Reproductive Health (SRH) services among adolescent girls and young women (AYA) remains limited in many low- and middle-income countries (LMICs), particularly in rural settings, contributing to high rates of maternal morbidity, unintended pregnancies, and HIV infections. Simultaneously, non-communicable diseases (NCDs) account for nearly 65% of deaths among women worldwide, with 80% of these deaths occurring in LMICs. Given shared behavioural risk factors including tobacco and alcohol use, unhealthy diets, physical inactivity, and environmental exposures- integrated approaches are urgently needed. Ehealth technologies offer a promising platform to increase awareness, strengthen health-seeking behaviours and connect AGYW to essential services.
METHODS
This mixed-methods study aimed to cocreate an integrated ehealth prototype to promotes healthy behaviours, reduce NCD risks, and improve SRH outcomes

among AYA aged 15–24 years living in rural KwaZulu-Natal, South Africa. Using a cocreation framework, the study incorporated a systematic review, stakeholder and service mapping, in-depth interviews (IDIs), focus group discussions (FGDs), and participatory community workshops. Two advisory structures – a Youth Advisory Group and a Scientific Expert Advisory Group guided the iterative design and content development process. Participants included AYA, healthcare workers, teachers, educators, traditional leaders, community influencers, NGO representatives, and caregivers.
RESULTS
Findings from four community workshops highlighted key requirements for an acceptable and accessible ehealth platform: safe and non-judgement digital spaces; offline or low-data functionality; culturally relevant, credible and easy to understand content; short and engaging visual format and strong emphasis on confidentiality and youth-friendly communication. These insights have informed prototype's architecture and content strategy.
CONCLUSIONS
Co-creation approach meaningfully engaged AYA and community stakeholders, enabling the development of context-specific, accessible, and trusted ehealth solutions addressing integrated SRH and NCD needs.
Popul. Med. 2026;8(Supplement 1):A889

ABS3030
Digital Health Innovation: Development of the digital health educational portal within Brazil's Unified Health System

Paola Garcia[1], Deysianne Chagas[1], Ana Estela Haddad[2], Ana Emília Oliveira[1], Elza Ferreira[1], Osvaldo Sousa Junior[1], Adenilson Galvão Filho[1]
[1]Federal University of Maranhão, São Luís, Brazil, [2]Faculty of Dentistry, University of São Paulo – USP, São Paulo, Brazil

INTRODUCTION
Educational portals are digital interventions designed to expand and facilitate access to high-quality information (1,2). In health education, these platforms play a strategic role in promoting interactivity and stimulating knowledge production among healthcare professionals, family members, and patients (3,4). This study describes the development process of a Digital Health Educational Portal within Brazil's Unified Health System.
METHODS
The project was carried out between December 2024 and September 2025 and followed the stages of planning, prototyping, implementation, and validation. The activities included the elicitation of functional, pedagogical, and visual requirements, with a strong focus on usability and user experience. Development was guided by interdisciplinary collaboration involving faculty members, instructional designers, information technology specialists, and user interface designers, ensuring technical consistency, pedagogical coherence, and alignment with SUS policies and educational needs.
RESULTS
The main outcomes include the implementation of essential functionalities and the integration of multiple modules within a single digital environment. The portal provides professional training and continuing education courses for SUS workers and offers a digital library accessible on mobile devices, containing e-books, podcasts, videos, and other reference materials. A dedicated news section disseminates updated information on events, webinars, public policies, and innovations related to digital health. Interactive spaces, discussion forums, and an institutional repository support collaboration, knowledge exchange, and the dissemination of scientific production. The responsive interface allows access through different devices, increasing usability and territorial reach.
CONCLUSIONS
The Digital Health Educational Portal represents an important advance in the digital transformation of the SUS by consolidating an integrated, user-centered, and scalable educational infrastructure. The initiative contributes to the democratization of access to digital health knowledge, supports continuing professional development, and strengthens competencies for the ethical, critical, and effective use of emerging technologies in Brazilian public health across contexts, regions, services, populations, and care networks.

Innovation and transparency in brazilian health law: experience report on the implementation of the Capixaba Health Law Observatory

Fabrício Santos Neves[1,2], Caroline Feitosa Dibai de Castro[3], Christiane Vidal Moraes[2], Cristiano Luiz Ribeiro de Araújo[2], Edilene Rebeca Ferreira Alves[2], Erico Sangiorgio[4], Jeanine Pacheco Moreira Barbosa[1,2], Katrini Ribeiro Tiago[2], Maria Luiza Mageski Altafim Brandão[2], Ricardo dos Santos Costa[4], Maria Angélica Carvalho Andrade[1]
[1]Postgraduate Program in Public Health, Federal University of Espírito Santo (UFES), Vitória, Brazil, [2]Innovation and Right to Health Laboratory, Capixaba Institute of Education, Research and Innovation (ICEPi), Vitória, Brazil, [3]Higher School of Sciences of the Santa Casa de Misericórdia of Vitória (EMESCAM), Vitória, Brazil, [4]Capixaba Institute of Education, Research and Innovation (ICEPi), Vitória, Brazil

INTRODUCTION
The judicialization of public health in Brazil presents complex challenges for both management and the assurance of equity in the Unified Health System (SUS - Brazil's public healthcare system). In Espírito Santo, the demand for organizing data to improve decision-making led to the creation of a strategic monitoring tool, which is pioneering in the country in terms of its objective and format. This paper aims to present the implementation of the Capixaba Observatory of the Right to Health as a policy of transparency and information management.
METHODS
This is an descriptive study on the creation of the Observatory, which had a pilot project approved in 2023, made available in a test version in 2025, and instituted in 2026 by the Capixaba Institute of Education, Research, and Innovation. The methodology details the real-time integration between different sources: the state's database of legal claims, selected national indicators (demographic and healthcare output), and the state financial management system, using business intelligence tools to systematize indicators.
RESULTS
The Observatory consolidates interactive panels that allow for the analysis of the historical trends in the main judicial demands in health and the associated expenditures in the state. The tool facilitates access to information for researchers, legal practitioners, and managers, serving as a basis for strategic positioning and the qualification of public spending.
CONCLUSIONS
This initiative demonstrates that technological integration between health and justice is fundamental for the sustainability of the SUS. The Observatory not only promotes transparency, but also acts as a governance tool that helps reduce information asymmetries, ensuring the right to health in a more efficient and evidence-based manner.

Digital health in Brazil's Unified Health System (SUS): Advances and challenges for the consolidation of digital transformation

Deysianne Chagas[1], Paola Garcia[1], Ana Estela Haddad[2], Ana Emília Oliveira[1], Elza Ferreira[1], Alice Abreu[1]
[1]Federal University of Maranhão - UFMA, São Luís, Brazil, [2]Faculty of Dentistry, University of São Paulo – USP, São Paulo, Brazil

INTRODUCTION
Digital health is an interdisciplinary field that uses digital technologies to improve healthcare delivery, management, and health promotion. In Brazil's Unified Health System, its expansion has driven relevant advances in primary care and specialized services through initiatives such as e-SUS Atenção Básica, the Citizen's Electronic Health Record, telehealth, and the SUS Digital Program (2-4). This study aimed to conduct a narrative review of advances and challenges related to digital health within the SUS.
METHODS
A qualitative narrative review was conducted using Medline, Google Scholar, Scopus, and SciELO databases. Search terms related to telemedicine, digital health, and the SUS were applied. Studies addressing the impacts or implementation of digital health initiatives within the SUS were included, while opinion papers and studies outside this context were excluded. In total, 54 studies were selected.
RESULTS
Findings were categorized into advances and challenges. Major advances include consolidation of the Electronic Health Record, improving information security, productivity, and data sharing between regions. Telehealth and telemedicine have become essential by supporting continuing professional education, expanding access to services, and promoting equity, especially during the COVID-19 pandemic. The National Health Data Network and digital appointment scheduling improved care integration, while e-SUS AB and e-SUS APS optimized Primary Health Care processes. Key challenges include unstable internet connectivity, system failures, and limited infrastructure. Human-related barriers were also identified, such as low digital literacy, professional insecurity, work overload, and resistance to change. Users face additional obstacles, including limited access to devices and internet connectivity.

CONCLUSIONS
Digital health represents a strategic approach to modernizing the SUS by increasing efficiency and equity. Addressing existing challenges requires strong public policies, sustained investment in infrastructure and workforce training, and coordinated engagement among managers, health professionals, and users. This alignment is essential for sustainable digital transformation nationwide within Brazil.

National Digital Health Strategies in The Global South: Comparative Perspectives on Governance, Data and Health Systems Strengthening

Marcelo Fornazin[1,2], Yanlin Cao[3], Lourino Alberto Chemane[4], Andre de Vasconcelos Costa Lobato[5,2]
[1]Department of Health Administration and Planning, Oswaldo Cruz Foundation (Fiocruz), Rio de Janeiro, Brazil, [2]Office of Fiocruz Strategy for the Agenda 2030, Oswaldo Cruz Foundation (Fiocruz), Rio de Janeiro, Brazil, [3]Institute of Medical Information, Chinese Academy of Medical Sciences, Peking, China, [4]National Institute of Information and Communication Technologies (INTIC), Maputo, Mozambique, [5]Center for International Relations in Health (CRIS), Oswaldo Cruz Foundation (Fiocruz), Rio de Janeiro, Brazil

INTRODUCTION
Digital health has become a strategic component of national health policies, reflecting societal values, governance arrangements, and technological priorities within health systems. In the global south, digital health strategies are shaped by diverse institutional trajectories and political commitments regarding the role of the state, public interest in health data, and regulation of digital technologies. Comparative analysis offers insights into these differences.
METHODS
his round table adopts a comparative qualitative approach based on the analysis of national digital health strategies, policy frameworks, and institutional experiences from Brazil, China, and Mozambique. The discussion is structured around three analytical dimensions: underlying values guiding digital health policies, technological orientations prioritized by national strategies. Each country case is presented by experts with direct involvement in policy formulation, implementation, or evaluation.
RESULTS
The comparison reveals distinct yet complementary national strategies. China presents a state-centered model based on strong national planning, large-scale health information infrastructures, and comprehensive regulatory frameworks governing data security, interoperability, and digital technologies, framing digital health as a collective asset for system-wide coordination. Brazil illustrates a rights-based approach rooted in constitutional commitments to universal health, where digital health strategies focus on national data integration within the Unified Health System amid ongoing debates on governance, participation, transparency, and public–private relations. Mozambique demonstrates a health system–oriented strategy in which digital health is embedded in a national framework aligned with public health priorities, interoperability, workforce development, and strengthened state coordination to support continuity of care, surveillance, and service integration.
RESULTS
The comparative analysis shows that digital health strategies are shaped primarily by values and governance choices rather than technology alone. South–South perspectives highlight multiple pathways for aligning digital innovation with public interest, equity, and health system strengthening, offering relevant lessons for future national digital health strategies.

ABS3102

Adherence to Directly Observed Treatment via Video as a strategy for monitoring tuberculosis care in migrants.

Beatriz Fornaziero Vigato[1], Willie Otavio Bueno Bernardi[1], Maria Eduarda Pagano Pelodan[1], Daniele de Moraes Pinheiro[1], Nathalia Zini[1], André Luiz Teixeira Vinci[1], Marcos Augusto Moraes Arcoverde[2], Ricardo Alexandre Arcêncio[1]
[1]Escola de Enfermagem de Ribeirão Preto da Universidade de São Paulo (EERP-USP), Ribeirão Preto., Brasil, [2]Curso de Enfermagem da Universidade Estadual do Oeste do Paraná (Unioeste), Foz do Iguaçu, Brasil

INTRODUCTION
Adherence to tuberculosis (TB) treatment remains a major challenge for disease control, particularly among migrant populations, who face linguistic, social, economic, and health service access barriers 1. Strategies that strengthen care monitoring and promote treatment continuity are essential to reduce treatment interruption and improve outcomes in this group 2. Video-Directed Treatment Observation (VDOT) has emerged as an alternative to conventional directly observed treatment (DOT), using digital technologies to remotely monitor medication intake 3. This approach may increase care flexibility, reduce operational costs and minimize barriers related to mobility and stigma experienced by migrants. This study aimed to evaluate adherence to tuberculosis treatment among migrants monitored through VDOT 4.
METHODS
This is an observational, descriptive study with quantitative approach, conducted with international migrants diagnosed with TB, monitored through (VDOT). International migrants diagnosed with TB infection and disease and linked to health services were included. Adherence was assessed based on the record of doses observed, the regularity of video submissions, and follow-up throughout TB treatment. Data were analyzed using descriptive statistics, with calculation of absolute and relative frequencies for adherence indicators and treatment outcomes.
RESULTS
Of the 78 migrants included in the VDOT follow-up, 61.5% (n=48) showed good acceptance of the strategy, progressing to completion of treatment; 2.6% (n=2) discontinued treatment; 34.6% (n=27) were undergoing treatment during the evaluation period, and 1.3% (n=1) were transferred to another country.
CONCLUSIONS
VDOT proves to be a promising strategy for monitoring TB treatment in migrants, promoting therapeutic adherence, improving the quality of care provided, and reducing barriers to access to health services in vulnerable populations, in addition to highlighting the potential of digital technologies as auxiliary tools in monitoring care and strengthening health services.These findings support the feasibility of VDOT as a complementary strategy within tuberculosis control programs, particularly in contexts involving migrant and other vulnerable populations.

Digital health and its impacts on the access of minority groups to primary care: a systematic review

Gabriel Ricardo Fernandes[1], Gabriela de Oliveira Laguna Silva[2], Jacqueline Castro da Rocha[2], Gabriela Tizianel Aguilar[2], Isadora D'Avila Lottici[2], Andressa Dutra Dode[2], Felipe Cezar Cabral[3], Taís de Campos Moreira[2], Maria Eulália Vinadé Chagas[2]
[1]School of Public Health, University of São Paulo, São Paulo, Brazil, [2]Department of Social Responsibility, Moinhos de Vento Hospital, Porto Alegre, Brazil, [3]Department of Digital Health, Moinhos de Vento Hospital, Porto Alegre, Brazil

INTRODUCTION
Health inequities driven by social determinants persist globally1. In Brazil, primary care and digital health tools may reduce disparities among marginalized groups, though implementation challenges remain and evidence is limited2, 3. To identify digital interventions applied in the context of primary health care (PHC) and assess their impact on access to health care by minority population groups.
METHODS
We performed a systematic review of randomized clinical trials evaluating digital interventions in PHC settings, with health care access as the primary outcome. Searches were carried out in the PubMed, Scopus, and LILACS databases up to January 2025, with no restrictions regarding language, country, or year. The interventions were further analyzed using the PROGRESS-Plus framework to identify the social vulnerability markers addressed in the studies4.
RESULTS
Six studies were included5-10, all conducted in the United States, focusing on populations vulnerable due to race (Black and Hispanic/Latino individuals), gender (women), education level (individuals with low educational attainment), and socioeconomic status (low-income individuals). Most participants (adults aged 30 to 60 years) were overweight or obese and had chronic comorbidities. In all studies, digital solutions were integrated into interprofessional practices involving dietitians, nurses, pharmacists, physicians, and/or psychologists, and were successful in improving clinical outcomes and expanding access to care. However, barriers related to digital and health literacy were reported, as well as difficulties using digital tools, particularly among participants with lower educational levels.
CONCLUSIONS
Realizing the equity potential of digital interventions requires overcoming barriers such as limited literacy, low connectivity, and social inequality through participatory design approaches and public policies guided by principles of social justice5-10.

Strengthening Brazil's Unified Health System through digital health strategies for traditional Amazonian communities

Lia Ferreira da Silva[1], Mickela da Silva Souza Costa[1]
[1]Fundação Amazônia Sustentável, Manaus, Brasil

ABSTRACT
The Brazilian Amazon plays a critical role in global environmental sustainability, yet the well-being of the populations who inhabit and protect this territory remains largely overlooked. These populations face persistent structural inequalities in access to Primary Health Care (PHC), driven by social invisibility, geographic barriers, territorial isolation, limited state presence, and constrained public service provision. Such challenges are exacerbated by long river distances, climatic seasonality, extreme weather events related to climate change, and population dispersion across remote areas. In this context, this study examines initiatives aimed at strengthening Brazil's Unified Health System (SUS) through the integration of PHC and digital health strategies in traditional Amazonian communities. The initiative seeks to expand access to health services by strengthening physical and digital infrastructure, organizing care pathways for both in-person and telehealth services, identifying technical gaps in the health workforce, and enhancing PHC governance. The intervention is guided by participatory approaches and by the adaptation of strategies to local sociocultural and territorial contexts, through partnerships involving civil society organizations, philanthropic institutions, health authorities, and environmental agencies. This study adopts an experience-report design based on the systematization of data from technical and managerial monitoring processes, including technical documents, monitoring reports, interinstitutional meetings, and workforce training activities. Preliminary findings indicate improvements in interinstitutional governance arrangements and strengthened social participation, with active engagement of community leaders in priority setting and contextual adaptation of strategies. Advances were also observed in the organization of PHC work processes and in territorial readiness for the integration of digital health strategies. The integration of PHC and digital health, supported by collaborative governance and community participation, demonstrates strong potential to reduce territorial health inequalities and enhance the resilience and sustainability of health systems in remote Amazonian contexts.

ABS3246

Developing and testing automated Interactive reminders for cervical cancer screening and chronic disease follow-up in Brazilian primary care

Gabrielle Arruda[1,2], Isabela Santos[1], Bernardo Baron[3], João Cavalcante[3]
[1]Product development - Messaging, ImpulsoGov, São Paulo, Brazil, [2]Universidade Federal do ABC, São Paulo, Brazil, [3]Monitoring and Evaluation, ImpulsoGov, São Paulo, Brazil

BACKGROUND
Gaps in preventive care remain a challenge in Brazil's Unified Health System. We developed automated WhatsApp reminders and evaluated them through a process that combined qualitative research, pilot testing, and a randomized controlled trial.
METHODS
The intervention was developed in two phases. Phase 1 consisted of a pilot study including semi-structured interviews with primary care users guided by the COM-B model (Behavior Change Framework), followed by implementation and quantitative assessment in 4 municipalities, alongside qualitative interviews with Primary Health Care (PHC) professionals. Phase 2 was a cluster-randomized controlled trial conducted in 12 municipalities. Reminders were sent to women aged 25–64 years overdue for cervical cancer screening and to adults with hypertension and/or diabetes overdue for follow-up. Outcomes were measured using electronic PHC records.
RESULTS
In the pilot phase, completion of cervical cancer screening increased from 1.3% in the control group to 2.6% (OR: 2.14 [95% CI: 1.23-3.70]) with reminders that included scheduling, and 3.1% (OR 2.52 [1.47-4.32]) with reminders without scheduling. No relevant differences were observed for chronic disease follow-up. PHC professionals reported high satisfaction with the intervention and perceived workflow benefits. In the randomized trial, reminders non-significantly increased cervical cancer screening (OR: 1.25 [0.63-2.48]) and chronic care follow-up (OR: 1.24 [0.81, 1.90]). Positive framing improved cervical screening completion, whereas messages including video reduced uptake. Qualitative findings highlighted barriers such as fear of scams, low literacy, and frequent changes in phone numbers.
CONCLUSIONS
Automated message reminders are feasible to implement within PHC systems, but their effectiveness is constrained by data quality and contextual barriers. Iterative testing informed product development and highlighted the need for institutional endorsement, accessible message formats, and continuous updating of contact information to enhance reach and impact.

Digital Technologies and Health Inequalities in Tuberculosis Care: An Analysis of Institutional Processes in the Implementation of Video Directly Observed Therapy with a Focus on Equity and Health System Sustainability

Tatiana Ferraz de Araújo Alecrim[1], André Luiz Teixeira Vinci[1], Nathalia Zini[1], Vinicius de Paula Pereira[1], Carolina Nogueira Gomes[1], Yan Yan Mathias Alves[1], Pedro Fredemir Palha[1], Rubia Laine de Paula Andrade Gonçalves[1], Isadora Menezes Caldeira de Oliveira[1], Lorenza Moura Barbosa[1], Vitor Alexandre Dias da Silva[1], Mariana Gaspar Botelho Funari de Faria[1], Luciana Aparecida Fabriz[2], Luz Maria Hughes Palma[1], Fabiana Costa Machado Zacharias[1], Silvia Helena Valente[1], Aline Aparecida Monroe[1], Ione Carvalho Pinto[1], Jaqueline Garcia de Almeida Ballestero[1], Ricardo Alexandre Arcêncio[1]
[1]University of São Paulo at Ribeirão Preto College of Nursing, Ribeirão Preto, Brazil, [2]State University of Western Paraná, Foz do Iguaçu, Paraná, Brazil, Foz do Iguaçu, Brazil

INTRODUCTION
Tuberculosis (TB) remains a major public health challenge in Brazil, strongly associated with social and structural inequalities affecting diagnosis, continuity of care, and treatment adherence, particularly in Primary Health Care (PHC). Digital health technologies, such as Video Directly Observed Therapy (vDOT), can expand and flexibilize care, optimize supervision, and reduce costs. However, social and digital inequities limit access and adherence, requiring complex institutional processes, including workflow reorganization, technological infrastructure, governance, interinstitutional coordination, and workforce training.
OBJECTIVE
To analyze the institutional processes involved in adopting digital technologies for TB care, emphasizing equity, inclusion, sustainability, and health system resilience.
METHODS
An analytical study was conducted in eight municipalities in São Paulo, Brazil, integrating observation of institutional processes related to vDOT implementation and interviews with patients, health managers, and professionals. The analysis focused on implementation, care workflow reorganization, institutional agreements, intersectoral negotiation, training, technological infrastructure, and digital access.
RESULTS
vDOT implementation revealed complex institutional and operational barriers, requiring interinstitutional coordination and negotiation across multiple management levels. TB had low prioritization, associated with limited awareness among managers and professionals. Inequities in digital devices, connectivity, and literacy negatively impacted adherence. Successful strategies included strengthening patient-provider relationships, integrating PHC and local management, targeted training, and contextualized technology adaptation, contributing to resilience, sustainability, and local governance strengthening.
CONCLUSIONS
vDOT can reinforce PHC and improve TB treatment adherence; however, its effectiveness depends on institutional context, governance, infrastructure, integration across care levels, and qualified teams. Ensuring TB prioritization, reaching vulnerable populations, and minimizing treatment interruptions require comprehensive institutional and systemic support.

Unsupervised, Personalized, and Interpretable Activity Recognition and Anomaly Detection in a Real-World Smart Home

Plinio Morita[1], Kang Wang[1], Ashish Saragadam[1], Jasleen Kaur[1], Yazan Mahmoud[2], Dan Istrate[2]
[1]School of Public Health Sciences, University of Waterloo, Waterloo, Canada, [2]Department of Bio-Mechanics and Bio-Engineering, University of Technology of Compiègne, Compiegne, France

INTRODUCTION
Ambient Assisted Living (AAL) research frequently contends with limitations,

including a reliance on supervised data, a lack of personalization and interpretability, and evaluations in artificial laboratory settings. These challenges hinder real-world deployment by requiring burdensome data labelling and failing to capture individual-specific routines. The primary study aim was to use low-cost, multi-modal sensors for long-term, real-world activity recognition (cooking, couch-sitting, showering) and behavioural anomaly detection in a genuine home environment.
METHODS
A multi-modal sensor network, including contact, vibration, smart outlet, and air quality sensors, was deployed in a single participant's apartment for over 90 days, ensuring high ecological validity. Primarily unsupervised machine learning techniques were employed. K-means clustering, validated by the Silhouette Coefficient, was used to identify appliance states (for cooking) and to cluster bathroom events (showering). Isolation Forest models were used to detect personalized behavioural deviations in each room. These models were augmented with interpretability methods (SHAP values) to explain anomaly flags. A minimally supervised Random Forest, evaluated using Accuracy, Precision, Recall, and F1-score, was also compared.
RESULTS
The unsupervised K-means clustering for appliance states showed high cluster separation (e.g., Silhouette Scores > 0.93) and high fidelity (e.g., >99.6% agreement). The unsupervised shower model achieved a Silhouette Score of 0.867 and 99% accuracy. In comparison, the minimally supervised Random Forest model (trained on ~20 days of data) achieved 99.8% accuracy and an F1-score of 0.989. The system effectively identified interpretable anomalies, such as abnormally long non-shower bathroom stays (over 60 minutes), atypical late-night bedroom activity, and unusually long cooking durations.
CONCLUSIONS
This study confirms the feasibility of leveraging unsupervised, interpretable methods with affordable, non-intrusive sensors for personalized and ecologically valid AAL. By providing clear, human-readable explanations for detected anomalies, the system enhances trustworthiness, addressing a key barrier to AAL adoption.

Harnessing Artificial Intelligence for a Healthier Future: Applications in Public Health

Vina HuLamm[1]
[1]American Public Health Association, Washington/DC, United States

ABSTRACT
As artificial intelligence (AI) becomes increasingly embedded in health care systems, its role in shaping public health strategies is more vital than ever. This panel discussion explores the transformative potential of AI in addressing critical challenges in public health. Experts from diverse fields — including epidemiology, data science, health care policy, and technology — will examine how AI is being used to enhance disease surveillance, improve health outcomes, optimize resource allocation, and advance health equity. The session will highlight real-world case studies, discuss ethical considerations, and identify opportunities for cross-sector collaboration. Attendees will gain insights into the current landscape and future directions of AI in public health, empowering them to navigate and contribute to this rapidly evolving field. This session is proposed as a panel discussion (ie "fireside chat" with a facilitated dialogue and audience Q&A). Invited speakers are in the process of being identified and are pending final confirmation for inclusion in this session proposal.
Popul. Med. 2026;8(Supplement 1):A914

ABS3428
Mapping Global Cybersecurity Policies in Healthcare in WHO Member States and their alignment to the WHO Digital Strategy, the National Institute of Standards and Technology and the WHO Health Systems Frameworks.

Mhlengi Vella Ncube[1], Inge Kleinhans[1], Lerato Pitso[1]
[1]Health Policy and Research, South African Medical Association, Pretoria, South Africa

INTRODUCTION
Evidence-based decision-making is imperative for health system planning, a process largely informed by health information. The global movement towards Universal Health Coverage (UHC) relies heavily on robust information systems and effective data management. However, the healthcare industry's reliance on these digital assets has positioned it as one of the largest targets of cyber-attacks, threatening patient data integrity and continuity of care.
OBJECTIVES
This study aimed to systematically describe the landscape of existing cybersecurity policies within the health sectors of WHO Member States. The core objective was to identify similarities, critical differences, and fundamental gaps in data protection strategies and cybersecurity governance to support the implementation of UHC worldwide.
METHODS
A scoping review was conducted to map the extent and nature of cybersecurity in health policies. The review involved a comprehensive search across governmental and intergovernmental websites, academic databases (including PubMed, Scopus, Web of Science, and CINAHL), and grey literature published between 2013 and 2023. Policy documents were subjected to thematic content analysis and mapped against the WHO Digital Strategy, the NIST Framework, and the WHO Health Systems Frameworks.
RESULTS
The findings indicated that only 31 (16%) of 194 WHO Member States possess dedicated national cybersecurity policies specific to the health sector. Existing policies predominantly emphasise administrative controls but show significant deficiencies in technical and physical controls. Furthermore, alignment with the NIST framework was weak, and integration across the six WHO Health Systems Framework building blocks was inconsistent, neglecting workforce training and financing.
CONCLUSIONS
The widespread absence of dedicated cybersecurity in health policies among WHO Member States constitutes a major risk to global UHC and digital health transformation. This review highlights the urgent necessity for a harmonised, globally applicable framework to guide countries in developing robust, integrated cybersecurity policies, thereby safeguarding health information systems and enabling digital health implementation worldwide.

ABS3448
Overcoming Systemic Barriers to Telehealth Implementation in the Brazilian Public Health System: The Experience of a University-Based Digital Health Hub

Paulo Bandiera-Paiva[1], Lidiane Cristina da SIlva[2], Gabriel Vianna Brasil de Rezende Carvalho[3], Thiago da Silva Domingos[4], Claudia Fegadolli[4]
[1]Health Informatics Department, Universidade Federal de São Paulo, São Paulo, Brazil, [2]Information Technology Superintendency, Universidade Federal de São Paulo, São Paulo, Brazil, [3]Department of Planning and Analysis and Control Unit, Prefeitura da Estância Turística de Embu das Artes, Embu das Artes, Brazil, [4]Digital Health Hub, Universidade Federal de São Paulo, São Paulo, Brazil

BACKGROUND
Telehealth expansion in low- and middle-income countries faces persistent technical, organizational, and regulatory challenges. In Brazil's Unified Health System (SUS), fragmented information systems, infrastructure limitations, and workforce constraints hinder the sustainable integration of digital health into routine care. This study presents the experience of a university-based Digital Health Hub in addressing these barriers through coordinated technological and institutional strategies (2-3). To analyze systemic challenges to telehealth implementation in public health services and to describe the strategies planned for adoption by a Digital Health Hub to promote sustainable and scalable solutions within the SUS.
METHODS
Qualitative, descriptive implementation study conducted in 2025, the first year of activities. Data were collected through document analysis, technical reports, system logs, and meeting records. Thematic analysis identified barriers and enabling factors related to telehealth deployment.
RESULTS
Key challenges included limited interoperability, constrained connectivity, insufficient digital literacy among health professionals, fragmented governance structures, and regulatory uncertainties. Integration with Brazil's Primary Care Information System (e-SUS APS) was especially challenging: teleconsultation tools often failed to interface with local electronic medical records, forcing parallel data entry and reducing adherence to digital workflows. The Digital Health Hub planned response includes developing an integrated teleconsultation platform, implementing standards-based interoperability layers and data pipelines to enable structured exchange with e-SUS APS; providing continuous professional training; and establishing governance mechanisms to improve coverage, stability, and user experience.
CONCLUSIONS
The Digital Health Hub model implemented by UNIFESP highlights the role of academia in adapting global technological solutions to local realities. This

university-based approach has proven effective in overcoming systemic barriers in the SUS, establishing a replicable framework for other Brazilian states and low- and middle-income countries. By aligning technological development with professional training and institutional governance, UNIFESP ensures that digital health innovation is effectively translated and sustained in resource-limited public health settings.

Implementation and Evaluation of Syphilis Telemonitoring in Primary Health Care: An Innovative Approach to Public Health Management

Danielle Satie Kassada[1], Ana Carolina Souza Peratelli[1], Guilherme Coelho[1], Leonardo Dresch Eberhardt[1], Igor Lima Peixoto Rocha[1], Larissa Marques Suardi[1], Alex Sandro Freitas Costa[1], Kelle Cristina Costa Araújo[1], Paulo Gabriel Batalha da Silva[1], João Victor Matias de Oliveira[1]
[1]Universidade Estadual de Campinas, Campinas, Brasil

BACKGROUND
Syphilis remains a major public health problem in Brazil, despite the availability of effective diagnostic tools and treatment1,2. Persistent weaknesses in longitudinal follow-up, health education activities, and care network coordination contribute to the continued transmission of the infection, particularly within Primary Health Care (PHC)3-6. In this context, the use of digital health strategies, such as telemonitoring and telenursing, has emerged as a potential approach to enhance care management and expand access to health services6-8.
METHODS
This study is a narrative and exploratory literature review conducted through searches in the PubMed, LILACS, and SciELO databases, with support from the Virtual Health Library and the CAPES Journals Portal. Scientific articles and institutional documents published over the last ten years, in Portuguese and English, addressing the use of telemonitoring and telenursing in the context of Primary Health Care were included.
RESULTS
The analyzed studies revealed persistent challenges in syphilis control within Primary Health Care, including failures in clinical follow-up, difficulties in treatment adherence, insufficient educational actions, and limitations in active partner notification and follow-up9-12. The incorporation of telemonitoring, particularly intensified during the COVID-19 pandemic, enabled remote patient follow-up, clinical guidance, and health education activities, contributing to improved continuity of care and strengthening the relationship between users and health services13-16. However, challenges related to digital infrastructure, inequalities in access to technology, and the need for professional training were also identified14,17-19.
CONCLUSIONS
Telemonitoring represents a promising strategy to enhance care management for people with syphilis in Primary Health Care by promoting continuity of care and expanding access to health services. Nevertheless, its effective implementation requires investments in digital infrastructure, professional capacity-building, and the strengthening of public health policies within the Brazilian Unified Health System.

Developing and Evaluating Chatbots for Health: To Bot or Not to Bot?

Simone Storey[1], Lucia Knight[1]
[1]School of Public Health, University of Cape Town, Cape Town, South Africa

ABSTRACT
A chatbot can be a powerful tool to share accurate, non-judgmental, and private information about many different health topics. There are various chatbots already making a difference in improving access and strengthening health systems. How do you develop a chatbot? How do you even know if you should be developing one? These are the questions that we will answer in this workshop as we take you through the steps of deciding if a chatbot makes sense to achieve your goals, how to develop one, and, very importantly, how to evaluate if it's reaching your target population and having a positive impact. Developing a chatbot can sound intimidating, but it doesn't have to be! You can use platforms that offer no-code tools to build conversation flows or work with a developer or tech partner. We'll take you through the steps of developing a prototype, training an AI model, and improving your chatbot through iterative user testing. Evaluating the impact of your chatbot is key to understanding how well it is working, but you don't need to design a whole RCT! There are various levels of evaluation, and we will take you through the basic, intermediate, and comprehensive options. We will go through examples of some important variables to evaluate and what these look like at each level, including reach, engagement, knowledge, behaviour change, and satisfaction. By the end of this session, we hope you will have a clearer idea of how a chatbot might be useful in your context, what steps you can take to develop one, and how you can evaluate it. We will be guiding you through the planning process, so you will benefit most if you come with an idea for a chatbot and/or a target population in mind.

Inclusive Digital Health in Primary Health Care: Bridging Governance, Education, Provision of Health Service, and Social Participation

Marcelo Fornazin[1], Bruno Elias Penteado[2], Nathalie Pontes Azevedo[3], Fabiana Dias[3], Carlos Augusto Ferreira de Andrade[4], Daniel Sauvignon Marinho[4], Cleber Carmo[4]
[1]Department of Health Administration and Planning, Oswaldo Cruz Foundation (Fiocruz), Rio de Janeiro, Brazil, [2]Computing Department, São Paulo State University, São Paulo, Brazil, [3]Office of Fiocruz Strategy for the Agenda 2030, Oswaldo Cruz Foundation (Fiocruz), Rio de Janeiro, Brazil, [4]Department of Epidemiology and Quantitative Methods, Oswaldo Cruz Foundation (Fiocruz), Rio de Janeiro, Brazil

INTRODUCTION
Digital Health has emerged as a strategic field for mediating healthcare through Information and Communication Technologies (ICTs), guided by the WHO Global Strategy on Digital Health and the pursuit of universal health coverage. However, its effectiveness in Primary Health Care (PHC) depends on addressing persistent digital divides. This study systematizes reflections from the workshop "Digital Inclusion as a Guiding Principle for Inclusive Digital Health in Primary Health Care", held during the XVIII Latin American Congress of Social Medicine and Collective Health (ALAMES, 2025). The analysis examines digital inclusion as a structural determinant of equity in health mediation within Latin American contexts.
METHODS
This experience report adopts a participatory and dialogical approach, engaging actors from academia, health governance, service delivery, and social movements. A qualitative systematization of collective reflections was conducted, focusing on challenges within Brazil's Unified Health System (SUS), particularly in PHC. The analysis was organized around key dimensions: infrastructure and connectivity; digital literacy; strategies to address misinformation; governance of health data as a public good; and the development of a secure and democratic digital ecosystem.
RESULTS
Findings indicate that inclusive digital health in PHC requires coordinated, multi-level actions beyond technological deployment. Priority areas include expanding universal connectivity, ensuring interoperability of health information systems, and strengthening digital skills among professionals and citizens. The study highlights the importance of territorial specificities and social participation to prevent top-down technological approaches. Persistent structural inequalities remain the main barrier, reinforcing digital access as a fundamental component of the right to health.
CONCLUSIONS
Digital transformation in health must go beyond technology, addressing structural inequities, valuing territorial knowledge, and strengthening democratic governance. Social participation is essential to ensure that digital health advances equity and supports universal health systems.

ABS3517
The association between digital health technology utilization and health worker well-being at selected general hospitals in Uganda

Michael Kakinda[1], Brenda Nakimuli[1], Henry Ijjo[1], Raymond Tweheyo[1], Freddie Ssengooba[1]
[1]Department of Health Policy Planning and Management, Makerere University School of Public Health, Kampala, Uganda

BACKGROUND
Digital health technologies (DHTs) have the potential to improve hospital performance. However, their association with health worker well-being, which is the likely mechanism to hospital performance, has not been adequately explored. We hence set forth to assess the relationship between DHTs utilization and health worker wellbeing at selected general hospitals in Uganda.
METHODS

A cross-sectional study was conducted at five purposively selected general hospitals in Uganda from 29th September- 24th October 2025. The health care workers who consented had their socio-demographics taken. They were requested to rate their utilization and intensity of DHTs, their quality of life, mental health, physical health and their job satisfaction using a Likert scale (0-very bad-10 very good). Data were collected via REDCap and analyzed using Stata 17. Multivariable linear regression was used to examine associations between DHT utilization and well-being.
RESULTS
A total of 596 health care workers participated in the study. They were predominately female (60.9%), with a median age of 30 years (IQR 17). Their perceived mean use of DHTs was 6.5 (SD=2.3). They used electronic medical records (86.4%), Clinical decision support tools (58.3%), Telemedicine (42.4%), eLearning (45.0%), Computer-aided-diagnosis (51.8%), AI tools (30.7%), WhatsApp/Google Groups (76.6%) and Point -of-care Ultrasound (38.4%). Higher DHT utilization was significantly associated with better physical health (β = 0.30; 95% CI: 0.15 to 0.45; p < 0.001) and increased job satisfaction (β = 0.21; 95% CI: 0.10 to 0.32; p < 0.001). However, quality of life (β = 0.13; 95% CI: -0.02 to 0.28, p = 0.085) and mental health (β = 0.05; 95% CI: -0.19 to 0.09, p = 0.497) were not statistically significant.
CONCLUSIONS
Utilization of DHTs was associated with better physical health and job satisfaction. This is likely to be a pathway to improved individual health worker performance and eventually hospital performance.
Popul. Med. 2026;8(Supplement 1):A932

ABS3529
The determinants of digital health technology utilization among health workers at selected general hospitals in rural Uganda

Michael Kakinda[1], Brenda Nakimuli[1], Henry Ijjo[1], Raymond Tweheyo[1], Freddie Ssengooba[1]
[1]Department of Health Policy Planning and Management, Makerere University School of Public Health, Kampala, Uganda

BACKGROUND
Digital health technologies (DHTs) are increasingly being adopted to improve efficiency, effectiveness, quality of care and access to health services. However, there is a paucity of data on the determinants of DHTs utilization among health workers in rural settings in sub-Saharan Africa. We, therefore, set out to examine the determinants of DHT utilization among health workers at selected general hospitals in Uganda.
METHODS
We conducted a cross-sectional study at five purposively selected general hospitals in Uganda between 29th September -24th October 2025. 2025. Their social demographics were taken, and they rated their utilization of DHTs (1-very poor-10-very good), their perceived professional support, autonomy and workload. Data were collected using REDCap and analyzed in Stata 17. Multivariable linear regression was used to identify factors associated with DHT utilization.
RESULTS
A total of 596 health workers participated; 60.9% were female, with a median age was 30 years (IQR: 17). The mean self-rated DHT utilization score was 6.5 (SD: 2.3). Utilization was significantly lower among health workers aged over 50 years (β = −1.04; 95% CI: −1.60 to −0.47; p < 0.001), males (β = −0.57; 95% CI: −1.00 to −0.15; p = 0.008), and those reporting heavy workloads (β = −0.52; 95% CI: −0.98 to −0.05, p = 0.028). Higher utilization was associated with greater perceived professional support (β = 0.19; 95% CI: 0.08 to 0.29; p < 0.001), autonomy (β = 0.12; 95% CI: 0.01 to 0.23; p = 0.029), and access to internet services (β = 0.50; 95% CI: 0.52 to 1.03; p = 0.030).
CONCLUSIONS
Therefore, when developing or scaling up DHTs, it is vital that you consider the age of the intended user, their perceived workload or how the technology will affect their workload, the internet access and the support structure (how will they receive continuous support).

ABS3562
Implementing digital health innovations for tuberculosis treatment in real-world settings: operational insights from São Paulo state, Brazil

André Luiz Teixeira Vinci[1], Vinicius de Paula Pereira[1], Nathalia Zini[1], Carolina Nogueira Gomes[1], Yan Mathias Alves[1], Luz Maria Hughes Palma[1], Ana Paula Cortes de Oliveira Sorbo[1], Fabiana Costa Machado Zacharias[2], Luciana Aparecida Fabriz[3], Sérgio Moacir Fabriz[3], Silvia Helena Valente[4], Rubia Laine de Paula Andrade[1], Jaqueline Garcia de Almeida Ballestero[1], Tatiana Ferraz de Araújo Alecrim[1], Ione Carvalho Pinto[1], Ricardo Alexandre Arcêncio[1]
[1]Ribeirão Preto College of Nursing, University of São Paulo, Ribeirão Preto, São Paulo, Brazil, [2]Regional Health Department XIII, São Paulo State Department of Health, Ribeirão Preto, São Paulo, Brazil, [3]Foz do Iguaçu Campus, State University of Western Paraná, Foz do Iguaçu, Paraná, Brazil, [4]Maria Auxiliadora Campus, Salesian University Center of São Paulo, Americana, São Paulo, Brazil

BACKGROUND
Tuberculosis (TB) treatment adherence remains challenging, particularly in settings with high social vulnerability and limited health system capacity. Digital health technologies, such as Video Directly Observed Therapy (vDOT), have been recommended by the World Health Organization and the Brazilian Ministry of Health as patient-centered strategies for treatment supervision while reducing patient and service burdens. Despite favorable evidence, implementing vDOT in decentralized health systems remains challenging. This study aimed to analyze key operational barriers and facilitators to implement vDOT in municipalities in São Paulo state, Brazil.
METHODS
This pragmatic implementation study was conducted between October 2024 and January 2026 in 15 municipalities. vDOT implementation was assessed in local healthcare systems across sequential stages: municipal recruitment, formal institutional agreement, planning, workforce training, system deployment, and continuous monitoring and technical support. Periodic meetings with health managers were conducted to monitor progress, identify barriers, and adapt implementation strategies. Quantitative implementation indicators were obtained from monitoring records and the vDOT platform, and qualitative data were gathered from health professionals' feedback and meeting reports.
RESULTS
Most municipalities (73.3%, n=11) initiated vDOT, while 4 (26.7%) remained under negotiation. vDOT was integrated into 166 health services, 289 professionals were trained, and 40 TB treatments were supervised. Implementation indicators varied substantially across municipalities regarding adoption, timelines, training coverage, and system use. Moreover, monitoring showed that heterogeneity was mainly associated with differences in health system organization, local decision-making processes, workforce availability, digital infrastructure, and adaptive strategies adopted during implementation.
CONCLUSIONS
vDOT implementation revealed substantial operational challenges related to health system capacity, governance, and digital implementation readiness. Despite these constraints, the strategy proved feasible across diverse municipal contexts when supported by adaptive planning, workforce training, and sustained institutional engagement. These findings underscore the critical role of adaptive implementation strategies in enabling scalable, equitable, and sustainable digital innovations for TB control.

A Digital Health Approach to Addressing Technology-Facilitated Gender-Based Violence and Mental Health Support in India

Satviki Varma[1], Kavita Ayyagari[1]
[1]Programmes, Girl Effect, Gurugram, India

INTRODUCTION
India's rapid digital expansion has intensified technology-facilitated gender-based violence (TFGBV), disproportionately affecting adolescent girls and young women. TFGBV is linked to adverse mental health outcomes, including anxiety, stress, social withdrawal, and reduced digital participation. Despite cybercrimes against women accounting for nearly 30% of all reported cybercrimes, awareness of online safety, reporting mechanisms, and support services remains limited. Only one in ten girls knows how to report online abuse, highlighting critical gaps in access to mental health–linked support and digital health information.
METHODS
Girl Effect India (GEI) implemented a population-level digital health support ecosystem combining a unified Interactive Voice Response (IVR) helpline and an AI-enabled WhatsApp chatbot. The IVR provides a confidential, stigma-free entry point with guided information on online safety, digital rights, and support options, routing callers to vetted partner organisations. Rapid, user-centred iteration introduced age-based routing to safeguard minors, an information layer to support decision-making, and call-blocking features to mitigate misuse. Complementing the IVR, Bol Behen, GEI's AI-enabled WhatsApp chatbot for adolescent girls and young women (18–24), integrated TFGBV-specific chatflows to support harm recognition and referrals.
RESULTS
The ecosystem demonstrated strong demand for confidential support. Digital

outreach generated 15,873 engagements, resulting in 4,786 incoming IVR calls, of which 492 were successfully connected to partner services. Age-based routing and call-blocking reduced operational disruptions, while the chatbot enabled multilingual, anonymous access to TFGBV-related mental health information, with user testing indicating improved clarity and perceived safety.
CONCLUSIONS
Combining IVR and AI-enabled chatbot platforms can lower barriers to mental health–linked support for adolescent girls and young women experiencing TFGBV. By integrating accurate health information, safeguarded referral pathways, the model supports earlier help-seeking and strengthens linkages between digital engagement and offline services. This scalable digital health approach offers a solution for addressing online harm and its mental health consequences.

ABS3705
iGOGO: bridging the digital divide by addressing the grey divide
Hlumelo Gxotiwe[1], Jane Simmonds[1]
[1]goGOGOgo, Johannesburg, South Africa
INTRODUCTION
The covid-19 pandemic accelerated the digitisation of public services and communication. While households with fixed internet and smart devices had the means to adapt, for families with limited resources, internet access became a barrier to education and critical information systems. In South Africa, nearly 8.4 million children aged 0-17 are being raised in 3.4 million grandparent-headed households, with 64.5% headed by grandmothers, locally known as gogos. In these households, older caregivers mediate access to e-learning and online resources for school-aged children. iGOGO provides grandmothers with both digital skills training and smart devices to enhance internet access and support the digital inclusion of school-aged grandchildren.
METHODS
iGOGO provides basic information communication technology (ICT) training and devices to grandmothers aged 60+ who are primary caregivers to school-aged children in under-resourced communities. Participants learn foundational internet skills through a two-week digital literacy course, which covers online communication, safe browsing, email, e-hailing, online shopping, cybersecurity practices and e-learning over 20 sessions. Participants receive a tablet for training, which they keep upon graduation to facilitate online learning and internet access for grandchildren at home.
RESULTS
Participants demonstrated increased knowledge and confidence in using the internet throughout training. Graduates demonstrated a range of advanced skills in follow-up sessions as tablet use increased knowledge and confidence over time. Grandchildren expressed excitement at being able to access digital programmes and education portals to supplement their schoolwork, and praised the example their grandparents set as older learners.
CONCLUSIONS
With the right resources, grandmothers can help bridge the digital divide for their grandchildren, enabling their participation in online learning. Although children today are more readily exposed to the internet, digital literacy is not enough. Adequate technology and caregiver support are key to ensuring fair and sustainable access to the virtual classroom.

ABS3762
Cancer surveillance gaps and data fragmentation in middle-income health systems: lessons from South Africa
Noluthando Ndlovu[1], Andrew Gray[2], Ntombifuthi Blose[1], Matome Mokganya[1]
[1]Research and Implementation Science, Health Systems Trust, Durban, South Africa, [2]Discipline of Pharmaceutical Sciences, University of KwaZulu-Natal, Durban, South Africa
INTRODUCTION
Cancer is an increasing contributor to morbidity and mortality globally, yet in many low- and middle-income countries, weak surveillance systems limit the ability to monitor trends, guide policy, and evaluate progress in cancer control. South Africa, with its dual health system and high burden of communicable and non-communicable diseases, provides a useful case study to examine how data limitations constrain effective cancer planning and equity-oriented responses.
METHODS
This analysis synthesised cancer-related indicators from multiple data sources, including the National Cancer Registry, routine health information systems, national surveys, and international databases such as GLOBOCAN. Indicators were assessed for completeness, timeliness, population coverage, and alignment with service delivery, financing, and equity dimensions across provinces and population groups.
RESULTS
While cancer incidence and mortality data are available from several sources, major surveillance gaps persist. National registry data are delayed and largely limited to pathology-confirmed diagnoses, excluding clinically or radiologically diagnosed cases, particularly in underserved settings. Routine health information systems capture service activity but lack comprehensive outcome and stage-at-diagnosis indicators. COVID-19-related disruptions further exposed system fragilities, with sharp declines in cancer diagnostics and uneven recovery across provinces. Significant inequities were observed between public and private sectors, across provinces, and among populations affected by HIV, undermining the accuracy of national cancer burden estimates and masking disparities in access to prevention, screening, and treatment.
CONCLUSIONS
Effective cancer control requires integrated, timely, and equity-sensitive surveillance systems. South Africa's experience highlights the need to strengthen cancer registries, expand reporting beyond pathology-based diagnoses, improve interoperability between routine and registry data, and embed cancer indicators within broader health system monitoring frameworks. These lessons are transferable to other middle-income countries seeking to strengthen cancer surveillance as part of universal health coverage and non-communicable disease strategies.
Popul. Med. 2026;8(Supplement 1):A947

ABS3797
Digitalizing community health workers: learnings on the drivers of impact from a narrative review of digital health programs
Chimwemwe Chibambo[1], Naomi Chitsa[1], Luyanduthando Mqadi[1], Jill Olivier[1], Kerry Scott[2], Diwakar Mohan[3], Amnesty LeFevre[1]
[1]Health Policy and Systems, University of Cape Town School of Public Health, Cape Town, South Africa, [2]Global Health, York University, Toronto, Canada, [3]International Health, Johns Hopkins Bloomberg School of Public Health, Baltimore, United States
INTRODUCTION
Community health workers (CHWs) are central to primary health care delivery in low- and middle-income countries (LMICs), yet program effectiveness varies widely. Digital health interventions have been introduced to strengthen CHW performance, improve service delivery, and enhance health system integration. However, evidence on how and under what conditions digitalization produces impact remains fragmented. This review synthesizes evidence on digital health interventions targeting CHWs in LMICs to identify key drivers, mechanisms, and contextual factors influencing service delivery, care-seeking, health outcomes, and CHW performance.
METHODS
This narrative review builds on a prior systematic review of digital health interventions for reproductive, maternal, newborn, and child health (RMNCH). Twelve high-quality CHW-focused digital health programs implemented across eight LMICs were identified. Targeted searches yielded 59 additional publications linked to these programs, resulting in 16 randomized controlled trials, cluster randomized trials, or quasi-experimental studies. Data were extracted on CHW program context, digital intervention design, health system integration, digital access and use, and outcomes. Evidence was synthesized thematically to examine pathways through which digital interventions influenced impact.
RESULTS
Evidence from 12 programs across Asia and Africa indicates that digitalization can improve CHW performance, service delivery quality, and selected health behaviors. However, effects were inconsistent and highly context-dependent. Variation in CHW program design, digital tool functionality, and implementation support limited comparability across studies. Persistent challenges related to system integration, sustainability, and inequities in digital access were common and constrained observed impact.
CONCLUSIONS
Digital health interventions can strengthen CHW performance and selected RMNCH outcomes, but impact depends heavily on foundational program design, integration with health system processes, and sustained support. Digitalization should be understood as a process of health system strengthening rather than a standalone technical solution.

Between platforms and practices: a critical analysis of digital

health from the perspective of education and communication in the Brazilian Unified Health System (SUS)

Marcele Paim[1], Samilly Miranda[1], Luis Eugênio Souza[1], Marcio Natividade[1], Bruno Olivatto[1]
[1]Instituto de Saúde Coletiva, Universidade Federal da Bahia, Salvador, Brazil

ABSTRACT
Digital health is systematically presented as synonymous with technological tools that optimize services, expand access, and automate clinical and administrative processes. However, it should be observed as a socio-technical, political, and symbolic phenomenon, shifting the focus from the technology itself to the ways in which it reorganizes practices, knowledge, relationships, and ways of doing health. This study analyzed the development of new digital ecosystems, the role of networks and artificial intelligence in public health systems, from the perspective of the interface between education, communication, and digital health. The qualitative approach, through a case study, included the documentary analysis of the content of digital health courses offered remotely to professionals of the Brazilian Unified Health System (SUS). The results reveal a critical perspective on the course content, which underlines the risks of technological dependence and increased inequalities. These risks arise when digital health is seen only as the importation of global solutions, without a national project guided by principles of equity and sovereignty in health. On the other hand, educational materials also present initiatives with other forms of technology use, such as community data networks, like those created by indigenous peoples for environmental and health monitoring in traditional territories; social technology projects, such as applications co-created by community health agents; and the creation of an application to strengthen equity policies in the Unified Health System (SUS), among others. They also discuss experiences of digitizing health systems in various countries, which mostly occur amidst historical inequalities of access, limited infrastructure, and technological dependence. In the Latin American context, this takes on specific contours. The digitization of health systems occurs amidst historical inequalities of access, limited infrastructure, and technological dependence on the Global North. The conclusion highlights the need for national projects guided by principles of equity and sovereignty in health.

Digital Mental Health: Expanding and Strengthening Mental Health Care in Primary Health

Maria Inês Badaró Moreira[1], Paula Andrea Martins[1], Luciana Togni de Lima e Silva Surjus[1], Thiago da Silva Domingos[1], Claudia Fegadolli[1]
[1]Digital Health Hub, Universidade Federal de São Paulo, São Paulo, Brasil

INTRODUCTION
This study describes a mental health program for primary care with specialized support through digital health resources. It presents a mechanism for expanding and supporting care, strengthening it with professional supervision for diagnostic qualification and non-pharmacological community interventions, with an emphasis on promoting mental health. The program aims to strengthen mental health care in primary health systems by offering epistemological resources in the construction of territorial care plans for people experiencing common mental disorders.
METHODS
report of a mental health care program as a territorial care strategy, reducing barriers to access to care and the vulnerabilities experienced by people suffering from mental distress. The starting point for care is the territory and the subject's context, since mental distress is constructed within the social body.
RESULTS
The welcoming actions are linked to training processes through tele-education, web conferences, and training paths in a set of initiatives from the Digital Health Center of the Federal University of São Paulo, Brazil, with a view to increasing the effectiveness and quality of mental health care provided by primary care teams with specialized support.
CONCLUSIONS
The Center uses different digital resources, addressing different epistemologies and practical models that facilitate the care of territorial psychological suffering, ensuring welcoming, promoting mental health, and reducing harm. The challenges of digital inclusion for those served are pressing for the search for solutions, which demand continuous monitoring of the actions and strategies employed.

ABS3868

Factors associated with risky online behaviour and lifetime online victimization among children and adolescents in Juba: A Cross-Sectional Analysis

Marcus Hollington[1]
[1]Sociology, University of Pretoria, Germiston, South Africa

BACKGROUND
Africa's rapid digital transition has increased children's online risk exposure, yet evidence from fragile states is lacking. This study examines Risky Online Behaviours (ROB) and victimization among children in Juba, South Sudan, a post-conflict setting with uneven connectivity, systemic challenges, and scarce mental health resources, heightening trauma potential.
METHODS
A cross-sectional household survey of 528 children aged 8–17 years in Juba used purposive sampling and face-to-face interviews. ROB was a composite binary measure of five interpersonal behaviours. Lifetime online victimization covered harassment, bullying, or abuse. Analysis employed descriptive statistics, univariable and multivariable logistic regression.
RESULTS
Prevalence was high: 69% engaged in at least one ROB, and 23% reported lifetime online victimization. Analyses confirmed a strong bidirectional relationship between ROB and online victimization and vice versa. Key predictors included higher education (secondary students, UOR: 7.66; p<0.001; CI: 4.09 - 14.34; AOR: 6.45; p<0.001; CI: 3.15 - 13.20 for ROB) and male gender. Educational internet use was protective (UOR: 0.44; p<0.001; CI: 0.29 - 0.67; AOR: 0.44; p<0.001; CI: 0.27 - 0.70 for lifetime online victimization), while moderate daily use of the internet (1–5 hours) increased odds (AOR=1.63) of lifetime online victimization.
CONCLUSIONS
This study provides first empirical evidence of extensive online risks for children in South Sudan, revealing a harmful cycle between behaviour and victimization. Findings urge context-specific, evidence-based interventions informed by the African Union Child Online Safety Policy. Priorities include school-based programs at key transitions, promoting positive digital engagement, and trauma-informed support in vulnerable, digitally evolving settings.

Multidisciplinary Team Practice in Digital Health for Transgender People: experience from a university-based digital health hub

RENATA RANGEL AZEVEDO[1], Renan Quinalha[1], Rosangela Chriguer[1], Thiago da Silva Domingos[1], Claudia Fegadolli[1]
[1]Digital Health Hub, Universidade Federal de São Paulo, São Paulo, Brazil, Universidade Federal de São Paulo, São Paulo, Brazil

INTRODUCTION
access to comprehensive and specialized healthcare remains uneven for the transgender population in Brazil(1), particularly in regions characterized by territorial gaps and limited professional training. Digital health strategies represent a potential approach to reduce inequities, expand access, and support healthcare teams working within the public health system.
METHODS
this study describes the formation and structuring of a digital multidisciplinary care service within the Brazilian public health system, implemented across multiple territories nationwide . The initiative focuses on strengthening professional training, facilitating user access to public health services, and enabling digital care for transgender individuals. The service offers telehealth modalities including case discussions, telediagnosis, teleconsultation, telemonitoring, teleconsulting, and teleeducation. A multidisciplinary team composed of endocrinologists, psychiatrists, gynecologists, nutritionists, psychologists, nurses, and speech-language pathologists coordinates the activities.
RESULTS
the implementation of the digital service enabled the creation of collaborative networks between specialized professionals and local healthcare teams across diverse regions of Brazil.
CONCLUSIONS
a digitally mediated multidisciplinary care model is a feasible and scalable strategy to address healthcare disparities affecting the transgender population.

AI Applications for Epidemic Preparedness in Cross-Border Contexts (IHR Perspective)

Duha Shellah[1]
[1]Public Health in Emergencies and Disasters Working Group - WFPHA, Nablus - P400, Palestinian Territory, Occupied

INTRODUCTION
AI-powered tools such as natural language processing (NLP), predictive analytics,

and open-source intelligence (OSINT) are reshaping epidemic surveillance and response. Yet their integration into International Health Regulations (IHR) core capacities remains inconsistent—especially across borders.
METHODS
This oral session will present synthesized evidence on AI use in cross-border preparedness, drawing from pilot projects, database reviews, and regional experiences in Africa, Asia, and Europe. A draft roadmap will be shared to support national and regional implementation aligned with IHR.
RESULTS
The session will explore use cases, barriers, and ethical considerations around AI integration in LMICs. It will also present frameworks for equitable digital adoption, and recommendations for regional epidemic intelligence systems.
CONCLUSIONS
AI must serve global health equity—not widen the gap. Cross-border preparedness needs intelligent, inclusive, and interoperable solutions to meet the challenges of tomorrow.

Monitoring telehealth actions in a university digital health hub: operational indicators to advance health digital transformation
Maria Gabriella Simões Alves de Oliveira[1], Rosangela Soares Chriguer[1], Thiago da Silva Domingos[1], Claudia Fegadolli[1]
[1]Digital Health Hub, Universidade Federal de São Paulo, São Paulo, Brasil
BACKGROUND
The digital transformation of health is a strategy to strengthen Brazil's Unified Health System (Sistema Único de Saúde, SUS) by expanding access, improving the quality of care, and integrating care networks. In this context, the Secretariat of Information and Digital Health (Secretaria de Informação e Saúde Digital, SEIDIGI) of the Ministry of Health, through strategic investments, has proposed the institutionalization of telehealth as a tool to support clinical care, education, and management. This report aims to describe the experience of the Digital Health Hub at the Federal University of São Paulo (Universidade Federal de São Paulo, UNIFESP) in implementing mechanisms to monitor operational indicators for telehealth actions (1-4).
METHODS
This descriptive experience report was based on an analysis of federal regulations related to telehealth, follow-up of operational indicators, and systematization of monitoring strategies developed by the UNIFESP Digital Health Hub between November 2024 and December 2025. Governance flows were analyzed, including operational procedures and institutional structure, data collection and validation processes, and strategies for capacity building and support for public health services within the public network.
RESULTS
The UNIFESP Digital Health Hub developed 18 instruments, including governance flows and operational tools, as strategies to monitor production indicators, promoting continuous team qualification and process standardization. These instruments were developed based on the SUS policy framework and the Brazilian digital health agenda, the characteristics of the partner territories, and the operational capacity of telehealth teams. Conceptual alignment and coordination with care delivery teams enabled systematic monitoring of telehealth actions within the initiative.
CONCLUSIONS
Implementing monitoring methods contributes to consolidating digital health transformation as a sustainable public policy, expanding access and improving the quality of health care.

ABS3975
Digital health intervention for cardiovascular disease risk score reduction: a systematic review and meta-analysis
Aminata Sow[1], Dr. Diandra Daley[1], Dr. Mariam Molokhia[1]
[1]King's College London, London, United Kingdom
INTRODUCTION
Cardiovascular disease is the leading global cause of death. Digital health interventions have emerged as scalable tools for reducing cardiovascular risk, yet their role in reducing validated risk scores remains unclear. Previous reviews were limited by methodological heterogeneity and equity considerations
METHODS
A systematic review and meta-analysis were conducted following PRISMA guidelines. Six databases were searched between 01/03/2021 and 04/07/2025, reflecting the rapid advancement in digital health technologies and remote care since the COVID-19 pandemic. Eligible studies were randomised controlled trials reporting changes in validated cardiovascular risk scores. A meta-analysis was conducted using a random-effects model to calculate the pooled mean difference in cardiovascular risk score. Subgroup analysis was performed by intervention modality. Bias was assessed using the Cochrane RoB2 tool and STATA 19 for publication bias; evidence certainty with GRADE.
RESULTS
Database searches identified 2553 studies, which were screened by title and abstract. Of these, 38 were considered for full-text review, and 12 randomised controlled trials, involving 10924 participants, were included. 11 studies were eligible for meta-analysis. The pooled cardiovascular risk reduction effect across studies was not statistically significant (Mean Difference = -0.01; 95% CI -0.02 to 0.00; p = 0.07), with substantial heterogeneity (I = 86.8%). However, smartphone-based interventions showed a modest, significant reduction (Mean Difference = -0.02; 95% CI -0.03 to -0.02) with low heterogeneity. Certainty of evidence was rated as "moderate" using GRADEpro. Most studies lacked equity-focused reporting, cost-effectiveness data, or long-term follow-up.
CONCLUSIONS
Digital health interventions show limited overall effectiveness in reducing cardiovascular risk scores, though smartphone apps may offer modest benefits. Future research must address equity, standardisation, and sustainability of DHI use to ensure they achieve meaningful clinical and public health impact.

ABS3986
Reducing barriers to mental health care: the experience of the Digital Health Hub at Unifesp, Brazil
Luciana Surjus[1], Paula Martins[1], Maria Inês Moreira[1], Karina Meira[1], João Francisco Vasques[1], Thiago Domingos[1], Claudia Fegadolli[1]
[1]Federal University Of São Paulo, Santos, Brazil
BACKGROUND
The COVID-19 pandemic intensified mental health needs worldwide, disrupted services, and increased the prevalence of anxiety and depression, compounding inequities for groups facing social vulnerability. Prevention and promotion strategies therefore prioritise education, social support, early intervention, and multisectoral collaboration to address social determinants. These priorities align with the WHO Comprehensive Mental Health Action Plan 2013–2030, which emphasises universal coverage, community-based care, and the reduction of stigma and discrimination through a rights-based approach. Discrimination—including racial and ethnic discrimination—is consistently associated with poorer mental health outcomes and remains a critical equity concern for implementation.
METHODS
We implemented and evaluated mental health actions within Unifesp's Digital Health Hub using mixed methods. Quantitative indicators summarised first-year implementation progress, while qualitative thematic analysis examined documents, technical reports, and meeting records to identify salient implementation features.
RESULTS
The hub supports Brazil's Unified Health System (SUS) digital transformation through the inclusion of technological devices, workforce training, and implementation support across care networks and pathways, prioritising mental health and telehealth solutions aligned with the SUS Digital–Telessaúde strategy. To mitigate stigma, gaps in care, and digital exclusion, actions were designed and delivered by professionals with extensive experience in the Psychosocial Care Network (RAPS), instituted within SUS as a territorial, community-based network for people with mental distress and substance-related needs. Incorporating territorial support agents from marginalised groups (e.g., people experiencing homelessness, rural and Indigenous communities) facilitated community-based responses to displacement, cultural loss, violence, socioeconomic stress, and geographic, cultural, and language barriers.
CONCLUSIONS
Digital mental health initiatives should expand opportunities for participation and belonging, strengthen community anti-stigma actions, disseminate evidence-based information, invest in continuing education, and address inequalities in technological access. Embedding community members in implementation teams may enhance broad-reaching, culturally safe, non-specialised mental healthcare.

Closing the evidence-to-practice gap: a scalable framework for strengthening national clinical guidance in the global south
Alek Palkowski[1], Lara Fairall[1], Vanessa Mudaly[1], Nafeesa Saldulker[1], Faye Eshraghi[1], Nathirah Bosch[1], Patrick Ganhiwa[1]

[1]Knowledge Translation Unit, University of Cape Town, Cape Town, South Africa
BACKGROUND
The interval between the generation of medical knowledge and its application challenges patient safety. Clinical guidelines often function as static documents with update cycles of 3 to 5 years, causing outdated practices and inefficient resource use. Furthermore, guidelines are often created in silos; consequently, 71.4% of living guideline activities in low- and middle-income countries are conducted by global organizations rather than national systems. In this study, we propose and evaluate a framework to transition from this decentralized landscape into a structured knowledge format.
METHODS
We are designing a Knowledge Library platform to consolidate decentralized clinical guidance—including government circulars and standard treatment guidelines—into a centralized, structured repository that utilizes artificial intelligence. This study examines data extraction techniques for continuous literature monitoring. The methodology outlines a testing phase where clinical editors evaluate retrieval accuracy on complex clinical problems, prioritizing source documentation for expert verification. Additionally, technical exploration includes managing document versioning to ensure clinical content remains current, traceable, and authoritative.
RESULTS
Preliminary evaluation indicates that this framework streamlines the identification of relevant updates within a multifaceted landscape. By consolidating sources into a single repository, the system reduces the administrative effort required to monitor decentralized documentation, shortening the guideline update timeline. The structured format enables rapid retrieval of source documentation, facilitating faster expert verification of new protocols.
CONCLUSIONS
Establishing a centralized repository is essential for evidence-based practice. This infrastructure provides a "Single Source of Truth," ensuring current medical evidence remains an accessible right. By facilitating a direct link between research and policy, this shift allows national health systems to manage clinical standards directly, ensuring recommendations are adapted to regional priorities rather than external schedules [1, 5].
Popul. Med. 2026;8(Supplement 1):A965

ABS4019
Bridging the digital implementation gap: identifying determinants for the adoption of source-grounded living evidence in low- and middle-income primary care

Alek Palkowski[1], Lara Fairall[1], Nafeesa Saldulker[1], Nathirah Bosch[1], Kelly Sweatman[1], Faye Eshraghi[1], Pearl Spiller[1], Rushaan Hassen[1]
[1]Knowledge Translation Unit, University of Cape Town, Cape Town, South Africa
BACKGROUND
Current data suggests that even when adaptive methodologies are applied in the Global South, they are often narrow in scope, focusing almost exclusively on isolated health priorities (e.g., COVID-19) to the detriment of broader clinical needs. While the theory of living evidence is promising, its feasibility in low-resource settings remains poorly understood. This implementation gap creates a two-tiered system of medical knowledge, where some regions benefit from real-time updates while others rely on obsolete documentation.
METHODS
This research investigates the practical realities of primary care in South Africa to identify localized facilitators of digital evidence adoption. We utilize the NASSS Framework (Non-adoption, Abandonment, Scale-up, Spread, and Sustainability) to evaluate the complexity of transitioning from a linear "Reference Library" model to an active "Precision Clinical Guidance" model [2, 3]. Unlike static digital documents, this platform intervention provides direct shortcuts to clinical logic by highlighting relevant sections within authoritative evidence to maintain user trust. The framework evaluates factors such as connectivity, digital literacy, and administrative structures to identify obstacles that prevent clinicians from interacting with dynamic tools [2, 4].
RESULTS
Preliminary evaluation indicates that a source-grounded approach addresses the 10:1 paper-to-digital usage ratio identified in South African clinics by aligning with clinical workflows rather than serving as digital replicas of print media. Furthermore, the platform enables syndromic surveillance by capturing anonymized geospatial data on clinical queries. This provides a mechanism for identifying emerging disease clusters and regional training gaps while ensuring regulatory compliance with the Protection of Personal Information Act (POPIA).
CONCLUSIONS
Bridging the implementation gap requires a system that respects both global standards and local realities. Establishing a responsive digital infrastructure is essential for empowering local health systems and ensuring that clinical knowledge is accessible, current, and relevant for everyone, regardless of geography.
Popul. Med. 2026;8(Supplement 1):A969

Development of an intercultural mental health care model using digital tools

Paula Andrea Martins[1], Luciana Togni de Lima e Silva Surjus[1], Maria Inês Badaró Moreira[1], Simone Alves[2], Maria do Socorro Gomes[1], Andressa Benini Mendes[1], Edinaldo dos Santos Rodrigues[1], Paula Sassaki Coelho[1], Renan Vieira de Santana Rocha[1], Adriel de Paula[1], Ana Lúcia Câmara[1], Ana Paula Silva[1], Auá Nheendy Santos[1], Awa Tenondegua dos Santos[1], Bianca Romão[1], Daniela Ribeiro[1], Frederico Avari[1], Gleicielle Silvano[1], Helena Ferreira[1], Lorrayne Moraes[1], Silvana Santos[1], Tailaine Gomes[1], Tayna dos Santos[1], Vinícius Medeiros[1], Renata Souza[1], Thiago da Silva Domingos[1], Claudia Fegadolli[1]
[1]1 Digital Health Hub, Federal University of São Paulo, São Paulo, Brazil, [2]2 Federal University of São Paulo, São Paulo, Brazil
BACKGROUND
International guidelines for mental health, alcohol, and other drugs policies emphasize the need to address stigma and discrimination, with care models in community settings that reduce barriers and access gaps that result from from inequality 1-4. This study aims to describe the development of an intercultural mental health care model for indigenous, rural, and homeless populations, using digital technologies.
METHODS
Process evaluation, using qualitative and quantitative methods, on the implementation of a mental health care model for specific populations, included in the project "Innovations in care and management from the perspective of Digital Health," carried out in partnership with the Brazilian Ministry of Health. The analysis included data from monitoring reports of actions carried out during the project´s first year, report of team meetings, and field diaries of articulation and planning activities in the territories.
RESULTS
the project´s implementation initially included the planning of a peer-to-peer, non-specialized care model, based on a process of listening and problem-solving, carried out by 16 Territory Supporters, 4 Supervisors, a technical reference, and coordinators. The actions were coordinated with local leaders and representatives of the health system in 5 territories. Continuing training and supervision processes were developed, with activities on digital platforms. A digital tool with accessibility and cultural adaptation resources was developed for registering information and managing meetings. The planning of actions in the territories was carried out with the participation of the entire team in weekly meetings.
CONCLUSIONS
An intercultural care model was implemented in indigenous, rural, and homeless populations communities, with participatory planning and based on human rights, individual autonomy, anti-asylum, anti-racist, and decolonial perspective of mental health. Analysis of the initial phase point toward implementation of actions to reduce barriers to access, providing qualified listening in mental health, and articulated care by strengthening the community and building networks.

ABS4055
University Digital Health Hub: Innovations for the digital transformation of the National System Health

Claudia Fegadolli[1], Daiana Rodrigues da Silva[1], Luciana Togni de Lima e Silva Surjus[1], Maria Cristina Gabrielloni[1], Maria Elizete Kunkel[1], Maria Gabriella Simões Alves de Oliveira[1], Renata Rangel Azevedo[1], Rosangela Soares Chriguer[1], Yara Ferreira Marques[1], Thiago da Silva Domingos[1]
[1]Digital Health Hub, Universidade Federal de São Paulo, São Paulo, Brasil
BACKGROUND
The Unifesp Digital Health Hub is a strategic initiative for the digital transformation of the Brazilian national health system, aiming to improve quality of care, expand access, and reduce health inequalities (1,2). The Hub targets areas requiring complex coordination, where digital solutions can strengthen care delivery, particularly for vulnerable populations such as people experiencing psychological distress, Indigenous peoples, rural and homeless populations, and individuals affected by violence (3–5). This study analyzes the implementation of the Digital Health Hub, highlighting initial results and key challenges.
METHODS
An implementation study using mixed methods was conducted with quantitative

and qualitative data produced between November 2024 - January 2026. Data sources included institutional documents, technical reports, and meeting records. Qualitative data were analyzed through thematic analysis to identify central implementation aspects. Quantitative data described the scope and progress of activities during the first year of implementation.
RESULTS
Priority areas were defined based on academic expertise and health system needs, including digital health skills development; maternal and child health; mental health; care for LGBTQIAPN+ populations; population health and assistive technologies; and selected medical specialties such as ophthalmology. The initiative engaged 87 health professionals to deliver tele-education, teleconsultation, teleinterconsultation, teleconsulting, telediagnosis, and teletriage services across nine municipalities. An associated educational program involved 134 scholarship holders, mainly students and health system professionals, contributing to the expansion and local integration of activities within health services. Key challenges included limitations in telehealth platform functionality, insufficient technological infrastructure, lack of interoperability between information systems, and the need for continuous professional training.
CONCLUSIONS
The Digital Health Hub demonstrates the potential of digital health strategies to expand access and support care delivery in underserved settings. However, its consolidation as a structuring health policy requires addressing persistent regional inequalities in technological infrastructure, limited connectivity in vulnerable territories, and fragmented health information systems.
Popul. Med. 2026;8(Supplement 1):A972

Digital health and advanced manufacturing to promote equitable access to assistive devices in the Brazilian Unified Health System
Thiago da Silva Domingos[1], Maria Elizete Kunkel[1,2], Eduardo Rorato[1,2], Thabata Ganga[1,2], Beatriz Basso[2], Claudia Fegadolli[1]
[1]Digital Health Hub, Federal University of São Paulo, São Paulo, Brazil, [2]Laboratory of 3D Orthoses and Prostheses, Science and Technology Institute - Federal University of São Paulo, São Paulo, Brazil
INTRODUCTION
Inequities in access to assistive devices remain a major public health challenge, particularly in large universal health systems where conventional production processes are centralized, costly, and slow. Digital health strategies combined with additive manufacturing offer opportunities to decentralize care, personalize devices, and expand access to rehabilitation services. This study describes the implementation and outcomes of a digital workflow for providing assistive devices to patients treated at the Digital Health Hub of the Federal University of São Paulo, within the Brazilian Unified Health System.
METHODS
A descriptive study was conducted based on real cases of patients assisted through digital orthoses and prostheses integrated into the public health system. The workflow included digital clinical assessment, three-dimensional scanning, virtual design, additive manufacturing, and delivery of personalized devices (3-4). Selected cases involved patients with neurological and musculoskeletal conditions requiring upper and lower limb orthoses. Data were collected on production time, device customization, clinical feasibility, and user acceptance.
RESULTS
The digital workflow enabled the production of personalized assistive devices with reduced manufacturing time compared to conventional methods. Devices demonstrated adequate fit, functional alignment with clinical goals, and high acceptance by patients and healthcare professionals. The approach supported individualized rehabilitation needs while reducing logistical barriers commonly encountered in public health services. The integration of digital health tools facilitated communication between clinicians and engineers and allowed rapid device adjustments and follow-up.
CONCLUSIONS
Digital health combined with additive manufacturing represents a viable and sustainable strategy to reduce inequities in access to assistive technologies within universal public health systems. The experience demonstrates the potential of locally implemented digital workflows to promote inclusion, patient-centered care, and equitable rehabilitation services without borders. This approach shows strong potential for scalability in Brazil and in other large countries with universal public health systems and significant territorial and social diversity.

The Experience of the Digital Health Work-Based Education Program Project at the Federal University of São Paulo in Strengthening the Unified Health System (SUS) through Digital Transformation
Rosangela Soares Chriguer[1], Thiago Da Silva Domingo[1], Paula Andrea Martins[1], Vinicius Demarchi Silva Terra[1], Adriana Eiko Matsumoto[1], Karina Cardoso Meira[1], Luciana Togni De Lima E Silva Surjus[1], Leandro Key Higuchi Yanaze[1], Maria Lucia Oliveira De Souza Formigoni[1], Paulo Bandiera Paiva[1], Maria Ines Badaro Moreira[1], Mariana Chaves Aveiro[1], Maria Elizete Kunkel Kunkel[1], Miriam Raquel Diniz Zanetti[1], Maria Cristina Gabrielloni Maria Cristina Gabrielloni[1], Sue Yazaki Sun[1], Renata Rangel Azevedo Azevedo[1], Felipe Mancini[1], Ivan Maynart Tavares[1], Caio Vinicius Saito Regatieri[1], Luis Filipe Nakayama[1], Claudia Fegadolli[1]
[1]Federal University of São Paulo, São Paulo, Brazil
INTRODUCTION
The Digital Health Work-Based Education Program Project at the Federal University of São Paulo, integrated into the Institution's Digital Health Center, is configured as a strategy to strengthen and articulate it within the municipal and state health departments of São Paulo, Brazil. It is organized into nine Tutorial Learning Groups (Grupos de Aprendizagem Tutorial—GATs), composed of tutors, students, and preceptors from eight health departments, focusing on the following themes: mental health in Primary Health Care; health of people experiencing homelessness; health in forest and rural areas; victims of police violence; harm reduction; equity in the use of cannabinoids; 3D orthotics and prosthetics; maternal–child health and the LGBTQIAPN+ population; and ocular emergencies. The main objective is to strengthen the teaching–service–community integration, aiming at the development of competencies in digital health. The project seeks to enhance student training and promote continuing education, using technological tools to expand equity, problem-resolving capacity, and innovation in health care across diverse territories and populations.
METHODS
Over six months the GATs conducted team formation and group-bonding activities to reinforce a sense of belonging, complemented by training all members in the course "Introduction to Digital Health". Additionally, the GATs carried out territorial assessment, mapping of digital tools, definition of efficacy indicators, and telehealth actions with an emphasis on tele-education.
RESULTS
Unifesp's experience in projects for the SUS enabled the development of an initiative that articulates public policies and innovations in digital health, promoting qualification in undergraduate education and extension of care and education actions. The Project's structuring demonstrates itself to be a powerful vector for expanding the objectives of Unifesp's Digital Health Center.
CONCLUSIONS
The articulation between public policies and technological innovation not only enhances academic training but also amplifies the SUS's capacity to respond to contemporary demands, consolidating digital transformation as one of the pillars sustaining comprehensive care.

ABS 4084
Parental needs and experiences with e-Health applications in chronic pediatric care – a scoping review
Anna Löffler[1], Helena Grüter[1], Lisa Stähler[1], Irem Gönen[1], Jenny Prüfe[1], Freia De Bock[1], Claudia Pischke[1]
[1]Institute for Medical Sociology - Public Health Section, Heinrich-Heine-Universität Düsseldorf, Düsseldorf, Germany
INTRODUCTION
Chronic conditions affect 30% of children worldwide and place organizational and psychosocial burdens on families. Parents must coordinate multidisciplinary care while managing stress and uncertainty. E-health offer potential to support families through accessible information, monitoring, and communication(2,3). However, existing evidence is dominated by diagnosis-specific tools, and less is known about parents' cross-diagnostic needs and lived experiences across the patient journey. This scoping review synthesizes parents' perspective on e-Health applications supporting children aged 0–16 years with chronic conditions.
METHODS
This scoping review was conducted according to PRISMA-ScR guidance, with the protocol preregistered on the Open Science Framework. Web of Science and Ovid (MEDLINE, APA PsycInfo) were searched for peer-reviewed studies published between January 2010 and February 2025 in English or German. Eligible studies examined parents' needs and/or experiences with e-Health applications supporting childhood chronic conditions, including mental health (oncology excluded). Screening and data extraction were performed independently by two reviewers with adjudication by a third. Findings were synthesized thematically.

RESULTS
Thirty-nine studies met inclusion criteria. Autism and diabetes were most frequently addressed (each n=10), followed by congenital heart disease, asthma, and obesity (each n=4). Six cross-cutting themes emerged: accessibility/usability (mobile-first, personalization); content/information (evidence-based, plain language, tailored to diagnosis); (3) coordination (central hubs for plans, reminders, tracking); consultation with clinicians (secure two-way messaging/video); psychosocial support (moderated peer communities, coping resources); and (6) data protection (transparency and control over sharing). Evidence on how needs shift across care stages was limited but suggested heightened value early after diagnosis and during long-term management.
CONCLUSIONS
Parents value e-Health tools that reduce coordination burden and provide trustworthy, tailored support, but adoption depends on usability, personalization, and transparent data governance. Future research should examine needs longitudinally and inform hybrid designs combining cross-diagnosis coordination features with condition-specific modules to strengthen family-centered chronic care.

AI on Fragile Foundations? - Lesson's from Ghana's Lightwave Health Management System

Maame Anim[1], Jennifer Osei[1], Akosua Frimpong[1]
[1]General Practice, 1.Accra Psychiatric Hospital, Accra, Ghana

INTRODUCTION
Artificial intelligence is increasingly layered onto digital-health systems in low-middle-income countries(LMICs), often before the underlying foundations of governance, infrastructure, and accountability are fully established. Ghana's Lightwave-Health-Management-System(LHIMS) was introduced to strengthen health data management, but its rollout exposed critical weaknesses in interoperability, vendor dependence, and institutional oversight. The governance weakness displayed by LHIMs raises questions about AI readiness and risk in LMICs.
METHODS
A qualitative policy and systems analysis was conducted using national digital policy documents, LHIMS implementation reports, stakeholder and practitioner perspectives from roll-out facilities. A thematic analysis was conducted across key governance domains: accountability, data stewardship, vendor-dependence and ethical oversight.
RESULTS
The analysis identifies significant governance weakness in LHIMs implementation. Limited interoperability and closed system architecture constrained data sharing across facilities and levels of care, while vendor lock-in reduced institutional control over public health data and system evolution. Accountability for data stewardship, system performance and ethical oversight remained insufficiently defined. Finally, AI-specific governance considerations- such as algorithmic transparency, auditability and bias mitigation were largely absent from the digital health framework, raising major concerns about equitable and trustworthy AI deployment.
CONCLUSIONS
The LHIMS-experience demonstrates that digital health systems without robust governance constitutes a fragile foundation for AI in public health and increase the bias gap and risks. For LMICs, governance readiness is a prerequisite for ensuring that AI strengthens health systems resilience, equity, and public trust rather than exacerbating existing vunerabilities. Ghana's experience offers transferable lessons for global policies, underscoring the need to align digital transformation with people centered, ethically-grounded AI governance.
RECOMMENDATIONS
-Make governance a precondition for AI and digital health deployment -Establish national digital and AI governance bodies. -Contracts should explicitly guarantee state ownership, portability and reuse of public-health data. -Invest in Public-Sector Technical Sovreignty -Integrate equity and bias audit into routine practice.

Teleconsultation as a strategy for strengthening the health system: effects on Primary Health Care and network organization

Patricia Machado[1], Claudia Flemming Colussi[1], Maria Cristina Marino Calvo[1], Josimari Telino Lacerda[1], Izaltina Adão[2], Marina Paim[2], Antônio Fernando Boing[1], Felipa Rafaela Amadigi[2], Rafaela Souza Petrolini[2]
[1]Departament of Public Health, Federal University of Santa Catarina, Florianópolis, Brazil, [2]Postgraduate Program in Public Health, Federal University of Santa Catarina, Florianópolis, Brazil

INTRODUCTION
Telehealth and telemedicine are relevant strategies for improving quality of care, expanding access, and integrating Health Care Networks (RAS) within Brazil's Unified Health System (SUS)1,2. However, gaps remain regarding the actual and perceived effects of teleconsultations on network organization from the perspective of the professionals involved in their delivery and sustainability3,4. Accordingly, this study analyzed the perceived effects of teleconsultation use within the SUS, based on the views of managers and teleconsultants affiliated with the Digital Health Center of the Federal University of Santa Catarina.
METHODS
This qualitative study was conducted in seven municipalities in the state of Santa Catarina between February and December 2025, using semi-structured interviews with 35 managers and 20 teleconsultants. Data were analyzed using thematic analysis5, from which five categories emerged: continuing professional education, improvement in referrals, reduction in waiting lists, cost reduction, and strengthening of Primary Health Care (PHC).
RESULTS
The findings indicate positive effects of teleconsultation on care quality and health system organization, particularly its role in continuing education by promoting ongoing clinical updating and improvement of care practices. Improvements in referral quality and strengthened communication across different levels of care were also observed. These effects contributed to more efficient use of system resources, reflected in cost reductions, rationalization of diagnostic tests, and decreased waiting times for specialized care.
CONCLUSIONS
Teleconsultation contributed to strengthening PHC by increasing its problem-solving capacity, integrating it more effectively with specialized care, and providing clinical support to underserved areas with a shortage of specialists. From the participants' perspective, teleconsultation proved to be an effective strategy for improving quality of care by integrating educational, clinical, and managerial dimensions, thereby consolidating PHC's role as the coordinator of care within the Unified Health System.

Adaptation and implementation of ophthalmic telediagnosis services: a strategy for prevention of avoidable blindness in rural remote regions

Isaura Ilorena D'alva Brito Dos Santos[1,2], Simone Schenkman[1], Carlos Eduardo Amaral[3], Juliana Gagno Lima[4], Vanessa Kemilly Gomes Lima[4], Moniky Rayanne Silva Dos Santos[4], Alef Mateus Da Silva Valentin[4], Aylene Bousquat[1]
[1]Politics, Management And Health, School Of Public Health, University Of São Paulo (Usp), São Paulo, Brazil, [2]Community Health, Faculty Of Medicine, Eduardo Mondlane University (Uem), Maputo, Mozambique, [3]Nutel, Federal University Of Minas Gerais (Ufmg), Minas Gerais, Brazil, [4]Institute Of Public Health, Federal University Of West Pará (Ufopa), Santarem, Brazil

BACKGROUND
Blindness due to Hypertension and, especially, Diabetes, although preventable, remains the main cause of visual loss in the productive population 1-3. In Brazil's southwestern Amazon region of Pará state, thousands of people live without access to basic eye health care 4,5. We aimed to bring eye health care closer to the communities through the implementation of a regional university telehealth center, local staff training, health network integration, and strengthening strategies in preventing blindness and visual impairment.
METHODS
Implementation pilot study in a Primary Health Unit set in a rural and remote municipality. Implementation phases: a) Situation analysis and coordination of activities with regional health authorities; b) Community health workers trained on counseling and active search procedures for high-risk patients, nurses/nursing technicians trained on visual acuity measurement and management of portable fundus cameras, the Phelcom Eyer2; c) The operationalization of eye screening. Visual acuity was measured, and images of anterior/posterior ocular follow-up were captured. Remote evaluation was done by an optometrist and ophthalmologist.
RESULTS
The pilot included 15 Community Health Agents, 2 health professionals, and 1 manager, and 60 users with Diabetes and/or Hypertension. We found a lack of eye health care professionals in the public network, a deficit of materials and diagnostic equipment, and a lack of qualified referrals to the regional reference. The process of measurements and capture of ocular images was well accepted

and adhered to by the participants, with high-quality images.
CONCLUSIONS
It is possible to prevent avoidable blindness even in more challenging contexts, building each stage together with both health professionals and local health authorities, respecting and strengthening communities. The strategy has proven to be a facilitator of reliable remote diagnostics as well as an expander for access to eye care in regions with difficult access to eye health professionals, reducing this public health problem.

Training health education multipliers to strengthen public health capacities

Márcia Cristina Néspoli Ando Márcia[1]
[1]Tecnologias em Saúde Educação Permanente, Sociedade Brasileira Caminho de Damasco, São Paulo, Brasil

BACKGROUND
The challenge of consolidating health education in diverse and resource-limited contexts requires innovative strategies to ensure sustainability and wide community impact. Traditional training programs often focus only on individual knowledge acquisition, with limited effect on systemic change. To address this gap, a structured program for training health education multipliers was developed, aiming to expand capacities for health promotion, prevention, and continuous education in primary care and specialized services.
METHODS
The initiative was designed as a multi-phase program grounded in principles of adult learning and Permanent Health Education, aligned with national policies. The curriculum included theoretical modules on health promotion, participatory methodologies, and educational planning, combined with practical workshops for contextual adaptation. Participants were selected among health professionals with leadership potential, and trained to act as multipliers within their institutions and territories. Continuous monitoring tools and feedback mechanisms were incorporated to evaluate performance and support progressive improvement.
RESULTS
The program engaged health professionals from different disciplines and regions, promoting interprofessional collaboration and knowledge exchange. Multipliers demonstrated significant improvement in educational planning skills, facilitation of participatory activities, and capacity to adapt content to local realities. As a result, new educational practices were implemented in primary health units, hospitals, and community programs, fostering local ownership of health promotion strategies. Furthermore, the multiplier approach amplified the reach of training efforts, reducing dependency on centralized educational resources.
CONCLUSIONS
Training health education multipliers proved to be an effective strategy for strengthening public health capacities, enhancing workforce empowerment, and ensuring sustainability of educational actions. By investing in multiplier formation, health systems can expand the impact of education initiatives, adapt interventions to diverse realities, and promote equity in access to health knowledge. This experience highlights the importance of integrating educational innovation into global strategies for health promotion and workforce development.

Training Integral Health Agents: An Innovative Report on Interprofessional Education in Brazil

Leticia Miranda Lima[1], Gabriela Madureira Baptista[1], Marilda Silva Souto Maior[1], Luciano Franco Ramalho[1], Laila Porto Azevedo Alves[1], Thais Alves Almeida Nascimento[1], Mariana Guedes De Carvalho[1], Edirute Silva Gabriel De Jesus[1], Patrícia Trindade Alves Santos[1], Maria Alice Santos Costa[1]
[1]Programa De Pós-Graduação Em Psicologia Da Saúde Ims, Universidade Federal Da Bahia, Vitoria Da Conquista, Brazil

ABSTRACT
Complex public health challenges require a workforce trained in interprofessional collaboration, a principle widely recommended by international and national organizations. This report describes an innovative pedagogical experience in the 2024 cohort of the Graduate Program in Health Psychology at the Federal University of Bahia, analyzing its role in training agents for comprehensive health care.
METHODS
Curricular integration was designed to foster synergy among diverse fields of knowledge, in line with national guidelines for reorienting professional health education. The cohort included nutritionists, administrative professionals, librarians, nurses, psychologists, electrical engineers, and occupational therapists. Although unplanned, this diversity proved to be a unique pedagogical asset, enriching activities such as complex case analysis and project development, where different expertises naturally converged.
RESULTS
The primary indicator of success was the quality of the solutions developed, which were more creative, comprehensive, and context-sensitive than those produced by homogeneous groups. The systemic perspective of electrical engineering on sound environments complemented the ergonomic analysis of occupational therapy. Information management by librarians and process optimization by administrative professionals streamlined decision-making in care simulations. Nutrition, nursing, and psychology integrated to construct a holistic view of the service user. The main outcome was the emergence of a collective competence capable of translating theory into integrated public health action.
CONCLUSIONS
The unplanned diversity of prior professional backgrounds proved to be a powerful pedagogical strategy for operationalizing interprofessional principles, making learning experiences qualitatively richer. This Brazilian experience offers a replicable model for postgraduate education, training leaders capable of strengthening health systems by translating theoretical collaboration into effective practice and promoting health equity through innovative training.

A qualitative study exploring nutrition knowledge, self-efficacy, and practices of Life Orientation educators in Limpopo Province, South Africa

Tebatjo Maja[1]
[1]School of Health System and Public Health, University of Pretoria, Pretoria, South Africa

BACKGROUND
Educators spend most of their time with learners during school hours and are the most suitable individuals to transfer health and nutrition knowledge to learners. Improving educators' knowledge, self-efficacy, and practices related to nutrition can have a positive impact on the learners' nutritional outcomes. Enhancing educators' knowledge, self-efficacy, and practices related to nutrition can have a positive effect on learners' nutrition outcomes.
METHODS
Qualitative phenomenological research was conducted to explore the nutritional knowledge, self-efficacy, and practices of 18 LO educators. The data was collected through face-to-face in-depth interviews using a pre-designed semi-structured interview guide. The interviews were audio recorded, and the data were transcribed verbatim into a Word document. Thematic analysis was used to analyse the data.
RESULTS
The study revealed that LO educators had a poor level of nutrition knowledge, primarily self-acquired from social media, as they never received any formal nutrition training. Classroom opportunities for nutrition education were often lost due to a curriculum lacking sufficient nutrition content and educator training, limited teaching resources, and weak parental and community involvement in supporting nutrition education. Despite reporting high self-efficacy in teaching nutrition, the educators' confidence was based on their teaching ability rather than subject-specific expertise. Additionally, the school nutrition environment was not conducive to healthy behaviours, as schools offered unhealthy food and beverage options for sale, and educators' modelling of healthy behaviours was limited.
CONCLUSIONS
The lack of nutrition knowledge in educators limits their ability to teach healthy eating habits. To address this, policies to address curriculum and training programs for educators from the Department of Education are urgently needed. Workshops and ongoing support will empower educators to deliver effective nutrition education and model healthy behaviours.

ABS0397

learning from the community: early medical students' immersive experience with community health agents in brazil

Zibeilde Ferreira Borges Paschoalini[1], Marcello Da Silveira Paschoalini[2]
[1]Department of Collective and Family Health, Faculty of Medicine, Faculdade Sulamérica, Luís Eduardo Magalhães, Brazil, [2]Faculty of Medicine, Federal University of Western Bahia (UFOB), Barreiras, Brazil

INTRODUCTION

Despite being central to Brazil's Unified Health System (SUS), the role of Community Health Agents (ACS) remains underrepresented in medical education. This project integrates first- and second-semester medical students into community-based experiential learning with ACS to promote empathy, social accountability, and contextual understanding of health systems.
METHODS
Sixty medical students from Faculdade Sulamérica participated in immersive fieldwork alongside ACS professionals in Bahia, Brazil. Through home visits and health mapping tools (genograms, ecomaps, vulnerability maps), students explored family structures, environmental contexts, and social determinants of health. Reflective circles guided by faculty facilitated qualitative analysis focused on empathy, teamwork, and professional identity formation.
RESULTS
Four key themes emerged: deepened empathy and emotional awareness; recognition of the ACS as an indispensable bridge between families and health services; (3) enhanced teamwork and communication skills; and transformation of professional identity. Students described "leaving the comfort zone" and realizing that "medicine begins with listening." Faculty observed stronger engagement and awareness of social determinants of health.
CONCLUSIONS
Early community immersion proved to be a powerful pedagogical tool in medical education, connecting theoretical learning with lived realities. Even brief experiences can promote empathy, reflection, and humanized practice when grounded in the community. The initiative offers a replicable, low-cost model for medical schools seeking to integrate social responsibility into curricula globally.

ABS0540
Assessing the Knowledge and Attitudes of a Cohort of Nurses Towards LGBTIQ+ Health Care
Tumelo Mzenda[1], Atholl Kleinhans[1], Mathildah Mokgatle[1]
[1]Public Health, Sefako Makgatho Health Sciences University, Garankuwa, Pretoria, South Africa
BACKGROUND
Lesbian, Gay, Bisexual, Transgender, Intersex, and Queer (LGBTIQ+) individuals face significant health disparities, often exacerbated by stigma, discrimination, and a lack of cultural competence among healthcare providers. Nurses, as frontline caregivers, are critical to mitigating these barriers and ensuring equitable health outcomes. Understanding their current knowledge and attitudes is an essential first step towards intervention. This study aimed to assess the overall knowledge and attitudes of a cohort of nurses regarding LGBTIQ+ health within the eThekwini district and identify specific knowledge gaps and attitudinal barriers that may hinder the provision of affirmative and non-discriminatory care.
METHODS
A quantitative, cross-sectional design was employed. Data was collected from 80 nurses in the eThekwini district across three healthcare facilities using a validated, self-administered questionnaire. The instrument measured: (a) knowledge of LGBTIQ+ health concerns, (b) attitudes towards sexual and gender minorities. Data analysis included descriptive and inferential statistics.
RESULTS
Overall knowledge was moderate (mean score 62%), with significant gaps identified, particularly in transgender health protocols and correct terminology. While 71% (57/80 nurses) reported generally positive attitudes, 35% (28/80 nurses) expressed discriminatory views related to LGBTIQ+ acceptance. Crucially, only 42% (34/80 nurses) reported feeling adequately prepared to take a sensitive sexual and gender history, highlighting a readiness gap.
CONCLUSIONS
A substantial portion of the eThekwini nursing workforce lacks the necessary knowledge and clinical confidence to provide optimal, affirming LGBTIQ+ care. These gaps contribute directly to health inequities. We recommend mandatory, comprehensive, and recurring cultural competence training integrated into both undergraduate and continuing professional development programs.

ABS0603
Adoption and Utilization Patterns of Artificial Intelligence Tools Among Public Health Students in South Africa
Kavitha Naicker[1], Mari van Wyk[1]
[1]School of Health Systems and Public Health, University of Pretoria, Johannesburg, South Africa
BACKGROUND
Artificial intelligence (AI) is transforming higher education by reshaping teaching, learning and administration through intelligent tutoring systems, personalized learning platforms and adaptive technologies.1 These innovations enhance engagement and academic performance while promoting sustainable outcomes.1 AI simulates human cognitive processes such as learning, reasoning and decision-making.2 The launch of ChatGPT in 2022 marked a turning point in generative AI, offering human-like interaction and reshaping educational practices globally. Despite its growing accessibility, AI integration among students in low- and middle-income countries remains inconsistent, highlighting the need to understand adoption patterns within public health education in South Africa.1 This study aims to determine the prevalence, purpose and most commonly used AI tools among public health students.
METHODS
A quantitative, descriptive design will be used. Data will be collected through an online questionnaire adapted from Fošner1 and Ajalo et al.3 targeting postgraduate public health students across three cohorts at a South African university. Convenience and simple random sampling will be applied. Data will be analyzed using descriptive and inferential statistics in Stata 15. Preliminary Results Preliminary results concur with previous studies that show widespread AI awareness and usage among students. In Uganda, 75.7% of medical students actively used AI tools for assignments and research writing.3 European findings revealed gender and disciplinary differences.4,5 Kausar6 reported a positive correlation between AI use and learning behaviours ($r = .529$, $p < .001$).
CONCLUSIONS
This study will generate context-specific evidence on AI adoption among South African public health students, guiding responsible and equitable integration of AI into higher education.
Popul. Med. 2026;8(Supplement 1):A1004

ABS0897
Strengthening community health capacity in rural Zambia through targeted training of community-based volunteers
Joseph Jameson[1], Elizabeth Timperley[1], Joanna Taylor[1], Edward Sibeen[1]
[1]On Call Africa, Livingston, Zambia
INTRODUCTION
Strengthening health systems is a key strategy used by many non-governmental organisations, including On Call Africa (OCA), to improve health outcomes in rural settings. OCA applies its Facility Quality Improvement Programme (FQIP) tool to assess performance against the WHO Health System Building Blocks framework. At a rural health post in Southern Province, Zambia, this assessment identified gaps in record keeping, monitoring of non-communicable diseases (NCDs), and community education on infectious diseases.
METHODS
To address this, a team of volunteers delivered a three-month intervention (October–December 2025) focused on capacity building for community-based volunteers (CBVs). As CBVs are responsible for vital sign collection and community-level health promotion, they were identified as a key workforce for strengthening service delivery. Sixty-three CBVs in the local area were organised into smaller groups to facilitate learning. Four two-hour refresher sessions were delivered, supported by a 16-page training booklet covering vital sign recording, NCD awareness, and health promotion on diarrhoea, sexually transmitted infections (STIs), and other priority conditions.
RESULTS
Fifty-seven CBVs participated. Verbal feedback, collected by a Chitonga-speaking health facility staff member, indicated that training on temperature and blood pressure measurement was particularly valuable. Education on STI prevention and diarrhoea management was also well received, and participants reported improved confidence in delivering health promotion messages. Challenges included reliance on English-language materials and the need for real-time translation. Participants expressed strong interest in more frequent sessions and additional topics such as malaria and malnutrition to further strengthen community health capacity.
CONCLUSIONS
The training programme was well received and contributed to strengthening CBV knowledge and community-level service delivery. Long-term health system strengthening will require transitioning facilitation to local staff and developing Chitonga-language materials to support sustainability, and improved comprehension. The programme demonstrates a practical model for community-led health system strengthening that can be adapted across comparable settings.
Popul. Med. 2026;8(Supplement 1):A1010

ABS0945
Educational and physical exercise intervention on lower back pain among nurses in Botswana: a non-blinded randomized control trial

Kagiso Kgakge[1]
[1]Public Health, Boitekanelo College, Gaborone, Botswana
BACKGROUND
While ergonomic education and exercise programs have been proposed as intervention, their effectiveness among nurses in Botswana remains largely unknown. This study aimed to investigate the effectiveness of these combined interventions in managing LBP among nurses in Botswana.
METHODS
A Non-Blinded Randomized Control Trial (RCT) was conducted among nurses at a tertiary hospital in Botswana. Sixty participants were randomly allocated into the intervention group for (ergonomic education plus an 8-week home-based exercise program), or a comparison group which received (informational material only). Data was collected using a structured self-report questionnaire developed from; Low Back Pain Questionnaire (LKQ), Nordic Musculoskeletal Disorders (NMQ) and Ergonomic Knowledge Assessment Questionnaire (EKAQ). Pain severity was assessed using the numeric pain rating scale (NPRS). Statistical analysis included General Linear Models, repeated measures ANOVA, and Mann-Whitney U-tests ($p \leq 0.05$).
RESULTS
At baseline, the intervention group reported higher pain intensity mean of 6.5 ± 0.2 (95% CI: 6.4 – 6.6, p<0.0001) while comparison group reported 4.6 ± 1.5 (95% CI: 4.0 – 5.2, p < 0.0001). Post intervention, the intervention group showed a significant reduction in pain mean 3.9 ± 1.3 (95% CI: 3.4 – 4.4), while the comparison group experienced a slight increase 4.8 ± 1.6 (95% CI: 4.2 – 5.4, p < 0.0001). Post-intervention, the intervention group showed improved scores 33.5 ± 5.6 (95% CI: 31.4 – 35.6, p < 0.001) vs. 31.1 ± 2.4 (95% CI: 30.2 - 32.0, p < 0.001).
CONCLUSIONS
Ergonomic education and physical exercise therapy significantly improved participants' knowledge and reduced pain severity.
Popul. Med. 2026;8(Supplement 1):A1012

Engaging communities for health: Implementation and outcomes from the Texas CEAL consortium

Jamboor Vishwanatha[1]
[1]Institute for Health Disparities, University of North Texas Health Science Center, Fort Worth, United States
INTRODUCTION
Texas CEAL Consortium was formed to combat misinformation and provide health education during the pandemic, and represents 29 projects across 16 counties. We address a broad range of health concerns, such as chronic diseases, nutrition, maternal health, and behavioral health.
METHODS
Data were collected by the administrative core team from the projects. Areas of focus (chronic disease testing and management, nutrition, and addressing health misinformation), success stories, partnership adjustments, data collection (via surveys, focus groups, and interviews), reach metrics, dissemination, publication developments, and milestone updates were collected. Several methods of intervention were practiced, including training of CHWs, community education, and community consultation.
RESULTS
Various populations were reached throughout the project, namely Vietnamese Americans, Hispanics/Latinxs, African Americans, South Asians, rural communities, under-resourced communities, individuals with behavioral health conditions, caregivers, and community health workers. Traditional media included radio, magazines, and flyers, while social media included Facebook, Instagram, and Twitter (now known as X). Live and virtual events provided a central location for communities to acquire health resources in an efficient manner, as well as other methods of intervention, such as flyers (traditional) and educational outreach. Community members tend to rely on the information and education given by local leaders regarding health decisions for themselves and for their families. Representation is also important when it comes to making those decisions.
CONCLUSIONS
Many lessons were learned, including how the impact of administrative obstacles can have on project activities and opportunities. Design and low health literacy are two factors in creating limitations in data. The impact local organizations and leaders can have on members when it comes to making informed health decisions is what has led the current Texas CEAL sites to make data-driven decisions. Community members know best, so accept the help of community leaders to see health outcomes change for the better.

ABS1107
Evaluating Expanded Eligibility Pathways for Global Public Health Certification: A Pilot Study

Allison Foster[1]
[1]National Board of Public Health Credentialing, Arlington, VA, United States
ABSTRACT
The Certified in Public Health (CPH) credential is designed to strengthen and professionalize the public health workforce by assessing foundational knowledge and skills across practice settings. Currently, eligibility for the CPH exam prioritizes graduates of U.S.-based programs accredited by the Council on Education for Public Health (CEPH), with limited pathways for graduates of non-U.S. public health programs. This structure creates a barrier for internationally trained public health professionals, despite the existence of more than 200 graduate-level public health programs outside the United States. This project describes a structured, time-limited pilot conducted by the National Board of Public Health Credentialing to evaluate whether recent graduates of non-U.S., non-CEPH-accredited graduate public health programs can successfully demonstrate competence on the CPH exam without additional work-experience requirements. The pilot is designed to empirically test long-standing assumptions regarding candidate performance rather than relying on accreditation status as a proxy for readiness. Pilot participants apply through the standard CPH application process and are flagged for subgroup analysis. Exam performance, overall pass rates, and outcomes by relevant candidate characteristics will be evaluated at the conclusion of the pilot. This approach builds on prior NBPHE experience using pilot studies to inform eligibility changes, including a successful 2015 pilot that expanded eligibility to public health professionals without CEPH-accredited degrees. Findings from this pilot will inform evidence-based decisions regarding permanent eligibility policy changes and contribute to broader discussions about equity, access, and global alignment in public health credentialing. By rigorously evaluating outcomes, this initiative seeks to balance certification rigor with inclusivity, supporting a more globally representative public health workforce.

ABS1108
How the Public Health Workforce Learns: Insights From Nearly 500,000 Recertification Credits

Allison Foster[1], Richard Kurz[1]
[1]National Board of Public Health Credentialing, Arlington, VA, United States
ABSTRACT
The Certified in Public Health (CPH) credential requires all active certificants to report a minimum of 30 recertification credits every two years, earned through a wide range of continuing education and professional development activities. Since the launch of this requirement, nearly 500,000 individual recertification credits have been reported, creating one of the largest known, practitioner-reported datasets documenting how the public health workforce maintains competence and stays current with evolving scientific and professional standards. This presentation draws on a comprehensive analysis of these reported credits to examine patterns in the types of activities, subject-matter focus, and modes of professional development utilized by CPH professionals. Unlike surveys or self-reported intentions, these data reflect verified, completed learning activities tied directly to an active professional credential, offering rare insight into real-world workforce behavior at scale. Analyses explore variation in reported credits across key subgroups, including geographic location, area of practice, career stage, and professional seniority, allowing for an assessment of how different segments of the public health workforce engage in continuing education. In addition, the study examines longitudinal shifts in professional development activities before and after the COVID-19 pandemic, highlighting changes in format and content during and following a period of unprecedented disruption. The findings provide a unique, empirical perspective on workforce learning in public health. The results have implications for credentialing bodies, educators, employers, and policymakers seeking to ensure the public health workforce has relevant and timely continuing education opportunities.

ABS1109
Public Health Nursing Job Task Analysis: Defining Competencies for a Skilled Workforce

Allison Foster[1], Shantal Johnson[1]
[1]National Board of Public Health Credentialing, Arlington, VA, United States
BACKGROUND
Nurses comprise the largest section of the public health workforce. Public health challenges are ever-changing, and it is critical to understand how the scope of

work of public health nurses is evolving. This is particularly important with the rise of chronic diseases, and an aging population. A job task analysis was conducted in 2025 to define the scope of practice and essential competencies for public health nurses across diverse settings, especially as they increasingly address health disparities and advocate for health equity.
METHODS
Supervisor level public health nursing subject matter experts first identified and categorized key job tasks and competencies through expert discussions and literature reviews. The job task analysis survey was then disseminated to a broad sample of public health nurses to assess the frequency, importance, and relevance of identified tasks. Statistical analyses, including descriptive statistics and factor analysis, were performed to validate and refine the final competency framework also known as the content outline.
RESULTS
The survey results indicated the degree of variability in public health nursing roles depending on geographic location and practice setting. Results validated the following domains: Assessment and Analysis; Planning and Implementation; Policy, Advocacy, and Partnerships; Communication and Cultural Competence; Leadership and Management; Systems and Foundational Knowledge; and Quality and Evaluation. Survey responses were analyzed by the Public Health Nursing Job Task Analysis Committee confirming competency relevance across practice settings and highlighting both traditional and emerging public health nursing responsibilities.
Popul. Med. 2026;8(Supplement 1):A1019

ABS1128
Nutrition and food safety knowledge, attitudes, and practices of school food handlers in Westrand district primary schools, Gauteng province.
Ntsako Mathye[1], Nothando Mbatha[1]
[1]School of Health Systems and Public Health, University of Pretoria, Pretoria, South Africa
BACKGROUND
Malnutrition remains a global public health challenge affecting all age groups. Among school-aged children, both undernutrition and overweight persist, often due to poor dietary intake. School feeding programmes have been shown to improve nutrient intake, particularly among vulnerable populations. In South Africa, the National School Nutrition Programme (NSNP) provides daily meals to learners in low-income communities, prepared by school food handlers. While food safety knowledge among food handlers has been widely studied, limited research has explored their combined nutrition and food safety knowledge, attitudes, and practices (KAP).
METHODS
A qualitative phenomenological design was employed. Data were collected from thirty-one (n=31) food handlers using a semi-structured interview guide to conduct face-to-face interviews and structured observations guided by a checklist. The data were analysed using content analysis to identify emerging themes.
RESULTS
Despite limited nutrition knowledge, food handlers demonstrated positive attitudes towards providing nutritious meals to learners. Participants generally showed adequate food safety knowledge and positive attitudes; however, the consistent and correct implementation of safe food handling practices was constrained by situational and resource-related challenges.
CONCLUSIONS
These findings highlight that food preparation practices within the NSNP are influenced not only by food handlers' knowledge and attitudes but also by structural and contextual limitations within school kitchens. Addressing these constraints is essential for strengthening the nutritional quality and safety of school meals and for enhancing the public health impact of school feeding programmes.
Popul. Med. 2026;8(Supplement 1):A1020

ABS1137
Development of oral health educational intervention in selected Primary Schools in Tshwane District, South Africa
Tshifhiwa Netshapapame[1]
[1]Public Health and Health Systems, University of Limpopo, Polokwane, South Africa
INTRODUCTION
The study set out to design, implement, and evaluate an oral health educational intervention aimed at improving the knowledge and behaviours of primary school children in selected schools within the Tshwane District, South Africa. The work was motivated by persistent evidence of preventable oral diseases among children and the limited availability of accessible, child-centered oral health information.
METHODS
To address these gaps, the study adopted a quasi-experimental design, allowing for the assessment of changes in knowledge, practices, and dietary behaviours before and after the intervention in a real school environment. Data was collected in two phases. The first involved baseline assessments using structured questionnaires administered to children and their parents to capture their initial oral health knowledge, hygiene routines, and dietary habits. The intervention consisted of two core outputs: a set of age-appropriate oral health educational materials for use in school and at home, oral health screening for children with a brushing program and a mobile application specifically developed to extend learning beyond the classroom. The application was designed to reinforce daily brushing habits, simplify oral health messages through interactive features and offer parents a resource for guiding their children.
RESULTS
The findings showed notable gains in children's knowledge scores, clearer understanding of plaque control, and improved self-reported brushing practices. The positive response to both the educational materials and the mobile application indicates that blended digital and school-based approaches may enhance oral health promotion efforts in under-resourced communities.
CONCLUSIONS
The study demonstrates that structured, context-sensitive educational interventions supported by digital tools can strengthen preventive oral health behaviours among primary school learners. The findings highlight the value of integrating oral health education into school programmes and adopting innovative technologies to sustain long-term behaviour change
Popul. Med. 2026;8(Supplement 1):A1022

ABS1151
Mental health and wellbeing promotion in teaching and learning for dental students in Australian universities: a scoping review
Meagan Huebl[1], Amy Hickman[1]
[1]College of Medicine and Public Health, Flinders University, Adelaide, Australia
BACKGROUND
Current policy, frameworks and governance for the mental health and wellbeing of dental students in Australian universities require examination to support the development of settings-based mental health promotion and prevention strategies in dental education in Australia. This scoping review aims to explore current knowledge in providing mental health and wellbeing promotion in teaching and learning for dental students in Australia.
METHODS
The JBI methodology for scoping reviews was followed.3 Databases (Medline, CINAHL, ProQuest, A+Education, PsycInfo, Scopus, DOSS and Web of Science) and search engines (Google and Google Scholar) were searched for relevant documents in English from 2010 to the present, using a comprehensive search strategy. The reference lists of included studies were also searched. A data extraction tool was created using Covidence to extract data from the included sources.
RESULTS
Thirty sources met the inclusion criteria for this scoping review.,4-31 Data analysis used an inductive approach to create a coding framework. The data was grouped into five key themes: legislation and standards; policy, frameworks and reports; university framework or strategy; primary research; and facilitators and barriers.
CONCLUSIONS
Mental health and wellbeing promotion in teaching and learning in dental students is influenced by existing frameworks, policy and governance, and clinical education and pedagogies. A settings-based approach should be combined with individual strategies that utilise identified facilitators to improve dental students' mental health and wellbeing. This scoping review highlights gaps in legislation, consideration of stakeholder concerns, implementation of university mental health frameworks or strategy, accessibility to university evaluation data, and methodology to incorporate mental health and wellbeing promotion into teaching and learning as further areas for research. This area is under-researched and under-evaluated in Australia, and more research is needed to support dental students' mental health and wellbeing now and into the future.

ABS1155
Designing a food-related learning agenda among vulnerable populations
João Sebastião[1], Ana Virgolino[1], Rita Marau[2], Ema Gonçalves[2], João Dinis[2], Osvaldo Santos[1]

[1]Environmental Health Institute, Lisbon School of Medicine, Lisbon, Portugal, [2]Climate Action Department, Cascais Ambiente, Cascais, Portugal

BACKGROUND

Globally, Food Policy Networks (FPN) are negatively impacting our planet and play a crucial role in unhealthy food choices and habits. The CLIC framework was developed to create healthier, sustainable and more inclusive FPN. Lisbon's Metropolitan Area takes part of the Horizon Europe FoodCLIC, aiming the development of more resilient food environments supported with the CLIC framework. Based on participatory and codesigning approaches, a learning agenda has been cocreated with stakeholders and residents in two vulnerable neighborhoods at Cascais Municipality.

METHODS

A mixed-models participatory codesigning approach was performed for mapping and gapping current FPN elements affecting two vulnerable populations of Portugal. Four priorities emerged: promoting food literacy, food access, housing and community spaces conditions for interaction with food, and food habits. Workshops with local stakeholders and neighborhoods' residents, focus groups and a face-to-face baseline survey with residents were main data collection approaches. Interventions were co-designed in close articulation with stakeholders and citizens, with regular reflexive learning meetings during its implementation.

RESULTS

High prevalence of self-perceived food literacy deficit together with barriers to food access (lack of local food retailers, flaws to donated healthy food products, housing and community spaces inadequate conditions) are associated to a very high percentage of food insecurity, low ingestion of fruit, vegetables, and pulses, eating monotony, and ultra-processed food consumption. Based on this scenario, a healthy and sustainable food learning agenda was delineated, with four complementary and integrated interventions, together with a medium and longterm monitoring and feedback system.

CONCLUSIONS

A learning agenda is a crucial output to guide the promotion of individuals' food literacy and communities' food-related culture change. Local food transitions imply working in proximity with the community, allowing a progressive change of the FPN, as a driver for more healthy and resilient food systems.

ABS1190

Knowledge Gap to Action: Impact of a Community Based Health Education Intervention on Dengue Fever Awareness

Hamzaelhussein Mohieldin[1], Al haj Ezzaaddeen[1], Abd Almoneim Mustafa[1], Sohayb Mohamed[1], Malaz Algassim[1]

[1]KURA Research Center, Kasaala, Sudan

BACKGROUND

Dengue fever remains a significant public health challenge in endemic regions, often exacerbated by community misconceptions regarding transmission and management. Effective health education is critical for disease prevention and safe home-based care. This audit evaluated the immediate impact of a targeted health education program on the knowledge, attitudes, and practices of residents in New Halfa Village regarding dengue fever.

METHODS

A pre-test/post-test interventional study design was employed with a cohort of 42 participants from New Halfa Village. Participants completed a structured questionnaire assessing knowledge of dengue transmission, symptoms, severe signs, and medication safety before and after attending a health awareness session. Data were analyzed to measure changes in knowledge scores and specific competencies.

RESULTS

The intervention resulted in a significant improvement in overall knowledge, with the average score rising from 5.19 (pre-education) to 8.0 (post-education) out of 9 possible points. The most critical safety improvement was observed in medication awareness: prior to education, only 31.0% of participants knew to avoid aspirin; this increased to 97.6% post-intervention. Similarly, recognition of severe hemorrhagic signs (e.g., bleeding, shock) doubled from 47.6% to 95.2%. However, a persistent misconception regarding transmission vectors remained: despite the intervention, 61.9% of participants continued to incorrectly believe that dengue can be transmitted directly from person to person via touch. Participant satisfaction was high, with 100% recommending the session to others.

CONCLUSIONS

The health education program was highly effective in improving clinical awareness and critical safety practices, particularly regarding the avoidance of contraindicated medications like aspirin. However, deep-seated misconceptions regarding direct transmission proved resistant to standard educational methods. Future interventions in Halfa Village should employ targeted behavioral change communication strategies to distinguish between vector-borne and direct contact transmission.

Popul. Med. 2026;8(Supplement 1):A1027

ABS1259

Integrating Innovation-Based Learning into Public Health Education to Enhance Health Promotion Competencies: A Mixed-Methods Study

Buppha Raksanam[1]

[1]Human Research Ethics and International Relations Unit, Sirindhorn College of Public Health, Trang, Faculty of Public Health and Allied Health Sciences, Praboromarajchanok Institute, Thailand, Trang, Thailand

BACKGROUND

Innovation competency is essential for public health professionals in addressing complex and evolving health challenges. Higher education institutions are expected to adopt innovative teaching and learning approaches to enhance students' innovation knowledge, skills, and health promotion competencies. However, evidence-based instructional models that explicitly emphasize innovation in public health education remain limited.

METHODS

This study aimed to develop an innovation-based teaching and learning model and evaluate its effectiveness using a mixed-methods design. Participants were 37 undergraduate students in the Bachelor of Public Health program (Dental Public Health major) at Sirindhorn College of Public Health, Trang Province, Thailand. The model consisted of ten core learning activities implemented over 18 weeks, focusing on community health problem identification, innovation development and implementation, academic dissemination, and reflective learning. Quantitative data were collected through questionnaires, achievement tests, and innovation quality assessment forms, while qualitative data were obtained from reflective discussions and open-ended feedback. Quantitative data were analyzed using descriptive statistics, paired t-tests, and one-sample t-tests, and qualitative data were analyzed thematically.

RESULTS

Following implementation, students demonstrated good levels of innovation knowledge and innovation creation skills. Perceptions of health promotion, teaching effectiveness, and innovation-based learning management were rated at high to good levels. The quality of student-developed public health innovations was rated as very good. Post-intervention health promotion perception scores were significantly higher than pre-intervention scores ($p = 0.001$), and all post-intervention outcomes exceeded predefined benchmark criteria ($p < 0.05$). Qualitative findings supported these results, indicating improved student engagement, creativity, collaboration, and confidence in applying innovation to real-world public health contexts.

CONCLUSIONS

The innovation-based teaching and learning model effectively enhances innovation competencies and health promotion perceptions among public health students. It offers a practical framework for public health education in community-based settings.

BACKGROUND

Descriptive social norms, which indicate what most people do, are increasingly

being used to nudge healthier choices. However, evidence of their effectiveness is mixed in adults, and their application to guide food choices is recent. This study evaluates the effectiveness of a descriptive social norm intervention in increasing healthy food choices among users in three hospital canteens in the Friuli Venezia Giulia region (Italy).
METHODS
For two months, descriptive social norms regarding fruit choice (instead of dessert) and vegetables (at least one portion), were posted in three hospital canteens (C1, C2 and C3), then removed just before data collection. Users' trays were photographed at their first access during 5 working days between August and September 2023. A questionnaire was distributed to collect users' characteristics and assess correct recall of the messages. Multiple logistic regression (alpha < 0.05) was performed to examine the association between each message and the corresponding choice, adjusted for sex, age group, typology of work (shift/non-shift).
RESULTS
1,624 user questionnaires and trays were analyzed (1,005 from C1, 348 from C2, 271 from C3). The total sample included 899 females and 725 males; the median age was 45 years. 83% of those who correctly recalled the fruit message chose fruit (vs. 74% of those who did not). 83% of those who recalled the vegetable message chose at least one portion (vs. 73% who did not). A significant association emerged with users who remembered the message being more likely to choose fruit (OR: 1.91 [1.21-3.04]), and vegetables (OR: 1.90 [1.29-2.81]).
CONCLUSIONS
Descriptive social norms showed positive effects on fruit and vegetable intake, suggesting their potential as a tool for promoting healthier food choices in hospital canteens and their possible scalability to all workplace canteens.

Integration of infant feeding in clinical undergraduate education: a case study of one South African university faculty

Pamela Maluleke[1], Sara Jewett[1], Wiedaad Slemming[1,2]
[1]School of Public Health, University of the Witwatersrand, Parktown, South Africa, [2]Children's Institute, University of Cape Town, Cape Town, South Africa
INTRODUCTION
Healthcare workers have a significant influence on the infant feeding practices that parents use.1 It is, therefore, important to know what and how healthcare workers are taught and trained on infant feeding. There is a global paucity of data on how infant feeding education (IFE) is included in undergraduate curricula for clinical health science students who are being trained to have a direct involvement in patient care.2
OBJECTIVES
This study aimed to explore the timing, duration, delivery methods, content, and institutional factors; including potential commercial milk formula (CMF) industry influence that shape how IFE is included in the undergraduate clinical health science degrees.
METHODS
We conducted in-depth key informant interviews with staff members involved in either teaching, developing, or curating the curriculum of undergraduate students directly involved in patient care at Wits University. A smaller record review was conducted to characterize the timing, duration, and delivery methods of IFE. We used thematic analysis to analyse the qualitative data.3
RESULTS
Nursing students received more in-depth lessons compared to the other degrees, where lessons were minimal and unstructured. However, the lessons that were delivered across all degrees were based on the clinical evidence of the benefits of breastfeeding. Other influences of how IFE was structured were the coordinator's attributes, timetabling constraints, and the lack of prioritisation for IFE.
DISCUSSION
There was a notion that infant feeding was meant to be a nurse's job. Most programs emphasize breastfeeding's biological benefits over a holistic biopsychosocial approach, limiting practical application. Though CMF companies did not directly influence the curriculum, their presence in faculty awards subtly shapes perceptions
CONCLUSIONS
The study highlights the need to define the different roles that can be played by healthcare professionals to promote breastfeeding, encourage collaboration across degrees, and promote ongoing training, especially on CMF regulations and evolving IFE guidelines.

Peoples-Praxis (PP): A Mentorship Model for Public Health Skills Development in Low- and Middle-Income Countries (LMICs)

Mina Endeley[1], Hannah Patrick[1], Nicholas Osborne[1], Victor Joseph[1], Richard Heller[1], Fatai Ogunlayi[1]
[1]Peoples-Praxis Charity, London, United Kingdom
INTRODUCTION
Gaps in the public health (PH) workforce and limited access to flexible professional development are common in many low-and middle-income countries. Despite the abundance of courses on PH, there's no easy way to help practitioners put these into practice. Peoples-Praxis (PP) aims to address this through an accessible, fully-online model that embeds open online courses within structured mentor–mentee relationships, building on the success of Peoples-uni, which used volunteer tutors in 55 countries to support students from more than 100 countries (70% from Africa) in open online master's and CPD programmes.
METHODS
PP, a charity in the UK, offers support to public health staff (primarily graduates) in LMICs to apply their skills to real-world PH tasks through a mentorship programme with mentors and mentees across the global divide. A custom-built platform provides access to a range of online courses that offer skills development in mentorship and reflection, as well as support pathways to build the skills relevant to their practical PH needs. Certification signifies the successful completion of a mentor-mentee partnership and the development of relevant skills. Evaluation occurs through user feedback and stakeholder interviews.
RESULTS
Mentors and mentees are mainly based in the UK, Pakistan, Nigeria, Malawi, Sudan, Ethiopia, Australia, Ghana, Zimbabwe, and Zambia. Another focus has been a programme to support PH practitioners in war-torn Yemen. Mentees' development needs mainly focus on practical PH leadership, implementation skills, and evidence-informed decision-making. Learners reported increased confidence in applying PH skills, and mentors appreciated the framework for goal-setting, boundaries, and accountability. Administrative resources for the programme are a primary challenge.
CONCLUSIONS
PP offers a scalable method for developing practical PH skills in LMICs. Future developments will focus on alignment with the WHO Essential PH Functions and outputs from mentorship that demonstrate quality and are accredited for mentee and mentor development.

The Impact of Continuing Education on Strengthening Environmental Health Surveillance in the State of Bahia, Brazil

ELIELTON ARAUJO[1,2], ANDREA LAURA MOREIRA[2], ANDERSON TEIXEIRA[2], MANUELA SANTOS[2], RIVIA BARROS[2]
[1]Postgraduate Program in Ecology: Theory, Application and Values, Federal University of Bahia, Salvador, Brazil, [2]Environmental Health Surveillance Coordination, Government of the State of Bahia, Salvador, Brazil
ABSTRACT
The regionalization of Brazil's Unified Health System (Sistema Único de Saúde – SUS) is a key strategy to ensure decentralization, equity, and comprehensive health care1,2. The state of Bahia comprises 417 municipalities and is administratively organized into nine Health Macroregions, which function as operational units for implementing Environmental Health Surveillance (EHS) actions, in line with targets established by the State Health Plan and the Ministry of Health for the 2024–2027 period. These targets include the implementation of continuing education processes in health surveillance across all macroregions and ensuring that at least 60% of municipalities carry out a minimum of three EHS actions per four-month period3,4,5. This study analyzes continuing education as a strategic tool for strengthening EHS in Bahia, based on results from the three four-month periods of 2025. In the first period, continuing education initiatives reached 44.44% of the macroregions, while only 106 municipalities (25.43%) implemented the minimum number of EHS actions. Training activities focused primarily on drinking water quality surveillance and monitoring populations exposed to chemical contaminants. In the second period, coverage expanded to 100% of the macroregions, and the number of active municipalities increased to 116 (27.80%), a growth directly associated with previous capacity-building efforts. Full macroregional coverage was maintained in the third period, highlighting the relevance of institutional and matrix support provided through training initiatives. During this phase, the number of municipalities conducting three or more EHS actions increased to 147 (35%), consolidating a sustained upward trend. The findings demonstrate that continuing education plays a critical role in professional

qualification and institutional strengthening at the municipal level. The integration of regionalization, continuing education, and EHS enhances operational capacity, promotes equitable access to surveillance policies, and represents a strategic approach to addressing climate change–related health impacts6,7,8.

Teaching Strategies Used by Grade 11 Chemistry Teachers in Rural South Africa: Implications for Scientific Literacy and Public Health Education

Mkhubo Isaac Gwebu[1]
[1]Teacher Developent And Governance, Mpualanga Department Of Education, Ermelo, South Africa

BACKGROUND
Effective teaching of chemical reactions is central to developing foundational scientific literacy, an upstream determinant of health literacy and future public health workforce capacity. In rural and under-resourced settings, instructional practices may constrain learners' conceptual understanding and engagement with science. Evidence on the prevalence and determinants of teaching strategies at Grade 11 level in rural South Africa remains limited.
METHODS
A cross-sectional quantitative study was conducted among 61 Grade 11 chemistry teachers in the Chief Albert Luthuli Sub-district, Gert Sibande District, Mpumalanga Province. Data were collected using a structured self-administered questionnaire capturing demographic and professional characteristics and frequency of use of selected teaching strategies measured on a five-point Likert scale. An overall teaching strategy usage score was computed. Descriptive statistics, one-way analysis of variance, and univariate and multivariate linear regression models were used to identify factors associated with variations in strategy use.
RESULTS
Traditional instructional approaches were most frequently used, including textbook- and worksheet-based teaching (mean = 4.12; SD = 0.68) and teacher-centred lecturing (mean = 3.94; SD = 0.72). Learner-centred strategies were applied at moderate levels, while computer-based strategies showed low usage (mean = 2.11; SD = 0.97). Teaching strategy usage differed significantly by age, teaching experience, academic qualification, and continuing professional development (CPD) exposure. In adjusted analyses, teaching experience ($B = 0.11$; $p = 0.032$) and CPD exposure ($B = 0.19$; $p < 0.001$) remained significant predictors.
CONCLUSIONS
The dominance of traditional teaching approaches in rural secondary chemistry classrooms may limit the development of scientific literacy relevant to public health education. Strengthening targeted CPD and supporting learner-centred and technology-enhanced instruction represent critical upstream investments in health literacy, equity, and future public health workforce development in rural South Africa.

ABS1783
Creating an academically competent public health workforce through supportive education and training

Anika Daniels-Osaze[1], Marlene Camacho-Rivera[1]
[1]1 School of Public Health, SUNY Downstate Health Sciences University, Brooklyn, New York, United States

INTRODUCTION
According to a report published in January 2025 by the US Government Accountability Office (GAO), there is a shortage of public health workers across several occupations and locations. This has a profound impact on essential functions such as disease investigation, mitigation, hazard detection, and emergency response.1 The American Public Health Association (APHA) reports that to address basic health needs, health departments need 80000 more full-time public health employees locally and statewide. This increase does not address emergent situations.2
METHODS
The Health Resources and Services Administration (HRSA) provided funds to develop an innovative program that recruits, trains, and retains students to strengthen and diversify the workforce through a health equity focused curriculum, seminar series, mentoring program, career development workshops, and applied practice experiences (APEx). Students in the Downstate Public Health Scholarship Program (DPHSP) are trained in prevention, preparation, and response to COVID-19 and other emergencies, SDOH, disparities, and health equity. Through partnerships with governmental and community-based organizations, we provide field placement sites for 85 trainees per year. DPHSP provides scholarships to offset the financial burden faced by disadvantaged trainees.
RESULTS
In three years, we have trained and provided field placements for 255 students while facilitating entry into full-time public health jobs, with a 99% graduation rate. During our presentation, we will highlight data regarding the field experiences, employment rate, and industries where our program participants have entered.
CONCLUSIONS
In order to address local, national, and global public health challenges, it is necessary to increase and diversify the public health workforce through specific training, professional development and applied practice opportunities. Providing financial support to current trainees assists with retention and graduation rates. With the proper support and opportunities, we can increase the number of competent public health leaders to do the work necessary to resolve our current public health issues.

ABS1808
Recognising the Gaps: Reflections on the Absence of Cultural Humility and Ubuntu in Healthcare Spaces

Ubuntu Hlatshwayo[1], Jaisubash Jayakumar[1]
[1]University of Cape Town, Cape Town, South Africa

INTRODUCTION
Health is a fundamental human right whose full realisation may be undermined by the failure to provide culturally appropriate care. According to the World Health Organisation, the acceptability of healthcare refers to care that upholds sound medical ethics, is culturally appropriate, and is sensitive to personal identity factors. The provision of such care is grounded in cultural humility which is an ethical stance that recognises the limitations of one's understanding of another's cultural experience. In culturally diverse contexts such as South Africa, adopting a culturally humble stance is essential, as it directly influences the acceptability of healthcare services.
METHODS
This autoethnographic study explores the absence of cultural humility in clinical spaces, drawing on my experiences as a medical student at the University of Cape Town. Through reflective journaling, I recount moments in which cultural humility was notably lacking. Informal discussions with an educationalist enabled the co-development of themes situated within broader educational and social contexts, through which we critically examined potential root causes of this absence. Relevant literature was reviewed to situate personal narratives within a critical analytical framework.
RESULTS
The literature suggests that the acceptability of care is constrained by healthcare professionals' limited practice of cultural humility. This limitation is rooted in colonial legacies that marginalised indigenous knowledge systems, resulting in a healthcare system misaligned with local values. African philosophies such as Ubuntu emphasise interconnectedness and holistic personhood, whereas the biomedical model, shaped by colonialism, promotes a reductionistic approach. Challenging dominant Western epistemologies requires cultural humility, cultivated through ongoing critical reflexivity. Curriculum reform is therefore vital in fostering student awareness of cultural diversity, power, and positionality, enabling the development of truly reflexive healthcare professionals.
CONCLUSIONS
Through cultural humility and critical reflexivity, South Africa can move toward a health system that meaningfully responds to its population's diverse cultural realities.

Strengthening Cancer Civil Society Leadership through Education: Evidence from a Quasi-Experimental Study in Chile

Baltica Cabieses[1], Manuel Espinoza[2], Francisca Vezzani[1], Antonia Roberts[1], Alexandra Obach[1], Carla Campaña[1]
[1]Centro de Salud Global Intercultural, CeSGi, Universidad del Desarrollo Chile, Santiago, Chile, [2]School of Public Health, University of Hong Kong, Hong Kong, China

BACKGROUND
Cancer is among the leading causes of death in Chile, with significant disparities in access to healthcare. While the National Cancer Plan 2020-2028 emphasizes social participation, leaders and members of civil society organizations often lack technical knowledge for effective political incidence. We assessed the effect of a co-designed educational intervention ("Lidera con Ciencia") on improving knowledge.

METHODS
A quasi-experimental -controlled before-and-after- study was conducted in Chile (2024-2025). Following co-designed workshops prioritizing educational needs, 56 members from cancer-related civil society organizations were allocated to intervention (n=28) or control (n=28) groups. The intervention consisted of 17 hours of hybrid training covering public health, evidence-based medicine, health technology assessment, equity, socio-anthropology of health, and citizen participation. Knowledge was assessed using validated scales (0-30 points). Data were collected before and after the intervention via online surveys, with no participants lost to follow-up. Difference-in-Differences (DiD) analysis using Generalized Estimating Equations quantified intervention effects, adjusting for age, gender, and region. An additional qualitative component using focus groups explored participants' experiences immediately and three months post-intervention. The study had ethics approval and considered informed consents. Study funded by the Center for Cancer Prevention and Control (FONDAP 152220002, ANID-Chilean Government).
RESULTS
DiD analysis revealed significant 10.5% improvement in overall knowledge scores attributable to the intervention (CoeffB=0.099,p=0.029). Subset analysis showed significant gains specifically in evidence-based medicine knowledge (CoeffB=2.47,p=0.07). Qualitative findings highlighted substantial perceived learning gains, increased confidence, empowerment, and successful application of knowledge in health decision-making spaces. Participants reported forming strategic alliances, establishing formal organizations, and effectively advocating in policy meetings.
CONCLUSIONS
Co-designed educational interventions can significantly enhance technical knowledge and perceived confidence among cancer organization members. These findings support institutionalizing participatory capacity-building initiatives to strengthen democratic engagement in health governance and HTA processes, promoting equity and legitimacy in health decision-making in Chile and similar contexts.

A qualitative evaluation of a global surgery course within the University of Cape Town's master of public health curriculum: A cross- sectional study

Yvan Zolo[1], Wakisa Mulwafu[1], Moses Isiagi[1], Mary Kinney[1], Simon Le Roux[1], Salome Maswime[1]
[1]University of Cape Town, Cape Town, South Africa

INTRODUCTION
Access to safe surgery is a critical, yet often neglected, component of Public Health for health systems strengthening. Despite its importance, Global Surgery education remains absent from Public Health curricula, which may lead Public Health specialists unprepared to address the unmet global burden of surgical disease. This study evaluated a novel Fundamentals in Global Surgery course within the University of Cape Town's Master of Public Health (MPH) program, an initiative designed to bridge this educational gap.
METHODS
A qualitative descriptive study was conducted using in-depth structured interviews with ten program alumni (2022–2025). Data were analyzed thematically to explore the course's impact on participants' knowledge, careers, and professional identity.
RESULTS
Analysis revealed five central themes defined by the following key insights: 1) a notable paradigm shift from viewing surgery as a clinical discipline to understanding it as a Public Health imperative; 2) the critical role of a multidisciplinary learning environment in mirroring real-world health systems; 3) the effectiveness of applied pedagogical approaches like case-based learning and intervention design; 4) a significant professional impact, including direct career pivots, advancements, and the cultivation of a practitioner-advocate mindset; and 5) logistical challenges of balancing coursework with professional duties. UCT's Fundamentals in Global Surgery course for MPH students demonstrates an effective model for integrating Global Surgery into Public Health education.
CONCLUSIONS
By combining a systems-focused curriculum, an improvement science approach, and a multidisciplinary cohort, the course shows potentials to transform students into practice-ready change agents. The findings of this study inform a blueprint for curriculum development and strengthen the call to integrate Global Surgery into Public Health training.

ABS2106

Training social innovators and entrepreneurs for Community Oriented Primary Care in Western Cape, South Africa.

Gillian Vedan[1], Sarah-Anne Alman[1], Katusha de Villiers[1], Saadick Davids[1], Gcobisa Maqanda[1], Nozipho Ngwabi[1], Solange Rosa[1], Iviwe Sixolo[1]
[1]Bertha Centre for Social Innovation and Entrepreneurship, University of Cape Town, Cape Town, South Africa

INTRODUCTION
Social Innovation and entrepreneurship can contribute to stronger health systems. In collaboration with the University of Cape Town's Faculty of Health Sciences, the Bertha Centre team hosted a series of education and training activities between 2024 and 2025. The sites for the project are Klipfontein, Saldanha Bay and Knysna-Bitou.
METHODS
Programmes under the Bertha Centre were multifaceted in 2025: 1. Facilitated 3x introduction to social innovation and entrepreneurship workshops as a career for final year high school students 2. Facilitated 3x entrepreneurship bootcamps to build entrepreneurial thinking and intent among youth Not in Employment, Education and Training (NEET) 3. Facilitated a 17-week incubation and acceleration course to support early-stage social innovators and those with proven business models that have the potential to scale
RESULTS
1. 100 high school students completed the 3x workshops on social innovation and entrepreneurship as career pathways 2. 60 NEET students across 3 sites completed a 5-day entrepreneurship bootcamp on identifying a solution for a community health priority. Notable solutions tackled mental health, water and sanitation and drug addiction in communities 3. 17 students completed a 17-week incubator and accelerator programme. At a pitch day hosted on 31 October 2025, 7 students won seed funding for their social innovation, with the highest prize being ZAR500,000 or US$30,000 for an innovation to empower people living with disabilities.
CONCLUSIONS
Based on lessons from the previous 2 years, the Bertha Centre will continue to advocate for social innovations that should be integrated and institutionalised to strengthen fragmented health systems. There is also a need to strengthen the community structures that enable small businesses to thrive.
Popul. Med. 2026;8(Supplement 1):A1056

ABS2210

Care for Child Development Approach: A Large-Scale Hybrid Training Model for Primary Health Care Professionals in Brazil

Claudia Alves[1], Caroline Alves[2], Rachel Ferreira[3], Rita Rodrigues[4], Rafael Kucaniz[5], Laura Krauss[5], Tatiana Coimbra[6], Sônia Venâncio[6]
[1]Pediatrics, Federal University of Minas Gerais, Belo Horizonte, Brazil, [2]Occupational Therapy, Faculdade de Ciências e Tecnologias em Saúde da Universidade de Brasília (UnB), Brasilia, Brazil, [3]Post-Graduate Program Health Sciences, Federal University of Minas Gerais - UFMG, Belo Horizonte, Brazil, [4]Post-Graduate Program Public Health, Federal University of Ceará, Fortaleza, Brazil, [5]Medical School, Federal University of Minas Gerais, Belo Horizonte, Brazil, [6]CGCRIAJ, Ministério da Saúde, Brasilia, Brazil

INTRODUCTION
Promoting early childhood development (ECD) is a key global public health challenge. In Brazil, despite the wide coverage of Primary Health Care (PHC), guidance on ECD and positive parenting remains insufficient in routine services. To address this gap, the Brazilian Ministry of Health, in partnership with UFMG and PAHO, implemented the Care for Child Development (CDC) Project in PHC, adapting the WHO/UNICEF approach to the Unified Health System (SUS) through a scalable hybrid training model combining online (30 hours) and in-person components (8 hours).
OBJECTIVES
To examine the capillarity, adhesion, satisfaction, and socio-professional profiles of professionals participating in the CDC-PHC training.
METHODS
This exploratory study analyzed data from course registration, academic trajectory, and the final anonymous evaluation questionnaire. Descriptive statistics assessed socio-professional profiles, geographic distribution, course completion rates, satisfaction, and participation in in-person training.
RESULTS
From February 2025 to January 2026, 57920 professionals registered for the online course; 5737 (10%) completed the theoretical phase; 50% worked in the SUS. Among SUS completers, most were nurses (31%) and general physicians (36%) working in Family Health Teams (67%), alongside other multiprofessional

categories (22%). All 27 Brazilian states were represented, with higher participation from the Northeast and Southeast (33% each). Course quality was rated as good by 89% of participants; content was considered pertinent by 81% and applicable to PHC by 74%. Most accessed the course from home (64%), over 80% would recommend it, and 14% of completers enrolled in in-person training (n=347).
CONCLUSIONS
The hybrid model is feasible for strengthening PHC capacities at scale and reducing regional inequalities in continuing education. However, high dropout rates indicate limited institutional support, especially protected study time. The well-rated online course suits diverse PHC contexts and professional categories, but its sustainability depends on institutional support and the integration of the CDC approach into routine practice.

ABS2217

PhD Mentorship Programme: An Emerging Community of Practice

Tsidiso Tolla[1], Lucia Knight[1], Jennifer Nyawira Githaiga[1]
[1]School of Public Health, The University of Cape Town, Cape Town, South Africa

BACKGROUND
Doctoral research is a complex, often isolating endeavour that demands high levels of self-motivation, academic writing proficiency, and engagement with scholarly debates. Many PhD fellows struggle to sustain research momentum, build confidence in presenting their work, and navigate expectations of academic integrity and high-quality argumentation. To address these needs, the University of Cape Town's School of Public Health established a PhD Mentorship Programme in 2024 to foster a supportive research community enabling connection, motivation, and accountability. Approach: The programme delivers monthly hybrid meetings, comprising a blend of student research presentations and professional development sessions, delivered by faculty and alumni, focusing on cross-disciplinary topics. These include critical argumentation, research integrity, effective communication of complex ideas, and managing the demands of doctoral studies. In 2025, a group of fellows and faculty attended a 3-day residential retreat funded by the MasterCard Foundation, through Health Futures South Africa.
RESULTS
Fellows' feedback on the programme indicates that it has provided accountability, a sense of community, and a safe, consistent space for academic growth. Reported highlights included sessions on elevator speeches, critical argumentation, and alumni reflections on their PhD journeys. Fellows who presented their work during mentorship sessions voiced appreciation for this space and the valuable feedback they received, expressing the value of the programme for improving their academic skills, building confidence in their work, and supporting their research trajectories. A significant outcome of the programme was the development of a supportive peer network and a sense of belonging.
CONCLUSIONS
Through fellows' engagement and faculty involvement in programme activities, a community of practice is emerging, fostering a collegial environment in which doctoral students feel accountable, motivated, and connected. Continued investment will allow the programme to further support the quality of work and well-being of the university's doctoral community.

ABS2264

Co-design, agency, and challenge: Understanding the experiences of educators engaged in the delivery of mental health promotion programs involving boys and young men in Australia

Yang Zhao[1], Garth Stahl[2], Rohann Irving[3], Melissa J. Opozda[3], James A. Smith[3], Elizabeth J. Edwards[2], Murray Drummond[4], Mair Underwood[2], Laura Scholes[5]
[1]London School of Hygiene and Tropical Medicine, London, United Kingdom, [2]The University of Queensland, Brisbane, Australia, [3]College of Medicine and Public Health, Flinders University, Northern Territory, Australia, [4]SHAPE Research Centre, Flinders University, South Australia, Australia, [5]Australian Catholic University, Brisbane, Australia

INTRODUCTION
Globally, rates of mental ill health and suicide among adolescent boys and young men (ABYM) are unacceptably high. Men's mental health experts are increasingly calling for gender-sensitive and gender-transformative programs to meet the specific mental health needs of ABYM, particularly those that embrace healthy, progressive and expansive concepts of masculinities. With the majority of mental illnesses emerging in adolescence, secondary schools are uniquely positioned to develop and implement innovative mental health promotion strategies and programs. Unfortunately, for the most part, school-based mental health programs remain almost exclusively gender-neutral, with limited research capturing how educators can best develop and implement effective health and well-being education.
METHODS
This research draws on 12 semi-structured interviews with school well-being leaders working in single-sex boys' schools in Australia. The participants committed to a well-being audit capturing their efforts and what they saw as the strengths and weaknesses of mental health programs delivered to ABYM. A thematic analysis captured some of the key barriers to effectively addressing the well-being of boys and young men in schools.
RESULTS
In examining the efforts of well-being leaders in boys' schools, we identified four key insights: 1) the evolving nature of the mental health and well-being of ABYM in reference to exposure to new gender pressures amplified through access to digital content; 2) the central role of educator agency and efforts to influence whole-school culture over one-off lesson-based programs; 3) the use of relational and strengths-based frameworks to get ABYM to reflect on the relationship between healthy masculinities and their well-being; and 4) the importance of co-designed mental health education with ABYM.
CONCLUSIONS
Together, these findings underscore the strategic importance of empowering well-being educators in schools to develop localised, gender-transformative practices focused on improving the mental health of ABYM.

ABS2295

From theory to practice: Health promotion in undergraduate medical education

Maryke Geldenhuys[1], Shani Dames[2], Erin von der Heyden[1,3]
[1]Department of Global Health, Stellenbosch University, Cape Town, South Africa, [2]Department of Medicine, Stellenbosch University, Cape Town, South Africa, [3]Western Cape Government: Health and Wellness, Cape Town, South Africa

INTRODUCTION
Health promotion is a core component of the Health and Wellness module for second-year medical students at Stellenbosch University. The curriculum is designed to expand on a theoretical foundation in health promotion that is intentionally paired with structured opportunities to apply health promotion principles in practice. Methods and
RESULTS
Students are introduced to key health promotion principles, models, and determinants of health through interactive teaching that emphasises upstream drivers of health, community contexts, and the doctor's role as a health advocate. This theoretical grounding is then reinforced through two scaffolded experiential learning activities: Campus Health Day and a Health Promotion Assignment. Campus Health Day aligns with World Health Day and provides a supported educational setting in which students collaboratively plan and implement a Campus Health Day for their peers and the broader campus community. Activities have included health screening initiatives and food security interventions. This initiative enables students to translate theory into practice in a supported, peer-focused environment. The second experiential component, the Health Promotion Assignment, situates learning within students' longitudinal primary healthcare experience (LPHCE) contexts. Working in groups, students identify a relevant health promotion need within their assigned community, and then plan, design, implement and reflect on an appropriate intervention. This assignment emphasises students' roles as health advocates working across individual, community, and population levels. Students disseminate their work through a conference-style poster presentation to peers and examiners, reinforcing reflective practice and scholarly communication skills.
CONCLUSIONS
Together, these learning activities demonstrate a scaffolded educational approach to teaching health promotion, moving from theory, to practice in a safe educational setting, and finally to application within real-world primary healthcare contexts. This model offers a practical example of how undergraduate medical curricula can meaningfully integrate health promotion education to prepare future doctors for preventive, community-oriented practice.

ABS2316

Impact of Training and Program Expansion on Proficiency Testing Performance in the Western Cape Province, South Africa.

Alarice Marsh[1], Tebogo Maomela[1], Nicolette Henney[1], Francois Buys[1]
[1]HIV and AIDS and STI, National Department of Health, Pretoria, South Africa

BACKGROUND

Strengthening diagnostic quality systems is essential for improving clinical decision-making and public health outcomes. In many low- and middle-income settings, the Proficiency Testing (PT) program is an essential mechanism for monitoring testing accuracy, identifying quality system gaps and guiding targeted corrective actions. Prior assessment revealed persistent challenges in the Western Cape province, including inconsistent PT performance, limited adherence to standard operating procedures, and insufficient facility participation in the external quality assurance activity. These gaps underscored the need for strengthening capacity building initiatives, improved quality assurance oversight and expansion of the PT coverage to ensure equitable access to quality diagnostic services across the province. Interventions A targeted, province wide training program was implemented by the National Department of Health in collaboration with the National Health Laboratory Services (NHLS) and Centers for Disease Control (CDC) focusing on PT handling, testing accuracy, corrective action procedures, and adherence to standard operating protocols. Simultaneously, the PT program was expanded to include over 45 additional healthcare facilities, significantly increasing program reach and enabling comprehensive quality monitoring across more service points
RESULTS
Following implementation, the PT performance increased from below 80% to 95%. This improvement reflects enhanced technical proficiency, strengthened understanding of quality assurance systems, and more consistent performance across testing sites. The expansion of PT participation further enabled broader quality monitoring and increased equity, particularly for previous underrepresented facilities.
CONCLUSIONS
The strategic combination of structured training and strategic program expansion led to significant measurable improvements in the provincial PT outcomes. These results highlight the effectiveness of targeted capacity-building and scale-up initiatives in strengthening diagnostic quality. Continued investment in staff training, monitoring systems, and facility inclusion will be essential and advance gains and to ensure that the province sustains and build on these achievements

Stakeholder and Community engagement for non-communicable disease training in West Africa

Betty A. Nartey[1], Tobilola Omotosho[2], Haddy Tunkara Bah[2], Kwame Adu-Bonsaffoh[3], Titus K. Beyuo[3], Jainaba Sey-Sawo[2], Paul Bass[4], Thomas Senghore[2], Arti Singh[5], Yeetey Enuameh[5], Faith Agbozo[6], Paul Amuna[6], Daniel Boateng[5]
[1]1 Department of Biological, Environmental and Occupational Health, School of Public Health, University of Ghana, Legon/ Accra, Ghana, [2]2 Department of Nursing and Reproductive Health, University of the Gambia, Banjul, Gambia, [3]3 Department of Obstetrics and Gynaecology, University of Ghana Medical School, Accra, Ghana, [4]4 Department of Public and Environmental Health, University of the Gambia, Banjul, Gambia, [5]5 Department of Epidemiology and Biostatistics, School of Public Health, Kwame Nkrumah University of Science and Technology, Kumasi, Ghana, [6]6 Department of Family and Community Health, Fred N. Binkah School of Public Health, University of Health and Allied Science, Ho, Ghana
BACKGROUND
Stakeholder engagement is critical in curriculum development for non-communicable disease (NCD) training in West Africa. For countries like Ghana and the Gambia, experiencing a growing burden of NCDs, strengthening the capacity of health workers to respond to the steady increase in NCDs has become more important. In view of this, the Capacity Strengthening of Transdisciplinary Education for Non-Communicable Disease Care in West Africa (CAPSTONE) project set out to address this urgent need.
METHODS
Stakeholder analysis and prioritization were conducted to identify stakeholder groups, their potential roles, interest level and influence on the project at each phase. Stakeholders were engaged between January 2023 and December 2025. Prior to this engagement, needs assessments were undertaken to identify gaps and provide insight into the current situation in Ghana and the Gambia.
RESULTS
From January 2023 to December 2025,141 stakeholders across Ghana and the Gambia were engaged in eight engagement sessions. Stakeholders included individuals from Government Institutions, Academic Institutions, Healthcare Professionals, Civil Society Organizations, Researchers, Persons involved in curriculum development, Teachers and Students. Stakeholders met to validate the needs assessment. Nearly all stakeholders emphasized an urgent need for capacity building in the area of NCD in Ghana and the Gambia. In the Gambia, all respondents stated the need for a program on NCDs, highlighting training needs at the following levels; CPD, Diploma, Bachelor, Postgraduate Diploma and Masters, Together with stakeholders, six NCD-focused short courses were co-developed and successfully piloted in Ghana, and The Gambia.
CONCLUSIONS
Effective stakeholder and community engagement played a crucial role in the successful development and piloting of practical, skill-based NCD care education curricula that fits local needs in Ghana and the Gambia.

Challenge-based learning for interprofessional health science education for non-communicable disease care – the CAPSTONE experience

Judith van de Kamp[1], Rupal Shah-Rolfs[2,3], Arti Singh[4], Jainaba Sey-Sawo[5], Faith Azongo[6], Kerstin Klipstein-Grobusch[1,7]
[1]Department of Global Public Health & Bioethics, Julius Center for Health Sciences and Primary Care, University Medical Center Utrecht, Utrecht, Netherlands, [2]Department of Global Health, Hans Rosling Center for Population Health, University of Washington, Seattle, United States, [3]Heidelberg Institute of Global Health, University of Heidelberg, Heidelberg, Germany, [4]School of Public Health, Kwame Nkrumah University of Science and Technology, Kumasi, Ghana, [5]Department of Nursing & Reproductive Health, School of Medicine & Allied Health Sciences, Banjul, Gambia, [6]Fred N. Binka School of Public Health, University of Health and Allied Health Sciences, Ho, Ghana, [7]School of Public Health, Faculty of Health Sciences, University of the Witwatersrand, Johannesburg, South Africa
BACKGROUND
Effective prevention and control of non-communicable diseases (NCDs) depends on a health workforce that is supported to respond to evolving health system realities. In many low- and middle-income country settings, including West Africa, health professionals are navigating a growing prevalence of NCDs alongside communicable disease and reproductive, maternal, newborn and child health burden, often within complex health delivery service environments. Strengthening opportunities to apply existing clinical and public health expertise to NCD prevention, management and care is therefore a critical priority.
METHODS
Challenge Based Learning (CBL) has emerged as an innovative pedagogical approach in health professions education. Evidence suggests that CBL can enhance interprofessional and interdisciplinary collaboration, support competency development and foster reflective and context responsive problem-solving. Within the Capacity Strengthening of Transdisciplinary Education for Non-Communicable Disease Care in West Africa (CAPSTONE) project, CBL is being integrated into graduate education at four higher education institutions in Ghana and The Gambia. Building on existing strengths in health professional training, this approach aims to support graduates to engage effectively with the prevention, management and care of NCDs, and to translate evidence into practice within local health system contexts.
RESULTS
CAPSTONE co-developed and delivered six new accredited NCD short courses for professionals in Ghana and the Gambia. The courses intentionally bring together learners from different disciplines and levels of the health system, creating spaces for mutual learning that value professional experience and contextual knowledge alongside global evidence. Training-of-Teacher (ToT) sessions proved valuable to strengthen locally led integration of CBL into NCD education. These sessions supported educators to adapt CBL pedagogies in ways that are locally grounded, culturally responsive, and institutionally sustainable.
DISCUSSION
In this session, participants will take part in a mini-masterclass introducing CBL through experiential learning, followed by guided reflection on its potential to support health science education across diverse contexts.

Reframing Communication Partner Training in Healthcare: A Critical Interpretive Synthesis to foreground culture, power and linguistic diversity

Jordan Nash[1], Helene-Mari van der Westhuizen[1]
[1]Continuing Education, University of Oxford, Oxford, United Kingdom
INTRODUCTION
Communication disability can disrupt equitable participation in healthcare, particularly for people with acquired communication impairments such as aphasia, most commonly following stroke. Communication Partner Training (CPT) is a widely adopted approach applied across healthcare contexts to improve

communication accessibility by targeting the knowledge, skills and practices of healthcare providers and caregivers. Most CPT models were developed in Global North contexts and operationalise success primarily through behavioural and interactional metrics. In doing so, culture, power and linguistic diversity are more often treated as contextual factors rather than core to communication and participation. This study critically examines how CPT is conceptualised and theorised in the literature, with particular attention to assumptions that researchers make regarding communication success, participation and change.
METHODS
Critical Interpretive Synthesis methods were used to locate and synthesise literature from multiple international settings, including culturally and linguistically diverse contexts like South Africa. Our initial search yielded 326 papers, of which 25 were included as core to the review. Literature was analysed iteratively to identify underlying assumptions, theories of change, and conceptual frameworks.
RESULTS
Three key patterns were identified. First, culture is rarely theorised explicitly and is typically positioned as contextual background rather than constitutive of communication. Second, despite acknowledging interactional complexity, CPT models privilege observable behavioural change, often marginalising relational, moral and epistemic dimensions of participation. Third, participation is frequently operationalised as interactional performance rather than social recognition, authority and inclusion. Evidence from culturally diverse settings challenges assumptions that participation can be enhanced primarily through standardised strategies and training models.
CONCLUSIONS
This synthesis reframes CPT as a culturally situated, relational and power-influenced practice. A narrow focus on effectiveness risks obscuring public health concerns regarding appropriateness, equity and contextual fit, with implications for both research and clinical care.

Digital screen use and educational performance in early childhood: evidence from an early childhood education center

Caroline Feitosa Dibai de Castro[1], Mariana Miranda[1], Luísa Prezotti Bomfim[1], Valentina Soares Faé de Oliveira[1], Tiago Pedrini Chagas[1], Jenuan Bourguignon[1], Júlia Coelho Grobério[1], Fernanda Fernandes Molini[1], Camila de Brito Rodrigues[1], Alvaro Borlini Machado[1], Ricco Spelta Risso Tranhago[1], Francine Alves Gratival Raposo[1], Kelen Antunes Iyrio[2]
[1]1 Escola Superior de Ciências da Santa Casa de Misericórdia de Vitória, Vitória, Brazil, [2]2 Universidade Federal do Espírito Santo, Vitória, Brazil

INTRODUCTION
Excessive exposure to digital screens in early childhood is a growing global public health concern, particularly in low- and middle-income countries experiencing rapid digital expansion alongside social inequalities. International guidelines, including those from the World Health Organization and pediatric societies, recommend strict limits on screen use in this age group due to potential negative impacts on cognitive development and educational performance. Evidence from real-world educational settings, especially post-pandemic, remains limited.
OBJECTIVE
To evaluate the association between screen time and educational performance among children aged 0–6 years enrolled in a public early childhood education center in Vitória, Espírito Santo, Brazil, highlighting implications for public health and education policies in similar contexts.
METHODS
A cross-sectional mixed-methods study was conducted at a municipal early childhood education center. From 321 children, 188 were selected through simple random sampling (95% confidence; 5% margin of error). Data were collected using structured questionnaires for caregivers and school record analysis. Screen time was categorized according to international pediatric recommendations. Outcomes included language development, literacy, and mathematical skills. Statistical analyses used chi-square and Fisher's exact tests, prevalence ratios (PR), and odds ratios (OR), with $p < 0.05$.
RESULTS
Excessive screen time was observed in 56.9% of children, more prevalent among ages 3–6. Mathematical difficulties were identified in 27.9% of the sample. Children with excessive screen exposure showed higher prevalence of mathematical difficulties (PR = 2.86) and increased odds of learning difficulties (OR = 3.83).
CONCLUSIONS
Screen exposure above recommended limits was associated with poorer educational performance in early childhood, especially in mathematics. Findings support integrated public health and education strategies, including guidance on responsible screen use in primary care and early childhood education policies, particularly in middle-income countries undergoing rapid digitalization.

INTRODUCTION
Delivering the World Health Organization (WHO) Roadmap requires a skilled workforce equipped to deliver the Essential Public Health Functions (EPHFs). The Association of Southeast Asian Nations (ASEAN) countries have varied public health systems and resources but share a commitment to strengthening regional public health collaboration. This study systematically maps public health training across ASEAN countries, using the United Kingdom as a benchmark, reflecting extensive UK collaboration to advance competency based public health training.
METHODS
A two stage review was conducted: a scoping review of peer reviewed literature (search date 13.12.2023) and national policy documents, followed by institutional data collection by subject matter experts in each country. Training pathways, curricula, and workforce planning were mapped against the WHO EPHFs for core public health professionals and specialist training linked to national authorities. Comparative analysis included both medical and non medical tracks.
RESULTS
Training structures, duration, certification, funding, and delivery models varied across ASEAN countries. Most countries offered separate pathways for medical and non medical professionals, with differing entry requirements for bachelor's, master's, and doctoral programmes. Training approaches for the EPHFs varied across countries and functions, using academic, workplace based, or combined models. Workforce planning and regulatory frameworks existed in most ASEAN countries. The UK offered a unified, competency based training scheme for both groups, including a master's and a portfolio route for accreditation.
CONCLUSIONS
This study is the first to systematically map national public health training programmes in ASEAN and the UK. The regional perspective provided a richer understanding of national approaches, and we present a replicable methodology for further international collaboration on workforce mapping. It surfaced opportunities to strengthen competency based education for delivering the EPHFs and to build on regional collaborative initiatives for resourcing training. Leveraging the UK model, ASEAN can work towards standardised curricula and multisectoral

entry pathways.

ABS2636
Integrating health systems and public health into a renewed undergraduate medical programme at a sub-Saharan university
René English[1], Maryke Geldenhuys[1], Steffni Albertyn[1]
[1]Department of Global Health, Stellenbosch University, Cape Town, South Africa
ABSTRACT
The renewed undergraduate medical curriculum at Stellenbosch University, implemented in 2022, is structured around four pillars: the self (student), the patient, the community, and the healthcare system. This organised, interactive session explores how Health Systems and Public Health content has been intentionally integrated within the Community and Health Systems pillars to advance community-oriented and socially accountable medical education. Although the first graduates of the renewed curriculum will only complete their studies in 2027, this session argues that such integration is critical for preparing future doctors who are equipped to engage ethically, collaboratively, and reflectively with complex health systems and community health needs. Exit Level Outcome 3 of the MBChB (Bachelor of Medicine and Bachelor of Surgery) programme requires graduates to contribute to strengthening the health system through a community-oriented approach; demonstrate social and environmental accountability; communicate respectfully and professionally within diverse healthcare teams; and navigate communities and health systems ethically, demonstrating advocacy, leadership, self-awareness, and reflective practice. This session illustrates how Health Systems and Public Health teaching was designed to operationalise this outcome across the undergraduate curriculum. Participants are introduced to key curricular components, including population and community concepts; determinants of health; health promotion; Community-Oriented Primary Care; South African health system development and policy; governance and financing of health systems; health information systems; and leadership skills and self-regulation. Drawing on early implementation experiences, the session reflects on both successes and challenges in integrating Health Systems and Public Health teaching in a longitudinal and contextually relevant manner. The development team describes the rationale, design process and implementation approach undertaken. Through facilitated discussion and interactive engagement, participants are invited to share perspectives and critically reflect on best practices and strategies for strengthening the inclusion of Health Systems and Public Health content in undergraduate medical education across diverse contexts.

ABS2662
Strengthening Quality of Care Through a Blended Training Model at Private Not for Profit Health Facilities in Central and Eastern Uganda.
Joseph Mugerwa[1], Chelsea Lipoto[1], Lydia Nakanjako[1], Alex Alinaitwe[1], Sarah Borger[2], Patricia Namakula[1]
[1]Program, LifeNet International, Kampala, Uganda, [2]Program, LifeNet International, Washington D.C, United States
BACKGROUND
Private Not for Profit (PNFP) health facilities play a critical role in Uganda's health system, delivering up to 40% of primary and referral care, particularly in underserved areas. However, persistent gaps in health worker competencies, limited access to continuous professional development, and a weak supportive supervision mechanism continue to affect quality of care. Blended training approaches combining structured centralized learning with on-site mentorship and continuous performance monitoring offer a promising strategy to strengthen workforce capacity and improve service delivery. This study assessed the effect of LifeNet linternational's blended training and mentorship model on quality of care at PNFP health facilities in Central and Eastern Uganda.
METHODS
We conducted a pre-post implementation study across 24 LifeNet partner health facilities from 2023 to 2025. The intervention combined centralized training focused on best medical practices and management systems, followed by regular onsite mentorship and supportive supervision aligned with LifeNet's quality scorecard (QSC) framework. The QSC is a standardized tool measuring adherence to clinical standards, patient safety practices, documentation, and management systems with an 80% minimum module competency. Health facility performance was assessed using QSC for both medical and management domains at baseline and endline. Paired tests analyzed changes in health facility performance.
RESULTS
Improvements were observed across both medical and management domains following implementation of the blended training model. Mean medical QSC scores increased from 53.78% at baseline to 85.96% at endline (+32.18%, p<0.001). Management performance improved from 42.66% to 86.83% (+44.17%, p< 0.001).
CONCLUSIONS
Blended training significantly improved quality of care in PNFP health facilities strengthening both clinical and managerial practices demonstrating that sustained, practice-oriented capacity building improves service delivery. This approach provides a scalable and context-appropriate model for health system strengthening in resource-limited settings.

Academia, Public Health, and the Challenges of the Current Environment
Laura Magaña[1], Laura Rasar King[2]
[1]Association of Schools and Programs of Public Health, Washington, DC, United States, [2]Council on Education for Public Health, Washington, DC, United States
INTRODUCTION
Public health systems worldwide are facing intensifying political, social, and economic pressures. These include misinformation, declining public trust, and polarization. Academic institutions are facing similar challenges along with threats to academic freedom, constraints on research agendas, and increasing scrutiny of teaching and public engagement. Taken together, these forces create compounded risks for schools and programs of public health, leading to potentially detrimental impacts to public health teaching, research, and service.
METHODS
This panel will examine how academic public health is navigating a rapidly evolving environment across different country and regional contexts. Panelists will consider issues such as accreditation, recognition and professionalization of the workforce, restrictions on academic expression, and financial sustainability.
RESULTS
Speakers will share examples from their countries/regions, highlighting strategies to respond to these challenges. Panelists will identify lessons learned and promising practices.
CONCLUSIONS
Academic public health offers a critical pathway into public health practice and leadership. Identifying and addressing the challenges of the current environment is critical to ensuring a strong public health workforce and continued advancement of public health science. This session will offer an interactive opportunity for shared learning and dialogue on sustaining academic public health amid global uncertainty.
Popul. Med. 2026;8(Supplement 1):A1083

ABS2982
Co creating Ubuntu Pedagogy: A Participatory Workshop Model for Strengthening Educational Capacity in Higher Education
Sungano Chigogora[1], Masumi Odari[2]
[1]School of Public Health, Imperial College London, London, United Kingdom, [2]Department of Literature, University of Nairobi, Nairobi, Kenya
BACKGROUND
Ubuntu (also Unhu/Utu), a Bantu philosophy centred on relational humanity, community, and shared responsibility, is rarely embedded in Higher Education (HE) despite its alignment with participatory and community based pedagogies. This project, situated within a collaboration by the Imperial College London School of Public Health and the University of Nairobi (UON), sought to explore how Ubuntu principles could support student led learning, belonging, and community building within HE settings. A workshop held with UoN students formed the cornerstone of this inquiry.
METHODS
Using a deliberative dialogue approach consistent with public engagement, the workshop was co-created with UoN student representatives and followed a structured plan including (i) introduction to Ubuntu, (ii) small group moderated discussions, (iii) thematic synthesis, and (iv) collaborative reflection. Sessions ran for 3.5 hours with breaks and refreshments to support comfort and inclusion. Participants were grouped in tables of 5-8 to ensure equitable voice and peer moderated dialogue. Data were recorded and shared via flip chart notes and presentations, showcasing group reflections across themes such as community, responsibility, collaboration, and barriers to solidarity.
RESULTS
The participatory model successfully enabled students to articulate lived experiences of Ubuntu within education. Students highlighted the value of shared roles based on strengths, guidance and mentorship, collective problem solving,

and community centred learning. They also identified structural challenges, including peer pressure, tribalism, limited diversity exposure, financial constraints, and inequitable participation. The inclusive workshop design—emphasising storytelling, consensus-building, and co leadership—was perceived as empowering and reflective of Ubuntu ethics.
CONCLUSIONS
This workshop model demonstrates how Ubuntu aligned pedagogical processes can strengthen educational capacity by embedding equity, dialogue, and mutual responsibility into learning environments. The approach directly aligns with WCPH streams on Education and Capacity Strengthening and Community Engagement, illustrating a replicable participatory methodology for fostering relational learning cultures in African and global HE contexts.
Popul. Med. 2026;8(Supplement 1):A1086

ABS2992
Ubuntu informed Student Perspectives on Community, Solidarity, and Learning: Outcomes from a Multidisciplinary Workshop at the University of Nairobi
Sungano Chigogora[1], Masumi Odari[2]
[1]School of Public Health, Imperial College London, London, United Kingdom, [2]Department of Literature, University of Nairobi, Nairobi, Kenya
BACKGROUND
As part of an ARUA–Imperial project exploring the operationalisation of Ubuntu (or Unhu/ Utu) principles in Higher Education (HE), a workshop with students across Literature, Engineering, Medicine and Education at the University of Nairobi sought to identify Ubuntu characteristics that facilitate community building and student led learning. Outcomes from this workshop inform a framework intended for adaptation within Western HE settings, particularly the Imperial College London School of Public Health.
METHODS
Student generated themes were captured through group flip chart activities addressing roles, responsibilities, barriers to unity, and visions for Ubuntu aligned learning environments. Facilitated discussions elicited both individual reflections and collective aspirations across diverse academic backgrounds.
RESULTS
Analysis revealed several overarching themes: 1. Community and Belonging: Students emphasised that "I am because you are" must underpin learning, calling for student centred models recognising shared humanity and interdependence. They stressed the need for peer support, compassion, and acknowledgement of diverse linguistic and cultural identities. 2. Roles and Shared Responsibility: Groups highlighted the importance of assigning roles based on strengths, cultivating mentorship, and embedding collaborative decision making. Guidance, empathy, and reciprocal accountability were seen as foundational to effective learning communities. 3. Barriers to Solidarity: Students identified tribalism, limited diversity exposure, peer pressure, and financial barriers as key inhibitors of harmony and academic flourishing. 4. Pathways for Ubuntu in HE: Suggested practices included peer learning programmes, community outreach, student clubs, environmentally responsible initiatives, and co designed academic projects that centre collective growth.
CONCLUSIONS
Findings demonstrate that Ubuntu offers a robust ethical and relational foundation for enhancing solidarity, peace building, and student led learning. Themes strongly align with the WCPH streams of Community Engagement and Participatory Approaches and Peace, Humanitarianism and Global Solidarity. These outcomes now inform the development of an Ubuntu based framework to be trialled at Imperial College London.
Popul. Med. 2026;8(Supplement 1):A1088

ABS3029
Bridging the skills gap: An open access initiative to strengthen hand injury care in low resourced settings
Erica Conibear[1], Nicola Ehlers[2], Kirsty van Stormbroek[2]
[1]Occupational Therapy, University of the Witwatersrand, Johannesburg, South Africa, [2]Open Hand Therapy Initiative, Johannesburg, South Africa
BACKGROUND
Hand injuries are common in low-resourced settings and can result in profound, long-term functional loss. When mismanaged, these injuries limit participation in daily life and jeopardise livelihoods, contributing to cycles of poverty and disability. Specialist hand therapy services, however, are scarce in many low-income regions, leaving the majority of patients dependent on generalist occupational and physiotherapists who manage diverse caseloads with limited access to specialist training, literature, mentorship, or continuing professional development. Addressing this skills gap is essential for equity, inclusion, and the World Health Organisation's goal of health for all.
METHODS
In June 2024, we launched the Open Hand Therapy Initiative to strengthen the capacity of generalist therapists providing hand injury care in low-resourced contexts. The initiative delivers free, CPD-accredited, open-access monthly webinars developed and presented by volunteer clinicians with expertise in low-resource service delivery. Each webinar focuses on practical, contextually relevant skills and clinical reasoning strategies tailored for environments with limited materials, high caseloads, and systemic service constraints.
RESULTS
To date, 16 webinars have been delivered with contributions from 24 volunteer presenters. The sessions have reached 1,683 live participants across 38 countries, with an additional 4,000+ asynchronous views on YouTube and Zoom. Post-webinar evaluations demonstrated an average 2.4 point increase (on a 10-point scale) in participants' self-reported working knowledge. Most participants also reported improved confidence in managing the featured conditions and enhanced clinical reasoning within their service context.
CONCLUSIONS
Accessible, context-responsive, open access education can meaningfully strengthen the skills of generalist clinicians delivering hand injury care in low-resourced settings. This initiative illustrates a feasible, scalable model for bridging specialist skills gaps and advancing equitable access to quality care. Continued collaborative development of open-access educational resources is recommended to support health workforces globally.
Popul. Med. 2026;8(Supplement 1):A1090

ABS3054
Data to Policy: Equitable Health Policy Development for the Improvement of Health Outcomes
Andrew Ancharski[1], Leigh Johnston[2], Mabore Maorifi[2], Khumo Mngomezulu[1]
[1]The CDC Foundation, Atlanta, United States, [2]Division of Public Health Surveillance and Response, National Institute for Communicable Diseases, Johannesburg, South Africa
BACKGROUND
The Data to Policy (D2P) program, developed by Vital Strategies and the U.S. Centers for Disease Control and Prevention under the Bloomberg Philanthropies Data for Health initiative, aims to bridge the data-policy gap through team-based training and mentoring of health policy professionals. D2P participants develop data-driven policy briefs and recommendations that respond to government health priorities. The objective of the interactive session is to demonstrate the value and feasibility of developing equitable policy briefs within Ministry of Health settings that improve health outcomes.
METHODS
The one-hour interactive session will demonstrate the process of producing and advocating for a data-driven policy brief and provide hands-on experience using key tools. A 10-minute introductory presentation will include the background of D2P. A 30-minute interactive workstation rotation will focus on performing a root-cause analysis, incorporating equity into a health policy and evaluating policy options with a health economics lens to create a case study. A 15-minute closing presentation will emphasize policy advancement techniques, including examples from D2P South Africa.
RESULTS
At the end of the session, participants will be able to define "policy" and "policy brief," describe basic methods relevant to policy brief development in a health setting, and understand how to advance health policies to improve health outcomes. Participants will appreciate how important health equity is in every step of the process of health policy development and implementation.
CONCLUSIONS
The equitable implementation of health policies can improve health outcomes across multiple sectors in public health settings. This short session is an introduction to the tools for health policy development so attendees can see how the data they collect can lead to change.

Preparing the Frontline: Integrating Oral Health into Medical and Nursing Curricula
Feroza Amien[1], Faheema Kimmie-Dhansay[2], Nashna Rampersad[2], Khabiso Ramphoma[2], Jawaya Shae[3]
[1]School of Public Health, University of Cape Town, Cape Town, South Africa, [2]Community Dentistry, University of the Western Cape, Cape Town, South Africa,

[3]University of Cape Town, Cape Town, South Africa
INTRODUCTION
Medical practitioners and nurses are frontline health professionals and are often the first point of contact for patients presenting with oral health (OH) concerns[1-3]. Despite this central role, OH has historically been marginalised within medical and nursing curricula, resulting in gaps in graduate competence across prevention, early recognition, and management of common oral conditions. These gaps contribute to missed opportunities for early intervention and reinforce the artificial separation of oral and general health care. Integrating OH into medical and nursing education through a competency-based, primary health care-oriented approach supports comprehensive, patient-centred care by equipping graduates with clearly defined context-appropriate capabilities that can be applied within routine clinical practice. Importantly, such integration advances equity by expanding access to OH care through existing health system contact points, rather than relying on parallel, dentist-centred service delivery models that remain inaccessible to many populations.
METHODS
This one-hour interactive workshop is designed for public health educators, curriculum leaders, and health professionals involved in medical and nursing training. It commences with a short lecture outlining the public health rationale for integrating OH into health professions education, including key content areas and competency domains. Participants then break into small, facilitated groups to examine real-world curricular scenarios and identify feasible entry points for integrating OH into medical and nursing curricula.
RESULTS
The workshop will generate a set of practical strategies for integrating OH into medical and nursing curricula across diverse contexts. Outputs include mapped curricular entry points and shared teaching approaches. Conclusion. Integrating OH into medical and nursing education is feasible and necessary to strengthen holistic, equitable health care. This workshop provides participants with actionable strategies to embed OH meaningfully within existing curricula, supporting improved patient care and more integrated health systems.

Health Professionals' Perceptions after a Hybrid Continuing Education Strategy of the Care for Child Development Project in Primary Health Care

Caroline de Oliveira Alves[1], Claudia Alves[2], Rachel Ferreira[3], Rita Rodrigues[4], Rafael Kucaniz[5], Laura Krauss[5], Tatiana Coimbra[6], Sônia Venâncio[6]
[1]Faculdade de Ciências e Tecnologias em Saúde, University of Brasília, Brasília, Brazil, [2]Pediatrics, Federal University of Minas Gerais, Minas Gerais, Brazil, [3]Post-Graduate Program Public Health, Federal University of Minas Gerais, Minas Gerais, Brazil, [4]Post-Graduate Program Public Health, Federal University of Ceará, Fortaleza, Brazil, [5]Medical School, Federal University of Minas Gerais, Belo Horizonte, Brazil, [6]CGCRIAJ, Ministério da Saúde, Brasília, Brazil
INTRODUCTION
Continuous professional development in Primary Health Care (PHC) is essential for strengthening health systems and integrating evidence-based practices into early childhood care. Hybrid training models that combine distance learning with face-to-face activities are promising for balancing quality and practical applicability. The Care for Child Development project in PHC (CDC-PHC) adapted the World Health Organization and UNICEF approach to the Brazilian Unified Health System (SUS) through a hybrid program with a 30-hour online theoretical module and an 8-hour in-person practical component.
OBJECTIVE
To assess health professionals' perceptions of the CDC online course and practical training, focusing on counseling skills development, clinical practice, and applicability within PHC services.
METHODS
This exploratory qualitative study included professionals who completed the theoretical course and were nominated by PHC managers to participate in the practical training. A purposive sample of 15 professionals—three from each Brazilian region—participated in online interviews conducted after the theoretical and practical stages. Interviews addressed the training pathway, institutional agreements, and applicability within health services. Data were analyzed using thematic analysis to identify perceptions related to theory–practice integration.
RESULTS
The training was described as enriching and essential, highlighting improved understanding of sensitive caregiving and strengthened caregiver–child interactions. Key challenges included platform navigation difficulties, workload overload, and lack of protected time for training. The practical component was crucial for consolidating theoretical knowledge through real-world experience.
CONCLUSIONS
The hybrid model is a viable strategy for large-scale capacity building in PHC. Sustainability depends on improved technological usability and institutional support in public health settings globally.

ABS3273
Strengthening the public health workforce: Insights from South Africa's MPH graduate career trajectories and leadership pathways

Virginia Zweigenthal[1,2], Laetitia Rispel[3], Sean Patrick[1]
[1]School of Health Systems and Public Health, University of Pretoria, Pretoria, South Africa, [2]School of Public Health, University of Cape Town, Cape Town, South Africa, [3]South African Research Chairs Initiative (SARChI) and School of Public Health, University of the Witwatersrand, Johannesburg, South Africa
BACKGROUND
The public health workforce is critical for resilient health systems, particularly in low- and middle-income countries. However, there is limited empirical evidence on Master of Public Health (MPH) graduates' career trajectories, leadership pathways, and competency gaps in the African context.
METHODS
The session draws on findings from multi-institutional studies of MPH graduates from eight South African universities and complementary multi-country research in other African countries that focused on core public health competencies. The diverse research methods include online alumni surveys, competency assessments, employer interviews, and curriculum reviews to examine motivations, career trajectories, leadership roles, workplace competencies, and curriculum revision or alignment. The organised session will combine a panel of short expert inputs and interactive discussion.
RESULTS
The session will be structured around five evidence-based themes emerging from the study
RESULTS
(1) Career Mobility and Workforce Entry: MPH graduates were typically mid-career professionals with high employment rates and strong mobility across government, NGO, and academic sectors; Leadership Pathways: the MPH serves as a key gateway into technical and managerial public health leadership roles; (3) Workplace Impact: most graduates report meaningful organisational and societal contributions after graduation; Competency Gaps: leadership, crisis and outbreak management, monitoring and evaluation, communication, and project management remain underdeveloped for a notable proportion of graduates; and Curriculum–Workforce Alignment: graduates and employers highlight the need for more experiential learning, mentorship, and closer alignment between MPH training and workforce needs.
CONCLUSIONS
The session will enable participants to identify, discuss, and prioritise practical strategies for MPH curriculum reform, leadership pathway development, and workforce planning in African contexts.

A health systems intervention project to address the suboptimal disease surveillance and response capacities in the Western Cape

Charlene Lawrence[1], Washiefa Isaacs[1,2], Levani Naidoo[1], Janine Bezuidenhoudt[1,2], Thanya Petersen[3], Elrien Joubert[3], Emelda Ramutshila[2]
[1]Emergency and Clinical Services Support, Service Priorities Coordination, Communicable Disease Control and Outbreak Response, Western Cape Government, Department of Health and Wellness, Cape Town, South Africa, [2]Division of Public Health Surveillance and Response, National Institute for Communicable Diseases, a division of the National Health Laboratory Service, Johannesburg, South Africa, [3]People Development Centre, Western Cape Government, Department of Health and Wellness, Cape Town, South Africa
INTRODUCTION
Public health surveillance underpins timely outbreak detection and epidemic response. In the Western Cape, limited district and facility-level capacity, fragmented surveillance systems, absence of a formally designated trained surveillance and outbreak response workforce, and data analysis skills, have contributed to delayed and suboptimal responses. This study aims to design, implement, and evaluate an intervention to strengthen disease surveillance and response capacities.
METHODS
A critical descriptive analysis of a policy implementation challenge and evaluation

of a health system intervention project was undertaken. Health systems frameworks guided the development of a "Rich Picture" to contextualize the problem. Analytical tools - including CATWOE (Customer, Actors, Transformation, Worldview, Owner, Environment), stakeholder mapping, the 5Cs (Create, Comprehend, Communicate, Collaborate, Confront) of people management, opportunity cost analysis, Brinkerhoff and Crosby's strategy areas, and monitoring and evaluation methods were applied. These tools supported the identification and implementation of two "small- win" interventions.
RESULTS
The Rich Picture revealed the broader system context and resource-intensive processes shaping implementation. Root Cause Analysis identified 12 underlying factors: three key drivers, five linking factors, and four outcomes. Stakeholder analysis informed seven overarching actor-management strategies. Availability of human resource capacity for disease surveillance and response emerged as a key driver and priority intervention area. Opportunity cost analysis informed the first small win through collaboration with a national training unit to upskill a group of provincial trainees. This enabled a second small win of engagements with a provincial training unit to develop online training modalities. Monitoring and evaluation indicated positive outcomes, including trained public health officials, publication of online courses, and interest in further curriculum development.
CONCLUSIONS
The critical systems analysis informed stakeholder management and targeted interventions to strengthen human resource capacity for surveillance and response. These gains illustrate how effective planning, leadership, and people management can drive improvements in surveillance and response.

ABS3355
Health systems and public health learning through partnership: Co-designing a game-based assessment with South African medical students

Rene English[1], Charisma Adams[1], Tunisang Monoau[1], Imaan Parker[1], Sana Moodley[1], Liam Botha[1], Dylan Rudolph[1]
[1]Health Systems and Public Health, Stellenbosch University, Cape Town, South Africa

BACKGROUND
Strengthening health systems and public health (HSPH) learning is essential in South Africa, where inequity and a quadruple burden of disease require graduates who can apply systems thinking in complex care environments.1 Game-based learning offers an active, scalable approach to reinforce HSPH concepts. We report a student–staff partnership to co-design a game-based assessment for fourth-year medical students.2-4
METHODS
A partnership team (five undergraduate medical students, two interns, and an academic lead) co-designed a 25-minute, station-rotation assessment delivered to a cohort of under 300 students in a fourth-year module following clinical rotations. Games were selected and adapted through iterative prototyping and feasibility testing to ensure alignment with priority health systems and public health concepts and suitability. The final Game Day comprised four rapid, facilitator-led games with a points system: Bingo using short-answer questions; Jubilee, a movement-based yes/no/maybe decision game; (3) Rapid Fire, a timed team-response game using flags; and Connections (a categorisation task using projected terms).
RESULTS
The format enabled high-throughput participation, repeated retrieval practice, peer discussion, and immediate feedback on health systems and public health concepts within a constrained timeframe. Students engaged competitively and collaboratively, and facilitators could quickly identify misconceptions and address knowledge gaps. Practical adaptations (simplified rules, pacing cues, and removal of one game) were necessary to maintain fidelity to time and group-size constraints.
CONCLUSIONS
Co-designed, low-resource, rapid-cycle games can operationalise health systems and public health teaching at scale in undergraduate medical education. For sustainability, game-based assessments should be built around clear concept maps, tight timing, facilitator scripts, and contingency plans for pacing in large cohorts.5
Popul. Med. 2026;8(Supplement 1):A1103

ABS3356
Playing public health: An interactive demonstration of a game-based assessment for health systems and public health learning at a higher education institution

Rene English[1], Charisma Adams[1], Tunisang Monoau[1], Imaan Parker[1], Sana Moodley[1], Ian Botha[1], Dylan Rudolph[1], Geldernhuys Maryke[1], Maria Van Zyl[1]
[1]Health Systems and Public Health, Stellenbosch University, Cape Town, South Africa

BACKGROUND
Health systems and public health teaching can be challenging in crowded curricula, yet these competencies are central to equitable, inclusive, and sustainable health. In a South African undergraduate medical programme, we used a student–staff partnership process to co-design and implement a set of low-resource educational games for use in assessment to fourth-year medical students.[1,2] The development process combined collaborative ideation, rapid prototyping, feasibility testing for large cohorts, and rehearsal for delivery within strict time and space constraints. Gamified assessments are useful because they promote active learning and retrieval practice, create immediate feedback loops, and enable scalable participation in a high-throughput format while sustaining motivation through play and social interaction.
METHODS
This organised session translates our game-design and implementation approach into an interactive workshop. Facilitators (students and academics) will briefly introduce the partnership-based design process, design constraints (large groups, short station rotations, resource limits), and how health systems and public health concepts were mapped to game mechanics and question formats. Participants will then rotate through selected games designed for rapid engagement and formative assessment. Game materials, facilitator scripts, and example question sets will be displayed for participants to examine.
RESULTS
Participants will experience multiple game formats that operationalise key health systems and public health concepts; identify how game mechanics can assess knowledge application, reasoning, and reflection under time constraints; and (3) leave with practical design principles for adapting game-based assessments to their own contexts, including pacing, group management, and low-resource material options.
CONCLUSIONS
This session offers a practical, inclusive, low-stakes way to explore how game-based assessment can strengthen HSPH learning at scale. The session concludes with an open question-and-answer discussion with student and academic co-designers on the development process, implementation lessons, resourcing, facilitation, and transferability to different settings.

ABS3419
Education and intersectorality: the importance of territorial meanings based on the experience of the course "education, health, and social assistance: complementary networks in basic social protection" in perus – São Paulo, Brazil

Leonardo Musumeci[1], Cleide Martins[1]
[1]School of Public Health, University of São Paulo, São Paulo, Brazil

ABSTRACT
Although research and public policies recognize the importance of intersectorality for health promotion (Akerman et al., 2014), academic education and professional practice remain relatively isolated (Monnerat & Souza, 2009). To address this issue, in 2021 — amidst the complexity of the COVID-19 pandemic and in collaboration with a network of public schools — was created the course "Education, Health, and Social Assistance: Complementary Networks in Basic Social Protection" was established. Based on a Freirean framework (Freire, 2017), the course investigates, supports, and provides training for the local coordination of social policies. The 100-hour program (60 theoretical hours and 40 practical action-research hours) is offered free of charge to undergraduate students from various fields, public service professionals, and community leaders from four territories in the São Paulo Metropolitan Area, Brazil. The initiative has been positively evaluated for its ability to attach theoretical pathways, work experiences, and current social policy challenges. Furthermore, it problematizes the debate on social rights and public systems by positioning local agents and situations as protagonists. In analyzing the heterogeneity of that territories, the district of Perus stands out due to the strong synergy between service providers and local leaders, alongside a history of social movements focused on tackling the social determinants of health (Almeida-Filho, 2009). This context clarifies the concept of "used territory" (Santos, 1999) as a material and identity-based result of social processes. The ability to articulate these meanings—as experienced locally—has been central to a meaningful educational experience. This is evidenced by the increased participation of professionals and leaders, the strengthening of intersectoral

networks, and the experience of undergraduate students who develop themselves in direct contact with the struggle for rights within both social movements and public services.

ABS3475
Public health entrepreneurial training as a pathway to equity and meaningful public health work

Nazik Nurelhuda[1], Sadaf Lynes[2]
[1]School of Health Sciences, Hamdan Bin Mohammed Smart University, Dubai, United Arab Emirates, [2]Director of Collaborative surveillance, workforce and health emergencies, International Association of National Public Health Institutes, Brussels, Belgium

BACKGROUND
Health inequities are shaped not only by unequal access to services but also by unequal access to meaningful public health work. Across many regions, public health systems face ongoing population health needs alongside limited and uneven career opportunities for trained public health professionals. This hits hardest on early-career practitioners, mobile populations, and those working in fragile or resource-limited settings. Public health entrepreneurship (PHE), as the use of innovation, sustainable business models, and cross-sector partnerships to design and scale solutions that improve population health and equity, is emerging as one way to address these challenges. In resource constrained countries, this capability is particularly valuable, enabling practitioners to develop affordable, scalable and locally adaptable solutions thus making efficient use of limited resources, partnerships and financing models. PHE broadens skills set beyond technical and enables a wider professional pathway. This session explores how PHE training can become a core, equity-driven part of workforce development in public health.
METHODS
The session begins with findings from a global review of public health entrepreneurship education, mapping current gaps in definitions, approaches, and institutional support. Drawing on insights from national associations, global public health institutes, and public health experts, a moderated panel and audience discussion will explore equity-oriented entrepreneurial pathways, focusing on how training design and inclusion can strengthen entrepreneurial capacity within the profession.
RESULTS
Participants will actively contribute to a shared understanding of how training models can promote equitable participation and recognize diverse forms of public health practice. The conversation will also outline opportunities for collaboration across education, policy, and practice.
CONCLUSIONS
The session will advance understanding of public health entrepreneurship as a vital equity-focused skill set.

ABS3492
Challenges to emergency medical care students' mental health and well-being during clinical training

Liza Mari Du Plessis[1,2], Eduard Nico Nell[1], Elzana Kempen[2]
[1]Clinical Sciences, Central University of Technology, Bloemfontein, South Africa, [2]Health Sciences, University of the Free State, Bloemfontein, South Africa

INTRODUCTION
emergency medical care students are exposed to high academic demands and emotionally challenging clinical environments during training1. Repeated exposure to trauma, critical illness, and death, combined with programme pressures, may negatively affect students' mental health and well-being2. Limited qualitative evidence exists describing how students experience these challenges during clinical training in the south african context3. The aim of this study was to explore the mental health and well-being challenges experienced by emergency medical care students during clinical training.
METHODS
a qualitative study employing a phenomenological design was conducted within a constructivist research paradigm. The study was guided by a relativist ontology and a subjective epistemology, recognising that meaning is constructed through students lived experiences. Individual semi-structured interviews were conducted with emergency medical care students at the free state college of emergency care. Data were analysed using thematic analysis to identify patterns across participants' experiences. Ethical principles of confidentiality, reflexivity, and respect for participants were maintained throughout the study.
RESULTS
seven interrelated themes emerged. Students reported psychological and emotional distress related to repeated exposure to trauma, death, and critically ill patients, often accompanied by anxiety, sleep disturbances, and burnout. Academic and programme-related pressures, including high workload, long clinical shifts, and fear of failing to meet outcomes, intensified distress. Challenges within the clinical practice environment, particularly inadequate supervision, inconsistent expectations, and limited resources, contributed to uncertainty and reduced confidence. Social, financial, and logistical stressors further compounded students' experiences. Despite these challenges, students reported adaptive coping strategies and personal and professional growth.
CONCLUSIONS
emergency medical care students experience complex and interrelated mental health and well-being challenges during clinical training. Targeted institutional support, improved clinical supervision, and accessible mental health interventions are required to promote student well-being and support effective clinical learning.

Integrating Data-to-Policy Training into Field Epidemiology Training Programme: Advancing Equitable and Sustainable Decision-Making in South Africa

Mabore Morifi[1], Leigh Johnston[1], Emelda Ramutshila[1], Masingita Makamu[1], Nchucheko Makhubele[1], Mandla Zwane[2], Phumzile Phiri[2], Lazarus Kuonza[1,3,4], Susan Nzenze[1]
[1]Division of Public Health Surveillance and Response, National Institute for Communicable Diseases, Johannesburg, South Africa, [2]Communicable Disease Control Directorate, Mpumalanga Department of Health, Nelspruit, South Africa, [3]Wits School of Public Health, University of the Witwatersrand, Johannesburg, South Africa, [4]School of Health Systems and Public Health, University of Pretoria, Pretoria, South Africa

BACKGROUND
In South Africa, the Intermediate Field Epidemiology Training Programme (iFETP) strengthens surveillance, and outbreak detection and response skills for provincial public health officials, while Data-to-Policy (D2P) training teaches structured methods to translate epidemiological data into policy. We piloted an integrated iFETP D2P curriculum in Mpumalanga province to institutionalise economic evaluation embedded knowledge translation and policy brief writing skills.
METHODS
We conducted cross-circular connections method for curriculum integration. We identified links across iFETP and D2P (iFETP/D2P) training modules and removed overlapping concepts to avoid repetition. The remaining D2P content was adapted into six facilitated sessions of 1–2 hours aligned with iFETP objectives per workshop contact. We used epidemiological analysis outputs from iFETP objectives to prioritise a health problem in collaboration with the Ministry of Health and applied D2P concepts through facilitated sessions. Guided field activities included root-cause analysis, cost inventory data collection, stakeholder engagement, and policy brief development, supported by periodic check-ins. Decision-tree and cost-effectiveness analysis concepts were taught using freely-accessible Amua and Microsoft Excel.
RESULTS
Eleven public health professionals from Mpumalanga province participated in the pilot. The D2P methods were successfully integrated into six of eight workshops, improving participants' confidence in problem definition, micro-costing, and cost-effective analysis. The cohort developed a policy brief on infant pertussis vaccination, engaging provincial stakeholders to reflect programme realities. The cohort concludes with a policy brief presentation on infant pertussis vaccination strategies to the Ministry of Health Programme managers. Key lessons included the value of group-based learning, accessible analytic tools, and reflection on data-driven decision-making at the subnational level.
CONCLUSIONS
The iFETP/D2P strengthens sustainable, equitable capacity for policy-relevant economic analysis within provincial health systems. Using accessible tools such as Amua and Microsoft Excel promotes inclusivity and sustainability while embedding D2P in programme-level training supports locally anchored, scalable policy advancement, supporting Health Without Borders.

Interprofessional relations and the humanization of neonatal care: a narrative review

Scheila Defante Peres[1], Fabiana Turino[1], Érika Maria Sampaio Rocha[2], Fabrício Santos Neves[1], Kátia Cristine Carvalho Pereira[1], Sibelle Maria Martins de Barros[3],

Stephania Mendes Demarchi[1], Fabiane Lima Simões[1], Heloísa de Carvalho Torres[1], Maria Angélica Carvalho Andrade[1]
[1]1 Postgraduate program in collective health, Federal University of Espírito Santo, Vitória, Brazil, [2]2 Health science training center, Federal University of Southern Bahia, Teixeira de Freitas, Brazil, [3]3 Postgraduate program in health psychology, Federal University of Paraíba, João Pessoa, Brazil

INTRODUCTION
the neonatal intensive care unit (NICU) is characterized by high technological complexity and the need for integrated actions among health professionals. This study aimed to critically analyze the literature regarding interprofessional relations and their impact on the care of premature newborns, emphasizing the transition from fragmented practices to collaborative models.
METHODS
a narrative literature review was conducted, based on a broad search of theoretical frameworks, national policies, and clinical studies. The analysis synthesized concepts of multiprofessionality, interdisciplinarity, and interprofessionality, confronting the "prescribed work" of health policies with the "real work" described in the literature.
RESULTS
the results highlighted that care fragmentation, driven by rigid hierarchies and communication barriers, remains a significant challenge. The review identified that successful humanization strategies, such as the Kangaroo Method, depend on the effective articulation of knowledge and shared responsibility among the team.
CONCLUSIONS
the study concluded that strengthening interprofessional relations is an ethical and technical imperative for the safety of the newborn. The findings underscored the importance of Interprofessional Education as a tool to overcome historical isolation between categories and to qualify neonatal assistance.

Sal & luz: a university extension initiative using integrative practices and popular health education to promote equity among socially vulnerable populations.

Caroline Feitosa Dibai de Castro[1,2], Thauan Da Silva Castro Borges[2], Lorenzo Almeida Stelzer[2], Maria Eduarda Ferreira de Carvalho[2], Mariana Avellar Campos[2], Sofia Sarti Baptista[2], Fabrício Santos Neves[1], Fabiola Fernandes Bersot Magalhães[1], Francine Alves Gratival Raposo[2], Maria Angélica Carvalho Andrade[1], Ana Claudia Pinheiro Garcia[1]
[1]1 Graduate Program in Public Health, Federal University of Espírito Santo, Vitória, Brazil, [2]2 University Extension Project, Higher School of Sciences of Santa Casa de Misericórdia de Vitória (EMESCAM), Vitória, Brazil

INTRODUCTION
People experiencing social vulnerability face structural barriers to access healthcare, health promotion and social participation. University extension, when grounded in dialogue and critical engagement with reality, constitutes a privileged space for care production, learning and social transformation. The project Sal & Luz: bringing flavor and illuminating lives is a university extension initiative developed by medical students from EMESCAM, guided by the principles of popular education in health and the Brazilian National Policy on Integrative and Complementary Practices, implemented at the Vitória Shelter.
METHODS
The project was carried out through biweekly meetings at the shelter, with collective planning of activities based on dialogue with residents and staff. Activities included music therapy, meditation, yoga, caricature workshops, painting workshops, physiotherapy actions, as well as educational activities addressing tobacco use, breast cancer and other health topics. Interventions prioritized participatory methodologies, valuing participants' knowledge and promoting horizontal relationships between students and shelter residents.
RESULTS
Continuous participation and active engagement of residents were observed throughout the activities. Participants reported feelings of welcome, relaxation, strengthened social bonds and appreciation of bodily and artistic expression. Body-based and meditative practices proved effective in promoting immediate well-being, while artistic workshops fostered autonomy and creativity. For students, the project contributed to a deeper understanding of social determinants of health, the development of listening, communication and comprehensive care skills, and the strengthening of ethical and social commitment to medical practice oriented toward real community needs.
CONCLUSIONS
The Sal & Luz project highlights the potential of university extension grounded in popular education and human encounter as a strategy for health promotion, social inclusion and critical medical education. It represents a feasible, low-cost model capable of integrating care, learning and social transformation, reinforcing the role of public universities in addressing health inequities and promoting more humane and comprehensive health practices.

Building Transdisciplinary Capacity for Non-Communicable Disease Control in sub-Saharan Africa and Beyond: Lessons from the CAPSTONE Community of Practice

Arti Singh[1], Daniel Boateng[1], Judith van de Kamp[2], Kerstin klipstein-Grobusch[2]
[1]School of Public Health, Kwame Nkrumah University of Science and Techology, Kumasi, Ghana, [2]Department of Global Public Health & Bioethics, Julius Center for Health Sciences and Primary Care, University Medical Center Utrecht, Utrecht, Netherlands

BACKGROUND
Non-communicable diseases (NCDs) account for over one-third of deaths in sub-Saharan Africa (SSA), with premature mortality rising fastest in the region and placing growing pressure on health systems and the health workforce1. However, training in many Higher Education Institutions (HEIs) remains fragmented and insufficiently aligned with service delivery needs, professional standards, and national policy priorities2. The CAPSTONE (Capacity Strengthening of Transdisciplinary Education for nON-communicable disease care in West Africa) project addresses this gap by establishing a multisectoral Community of Practice (CoP) as a policy-engaged network of practice linking HEIs with the Ghana Health Service (GHS), regulatory bodies, and other stakeholders to co-design and implement workforce-relevant NCD education.
METHODS
The CoP convenes clinicians, academics, GHS and Ministry of Health officials, health service providers, civil society partners, students, and regulatory authorities. Through structured virtual and in-person meetings (2024–2026), members jointly set priorities; co-developed six competency-based NCD short courses; embedded these within existing MPH and MPhil programmes; advanced accreditation of a multi-institutional MPH; and aligned curricula with professional and regulatory standards. Collaborative workshops, peer review, and stakeholder consultations supported implementation and sustainability planning.
RESULTS
The CoP produced six harmonised courses, shared teaching resources, and enabled joint delivery across institutions. Engagement with GHS and regulators ensured policy alignment, strengthened accreditation processes, and linked training to service delivery requirements. Partnerships expanded mentorship, placements, and applied learning opportunities, while institutions strengthened teaching capacity and cross-sector collaboration, creating a pipeline of practice-ready NCD professionals.
CONCLUSIONS
Embedding a multisectoral Community of Practice as an implementation platform moves beyond knowledge sharing to coordinated action across education, regulation, and service delivery. The CAPSTONE CoP demonstrates a scalable and replicable model for strengthening workforce capacity and accelerating NCD control in Ghana, SSA, and globally, offering a pathway to integrate transdisciplinary training with national and international health system priorities.

ABS3622
Building Digital Safety and Preventing Technology-Facilitated Gender-Based Violence Through School-Based Education in India

Satviki Varma[1], Anumegha Bhatnagar[1]
[1]Programmes, Girl Effect, Gurugram, India

INTRODUCTION
Formative research by Girl Effect India (GEI) indicates that many adolescents lack awareness of their digital rights and struggle to identify or respond to technology-facilitated gender-based violence (TFGBV). Adolescent girls, in particular, face heightened exposure to online harm, while schools remain underutilised platforms for structured digital safety education. These gaps highlight the need for early, school-based education to build digital literacy, promote responsible online behaviour, and prevent TFGBV.
METHODS
In response, GEI developed Tipi Tipi Talk, an interactive, age-appropriate digital safety education module for students in Classes 8–12. The module builds awareness of digital rights, online harms, and prevention of TFGBV, and combines animated videos, scenario-based learning activities, and supporting materials for

students, parents, and teachers. Content is tailored separately for Classes 8–10 and 11–12. Implementation commenced through an initial Expert Talk Series delivered in government schools, focusing on consent-based online behaviour, recognition of online harm ("Tech Hinsa"), and practical response strategies. The curriculum is structured around three pillars: Identification, Action, and Agency. The full Tipi Tipi Talk module will be rolled out in subsequent phases through digital safety workshops, alongside training peer-led Digital Safety Ambassadors. GEI has initiated discussions with education authorities to support institutional adoption.
RESULTS
To date, 1700students across seven government schools have been reached through the Expert Talk Series. Sessions demonstrated strong student engagement with topics related to consent, online boundaries, and help-seeking. The next phase will expand implementation across 45 schools and orient approximately 200 student ambassadors to promote digital safety and peer support.
CONCLUSIONS
Early implementation suggests that structured, school-based education can strengthen adolescents' digital literacy, awareness of TFGBV, and capacity to respond to online harm. Integrating interactive digital safety modules within school systems offers a scalable, preventive approach to fostering safer online environments and supporting adolescent wellbeing.

ABS3746
Equitable capacity building from postgraduate diploma to PhD: strengthening the public mental health training pipeline

Claire van der Westhuizen[1], Katherine Sorsdahl[1]
[1]Alan J Flisher Centre for Public Mental Health, Department of Psychiatry & Mental Health, University of Cape Town, Cape Town, South Africa

ABSTRACT
Introduction. Mental health conditions account for a substantial and growing proportion of the global burden of disease, and share common risk factors with other non-communicable diseases, underscoring the need for integrated prevention and care strategies. In sub-Saharan Africa, health systems remain under-resourced, contributing to persistent treatment and prevention gaps. Strengthening African-led mental health research and implementation capacity is critical to defining locally relevant priorities and scalable solutions. Since 2012, the Alan J Flisher Centre for Public Mental Health has contributed to public mental health capacity building and, with the addition of a postgraduate diploma in public mental health in 2023, the Centre sought to address the growing need for accessible public mental health training, bridging the gap to Masters and PhD training [5,6]. Methods. Programme monitoring data from 2012 to 2025 were analysed, including enrolment, completion, disciplinary background and country of origin. Mixed methods evaluation data were collected to assess student experience and inform the development and implementation of the PGDip. Results. Since 2012, the Centre has supported 28 postgraduate diploma, 58 master's, and 11 PhD graduates from 12 African countries and multiple disciplines, including psychiatry, social work, nursing and community youth work. The Africa-focused, globally informed PGDip was designed for working professionals and is delivered by faculty from five academic institutions across four African countries. Curriculum content integrates multidisciplinary perspectives and lived experience. Preliminary evaluation indicates high perceived relevance, improved skills in critical appraisal and programme evaluation, and enhanced capacity to apply evidence in policy and practice settings. Conclusion. Structured, Africa-led training programmes can strengthen regional public mental health capacity and contribute to workforce development aligned with population-level mental health needs.

Resources to Facilitate Capacity Building for Pathogen Surveillance

Kirsty Lee Garson[1], Perceval Maturure[1], Yiqun Li[1], Siddiqah George[1], Nicola Mulder[1]
[1]Computational Biology Division, Department of Integrative Biomedical Sciences, University of Cape Town, Cape Town, South Africa

INTRODUCTION
Training and workforce development is a central facet of effective pathogen surveillance. Successful training activities require coordinated and continuous efforts, involving multiple stakeholders and dedicated funding. To effectively leverage available expertise and resources, it is essential to develop and apply software tools strategically. Rapid responses to disease outbreaks are contingent upon sustained development of skills, partnerships and infrastructure in the periods which precede them.
METHODS
Over the past five years, we have developed and delivered training for staff of national public health institutions in Africa, across a range of competency levels and formats. To enhance the effectiveness and sustainability of our work, we have developed a variety of tools and infrastructure including: (i) a trainer database, (ii) a helpdesk ticketing system, (iii) a targeted Slack workspace including trainers and trainees, (iv) a curated collection of information about relevant training materials available, (v) recorded lectures for a variety of topics, (vi) a number of standardized curriculum for pathogen surveillance and (vii) a web interface which guides users in navigating relevant resources.
RESULTS
Addressing the crucial and substantial need for training and workforce development in pathogen surveillance requires strategic, sustained and targeted efforts. The development of software tools to facilitate these activities and enhance their sustainability has offered immense value. Advances in artificial intelligence (AI) present opportunities to accelerate the development of training resources, improve their accessibility and maximize their impact.
CONCLUSIONS
We have presented training for pathogen surveillance, developed software resources and (3) implemented AI tools to enhance their utility. Currently, we are identifying opportunities to adopt AI for functions including augmenting accessibility of training resources through translation, developing personalized learning paths, creating enhanced assessment tools and enabling efficient data-driven decision-making.

Support tools for the elderly – Opportunities for academic training

Mirna Neyara Alexandre de Sá Barreto Marinho[1], Isabela Rocha Siebra[1], Rafael Bezerra Duarte[2], Moziane Mendonça de Araújo[1], Leidy Dayane Paiva de Abreu[3], Aretha Feitosa de Araújo[4], Isabella Joyce Silva de Almeida Carvalho[5]
[1]Enfermagem, Universidade Regional do Cariri - URCA - Campus Multi-institucional Humberto Teixeira, Iguatu - CE, Brazil, [2]Medicina, Universidade Estadual do Ceará - Campus Itaperi, Fortaleza - CE, Brazil, [3]Medicina, Universidade Estadual do Ceará - UECE / Faculdade de Educação de Crateús, Crateús - CE, Brazil, [4]Medicina, Universidade Regional do Cariri - URCA - Campus Pimenta, Crato - CE, Brazil, [5]Enfermagem, Universidade de Pernambuco - UPE, Recife - PE, Brazil

ABSTRACT
Context: Current health education needs to increasingly link teaching to social reality, through diverse strategies that foster in students the competencies required for their future profession1. Regarding health education for the elderly, it is necessary to consider aspects that go beyond the biological dimension, also pointing out social, cultural, educational, economic, spiritual, labor, and social security aspects that will directly influence their quality of life2. Thus, the objective of this study is to present the construction of monitoring instruments for the elderly as a teaching-learning strategy in the nursing course.
METHODS
This is an experience report developed in the course 'Nursing in the process of caring for the elderly', at a public university in the interior of Ceará, Brazil, between September 2025 and January 2026. Six instruments related to the content studied in the classroom were constructed, covering aspects such as: 1. Statute, National Health Policy and social control; 2. Nursing consultation; 3. Health record; 4. Comprehensive geriatric assessment and scales; 5. Chronic conditions and care model; 6. Clinical parameters. The students were divided into pairs, choosing an elderly person, and were instructed on the approach and materials to be taken on each visit. The study does not require ethical approval, according to current legislation in the country.
RESULTS
After each meeting, a classroom discussion took place where participants could present their experiences, reflections, and how they contributed to the care of elderly people – providing guidance, listening, conducting exercises, visiting basic health units to update vaccination schedules, sharing results from tests administered using scales, and especially valuing their experiences and knowledge.
CONCLUSIONS
The elucidation of the instruments used in practice fosters important competencies in the students, such as the acquisition of knowledge and commitment to learning, communication, critical thinking, and decision-making, which are fundamental for work in public health.

Training for uncertainty: capacity building for public health professionals in emergencies

Duha Shellah[1]
[1]Public Health in Emergencies and Disasters Working Group - WFPHA, Nablus - P400, Palestinian Territory, Occupied

INTRODUCTION
Emergencies are becoming the norm, not the exception. From climate-driven disasters to political conflict and pandemics, the global public health workforce is increasingly operating in contexts of deep uncertainty. However, most traditional public health education remains rigid, theory-heavy, and insufficiently oriented toward real-time crisis leadership. This session explores how we can rethink training to prepare professionals for emergencies characterized by complexity, trauma, and rapid evolution.
METHODS
This interactive workshop draws from training experiences in Palestine, South Sudan, and Colombia—contexts marked by systemic fragility and chronic emergencies. It will present modular training approaches that integrate systems thinking, trauma-informed care, and scenario-based simulation. Participants will engage in designing "micro-scenarios" and explore virtual tools that replicate chaotic field conditions.
RESULTS
Case studies from the three regions will illustrate how intersectoral partnerships, digital capacity-building platforms, and youth-led design methodologies can enhance emergency preparedness. Key insights include how to incorporate emotional resilience, adaptive leadership, and inclusive decision-making into training models—especially in settings with limited institutional capacity.
CONCLUSIONS
Training for the age of emergencies requires more than technical skills. It demands courage, empathy, and the ability to lead through ambiguity. This session offers public health professionals and institutions a set of adaptable tools to embed uncertainty and ethical complexity into the core of public health education. Building resilience starts with building capacity.
Popul. Med. 2026;8(Supplement 1):A1124

ABS3900

Strengthening Africa's children's nursing workforce through contextualised training

Minette Coetzee[1]
[1]Children's Nursing Development Unit, Department of paediatrics and Child Health, University of Cape Town, Cape Town, South Africa

BACKGROUND
Global progress in reducing child mortality is slowing and millions of children are still dying from preventable causes1 This 2025 report indicates that the highest under-5 mortality is in sub-Saharan Africa. While countries in the WHO Africa region have made measurable progress in strengthening health systems and the health workforce, central to how health systems work and how services are delivered is an adequately prepared and educated health workforce. While nurses and midwives comprise the majority (37%) of the region's health workforce2,undergraduate training programmes usually include only basic child health.
METHODS
The Children's Nursing Development Unit, a teaching and scholarship unit at the University of Cape Town has developed a three-fold approach to building children's nursing capacity in the Africa Region. Offering postgraduate training, working alongside educators and Schools of Nursing across the region and working with clinical leaders to articulate and establish best practice models that provide safe and quality care in local settings.
RESULTS
Postgraduate training is increasingly recognised as important to prepare practice ready nurses for African's health systems. The 2025 WHO Prototype Asset-Based Curriculum for Paediatric and Child Health Nursing provides a useful guide to curriculum approach and content3. Initiating new or adapting existing in-country child health nursing training requires wide stakeholder engagement and enrolment in teaching and learning methods that are locally appropriate and Afrocentric by design.
CONCLUSIONS
This paper will describe the Unit's process of participative curriculum design including approaches and tools utilised in developing postgraduate curricula with colleagues in eight schools of nursing across six African countries4. Strategies will include identification and enrolment of local stakeholders5 systems mapping and an asset-based approach to the development of local care models and resources6 aligned with the goal of best outcomes for children and their families.

ABS3919

Defining the elements of a self and peer assessment system for academic institutions of public health in Africa as a precursor to accreditation: A sequential exploratory mixed-methods study

Neo Ledibane[1], Sean Patrick[1], Kuku Voyi[1]
[1]School of Health Systems and Public Health, University of Pretoria, Pretoria, South Africa

INTRODUCTION
African health systems require training and development of the region-specific public health workforce for achieving universal health coverage (UHC) and Sustainable Development Goals. Fundamental components informing relevance of public health education in the context of UHC comprise the academic workforce, curricula and capacity of academic institutions of public health. This study aimed to assess the quality improvement strategies of academic institutions of public health relative to the institutions' curriculum, academic staff and infrastructure for the Master of Public Health(MPH) programme within the World Health Organization (WHO) African region, to build consensus for developing a self- and peer-assessment tool for quality public health education.
METHODS
This sequential mixed-methods study targeted 52 ASPHA (Association of Schools of Public Health in Africa)-affiliated academic institutions. Phase 1 utilised a cross-sectional electronic survey to determine current MPH programme assessment standards. Phase 2 employed a modified Delphi method to reach consensus on these standards that would comprise the newly developed assessment tool. Key informants: MPH coordinators and department heads/equivalent were purposively sampled. Data summary: descriptive statistics and thematic analysis.
RESULTS
Institutional characteristics were varied across sub-regions. Phase 1: Cronbach alpha coefficient revealed internal consistency of the statements (measured scales) for domains:institutional teaching and learning strategies (α=0.81);MPH programme design and curriculum renewal strategies (α=0.83); (3)academic staff development (α=0.86) andregional accreditation system acceptability (α=0.75). Agreement was unanimous (score>20; min=20,max=25) for all domains but accreditation system acceptability (score:17-25). Through the Delphi technique(Phase 2), consensus was reached on all domains relating to core components of the proposed tool.
CONCLUSIONS
Findings produced a novel self and peer assessment tool comprising agreed standards to ensure quality MPH education in Africa. This tool (piloting in Phase 3) will enable institutions to advance capacity development, monitor progressive educational goals, and lay the ground for establishing a uniquely African accreditation system.

Simulation of a worker health conference – Contributions to the teaching-learning process

Mirna Neyara Alexandre de Sá Barreto Marinho[1], Leidy Dayane Paiva de Abreu[2], Aretha Feitosa de Araújo[3], Rafael Bezerra Duarte[4], Isabella Joyce Silva de Almeida Carvalho[5], Thayza Miranda Pereira[6], Olga Maria de Alencar[7]
[1]Enfermagem, Universidade Regional do Cariri - URCA - Campus Multi-institucional Humberto Teixeira, Iguatu - CE, Brazil, [2]Medicina, Universidade Estadual do Ceará - UECE / Faculdade de Educação de Crateús - FAEC, Crateús - CE, Brazil, [3]Medicina, Universidade Regional do Cariri - URCA - Campus Pimenta, Crato - CE, Brazil, [4]Medicina, Universidade Estadual do Ceará - Campus Itaperi, Fortaleza - CE, Brazil, [5]Enfermagem, Universidade de Pernambuco - UPE, Recife - PE, Brazil, [6]Enfermagem, Universidade Federal de Tocantins - UFT, Palmas - TO, Brazil, [7]Programa Saúde na Escola, Ministério da Saúde, Brasília - DF, Brazil

ABSTRACT
Context: In 2025, Brazil organized the fifth edition of the Workers' Health Conference, following a step-by-step approach that began in municipalities, progressing through their respective health regions and states to culminate at the national level, with three main themes: National Policy on Workers' Health; New labor relations and workers' health; Popular participation in workers' health for social control1. Considering the importance of the topic, it is opportune that these discussions be considered in health education. The objective was to report the experience of simulating a regional health conference as a learning strategy.
METHODS
Experience report developed in October 2025 with students of the course 'Nursing in the process of caring for workers' health', from a university in Ceará, Brazil. The class was divided into three large groups, considering the conference's themes, and these groups were instructed to organize themselves into segments of users,

professionals, and health providers/managers, as is the case in these settings. The course instructor provided examples of municipal proposals to the groups, so that they could choose the 10 most viable proposals for debate and select three from each theme.
RESULTS
The students brought relevant reflections, especially pointing out the need to expand the Occupational Health Reference Centers, increase the dissemination of the policy, expand reporting channels with respectful professionals so that workers can report situations of moral and institutional harassment, among others.
CONCLUSIONS
The proposed conference simulation on the theme provided students with the opportunity to strengthen skills such as knowledge, communication, and teamwork. Furthermore, the strategy also brought them closer to social control, highlighting the importance of delegates understanding their role in choosing proposals that are consistent with reality.

Remote teaching & learning: delivery of Africa focused, globally informed postgraduate programmes in public mental health
Claire van der Westhuizen[1]
[1]Alan J Flisher Centre for Public Mental Health,, University of Cape Town, Cape Town, South Africa
ABSTRACT
Introduction. In low-resourced African settings, accessible and contextually relevant postgraduate training is essential for professionals in clinical, education, and community sectors who must translate learning into practice while embedded in their local contexts. Population-level wellbeing requires coordinated action across sectors and geographic settings, making flexible, practice-oriented training models particularly important. Session aims. This symposium will share experiences, successes, and challenges in delivering remote postgraduate training across a coursework postgraduate diploma and research-based Masters and PhD programmes in public mental health. The programmes are designed as a complementary training pathway, building competencies in public mental health concepts, evidence-informed policy and practice, and rigorous research methods aimed at addressing population-level mental health challenges. Faculty members, supervisors, and postgraduate students will reflect on programme design, delivery, supervision models, and strategies for supporting students working in their home countries while engaging international faculty. We will discuss approaches to fostering peer learning and professional networks, as well as practical challenges in sustaining engagement, mentorship, and research productivity in remote settings. The session will also explore emerging lessons in the ethical integration of artificial intelligence for learning and assessment, including opportunities to enhance learning and risks related to academic integrity and inequity. Conclusion. This session aims to stimulate mutual learning and sharing across higher education programmes to extend the impact of these programmes across disciplines.

ABS4034
Primary Health Care as a practice field for Family and Community Medicine residents in Brazil
Renata de Paula[1], Rubens Bedrikow[1]
[1]Department of Internal Medicine, University of Campinas - Unicamp, Campinas, Brazil
ABSTRACT
Primary Health Care (PHC) constitutes a structuring axis of the Brazilian Health System (SUS) and represents an important training field for students and health professionals in Brazil. However, in recent years, PHC has faced significant challenges, such as chronic underfunding, professional devaluation, workforce reduction, and high service demand, factors that directly affect care organization and training processes. Within this context, the residency in Family and Community Medicine (FCM) is situated in a complex scenario, marked by tensions between training guidelines and the real operating conditions of health services.
OBJECTIVE
To understand the PHC practice setting from the perspective of Family and Community Medicine residents enrolled in a residency program in Campinas, Brazil.
METHODS
This is a descriptive study grounded in the snowball sampling methodology. A structured questionnaire consisting of 75 items was administered, developed based on the Family and Community Medicine Competency Framework. The instrument was applied to second-year residents.
RESULTS
A total of 26 residents participated in the study. Regarding self-reported race/ethnicity, 69.4% identified as White, 23.0% as Black, and 3.8% as Asian and Indigenous, respectively. Of the participants, 73.0% identified as women. Concerning residents' territorial integration within PHC and their bonding with the community, 65.0% of responses rated these aspects positively. The organization and distribution of the agenda for scheduled (elective) care were positively evaluated by 58.0% of participants. In contrast, care related to unscheduled demand for acute conditions was negatively evaluated by 69.0% of residents.
CONCLUSIONS
Although residents reported positive evaluations regarding community bonding, territorial integration, and the organization of scheduled care, PHC demonstrates difficulties in ensuring longitudinal care, as evidenced by the high volume of unscheduled, acute demand. Understanding the practice setting from the residents' perspective may support changes within the SUS, contributing to the improvement of medical training and the quality of care in PHC
Popul. Med. 2026;8(Supplement 1):A1132

ABS4042
The profile of Family and Community Medicine residents in Brazil
Renata de Paula[1], Rubens Bedrikow[1]
[1]Department of Internal Medicine, University of Campinas - Unicamp, Campinas, Brazil
ABSTRACT
In Primary Health Care (PHC) in Brazil, Family and Community Physicians deal daily with social vulnerability, territorial violence, the demands of longitudinal care, the establishment of bonds with users, and challenges inherent to the health system. Nevertheless, although the number of professionals remains insufficient to meet the needs of the health system, new Family and Community Physicians are trained every year, despite the difficulties intrinsic to PHC.
OBJECTIVE
To understand the sociodemographic and educational profile of Family and Community Medicine residents enrolled in a residency program in the municipality of Campinas, Brazil.
METHODS
This study was grounded in the snowball sampling methodology. Data were collected through a structured questionnaire consisting of 75 items, developed based on the Family and Community Medicine Competency Framework. The instrument was administered to second-year residents in the program.
RESULTS
A total of 26 residents participated in the study. Regarding self-reported race and ethnicity, 69.4% identified as White, 23.0% as Black, and 3.8% as Asian and Indigenous, respectively. Concerning sex, 73.0% identified as women, 19.0% as men, and 8.0% did not report. In terms of educational background, 58.0% graduated from private universities, 34.5% from public universities, and 7.6% reported other educational pathways. Among graduates from private institutions, 11.5% self-identified as Black, whereas among graduates from public institutions this proportion was 7.6%.
CONCLUSIONS
The preliminary analysis reveals a resident profile strongly influenced by race and social class, indicating a gap between medical training trajectories and the social realities of populations served in PHC. Moreover, the results reinforce the persistence of structural racism in Brazil, evidenced by unequal access to public universities and medical schools. A predominance of women was also observed within the Family and Community Medicine residency program.

INTRODUCTION

The 'Global competency and outcomes framework for the essential public health function' has been published by the WHO in 2024. This framework can help national workforces to be trained for essential public health services, including pandemics and disasters. However, implementing international frameworks into national, regional or local public health curricula is a challenge – as it is for all training programs/ studies. The international, non-commercial 'LOOOP-network for Research in Health Sciences Education' addresses this challenge since 2004 by developing and evaluating concepts for curriculum mapping in an online available tool named 'Learning Opportunities, Objectives and Outcome Platform' (LOOOP). This platform is currently used to map around 250 different health sciences programs in 65 countries . The main purpose of curriculum mapping is to create transparency for teachers and learners concerning what has to be learned and how this is related to frameworks. Thus, curriculum mapping ensures that the competencies and outcomes within the framework are fully addressed in each curriculum.

METHODS

Aim of this workshop is to develop ideas for implementation of the new essential public health function framework into existing or upcoming curricula for public health workforces. The authors will give a short introduction into the WHO framework and will present mapping experiences from around the world. Afterwards, participants will develop and discuss ideas for implementation of the framework in small groups.

RESULTS

Results of each small group will be presented shortly to the whole group.

CONCLUSIONS

Workshop results may have significant impact on implementation of the competency and outcome framework into upcoming curricula for global education and training of public health workforces.

Implementation of a permanent health education committee to strengthen primary health care governance and service quality in a countryside Brazilian municipality

Cesar Augusto da Silva[1], Franciele Marta Pergo[2], Simoni Correa Mantovam[2], Thaynan Aparecida Goudinho de Souza[2]

[1]Family Health, Universidade Federal do Paraná, Toledo, Brazil, [2]Municipal Health Secretary, Secretaria Municipal de Saúde de Assis Chateaubriand, Assis Chateaubriand, Brazil

INTRODUCTION

Permanent Health Education is a strategic policy within the Brazilian Unified Health System aimed at transforming health practices through learning embedded in daily work processes. In June 2025, the municipality of Assis Chateaubriand, Paraná, established an multiprofessional Permanent Health Education Committee to institutionalize continuous professional development aligned with territorial needs and to strengthen primary health care. This report describes its implementation process and initial outcomes.

METHODS

The implementation strategy was organized around four interconnected axes: diagnosis, regulation, training and evaluation. A participatory situational diagnosis was conducted through facilitated discussion circles in all primary health care units, involving health workers and local managers. These discussions were grounded in Paulo Freire's dialogical and problem-posing educational approach,. Identified gaps guided the development of clinical and organizational protocols and targeted educational interventions. Governance instruments were formalized, including internal regulations and a municipal work plan aligned with the National Permanent Health Education Policy. Educational activities prioritized active and problem-based learning methodologies.

RESULTS

The diagnosis revealed gaps in prescribing practices, medication stock management and procedural capacity in primary care. In response, the committee developed and implemented a safe prescribing protocol, medication stock guidelines and a municipal protocol for nutritional formulas and therapies. Workshops were delivered on safe prescribing and rational medicine use, along with a theoretical and practical training on intrauterine device insertion to expand procedural capacity. A municipal primary health care service portfolio was also structured to standardize delivery and enhance resoluteness. Regular coordination meetings and a monitoring framework were established to support continuous evaluation.

CONCLUSIONS

The institutionalization of a Permanent Health Education Committee proved viable as a governance strategy to align workforce development with service needs. By integrating participatory diagnosis, protocol development and targeted training, the initiative seeks to strengthen clinical quality and organizational coherence in primary health care.

Embedding person-centered teaching in nursing education: academic staff and clinical facilitator's experiences in a South African undergraduate program

Silindokuhle Nyezi[1], Justine Baron[1], Marianna van der Heever[1]

[1]Nursing and Midwifery, Stellenbosch University, Cape Town, South Africa

INTRODUCTION

Person-centeredness (PC) is a concept concerned with putting recipients of care in the center, thus, emphasizing empathy, shared decision making and respect for individuals. In nursing education, embedding PC within theoretical and clinical teaching is critical for preparing graduates who contribute to high quality, safe and equitable health systems. Despite the recognized importance of PC, limited evidence exists on how nurse educators enact PC teaching within undergraduate nursing curricula in the Western Cape, South Africa.

METHODS

an exploratory qualitative study was conducted at a university in the Western Cape, South Africa, which implemented the country's first person-centered Bachelor of Nursing curriculum. 13 semi-structured interviews were conducted with purposively sampled academic staff and clinical facilitators with more than 12 months of teaching experience within the programme. Thematic analysis was used to analyze data and explore the experiences of academic staff and clinical facilitators with integrating PC teaching.

RESULTS

Participants described substantial organizational and structural barriers that hindered the consistent implementation of PC teaching. These included high workloads, lecture schedules, fast paced learning environments, limited collegial collaboration and the absence of formalized mechanisms to monitor and evaluate PC teaching practices. Despite these limitations, participants shared a common understanding of PC principles. Additionally, the intentional use of learner-centered pedagogical strategies such as reflection, role modeling and continuous reinforcement of PC principles across teaching contexts. Although the absence of formal evaluations was noted, however, participants reported consistent anecdotal evidence from various clinical placements indicating that students demonstrated respectful and empathetic behavior in patient interactions, suggesting a translation of PC principles into practice.

CONCLUSIONS

Person-centered curricula plays a pivotal role in strengthening the public health nursing workforce by fostering compassionate, reflective and ethically grounding practitioners. To sustain PC teaching, institutional support, academic staff collaboration and robust evaluation systems must be implemented.

From curriculum to capability: developing Entrustable Professional Activities for Public Health training programmes across health systems

Harsha Somaroo[1,2], Hassan Mahomed[1,3], Fatai Ogunlayi[4]

[1]College of Public Health Medicine, CMSA, Pretoria, South Africa, [2]Department of Community Health, University of the Witwatersrand, Johannesburg, South Africa, [3]Public Health Medicine, Stellenbosch University, Stellenbsch, South Africa, [4]United Kingdom Faculty of Public Health, London, United Kingdom

BACKGROUND

Entrustable Professional Activities (EPAs) are increasingly used to translate competency-based education into observable professional work. However, their application has largely been shaped by clinically oriented specialties. Public health (PH) presents distinct challenges, as competence is exercised at population, system, and policy levels rather than through individual patient encounters. Across countries, PH training programmes are exploring how EPAs can be adapted to reflect real-world public health practice, governance complexity, and non-clinical forms of evidence for entrustment. These efforts are occurring at different stages of maturity and within diverse health system contexts, offering important opportunities for shared learning.

METHODS
This interactive workshop explores the process of developing EPAs for public health training across various health systems. Facilitators will present practical approaches to EPA development, including curriculum mapping, professional consultation, and structured consensus-building methods. The session will explicitly address discipline-specific challenges such as collective and system-embedded practice, political and institutional complexity, and assessing entrustment in non-clinical contexts. Audience participation is central to the workshop and will be facilitated through live polling and structured discussion to test draft EPA concepts, entrustment statements, and assessment approaches against participants' own training and practice settings. Real-time feedback will be synthesised to explore the transferability of EPA frameworks across different health systems. Expected Outcomes Participants will gain practical insight into EPA development processes for public health, a transferable framework for adapting EPAs to their own contexts, and a clearer understanding of entrustment beyond individual clinical encounters. Collective input will generate cross-context perspectives to inform ongoing EPA development efforts.
CONCLUSIONS
By sharing emerging experiences and integrating diverse perspectives, this workshop positions EPAs as evolving tools for strengthening the capability, legitimacy, and accountability of the public health workforce training across health systems; while aiming to produce practitioners who think beyond borders while acting within real health systems.

ABS 4126
Mapping Leadership Competencies and Program-level Characteristics Across U.S. MHA Programs Using the National Center for Health Leadership (NCHL) Competency Model
Teresa McKelvy[1]
[1]Health Administration, Central Michigan University, Mount Pleasant, Michigan, United States
BACKGROUND
Master of Healthcare Administration (MHA) programs are important for training future healthcare leaders, but there is a lot of variation in how these programs are structured, what they teach, and which skills they require. Accreditation aims to make programs more consistent, yet differences in program features and focus on certain skills still exist between schools. There has been little research comparing MHA programs by accreditation status using a common set of skills.
METHODS
This study looked at 131 MHA programs in the United States using information from university websites. Researchers recorded 22 different program features using a standard template. They used descriptive statistics to summarize things like program length, credit hours, tuition, and how often certain skills appeared in the curriculum. One-way ANOVA tested for differences in program features among CAHME-accredited, CAHME-candidate, and non-CAHME programs. Chi-square tests checked for differences in required skills by accreditation status. The team also checked their coding to make sure it was consistent and reliable.
RESULTS
Most programs took about two years to finish and required an average of 46 credit hours. Annual tuition varied significantly between accreditation groups, but out-of-state tuition was similar. More than 90 percent of programs included several skills from the National Center for Healthcare Leadership (NCHL) framework. However, skills like collaboration, public speaking, innovation, and negotiation were less common. Eight out of seventeen skills that varied between programs showed significant differences based on accreditation status.
CONCLUSIONS
The results partly supported the idea that program features differ by accreditation status and fully supported the idea that MHA programs closely follow NCHL skill areas. These findings help show how skill-based education is used in MHA programs and can guide curriculum planning, accreditation reviews, and training for future healthcare leaders.

Barriers and Facilitators of Continuous Professional Development for Non – Communicable Disease managers in a public health setting in Gauteng, South Africa
Bridget Ikalafeng[1], Bridget Ikalafeng[1], Thifhelimbilu Luvhengo[1], Maphefo Thekiso[1], Tracey De Klerk[1], Juliana Kagura[1], Phuti Ngwepe[1], Bridget Ikalafeng[1]
[1]Gauteng Provincial Health Department, Department of Health, Johannesburg, South Africa
BACKGROUND
A Foundation for Research and Evaluation Training Programme (FRETP) was established to capacitate managers in a public health setting and it enrolled 5 cohorts between 2019 – 2025. There was collaboration with academic community through allocation of Supervisors for fellows.
AIM
To investigate barriers and facilitators of Continuous Professional Development (CDP) of research on NCDs by managers enrolled and not enrolled in the FRETP.
OBJECTIVES
To explore views of NCD line managers on CDP and research translation; To assess the barriers and facilitators experienced by FRETP NCDs fellows on implementation of the research projects;
METHODS
Process evaluation using qualitative and quantitative methods was used. Purposive sampling was used to select Key Informants. 20 self-administered questionnaires were distributed online. Data was analyzed using thematic analysis and SPSS.
RESULTS
Research Translation was reported as Appraising evidence and applicability to local context and Implementation strategies. Translation into practice" is a recognized process, not an accidental outcome. Facilitators were fellow' Supervisors' support, Clear guidance on ethics processes, support and motivation of the programme leader, availability of protocols and reports. Barriers were online learning, dedicated time for data collection, poor access of data analysis software programmes; resignations and changing of jobs led discontinued studies.
CONCLUSIONS
CPD is valued when it strengthens service delivery, governance, and clinical processes. Collaboration with academic institutions is a pillar of FRETP. Physical classes should be encouraged and resources for research should be prioritized. Understanding of the research translation process was demonstrated, however application of the process should still be strengthened. Context instability and staff movement threaten continuity of CPD-linked projects. Strengthening CDP requires alignment to NCD priorities + equitable access + mentorship + monitoring. Research should be included in Operational plans of the managers in a public setting.

Training Needs of Teachers in Higher Educational Institutions for Non-Communicable Disease Capacity
Faith Agbozo[1], Judith van de Kamp[2], Daniel Boateng[3], Paul Amuna[1], Kerstin Klipstein-Grobusch[2]
[1]Department of Family and Community Health, University of Health and Allied Sciences, Ho, Ghana, [2]Department of Global Public Health and Ethics, University Medical Centre Utrecht, Utrecht, Netherlands, [3]Department Epidemiology and Biostatistics, Kwame Nkrumah University of Science and Technology, Kumasi, Ghana
BACKGROUND
Non-communicable diseases (NCDs) present complex public health challenges that require educational competencies with emphasis on real-world solutions. The CAPSTONE project addresses this gap by strengthening the competencies of graduates for effective NCD care using challenge-based learning (CBL).
OBJECTIVE
Assessment of educational values, teaching practices, and training needs of teachers in higher education institutions (HEIs) to inform the co-creation and delivery of a transdisciplinary training manual for NCD care.
METHODS
Train-the-trainer (ToT) workshop for teachers from four selected higher educational institutions (HEIs) in Ghana and The Gambia whose academic background, professional expertise, or teaching responsibilities transcended domains in NCD surveillance, prevention, control, management, policy and advocacy. The training was preceded by a cross-sectional survey to assess their educational philosophies, teaching practices, training needs, and expected support mechanisms, resulting in the co-design of a 3-day innovative NCD ToT workshop built on the CBL pedagogy.
RESULTS
The needs assessment was completed by 24 faculty members (29% females), 71% with doctoral degrees and 11.5 years teaching experience. Concerning CBL, 42% had moderate understanding of the concept. On a 5-point rating scale, knowledge application (4.5) and collaborative learning (4.4) underpinned the teachers' educational values more than skill/competency building (4.4) and self-directed learning (4.3), identified as educational development needs. Support requested included periodic workshops (75%), mentorship/coaching (71%), and providing standard operating manuals (67%). Key suggestions to promote NCD

education were practical training that incorporates teaching resources detailing CBL in videos or step-by-step activities, mentorship and peer-learning using real case studies.
CONCLUSIONS
While HEI teachers demonstrated strong educational values aligned with knowledge application and collaborative learning, their training needs focused on competency development and practical application through CBL. The demand for structured capacity-building support underscores sustained professional development that combines these support systems to enhance graduate training for effective NCD care.

Student-Led Public Health Exchanges Internships: Ensuring Quality and Capacity
Gustavo Henrique Nicoletti Dalle Cort[1], Sabiana Seferi[1], Arda Imrak[1], Deniz Uçar[1]
[1]International Federation of Medical Students' Associations, Amsterdam, Netherlands
INTRODUCTION
Despite increasing recognition of public health competencies, studies show that although many medical schools integrate public health education into their curricula, substantial global variation persists, reflecting ongoing training gaps. The International Federation of Medical Students' Associations (IFMSA) has promoted student exchanges for over 70 years and, since 2020, has implemented the Public Health Exchanges (PHEx), offering 59 internships across 16 countries.
METHODS
This is a descriptive analysis of the 2025–2026 Public Health Exchange internship portfolio (n=59 internship forms) across participating IFMSA's national member organizations. Internships were thematically categorized using recurring public health domains (health systems; noncommunicable diseases; communicable diseases and vaccination; mental health; environmental and occupational health; primary care/social determinants; maternal, child and preventive health; and global and comparative Public Health).
RESULTS
The PHEx program comprises 59 internships across 16 countries, with a total annual capacity of 425 students. The most represented domain was Health Systems (13 forms; 22%), covering topics from patient safety to the use of artificial intelligence in health data. Noncommunicable Diseases followed with 11 forms (18.6%), addressing conditions such as cancer, diabetes, glaucoma and cognitive decline. Communicable Diseases and Vaccination accounted for 10 submissions (16.9%). Primary Care, Community and Social Determinants of Health represented 8 internships (13.6%), three based in the Brazilian Primary Health Care System. Global and Comparative Public Health and Mental and Cognitive Health each comprised 5 forms (8.5%), while Environmental and Occupational Health included 4 proposals (6.8%). Maternal, Child and Preventive Health was the least represented domain, with 3 forms (5.1%).
CONCLUSIONS
The IFMSA Public Health Exchange program demonstrates a structured exchange with experiential public health education, offering exposure to diverse health systems and thematic areas. These findings highlight PHEx as a promising framework for strengthening global public health capacity through internationally coordinated medical education.

HEALTH DETERMINANTS, SUSTAINABLE HEALTH EQUITY AND SDGS

ABS0014
Piloting an Urban Health Index in Fast-Track Cities: Outcomes, Lessons Learned, and Pathways to Scale
Jose Manuel Zuniga[1]
[1]Fast-Track Cities Institute, Washington, DC, United States
BACKGROUND
Urban environments concentrate both risks and opportunities for health. To better capture multidimensional drivers of urban well-being, we piloted a new Urban Health Index (UHI) across five Fast-Track Cities, aiming to provide a composite, actionable metric for monitoring and guiding urban health interventions.
METHODS
The UHI integrates indicators across four domains: environmental (air quality, green space, climate resilience), infrastructural (healthcare density, housing quality, transport access), social (inequities, poverty, education), and governance (public health investment, community participation). Municipal datasets, health surveillance systems, and geospatial analysis were combined and standardized (scale 0–100) to produce a single UHI score for each city. Pilot testing was conducted in Lisbon, Kyiv, Nairobi, Buenos Aires, and Bangkok, representing diverse geographies, economies, and governance structures.
RESULTS
The UHI successfully differentiated health resilience profiles: Lisbon (82) and Bangkok (76) ranked highest, reflecting strong governance, health infrastructure, and investments in climate adaptation. Buenos Aires (64) scored mid-level, balancing robust healthcare with persistent social inequities. Nairobi (48) and Kyiv (42) ranked lowest, reflecting environmental exposures, housing vulnerabilities, and governance challenges amid political and economic instability. Higher UHI scores correlated with improved maternal health indicators, stronger HIV care continuum performance, and reduced heat-related morbidity. Stakeholders highlighted the UHI's usefulness in synthesizing diverse data into a single decision-making tool, though challenges emerged around indicator standardization, data quality, and weighting equity-sensitive measures.
CONCLUSIONS
The pilot demonstrates the feasibility of a multidomain Urban Health Index to monitor city-level health performance and resilience. Lessons include the need for simplified indicator frameworks, improved data governance, and local capacity building. Recommended adjustments for scale-up include integrating equity-disaggregated metrics, aligning with SDG targets, and embedding the UHI into city dashboards to support planning and accountability across the Fast-Track Cities network.
Popul. Med. 2026;8(Supplement 1):A1145

ABS0017
Stigma as a Barrier to Ending AIDS: Global Findings from the Zero HIV Stigma Day 2025 Survey
Jose Manuel Zuniga[1]
[1]International Association of Providers of AIDS Care, Washington, DC, United States
INTRODUCTION
HIV stigma remains a pervasive structural barrier to care and prevention, undermining progress toward UNAIDS 95-95-95 targets. To coincide with Zero HIV Stigma Day 2025, IAPAC and partners conducted a global survey to assess experiences of stigma among people living with HIV (PLHIV) and perceptions among the general public across diverse geographies.
METHODS
An online and community-administered survey collected responses from more than 7,800 individuals in 18 countries across North America, Latin America, Europe, Africa, and Asia. The survey included validated measures of self-stigma, societal stigma, and institutional stigma, alongside items on knowledge of the "Undetectable = Untransmittable" (U=U) message. Data were stratified by region, gender identity, age cohort, and HIV status. Qualitative input from focus groups in five Fast-Track Cities provided contextual depth.
RESULTS
Findings reveal persistent and intersectional stigma. 48% of PLHIV respondents reported internalized stigma, including fear of disclosure. 41% reported health system discrimination, with the highest rates in sub-Saharan Africa and the Southern United States. General population respondents demonstrated low HIV knowledge, with only 37% of Gen Z respondents aware of U=U. Across all regions, stigma was amplified at intersections of race, gender identity, and migration status. Comparative analysis with 2020 data showed no significant global decline in stigma, and in some regions (e.g., Southern U.S., Eastern Europe) stigma indicators worsened. Focus groups underscored how stigma discourages HIV testing, interrupts treatment adherence, and perpetuates isolation.
CONCLUSIONS
The Zero HIV Stigma Day 2025 survey confirms that stigma remains the most pervasive barrier to ending AIDS as a public health threat. Addressing stigma requires multi-level interventions: community mobilization, health workforce training, media accountability, and political leadership. Findings call for renewed global commitment to stigma eradication as a central pillar of the HIV response.

The Impact of Primary Health Care on Child Mortality Amid the Humanitarian Crisis in Sub-Saharan Africa: An Integrated Retrospective and Forecasting Analysis from 2007 to 2040
Gonzalo Barreix[1], Sophie ter Braak[2], Daiana Albino Pena[1], Andréa Ferreira da Silva[3], Elisa Landin[1], Lucas Sales[3], Rodrigo Anderle[3], Ivalda Macicame[4], James Macinko[5], Renato Tasca[6], Inácio Mandomando[7], Sintayehu Wolka[8], Selidji Todagbe Agnandji[9],

[1]Health Impact Assessment and Evaluation, Barcelon Institute for Global Health, Barcelona, Spain, [2]Utrecht University, Utrecht, Netherlands, [3]Institute of Collective Health (ISC), Federal University of Bahia (UFBA), Bahia, Brazil, [4]Instituto Nacional de Saúde, Maputo, Mozambique, [5]University of California (UCLA), Los Angeles, United States, [6]Institute for Health Policies Studies (IEPS), Rio de Janeiro, Brazil, [7]Centro de Investigação em Saúde de Manhiça (CISM), Maputo, Mozambique, [8]Ministry of Health, Adís Abeba, Ethiopia, [9]Centre de Recherches Médicales de Lambaréné, Lambaréné, Gabon, [10]College of Health and Medical Sciences, Haramaya University, Haramaya, Ethiopia, [11]London School of Economics & Political Science, London, United Kingdom

INTRODUCTION
Primary Health Care (PHC) is recognized as pivotal for achieving Universal Health Coverage (UHC) and reducing under-five mortality rates (U5MR), however, current declines in international development assistance for health (DAH) threaten to stall or reverse the U5MR progresses of the last years. We estimated the impact of the effective PHC coverage on U5MR in three diverse Sub-Saharan countries over the last two decades and forecasted U5MR trajectories through 2040 according to alternative PHC scenarios.
METHODS
We developed an effective PHC coverage index (PHC-index) based on several PHC services provision and access dimensions. The PHC-index impact on child mortality was estimated using a two-ways fixed-effects multivariable Poisson regression models with robust errors, adjusted for all relevant confounding factors at the individual, regional and national level, and developing extended sensitivity and triangulation analysis for causal inference. We also integrated this evaluation with validated microsimulation forecasting model, encompassing nearly three million children per year.
RESULTS
Increasing PHC coverage was strongly associated with U5MR decreases in a dose-response manner, reaching a 58% reduction (RR:0.420; 95%CI:0.193-0.916) for consolidated high coverage. PHC coverage reductions due to DAH defunding will lead to considerably higher U5MR in comparison with a Universal PHC coverage scenario in 2040: 57.2% (95%UI:56.1–58.4) higher in Mozambique, 57.6% (95%UI:55.5–59.6) in Gabon, and 57.6% (95%UI:56.7–58.6) in Ethiopia, amounting 1,871,833 (95%UI:1,607,602–2,175,827) excess child deaths across the 2025-2040 period.
CONCLUSIONS
PHC substantially reduced U5MR in SSA over the past two decades and should be expanded rather than diminished due to the current drastic DAH defunding.

ABS0076
Dentistry and Inclusion: Building Racial Equity

Florival Costa Junior[1], Mayrianne Mattos Pinto[1], Ariane Silva Carvalho[1], Barbara Mendes Guimaraes[1], Rita Cassia Duarte Lima[1], Jeanine Pacheco Moreira Barbosa[1], Maria Angelica Carvalho Andrade[1]
[1]Universidade Federal do Espírito Santo, Vitória/ES, Brasil

INTRODUCTION
Dentistry in Brazil reflects historically constructed racial inequalities that impact the education, retention, and professional practice of black individuals, as well as the black population's access to quality oral healthcare services. [1,2] Affirmative policies have increased diversity in dentistry programs, but structural barriers that hinder racial equity in the field still persist. [3-5]
METHODS
An integrative literature review was conducted using the SciELO, PubMed, and Google Scholar databases, covering publications from 2000 to 2024. Scientific articles, theses, dissertations, and official documents related to racial inequalities in dentistry, inclusion policies in higher education, and public management practices in oral health were selected. The analysis prioritized studies on racial quotas, mentorship programs, cultural competency training, and anti-racist practices.
RESULTS
Affirmative policies have increased the enrollment of black students in dentistry programs, promoting academic diversity. However, challenges such as institutional racism, lack of support networks, covert discrimination, and barriers to professional advancement persist. Initiatives such as mentorship programs and culturally sensitive training have shown positive impacts on the retention and professional integration of black dentists. In public health management, anti-racist practices have strengthened access to oral healthcare for the black population, although issues such as underfunding, institutional resistance, and underreporting of racism cases continue to undermine the effectiveness of these actions. [1-5]
CONCLUSIONS
Achieving racial equity in dentistry requires structural actions that go beyond access to higher education, including the assurance of professional advancement, the expansion of inclusion policies, and the consolidation of anti-racist practices in public management. Investing in mentorship, culturally sensitive training, and social participation is essential to address historical inequalities and promote a fairer and more inclusive dental practice.

Factors contributing to home deaths for children under 5 years old in Okavango district for the year 2021-2022: An Exploratory study

Abigail Lesego Olesitse[1], Dr Bokwena Moali[2], Ndovasi Karumendu[3], Sello Moyo[4], Dr Kaite Mashini[5], Malebogo Kehakgametse[6]
[1]Public Health, Unicaf University, Lusaka, Zambia, [2]Medicine, University Of The West Indies, Montego Bay, Jamaica, [3]Health Education, Boitekanelo, Gaborone, Botswana, [4]Agricultural Education, Uninersity Of Botswana, Gaborone, Botswana, [5]Medicine, University Hospital Of Kinshansa, Kinshasa, Congo, Democratic Republic of the, [6]Social Sciences, University Of Botswana, Gaborone, Botswana

INTRODUCTION
Globally under five mortality has declined over the past two decades, yet in 2017 alone, 6.3 million under five children died largely from preventable causes. Sub Saharan Africa carries the highest burden of deaths occurring at home. In Botswana, under five mortality rate is around 22 per 1,000 live births. In Okavango District, 26% of under five deaths over three years occurred at home, with a rising trend in 2022—underscoring an urgent need to investigate underlying causes.
METHODS
This qualitative study focused on children died outside health facilities who reside and mortality occurred in Okavango district. Semi structured, in depth interviews were conducted, analyzed using both descriptive statistics and thematic analysis. Sample size determined by data saturation.
RESULTS
Seven mothers meeting inclusion criteria were interviewed. Most were single, unemployed and had completed junior secondary education. Identified themes: Caregivers often turned to traditional healers/ religious remedies as alternative medical care, Witchcraft, cultural taboos and beliefs, Health system gaps—weak referrals, inadequate assessments and staffing shortages. Moreover, child negligence led to delayed care-seeking or mismanagement while extended family influence further discouraged formal healthcare
DISCUSSION
This study addresses a critical issue in line with the Sustainable Development Goals particularly in the Sub-Saharan African context. Its qualitative approach offers insight into sociocultural, health system, and household-level factors that quantitative data might overlook. Themes identified especially reliance on alternative medicine and perceptions of illness rooted in tradition and witchcraft strongly influence care-seeking behaviors. Service delivery challenges exacerbate delays in accessing appropriate care. Poor parenting practices, neglect and harmful family dynamics also play a crucial role in child health outcomes.
CONCLUSIONS
These insights underline the need for culturally sensitive health education, improved healthcare access and delivery, performance of Post mortem to all non-institutional mortalities and strengthened community and family support systems to reduce preventable child deaths.

Unmet health and care needs of persons with disabilities in Ethiopia: what and why

Fasil Walelign Fentaye[1,2], Sibusiso Zuma[3]
[1]Public Health, Wollo University, Dessie, Ethiopia, [2]Monitoring, Evaluation and Learning, MERQ Consultancy, Addis Ababa, Ethiopia, [3]Health Studies, University of South Africa, Pretoria, South Africa

INTRODUCTION
An estimated 1.3 billion persons with disabilities (PWDs) globally need to be prioritized in the push towards Universal Health Coverage (UHC), as they experience significant health inequities. However, there is limited evidence from low-income settings. This study aimed to assess the unmet health and care needs of PWDs and identify the barriers hindering their access to services.
METHODS
The research employed an explanatory sequential mixed-methods design. Data was collected from 708 community members (354 PWDs and 354 persons without

disabilities, or PWoDs), 42 health facilities, and 569 health service providers. This was supplemented by 19 Key Informant Interviews and 8 Focus Group Discussions. Quantitative data was analyzed using STATA and qualitative data with Atlas.ti.
RESULTS
The results reveal stark disparities. A much higher proportion of PWDs (69.5%) had at least one health problem requiring services compared to PWoDs (43.5%). Critically, two-in-five PWDs (39.8%) had unmet healthcare needs, a rate significantly higher than the 15.1% for PWoDs. This level of unmet need and disparity is higher than what has been observed in similar studies. PWDs face multiple, intersecting barriers within the health system. These include limited awareness about health and available services, inadequate efforts from the health system to promote inclusiveness, and communication barriers. Furthermore, PWDs encounter financial challenges and find most physical components of health facilities to be inaccessible. Despite multiple policy documents aimed at enabling inclusive health services, a significant implementation gap persists.
CONCLUSIONS
PWDs have higher healthcare needs and health risks yet experience substantially higher unmet needs and lower service utilisation. The barriers are multifaceted, stemming from personal, socio-cultural, provider, and contextual factors. To address these gaps, integrated and multi-sectoral strategies from all stakeholders are critical for achieving a more inclusive healthcare system.

ABS0332
Financial chains and caregiver strain:The True cost of Haemodialysis in rural India

Saba Mohammed Mansoor[1], Mohit Naredi[1], Mahendra Khatri[1]
[1]Department of community medicine, Pacific medical college and hospital, Udaipur, India
BACKGROUND
Haemodialysis places significant financial and caregiving strains on patients and caregivers, especially in low-resource settings. This study examines the relationship between out-of-pocket expenditure (OOPE) and caregiver burden among 110 haemodialysis patients in rural India, highlighting socio-economic and clinical factors.
OBJECTIVE
To evaluate the extent of OOPE, categorize caregiver burden, and identify socio-demographic factors contributing to financial and caregiving stress.
METHODS
A cross-sectional design employed the Zarit Burden Interview (ZBI-12) to assess caregiver burden (0–10: low; >20: high) and the Modified B.G. Prasad Classification (2024)1 for income stratification. OOPE encompassed medical, non-medical, and indirect costs 2.Statistical analyses, including Kruskal-Wallis and chi-square tests, were conducted to determine associations.
RESULTS
• Financial Burden: The mean monthly OOPE was $113.7 (medical: $37.3; non-medical: $72.2), representing 45% of average household income ($253.9). Catastrophic expenditure (>40% of income) was observed in 16.4% (n=18) of patients. • Caregiver Burden: 36.4% (n=40) reported high burden (ZBI >20). Most caregivers had provided support for less than 3 years (63.6%, n=70), yet no significant association with burden was found (p=0.24). • Socio-Demographics: o 71.8% (n=79) were rural residents; 41.8% (n=46) were illiterate. o 33.6% (n=37) of patients exhibited severe depression (PHQ-9), correlating with increased OOPE. • Statistical Outcomes: There were no significant relationships between caregiver burden and gender (p=0.576) or caregiver duration (p=0.24).
CONCLUSIONS
Despite the lack of significant statistical associations, haemodialysis patients endure substantial financial strain (45% of income spent on OOPE) and face a high caregiver burden. Factors such as rural residency, illiteracy, and depression worsen these challenges. Policymakers should prioritize subsidies for dialysis costs and support programs for caregivers to alleviate this dual burden in resource-limited settings.

Immigrants Health: Social Determinants of Health and Health Inequities among East African Migrants in Australia – an Ethnographic Approach

Majok Wutchok[1]
[1]School of Health, Medical and Applied Sciences, Central Queensland University - CQUniversity Australia, 120 Spencer Street, Melbourne 3000, Australia
ABSTRACT
Abstract Migrants from East African countries settling in Western nations face significant disadvantages due to their socioeconomic backgrounds. Evidence indicates that these populations experience health knowledge and access to health services is affected during their settlement in a new country. The purpose of this study was to explore social determinants influencing health equity but with particular focus on East African migrants in Australia. Therefore, using ethnographic approach, this study identified five critical social determinants contributing to health inequities: culture and beliefs, structural barriers, language and communication challenges, limited social support and networks, and systemic issues within the healthcare system. These factors were found to significantly influence migrants' interactions with health services and overall health outcomes. Therefore, addressing these social determinants leading to health inequities is crucial to promote health outcomes and improving the living conditions for East African migrants settling in Australia. These findings highlight the need for both policy and practice to address these disparities through culturally responsive and inclusive strategies. This suggests policy to focus on eliminating these systemic and structural barriers by improving interpreter services, mandating cultural competency training for health professionals, and ensuring equitable access to health information and care. Community-based initiatives that strengthen social networks and promote health literacy among migrant populations should also be supported. In practice, health care providers must be equipped to engage with diverse cultural perspectives, build trust, and collaborate with community leaders. Embedding cultural responsiveness into health systems is essential for reducing disparities and promoting equitable health outcomes among East African migrants and other culturally and linguistically diverse communities.

Bridging Barriers: A Proposed Ethics-Driven Ecological Paradigm for Global One Health and Intergenerational Well-being

Yueyi Tong[1]
[1]General Office, Xinjiang International Medical Center, Xinjiang, China
BACKGROUND
The intertwined challenges of global ecological health and zoonotic risks indicate room for the evolution of traditional public health "barrier" models, which focus on containment and response but have limitations in addressing the ecological root causes of disease. Given that approximately 75% of emerging infectious diseases are zoonotic, it is imperative to advance the public health paradigm towards a more proactive and inclusive vision that incorporates the well-being of ecosystems and future generations.
METHODS
We propose an ethics-driven "Bridge" paradigm. Reports have indicated that in similar ecological intervention practices in pastoral regions of Western China, a reduction of approximately 37% in reported zoonotic cases was observed. The paradigm is articulated through a three-tiered framework: 1) establishing foundational ecological restoration as the primary defense; 2) supporting it with cross-sectoral surveillance; and 3) reserving targeted emergency responses as a last resort. We outline a planned three-year comparative implementation study to test the efficacy, adaptability, and replicability of this framework across pastoral systems in Western China and South Africa. Results and
CONCLUSIONS
The study aims to systematically evaluate and quantify the framework's multifaceted outcomes, including improvements in ecological baselines, reductions in high-risk human-animal contact, decreases in zoonotic spillover rates, and enhanced inter-sectoral coordination efficiency. This paradigm transcends anthropocentric elimination mindsets, offering a replicable and practical blueprint for health governance. We conclude that this "Bridge" model provides a critical pathway toward a more resilient, equitable, and sustainable global health future, safeguarding well-being for all life, present and future.

Have health policy efforts reduced residential inequalities in mortality in Lithuania?

Olga Mesceriakova[1], Daumantas Stumbrys[1], Ramune Kalediene[2], Skirmante Sauliune[2]
[1]Vilnius University, Vilnius, Lithuania, [2]Lithuanian University of Health Sciences, Kaunas, Lithuania
ABSTRACT
Introduction. Lithuania has some of the largest social and demographic inequalities in mortality within the European Union [1,2]. To address these disparities, the Health Inequalities Reduction Plan was adopted in 2014, and the goal of reducing

health inequalities was included in the National Health Strategy [3,4]. This study examines residential inequalities in mortality from the main causes of death for males and females in Lithuania, comparing periods before (1990-2013) and after (2014-2024) the implementation of health policy measures targeting inequality reduction. Methods. Mortality data during 1990-2024 was obtained from the Institute of Hygiene. Age-standardized mortality rates per 100,000 population from cardiovascular diseases, cancer, external causes, and digestive system diseases were calculated for urban and rural residents by sex. Inequalities in mortality were assessed using a rate ratio (rural/urban). The Joinpoint regression analysis was applied to assess trends in inequalities during the periods 1990–2013 and 2014–2024. Results. We found that inequalities in mortality by place of residence from cardiovascular diseases and digestive system diseases for both sexes, and from cancer and external causes for females, increased (P<0.05) during 1990-2013. While during 2014-2024, mortality inequalities increased from cardiovascular diseases and cancers for both sexes, and digestive system diseases for males (P<0.05). A declining trend in inequalities was observed exclusively among females for deaths from external causes. Furthermore, between 2014 and 2024, the inequalities in mortality by place of residence from cardiovascular diseases and cancers for both males and females, and from external causes and digestive system diseases for males, increased faster than between 1990 and 2013. Conclusions. The study showed that despite the introduction of national health policy measures in 2014, inequalities in mortality from the main causes of death did not decrease in Lithuania during 2014-2024.

Nutrition equity and food environments in rural communities: assessment of small discount stores

Hadis Dastgerdizad Elyaderani[1], Theresa Andrasfay[2], Lovelyn Isiani[1]

[1]Global Health Studies & Sociology, University of Miami, Coral Gables, United States, [2]School of Health Sciences and Human Services, California State University, San Marcos, United States

BACKGROUND

Rural areas in the southern United States experience a disproportionate burden of diet-related disorders, driven by limited access to nutritious and affordable foods. Dollar stores have rapidly grown in these regions, often replacing traditional grocers and shaping residents' nutritional behavior. However, their food environment and their readiness to serve as vendors for the Women, Infants, and Children (WIC) nutrition program remain under-examined. This study addressed this gap using a newly developed Nutrition Environment Measures Survey for Dollar Stores (NEMS-DS). This tool captures dimensions that previous assessments may overlook, mainly since dollar stores rely heavily on ultra-processed foods.

METHODS

A quantitative, cross-sectional study was conducted in 13-dollar stores across six rural counties in the Lowcountry, South Carolina. All stores were located in rural, high-deprivation areas identified through the area deprivation index. Food environments of sampled stores were assessed to capture Healthy Food Availability (HFA); WIC Readiness; (3) Marketing of healthy versus unhealthy items. Descriptive statistics, F-tests, and χ-tests were employed to compare Lowcountry stores and 202-dollar stores from a parallel multi-state study.

RESULTS

The Lowcountry's stores demonstrated limited HFA scores (mean 23/62) and low WIC readiness (mean 51/190). Stores devoted only 12% of the total shelf space to healthy items compared to unhealthy snacks. None of the stores marketed healthy foods at checkout, while 100% promoted sugar-sweetened beverages and ultra-processed snacks—no significant differences with other sites. Although fresh produce availability was slightly higher than in stores from other states, frozen and shelf-stable produce options were significantly lower.

CONCLUSIONS

Dollar stores in the Lowcountry mirrored national patterns of reinforcing unhealthy food environments in rural high-poverty settings. Findings provide a policy-actionable framework for expanding WIC vendor eligibility to dollar stores, regulating marketing to improve nutritional behavior, promoting equitable access to nutritious foods, and preventing chronic disease in rural communities.

Factors associated with cocaine and ecstasy use among portuguese adolescents

Diana Mendes[1], Pedro Aguiar[2]

[1]Public Health Department, Local Health Center of Alto Alentejo, Portalegre, Portugal, [2]Compheensive health research Center, NOVA National School of Public Health, Lisbon, Portugal

INTRODUCTION

cocaine and ecstasy use represent a growing public health concern, given their adverse impacts on health, with high availability, early initiation, and increasing prevalence, particularly among youth (1-4). Among 16-year-old adolescents, the risks are especially pronounced due to the vulnerability of the developing brain, which may result in cognitive impairments, attention and memory deficits, and potential compromise their educational and social outcomes. This study aims to identify demographic, socio-economical, familial, and peer-related factors associated with the consumption of these substances among portuguese students aged 16 years old.

METHODS

an observational, descriptive, cross-sectional epidemiological study with an analytical component was conducted using data from the 2019 European School Survey Project on Alcohol and other Drugs (ESPAD). Independent variables included demographic, socioeconomic, family relationships, and peer relationships, while dependent variables were cocaine and ecstasy use in the last 12 months. Associations between variables were assessed using pearson's chi-square test, followed by multiple logistic regression to identify the most significant risk factors. Ibm® spss® statistics version 28 was used to perform the statistical analysis plan.

RESULTS

lack of parental control significantly increased the risk of cocaine use (AOR=2.540; 95% CI: 1.425–4.527; p=0.002) and ecstasy use (AOR=2.273; 95% CI: 1.422–3.634; p<0.001). Absence of family support significantly increased the risk of cocaine use (AOR=2.082; 95% CI: 1.121–3.866; p=0.020) and ecstasy use (AOR=2.168; 95% CI: 1.410–3.333; p<0.001). Ease of obtaining money significantly increased the risk of cocaine use (AOR=1.975; 95% CI: 1.092–3.572; p=0.024).

CONCLUSIONS

socio-economical and familial factors play a determining role in consumption behaviours among adolescents (5-8). Our results reinforce the importance of creating preventive social and health policies, as well as implementing public health interventions, in order to identify and act on individuals and communities at risk, promoting health and preventing disease.

Transforming health equity through nurse led inreach and outreach for people experiencing homelessness

Sonia Martin[1]

[1]OneBridge, Sunshine Coast, Australia

INTRODUCTION

People experiencing homelessness face profound barriers when accessing primary healthcare, contributing to avoidable illness, hospital demand and premature mortality. Nurse-led inreach and outreach models can improve health equity, particularly when informed by lived experience and grounded in the social determinants of health. Since 2023, OneBridge has conducted ongoing action research evaluating the impact of the MartMolly Method, an equity-informed nursing approach co-developed with people experiencing homelessness to translate social justice principles into clinical care. This model aligns with Sustainable Development Goal 3 (Good Health and Wellbeing) and Goal 10 (Reduced Inequalities) by strengthening access to care for excluded populations.

METHODS

A continuous action research cycle was undertaken across 29 community and housing locations in Queensland and New South Wales. Nurses provided trauma-aware primary care, mental health support, child health checks and care navigation for women, youth and culturally diverse groups. Data collection included service activity metrics, and thematic analysis of client and partner feedback.

RESULTS

Over 10000 health engagements were delivered across two years, with 67% of people experiencing or at risk of homelessness returning for regular care. 68% presented with mental health concerns and 41% required housing-related support. Care coordination resulted in 350 successful linkages to primary and specialist care including General Practitioners, mental health teams and alcohol and other drug services. Partner organisations reported increased tenancy sustainment and reduced crisis escalation. Clients described care as compassionate, safe and relationship-driven.

CONCLUSIONS

Nurse-led inreach and outreach informed by action research and lived experience improves equitable access to healthcare and continuity of care for people experiencing homelessness. Embedding the MartMolly Method within community nursing practice offers a scalable and sustainable strategy to advance health

equity and accelerate progress toward Australia's public health goals and the United Nations SDGs

Adopting a health equity lens to advance Health Literacy in South Tyrol (Italy) within the framework of the Local Prevention Plan

Piera Ceschi[1], Franco Finato[2], Lorella Zago[3], Ivo Paris[3], Antonio Fanolla[4], Romina Rossi[5], Richard Aschbacher[6], Leonardo Pagani[7], Patrizia Corazza[1], Dagmar Regele[8]
[1]Department of Prevention - Epidemiological Surveillance Unit, South Tyrolean Healthcare Services, Bressanone/Brixen (BZ), Italy, [2]Staff for Project Management, South Tyrolean Healthcare Services, Bolzano/Bozen, Italy, [3]Office for Prevention and Health Promotion, Automous Province of Bolzano/Bozen, Bolzano/Bozen, Italy, [4]Health Observatory, Automous Province of Bolzano/Bozen, Bolzano/Bozen, Italy, [5]SER.D, South Tyrolean Healthcare Services, Bolzano/Bozen, Italy, [6]Laboratory of Microbiology and Virology, South Tyrolean Healthcare Services, Bolzano/Bozen, Italy, [7]Antimicrobial Stewardship Unit - Division Infectious Diseases, South Tyrolean Healthcare Services, Bolzano/Bozen, Italy, [8]Department of Prevention, South Tyrolean Healthcare Services, Bolzano/Bozen, Italy

ABSTRACT
Background The Italian National Prevention Plan (NPP) serves as an essential operational tool for planning cross-cutting strategies at the national level, which have to be scaled up locally. It is renewed every five years to adapt to new health priorities and includes the implementation of equity-oriented initiatives through the adoption of the Health Equity Audit (HEA) cycle. An equity-based approach enables individuals to achieve their full health potential and should be embedded in public health strategies, regardless of a country's income level. Health literacy (HL) plays a crucial role in this process. The implementation of equity-oriented initiatives to strengthen HL can contribute to the achievement of better health outcomes. In South Tyrol, the local plan has been developed in alignment with the NPP. This abstract outlines local strategies, tools, outcomes, and future perspectives related to the co-creation of equity-oriented initiatives in a high-income territory, aimed at enhancing HL. Methods The HEA cycle has been systematically applied to design, implement, and monitor the initiatives, adopting a life-course, evidence-based, and integrated approach. Results Over the past five years, a multisectoral working group was established to strengthen the local governance. Twelve targeted equity-oriented interventions have been implemented, addressing key areas such as health-promoting schools, hygiene best practices in the local correctional facility, and antimicrobial resistance. A new model for implementing communication strategies, continuing education, and projects design aimed at enhancing HL has been established to guide the development of the next Prevention Plan 2027-2031. Conclusion Equity-oriented interventions have been successfully integrated into the local Prevention Plan 2021-2025 through actions across multiple settings, in alignment with the NPP 2020-2025, with the additional aim of improving HL. Strengthened local governance has enabled the achievement of the goals of this Plan and laid the groundwork for the strategic development of the upcoming local Plan.

Investigating the challenges faced by migrants in accessing public healthcare in Yeoville Bellevue community.

Zibusiso Msimanga[1]
[1]School of Health Systems and Public Health, University of Pretoria, Pretoria, South Africa

INTRODUCTION
Medical xenophobia is deeply entrenched within South Africa's public health system, despite being a fundamental violation of the country's constitution and ethical codes governing patient care. Many studies document discriminatory practices against migrants in public healthcare facilities. Yeoville Bellevue, however, represents a distinctive urban context. The suburb has a high concentration of both internal and international migrants and is widely recognised as a migrant community. While this phenomenon strains resources, including healthcare services, it also appears to limit the overt practice of medical xenophobia, which tends to manifest more strongly in healthcare settings located in areas predominantly populated by South African citizens. This study aimed to investigate the challenges faced by migrants in accessing public healthcare in Yeoville Bellevue and to assess how medical xenophobia is experienced or mitigated within this context.
METHODS
A qualitative study design was used. Fifteen international migrants were purposively sampled and interviewed using an interview guide comprising closed- and open-ended questions. Observational data gathered during interviews was used to complement participant narratives. Inductive thematic content analysis was done on data using Atlas.ti.
RESULTS
The study found high utilisation of public healthcare services by migrants, primarily due to financial constraints and perceptions of, thoroughness, and quality of care. Most participants reported minimal barriers to access and indicated that they had not experienced discrimination or at the Yeoville clinic. However, subtle challenges were identified, including slow service delivery, inadequate resources, language and cultural differences. These findings suggest that while medical xenophobia is structurally embedded in the South African public health system, its expression is spatially uneven and less pronounced in migrant-dominated communities.
CONCLUSIONS
Migrants in Yeoville Bellevue appear to experience minimal challenges in accessing healthcare services. However, gaps between policy and practice persist, underscoring the need for continued training, resource allocation, and rights-based healthcare approaches.

Empowering African Youth: A Community-Led, Culturally Responsive Early Intervention Program in South Australia

Lavender Otieno[1], Pip Henderson[1], Calvine Odhiambo[2], Jenna-Leigh Le Mottee[2], Clare Bradley[1], Shanti Omodei-James[1], Georga Sallows[1], Rocco McNeill-Kovacic[1], Courtney Ryder[1]
[1]Flinders Health and Medical research Institute, College of Medicine and Public Health, Flinders University, Adelaide, Australia, [2]Multicultural Affairs, Department of Premier and Cabinet, Adelaide, Australia

INTRODUCTION
Community-led interventions are highly effective in addressing complex social issues, but they require sustained support and investment. In 2023, the African Communities Council of South Australia published a report highlighting concerns about youth violence and recommending government investment in early intervention strategies to promote positive social behaviours. In response, the South Australian Government committed $2.5 million to the Empowering African Youth Program, a proactive and culturally responsive initiative designed to reduce risk factors for disengagement and anti-social behaviour while strengthening protective factors that support long-term wellbeing. This program includes an external evaluation led by the Discipline of Trauma and Injury at the College of Medicine and Public Health at Flinders University. In 2025, the evaluation team collaborated with government and community stakeholders to co-design a comprehensive evaluation plan, with data collection scheduled for 2026–2028.
METHODS
Baseline evaluations will commence in 2026 using a mixed-methods approach, with midline and final impact evaluations in 2027 and 2028. Surveys, focus groups, and interviews will generate qualitative and quantitative insights into how the program enhances school retention and engagement and fosters positive social participation within Adelaide's African diaspora community.
RESULTS
Preliminary findings from 2026 will showcase early impacts and the effectiveness of community-led interventions supported by government investment. Analysis will identify key program components contributing to positive social engagement among African diaspora youth.
CONCLUSIONS
This evaluation will provide evidence on 'what works' in culturally responsive early intervention programs. Results will inform future strategies for reducing antisocial behaviour among African young people, improving school engagement and promoting pathways that lead to positive life outcomes. Findings will have implications for policy and practice, offering a scalable model for governments and public health systems globally to invest in community-led solutions that foster inclusion and equity.

Health-related quality of life, stress coping, and optimism among adults receiving ambulatory care for non-communicable diseases

Kelechi Nnene[1]
[1]Clinical Pharmacy and Pharmacy Management, University of Nigeria, Nsukka Enugu, Nigeria

INTRODUCTION
Health-related quality of life (HRQoL), optimism, and coping are psychosocial

determinants of well-being and treatment outcomes in the management of non-communicable diseases (NCDs). While HRQoL measures patients' subjective physical, emotional, and social well-being, optimism and coping shape their adaptation to chronic illness and treatment demands. In low-resource settings such as Nigeria, these constructs are underexplored despite their implications for patient-centred care. This study assessed the relationship between HRQoL, optimism, and coping strategies among outpatients in a tertiary hospital in southeastern Nigeria to inform policies for psychosocial integration in clinical practice.
METHODS
A cross-sectional study was conducted over 16 weeks at the University of Nigeria Teaching Hospital, Ituku-Ozalla. Four hundred adults attending the cardiology, endocrinology, rheumatology, and nephrology outpatient clinics were recruited by convenience sampling. Data were collected using a demographic questionnaire, the EQ-5D for health-related quality of life, the Life Orientation Test–Revised for optimism, and the Coping Strategies Inventory–Short Form for coping (6). Analyses were performed in SPSS v19 using descriptive statistics and regression models to determine associations between sociodemographic factors, HRQoL, optimism, and coping.
RESULTS
Mean scores were 71.2 ± 23.3 for HRQoL, 61.5 ± 14.4 for optimism, 78.8 ± 21.2 for engagement coping, and 60.7 ± 17.1 for disengagement coping. Participants showed moderate optimism and greater use of engagement coping strategies. HRQoL differed across clinical specialities. Disengagement coping and overall self-rated quality of life significantly predicted perceived health status, while education level and smoking were not significant. Although optimism was positively associated with HRQoL, this relationship was not statistically significant ($p > 0.05$), indicating that coping showed stronger associations with positive health outcomes.
CONCLUSIONS
Policy efforts should integrate psychosocial and behavioural support into routine NCD care to encourage active or engaged coping.

ABS1059
The Widening Gap: How Differential Payment Standards Under Diagnosis-Intervention Packet Reform Influence Patients with Different Types of Medical Insurance
Yingbei Xiong[1], Li Xiang[1]
[1]Department of Health Management, School of Medicine and Health Management, Tongji Medical College, Huazhong University of Science and Technology, Wuhan, China
BACKGROUND
This study investigates the progressive impact of the Diagnosis-Intervention Packet (DIP) payment reform featuring annually widening, differential payment standards for Urban Employee Basic Medical Insurance (UEBMI) and Urban-Rural Resident Medical Insurance (URRBMI) on healthcare equity. We analyze how this dual-track policy design dynamically influences medical costs, patients' economic burden, patient selection, and quality of care, focusing on diseases with varying clinical discretion and across different hospital levels.
METHODS
We analyzed over 3.6 million inpatient records from City A (treatment site with widening payment gaps) and City B (control site with unified standards). Using interrupted time-series analysis, we compared monthly ratios (UEBMI/URRBMI) for hospitalization costs, out-of-pocket payments, Elixhauser Comorbidity Index (ECI), and 31-day readmissions. Two representative conditions were selected: ischemic stroke (low clinical discretion) and atherosclerotic heart disease (high clinical discretion).
RESULTS
In City A, the widening gap significantly compromised equity for atherosclerotic heart disease. Following the first intervention, the cost ratio trend increased by 0.03% ($p<0.01$), accelerating by an additional 0.04% monthly ($p<0.01$) after the third intervention, indicating a cumulative policy effect. Significant trend increases in ECI and 31-day readmission ratios were also observed, suggesting provider-induced patient selection and quality erosion. Conversely, impacts on ischemic stroke were minimal. Notably, tertiary hospitals primarily adjusted the ECI ratio, while non-tertiary hospitals exhibited widespread, complex disparity increases across all metrics. City B showed no significant changes under its unified standard.
CONCLUSIONS
Our findings demonstrate that widening insurance payment gaps create escalating risks to health equity, particularly for high-discretion conditions and in non-tertiary healthcare settings. This provides critical evidence for the need for targeted regulatory monitoring and the rational calibration of payment standards to achieve Universal Health Coverage goals in countries with fragmented health financing systems.

ABS1078
Language access as a public health intervention: Ethical and equity implications from public-sector maternal care
Sinawo Lukubeni[1]
[1]Linguistics and Applied Linguistics, Nelson Mandela University, Gqeberha, South Africa
BACKGROUND
Language barriers in healthcare are often framed as communication challenges or auxiliary service gaps rather than core public health concerns. In multilingual, resource-constrained public health systems, limited language access undermines informed consent, patient safety, dignity, and trust, contributing directly to inequitable maternal health outcomes. There is growing recognition that language access is not peripheral to care delivery but central to ethical and effective health systems.
METHODS
This study presents a realist-informed synthesis of empirical studies, policy documents, and ethical analyses published between 1995 and 2025. The review examines how language-access interventions, including professional interpreter services, language-concordant care models, and enforceable language policies, function within public-sector maternal health systems. Evidence from low and middle-income countries and comparable under-resourced settings was synthesised to identify key mechanisms and contextual conditions influencing effectiveness. The Dora Nginza Hospital context in South Africa was used as a case lens to interpret findings within a multilingual, resource-constrained public health system.
RESULTS
The synthesis demonstrates that language-access interventions improve maternal health equity by activating key mechanisms, including enhanced patient comprehension and agency, reduced clinical error, and strengthened ethical practice through meaningful informed consent. However, these benefits were sustained only where language access was institutionalised through policy enforcement, protected budgets, and leadership commitment. In settings where language services relied on ad hoc arrangements or individual clinician goodwill, impacts were inconsistent and vulnerable to systemic pressures such as staff shortages and time constraints.
CONCLUSIONS
Language access should be recognised as a core public health intervention essential to ethical, safe, and equitable maternal healthcare. Health systems that fail to institutionalise language services risk perpetuating structural inequities and ethical harm. Public health policy and planning must therefore integrate language access into health system design, financing, and accountability frameworks to advance maternal health equity in multilingual societies.

ABS1087
Factors Affecting Posttraumatic Growth Among Survivors Of Domestic Violence: A Scoping Review
Shinaaz Zoutenberg[1]
[1]Public Health, Sefako Makgatho Health Sciences University, Pretoria, South Africa
INTRODUCTION
Posttraumatic growth (PTG) refers to positive adaptation in the aftermath of coping with traumatic experiences. Notwithstanding the aversive nature of domestic violence (DV), there is evidence to suggest the potential for PTG among its survivors. The determinants of such adaptation are nonetheless heterogeneous and complicated.
METHODS
This peer-reviewed literature systematically accessed from the electronic databases of PubMed, PsycINFO, and Scopus. The review included studies from 2022 to 2024, specifically those that had conducted research with adult DV survivors and reported PTG variables. The proposed structure for this will follow the guidelines for the Preferred Reporting Items for Systematic reviews and Meta-Analyses for Scoping Reviews (PRISM ScR).
RESULTS
17 studies were eligible for this review. PTG-relevant factors individual factors (demographics, lifelong learning, cognitive processing, length of time since abuse ceased), and interpersonal factors (engagement with supportive networks) that

emerged as central to survivors' growth.
CONCLUSIONS
The review reflects that PTG in DV survivors is multifactorial in nature with various psychological, social, and environmental factors intertwining in an interrelated manner. Clarification of the factors can be utilised to inform trauma-informed intervention and support services in promoting development and recovery. Further research is necessary to investigate understudied populations and longitudinal pathways of PTG.

ABS1096
Violence Motivated by Religious Intolerance in Brazil: A Public Health Concern
Mariana Ito de Andrade[1], Gabriel Riceto Brandão[1], Gabriela Guarini[1], Lisie Tocci Justo[1]
[1]School of Medicine, Faculdade Municipal Professor Franco Montoro (FMPFM), Mogi Guaçu, Brazil
ABSTRACT
Religious freedom, recognized as a fundamental human right, ensures the peaceful coexistence of diverse beliefs and non-religious convictions, safeguarded by the principle of state secularism. However, the persistence of violence motivated by religious intolerance exposes the fragility of this guarantee, revealing violations that directly affect the dignity, health, and safety of affected populations. The objective of this study was to describe the epidemiological profile of reported cases of violence motivated by religious intolerance in Brazil between 2014 and 2024. This descriptive, cross-sectional, and quantitative study was based on notification forms recorded in the SINAN/DATASUS system and analyzed using descriptive statistics in SPSS version 28. A total of 2,195 cases were identified, with the highest concentration in São Paulo (27.3%), Minas Gerais (14.8%), and Rio de Janeiro (13.3%). Victims were predominantly female (71.3%), of mixed race (42.2%), single (44.1%), heterosexual (65.9%), with completed secondary education (17.0%), and without disabilities or disorders (74.7%). The household was the primary setting of occurrence (65.1%), with repeated episodes in 43.9% of cases, and most injuries were not self-inflicted (73.7%). Physical violence (70.0%) and psychological/moral violence (36.5%) were the most frequent types, while the main means of aggression were bodily force (51.6%) and threats (20.8%). In 66.4% of reports, a single perpetrator was involved, typically an adult aged 25–59 years (60.0%), and alcohol use was identified in 26.8% of incidents. Regarding referral pathways, health services were predominant (58.3%), followed by general police stations (20.2%). In conclusion, violence motivated by religious intolerance in Brazil occurs predominantly against mixed-race women, within domestic environments, with recurrent episodes and predominance of physical and psychological aggression, perpetrated mainly by individuals close to the victims. Referral is concentrated in health services and police authorities, underscoring the urgent need for intersectoral coordination to address and mitigate this form of violence.
Popul. Med. 2026;8(Supplement 1):A1213

ABS1124
Community Health Workers 's views on barriers and challenges on healthcare service access and utilisation faced by adult men in the City of Mbombela, Mpumalanga Province, South Africa: a qualitative analysis
Tshifhiwa Netshapapame[1]
[1]Public Health and Health Systems, University of Limpopo, Polokwane, South Africa
BACKGROUND
Marginalised men in South Africa, particularly in rural and peri-urban settings, face essential barriers to accessing healthcare services. These challenges are often rooted in structural, cultural, and social factors that influence health-seeking behavior and service utilization.
OBJECTIVE
This study aimed to explore the perceptions and experiences of CHWs regarding the barriers adult men face in accessing healthcare services in the City of Mbombela, and to identify potential strategies to improve service delivery and engagement.
METHODS
A qualitative descriptive design was employed, using purposive sampling to recruit 63 CHWs for five focus group discussions (FGDs). Semi-structured interviews were conducted in Siswati and English, and thematic analysis was performed using ATLAS.ti version 23.3. Data saturation was reached by the 5th FGD. Field notes and non-verbal cues were also documented to enrich contextual understanding.
RESULTS
Two major themes and sub-themes emerged: CHWs' awareness and support roles; cultural influences such as masculinity and stigma; systemic barriers including long waiting times, financial constraints, and inconvenient clinic hours; and proposed strategies for improvement. CHWs emphasized the importance of tailored counselling, mobile unit clinics, and male-led support groups to enhance men's engagement with healthcare services.
CONCLUSIONS
CHWs play a pivotal role in bridging the gap between men and healthcare services. Addressing cultural norms, improving service accessibility, and implementing community-based interventions are essential to overcoming barriers and promoting health-seeking behavior among adult men

Causes of Mortality in DIMAMO Health Demographic Surveillance Centre, Limpopo Province, 2019-2021
Tshifhiwa Netshapapame[1]
[1]Public Health and Health Systems, University of Limpopo, Polokwane, South Africa
INTRODUCTION
The major causes of death globally are on the rise, with the World Health Organization (WHO) (2020) reporting 55.4 million annual deaths, from injuries, communicable, and non-communicable diseases (NCDs). Non-communicable diseases (NCDs), including heart disease, stroke, cancer, diabetes, and chronic lung disease, accounted for 74% of global deaths in 2019. In sub-Saharan Africa, leading causes of death included lower respiratory infections (774/100 000), diarrheal diseases (496/100 000), neonatal disorders (880/100 000), and HIV/AIDS (435/100 000). In South Africa, TB was the leading infectious killer, contributing to 454 014 deaths in 2018.
AIM
This study aims to examine the causes of mortality and contributing factors within the DIMAMO Health and Demographic Surveillance System (HDSS) in Limpopo Province, South Africa, between 2019 and 2021.
METHODS
A retrospective cross-sectional design was employed; the researcher utilised secondary data from 308 recorded deaths in the DIMAMO HDSS database, collected through verbal autopsies. Data analysis involved descriptive and inferential statistical methods using SPSS Statistics 25.0 software, with a total sampling technique applied.
RESULTS
The results revealed that mortality was higher among the elderly (60+ years), with chronic diseases such as cancer, diabetes, and HIV as major contributors. A statistically significant association was observed between age and the prevalence of chronic diseases. The COVID-19 pandemic and limited healthcare access contributed to increased mortality rates and underdiagnosis of cardiovascular conditions.
CONCLUSIONS
The evidence underscores chronic conditions within the non-communicable disease spectrum, such as diabetes, cancer, and HIV, as leading causes of death, especially amongst elderly people in the DIMAMO HDSS and similar settings.

Childhood Socioeconomic Circumstances and Adult Mortality: A Systematic Review and Meta-Analysis
Philip Broadbent[1], Alistair Carr[1], Erik Igelstrom[1], Kirsten Hainey[1], Mhairi Campbell[1], Nina Micaela Calderon Huachi[1], Valerie Wells[1], Anna Pearce[1], Daniel Kopasker[1], Srinivasa Vittal Katikireddi[1]
[1]School of Health and Wellbeing, University of Glasgow, Glasgow, United Kingdom
ABSTRACT
Introduction Childhood socioeconomic circumstances are important determinants of adult health, yet no systematic synthesis of their impact on adult mortality has been published since 2008. This study aimed to synthesise evidence on the associations between childhood socioeconomic circumstances and adult all-cause and cause-specific mortality, quantifying population-level impacts to inform global health equity policy. Methods We conducted a systematic review and meta-analysis of longitudinal cohort studies. We searched MEDLINE, SocIndex, ASSIA and ProQuest Public Health from inception to March 2025 without language restrictions. We included studies linking childhood socioeconomic conditions (parental occupation, education, economic circumstances, housing) to adult

mortality (age 18 or older). Risk of bias was assessed using ROBINS-E and evidence certainty using GRADE. We pooled hazard ratios (HR) using restricted maximum likelihood random-effects models and calculated the relative index of inequality (RII) to standardise comparisons across socioeconomic hierarchies. Results The review included 99 studies comprising approximately 8.5 million participants from 18 countries, providing 484 effect estimates. Disadvantaged childhood socioeconomic circumstances were consistently associated with higher adult mortality. Comparing the most versus least disadvantaged groups for father's occupational social class yielded a pooled HR of 1.26 (95% CI 1.18 to 1.35), translating to 181 (95% CI 125 to 243) excess deaths per 100000 population per year. The relative index of inequality was greatest for childhood economic circumstances (RII 2.52; 95% CI 1.17 to 5.42). Harmful associations persisted across cause-specific outcomes, including cardiovascular disease (HR 1.28) and respiratory disease (HR 1.65 to 1.82), and remained consistent when restricted to studies with low risk of bias. Conclusions Disadvantaged childhood socioeconomic circumstances are robustly associated with increased adult mortality across diverse measures and geographic contexts. These findings support prioritising early-life interventions to improve population health and reduce mortality disparities

Environmental Health Surveillance in Brazil: The experience in the State of Bahia

Elielton Araujo[1,2], Luciana Fiuza[2], Ademildes Campos[2], Ynayara Rodrigues[2], Manuela Santos[2], Rivia Barros[2]

[1]Postgraduate Program in Ecology: Theory, Application and Values, Federal University of Bahia, Salvador, Brazil, [2]Environmental Health Surveillance Coordination, Government of the State of Bahia, Salvador, Brazil

ABSTRACT

Environmental Health Surveillance (EHS) is a strategic component of Brazil's Unified Health System (Sistema Único de Saúde – SUS), focused on the identification, monitoring, and mitigation of environmental risks to human health. In Brazil, EHS implementation faces challenges related to territorial heterogeneity, limited local technical capacity, and insufficient intersectoral integration. In the state of Bahia, characterized by wide socioenvironmental diversity, the Environmental Health Surveillance Coordination (Coordenação de Vigilância em Saúde Ambiental – COVIAM) has played a leading role in strengthening and consolidating structured actions across the territory, exceeding the national average in several aspects. This descriptive study analyzes actions developed by COVIAM during the 2023–2025 triennium, covering the surveillance axes of drinking water quality, air quality, populations exposed to chemical contaminants, environmental determinants of health, and climate change. Institutional records, technical reports, and data from environmental health information systems were reviewed. During the study period, 488 EHS actions were implemented statewide, with a strong emphasis on technical capacity building, institutional support, and territorial planning. Bahia demonstrated national leadership in the surveillance of populations exposed to chemical contaminants, registering the highest number of monitored areas in Brazil in 2025 (1.632 areas). In the climate change axis, the state became a national pioneer by developing the country's first Health Sector Plan for Climate Change Mitigation and Adaptation, presented at national forums and during the 30th Conference of the Parties (COP 30). These initiatives place Bahia above the national average in terms of organization, innovation, and scope of EHS actions. The findings indicate that strengthening environmental health surveillance, when integrated with territorial management, continuing education, and intersectoral collaboration, produces tangible impacts on the protection of collective health. The Bahia experience represents a national benchmark, highlighting the importance of investing in EHS to address health inequalities and climate-related emergencies while advancing sustainable development4-7.

Occupational and sociodemographic disparities in chronic respiratory disease mortality in south africa: a national analysis (2013-2019)

Asanda Mkulisi[1], Nqobile Mngoma[2,3], Alfred Musekiwa[1]

[1]School of Health Systems and Public Health, Faculty of Health Sciences, University of Pretoria, Pretoria, South Africa, [2]Africa Health Research Institute, Mtubatuba, South Africa, [3]Department of Family Medicine, School of Medicine, Faculty of Health Sciences, University of Pretoria, Pretoria, South Africa

INTRODUCTION

chronic respiratory diseases (CRDs) are a major cause of adult mortality globally and remain an important public health concern in south africa. Occupational exposures such as dust, fumes, and chemical agents are preventable risk factors, yet nationally representative evidence on occupational patterns of CRD mortality in south africa remains limited.

METHODS

we conducted an analytical cross-sectional study using national mortality data from statistics south africa for 2013-2019. We included all registered deaths among individuals aged 18-75 years with known occupation and certified underlying cause of death. We identified CRD deaths using ICD-10 codes J30-J99 and coded them as a binary outcome. We summarised sociodemographic and occupational characteristics using descriptive statistics. We used multivariable logistic regression to estimate associations between occupational groups and CRD mortality, adjusting for age, sex, population group, province, education, marital status, and smoking status. We report results as adjusted odds ratios (AORs) with 95% confidence intervals (CIs).

RESULTS

of 2373703 deaths, 79840 (3.4%) were attributed to CRDs, of which chronic obstructive pulmonary disease accounted for 40134/79840 (50.3%), followed by asthma at 15482/79840 (19.4%). Proportional mortality was higher among males and older adults and was elevated among coloured (15623/200310; 7.8%) and white (14329/207573; 6.9%) population groups compared with black africans (42218/1627714; 2.6%). Compared with professionals, individuals in elementary occupations had higher odds of CRD mortality (AOR 1.06; 95% CI 1.03-1.09), while managers, professionals, technicians, and service and sales workers had lower odds.

CONCLUSIONS

occupational factors contribute to CRD mortality in south africa, particularly among lower-skilled workers. Employers should strengthen exposure control measures and workplace monitoring in high-risk industries, while the department of employment and labour should enforce occupational health regulations more consistently. The department of health should integrate routine respiratory screening into occupational health and primary care services to improve early detection and prevention of CRD-related deaths.

Completeness of race/ethnicity data in national health surveillance information systems in Brazil (2010–2023): trends and implications for equity

Marcos V da Silva Cordeiro[1,2], Ademar Barbosa Dantas Junior[2], Rita C Duarte Lima[1], Thiago Nascimento Prado[1], Jeanine Pacheco Moreira Barbosa[1], Maria A Andrade[1], Ethel L Noia Maciel[1]

[1]Graduate Program in Collective Health, Federal University of Espírito Santo, Vitória, Brazil, [2]Secretariat of Health Surveillance and Environment, Ministry of Health, Brasília, Brazil

BACKGROUND

In multiracial societies such as Brazil, race/ethnicity data are essential for measuring, directly and indirectly, the impacts of structural racism on health outcomes1,2,3. Incomplete recording of this variable in health information systems undermines the capacity of the Brazilian Unified Health System (SUS) to identify health inequalities and to guide equitable public policies for historically marginalized populations, particularly Black and Indigenous peoples2,3–6. This study analyzes the completeness of race/ethnicity information in major national health surveillance information systems over time.

METHODS

We conducted an ecological, descriptive, and longitudinal study using secondary data from national information systems on notifiable diseases, births, deaths, COVID-19, HIV, malaria, occupational diseases, and other communicable diseases. A total of 43 data sources were analyzed, covering the period from 2010 to 2023 at the national level. Proportions of completed race/ethnicity records were calculated, and temporal trends were assessed across systems and for the country.

RESULTS

A progressive improvement in the completeness of race/ethnicity data was observed over the study period, with more pronounced advances in the second half of the time series. Nevertheless, substantial levels of missing information persist, with marked variability across information systems, particularly for dengue, COVID-19, rubella, varicella, and work-related health conditions. These findings suggest that, despite institutional and regulatory advances, data quality remains insufficient to fully support robust analyses of racial health equity.

CONCLUSIONS

Incomplete race/ethnicity data remain a significant barrier to monitoring racial

health inequalities in Brazil. Strengthening data governance, professional training, and institutional accountability is crucial to ensure that health information systems fulfill their strategic role in addressing structural racism and promoting health equity.

ABS1995

Population Health and the Burden of Neuropsychological Disorder Profile in 5 Southern African Development Community Countries from 2001 – 2021

Fiona Thistlewhite[1], Flavia Senkubuge[1], Moeketsi Modisenyane[1]
[1]Faculty of Health Sciences, University of Pretoria, Hatfield, Pretoria, South Africa

ABSTRACT
Introduction Neuropsychological disorders significantly contribute to the global burden of disease and disability, with conditions like depression, epilepsy, Parkinson's Disease, Alzheimer's Disease and other dementias (ADOD) leading to substantial Disability-Adjusted Life Years (DALYs) and Years Lived with Disabilities (YLDs) worldwide. As the Global Burden of Disease (GBD) shifts due to ageing populations and epidemiological transitions, neuropsychological disorders are emerging as a critical challenge, particularly in LMIC regions such as the Southern African Development Community (SADC). Methods This descriptive cross-sectional study utilised the open-access secondary GBD data from the Institute of Health Metrics and Evaluation over a 20-year period (2001 – 2021). Five SADC countries were studied: Lesotho, Namibia, Mauritius, South Africa, and Zambia. Population health and burden was measured as per the World Health Organisation standards of age-standardised DALYs, YLDs, and mortality rates. Results Neurological and mental disorder burden steadily increased over the 20-year period for all countries. Neurological burden (DALYs) was increased by 10-fold in the elderly population (70+) due to ADOD in all countries. Mauritius was disproportionately affected by overall neurological burden, with DALYs estimates (1815.44 per 100000) being far higher than global estimates (1419.64 per 100000) in 2021. Zambia's epilepsy burden (DALYs) was severely high in 2021 (690.41 per 100000) in comparison to global estimates (175.86 per 100 000). Lesotho was disproportionately affected by mental disorder burden (DALYs) in 2021 (2404.21 per 100000) in comparison with global estimates (1969.47 per 100000). The total leading causes of mental disorder DALYs for all countries were depressive disorders and anxiety disorders. Conclusions The novel findings of this study emphasise the dire state of neuropsychological burden in these SADC countries and calls for localised research, quick awareness and preventative intervention implementation. Specific focus should be placed on the ageing population, the increasing mental burden in Lesotho and epilepsy burden in Zambia.

ABS2044

Determinants of Non-Adherence to Tuberculosis Treatment in Patients Co-Infected with TB and HIV in Polokwane, Limpopo

Mbali Mohlamonyane[1], Phindile Shangase[1], Frank Sibusiso Nkosi[1]
[1]Health Sciences General Department, University of the Free State, Bloemfontein, South Africa

INTRODUCTION
Tuberculosis (TB) is the primary cause of mortality among those living with Human Immunodeficiency Virus globally, and those infected have a 16% higher chance of developing active TB1,2. Despite multiple interventions in South Africa non-adherence persists, leading to increased disease transmission, treatment resistance, and elevated mortality rates. Limpopo province reported a TB treatment cure rate of 76.3% in 2021, below the national target of 77.9%3. The province experienced a high mortality rate of 13.3% among DS-TB patients, significantly higher than the national norm of 7.7% in 20213. The Department of Health highlighted that high mortality rates in TB/HIV co-infected patients and significant loss to follow-up hindered performance.
METHODS
This study employed a qualitative methodology grounded in a constructivist paradigm, utilising Becker's Health Belief Model and a phenomenological framework to examine patients' subjective experiences and perceptions. Data collection involved in-depth interviews with ten purposively chosen participants at a Community Health Centre, as guided by data saturation. The data were systematically organized and analysed using thematic analysis.
RESULTS
Preliminary findings indicated: structural and socio-economic factors (job insecurity and inconvenient clinic hours), clinical and treatment-related challenges (adverse effects of medication and physical strain), leading to reduced adherence once TB symptoms improved., psychosocial determinants (e.g. alternative belief systems) and social and cultural influences. Perceived susceptibility to poor TB outcomes was generally low, as HIV was regarded as a more serious condition and TB as temporary.
CONCLUSIONS
Understanding these determinants is crucial for formulating targeted strategies to improve treatment results and reduce the incidence of TB-HIV co-infection in the Limpopo province. Enhancing implemented strategies, including integrated models for chronic illnesses, Social Relief of Distress (SRD), and the inclusion of patients, traditional practitioners and religious leaders, can facilitate the sustainability of local health initiatives and interventions, thereby amplifying their impact across various healthcare settings.

Persistent socioeconomic inequalities in cardiovascular disease mortality amid declining death rates in Australia, 2016-2023

Mai Nguyen[1], Grace Joshy[1], Nina Lazarevic[1], Ellie Paige[2,1], Sergey Timonin[1], Emily Banks[1], Jennifer Welsh[1]
[1]National Centre for Epidemiology and Population Health, Australian National University, Canberra, Australia, [2]QIMR Berghofer Medical Research Institute, Brisbane, Australia

BACKGROUND
Cardiovascular disease (CVD) mortality rates have declined substantially in Australia over the past half century. However, whether these reductions have been experienced equitably across subpopulations within the country remains unclear. This study quantifies changes in CVD mortality inequalities by area-level socioeconomic deprivation from 2016 to 2023 among Australians aged ≥25 years.
METHODS
We used individual-level death records and estimated resident population data to calculate annual age-standardised mortality rates 2016-2023 by population-based quintiles of the Index of Relative Socioeconomic Disadvantage. We analysed deaths from all CVD (ICD-10 codes: I00-I99), including coronary heart disease (I20-I25), and cerebrovascular disease (I60-I69, G45) subtypes. Absolute and relative inequalities were quantified using rate differences, rate ratios, slope index of inequality (SII), and relative index of inequality (RII), stratified by age group (25-54, 55-74, 75+) and sex.
RESULTS
Between 2016 and 2023, there were 333,508 CVD deaths. Socioeconomic inequalities persisted across all age-sex categories, with consistently higher mortality rates among more disadvantaged populations, although some anomalies were noted during COVID pandemic period (2021-2022). Absolute inequalities were generally higher among men than women. Among men, inequalities remained stable across all age groups; for example, among those aged 55-74 years, SII ranged from 53 (95%CI: 47-59) to 48 (41-54) per 100,000 population, and RII ranged from 2.6 (2.3-2.8) to 2.5 (2.3-2.9) between 2016 and 2023. Among women aged 25-74 years, there was little evidence of changes over time. In contrast, SII among women aged 75+ increased from 15 (6-24) to 29 (21-37) between 2016 and 2023. Similar patterns were observed across CVD subtypes.
CONCLUSIONS
Reductions in CVD mortality rates were observed in all socioeconomic groups, with inequalities in mortality rates persisting, not reducing, over time. Targeted public health efforts to achieve greater mortality reductions among disadvantaged populations are needed to narrow socioeconomic gaps in CVD mortality.

Rural-urban disparities in eye health: An oaxaca-blinder decomposition

Dire Thomas[1]
[1]Southern Centre for Inequality Studies, University of the Witwatersrand, Johannesburg, South Africa

INTRODUCTION
Eye health disparities in South Africa are well documented across gender, residence, race, and socioeconomic status. Although previous studies have linked eye health outcomes to multiple factors, few quantify the relative contribution of specific covariates to these disparities. This lack of evidence limits informed resource allocation and the design of targeted interventions to reduce inequities. This study addressed this gap by decomposing the rural-urban divide in eye health outcomes, separating the share attributable to differences in population characteristics from the share driven by differential effects of these characteristics between rural and urban groups.
METHODS

Using a cross-sectional design, data from SANHANES were analysed using the Oaxaca-Blinder decomposition method to quantify rural-urban disparities in eye health outcomes. The analysis identified the contributions of differences in population characteristics (endowments) and differences in their effects (coefficients) to disparities in eye examination uptake, predictors of vision loss, and the use of distance and near vision corrective glasses.
RESULTS
Persistent rural-urban disparities in eye health outcomes were evident, though their underlying mechanisms differed by outcome. Province, wealth, race and diabetes diagnosis accounted for much of the gap in eye exam uptake explained by endowments, albeit insignificant overall, while locality, race, age and wealth accounted for the gap explained by coefficients (significant overall). Disparities in vision loss identification, as well as in distance vision eyeglasses usage showed no statistically significant contributions from endowments or coefficients. Wealth, race, and province contributed significantly to disparities in near vison eyeglasses use.
CONCLUSIONS
No covariate consistently dominated across outcomes, indicating that rural-urban disparities may be driven by other unobserved structural and contextual factors. Future research should explore these determinants using mixed methods approaches, that possibly incorporate ethnography.

ABS2155

Identifying drivers of decreased avoidable mortality in Brazil: a longitudinal analysis of nationwide administrative and census data

Matías Mrejen[1], Rômulo Paes De Sousa[1]
[1]René Rachou Institute, Fundação Oswaldo Cruz (Fiocruz), Belo Horizonte, Brazil

INTRODUCTION
Avoidable mortality serves as a key indicator of health system performance and socioeconomic development. In Brazil, regional disparities persist in socioeconomic and health-system dimensions, potentially stalling progress in reducing deaths amenable to timely medical intervention and public health policies.
METHODS
We utilized administrative mortality data for 2010/2011 and 2022/2023. We calculated mean yearly avoidable death rates for children under 5 and individuals aged 5–74 (age-standardized) using the Brazilian Ministry of Health's official classification. Trends were analyzed by cause of death at the municipal, state and national level. Finally, a first-differences regression model identified municipal-level socioeconomic and health-system factors associated with these trends.
RESULTS
Avoidable mortality fell by 10.3% for children under 5 and 11.9% for the 5–74 age group. While child mortality improved nationwide—most notably in the Northeast and South—progress for the 5–74 group was concentrated in high-income regions, with the North and Northeast showing stagnation. Under-5 trends were primarily driven by improvements in antenatal, delivery, and neonatal care. For those aged 5–34, reductions were linked to external causes, while for those above 35, progress stemmed from reduced mortality due to non-communicable diseases. At the municipal level, expanded access to adequate sanitation was the most consistent predictor of declining mortality across all ages. Increased physician density was significantly associated with mortality reductions only for the 5–74 population. Increased per capita expenditure with health and income transfers were not associated with mortality reductions.
CONCLUSIONS
While Brazil has reduced avoidable mortality, progress is geographically uneven for adults. Accelerating gains requires prioritizing universal sanitation and the equitable distribution of health professionals at the local level.

Health and the many borders: how populations in Brazilian rural territories travel to access health services?

Patty Almeida[1], Lucas Cabral[2], Adriano dos Santos[3], Juliana Gagno[4], Márcia Fausto[5]
[1]Institute of Collective Health, Fluminense Federal University, Niterói, Brazil, [2]Leônidas e Maria Deane Institute, Oswaldo Cruz Foundation, Manaus, Brazil, [3]Federal University of Bahia, Vitória da Conquista, Brazil, [4]Federal University of Western Pará, Santarém, Brazil, [5]National School of Public Health Sergio Arouca, Oswaldo Cruz Foundation, Manaus, Brazil

ABSTRACT
Ensuring adequate and safe means of transportation is essential for maintaining and improving the health and well-being of rural communities worldwide. This study maps and analyzes distances, modalities, and means of transportation used by populations living in Brazilian rural territories to access routine and emergency health care services. Multiple case studies were conducted in Brazilian rural municipalities, using a qualitative approach based on interviews with key informants-managers and health professionals. Secondary data from national information systems were also analyzed to identify distances and travel costs between rural areas, municipal headquarters, health regions, and state capitals. National health policies do not include arrangements or financing mechanisms to ensure elective medical transportation, which in some localities represents a more significant barrier than the availability of health services itself. In rural territories, travel involves both intermunicipal and intramunicipal flows—from rural areas to the municipal headquarters. Demands for urgent and emergency care are partially met by a national policy known as the Mobile Emergency Care Service (SAMU). Multiple arrangements are established by municipal governments and users to ensure transportation by land, river, and air. Travel costs and distances—which may reach up to 46 hours to access specialized care in the capital of an Amazonian state—result in catastrophic expenditures for families when not covered by public resources. At the same time, the provision of health transportation under the exclusive responsibility of municipalities proves to be unfeasible. Insufficient availability, along with restrictions on days, schedules, and routes of health transportation, leads to the selection of beneficiaries based on socioeconomic criteria in areas of high vulnerability and limited investment in road infrastructure. For populations living in rural territories, the absence of policies ensuring sufficient, continuous, and timely provision of health transportation fuels cycles of inequity and compromises the universal right to health.

Association between socioeconomic conditions and environmental tobacco smoke exposure with eczema symptoms among teenagers attending school in Soshanguve, Gauteng Province, South Africa.

Mandla Bhuda[1,2], Khanyisa Mananga[2], Joyce Shirinde[2]
[1]Department of Health Studies, UNISA, Pretoria, South Africa, [2]School of Health Systems and Public Health, University of Pretoria, Pretoria, South Africa

BACKGROUND
This study investigated the association between socioeconomic conditions and environmental tobacco smoke exposure with eczema symptoms among teenagers attending school in Soshanguve, Gauteng Province, South Africa.
METHODS
A cross-sectional study was conducted among 2 885 schoolchildren aged 13–14 years from 13 high schools in Soshanguve. Participants completed a validated, modified ISAAC Phase III questionnaire. Data were analysed using univariate and multivariable logistic regression in Stata 18 to identify predictors of eczema symptoms (ES) and eczema ever (EE).
RESULTS
The prevalence of ES and EE was 26.8% and 23.3%, respectively. Females were more likely to report ES (adjusted odds ratio [AOR] = 2.07) and EE (AOR = 1.63). Monthly paracetamol use was strongly associated with both ES and EE (AOR = 2.37). Environmental and household factors increased risk: frequent truck traffic near homes was associated with ES (AOR = 1.26) and EE (AOR = 1.34); cat ownership increased ES risk (AOR = 1.49); dog ownership increased EE risk (AOR = 1.39); and exposure to environmental tobacco smoke at home for 16–20 days per month significantly increased the likelihood of EE (AOR = 1.96; $p < 0.05$).
CONCLUSIONS
Socioeconomic conditions, household characteristics, and air pollution–related exposures influence eczema prevalence among teenagers in Soshanguve, highlighting the need for targeted public health interventions.

Rising Burden of Congenital Syphilis in South Africa: Trends from 2020–2023: Opportunities to Optimize Implementation of Dual HIV/Syphilis in Pregnant women and their sexual partners

Alarice Marsh[1], Thato Chidarikire[1], Tebogo Maomela[1], Vuyiswa Lebese[1]
[1]HIV and AIDS and STI, National Department of Health, Pretoria, South Africa

BACKGROUND
Congenital syphilis (CS) is a severe but preventable condition caused by vertical transmission of Treponema pallidum during pregnancy. Despite the availability of cost-effective interventions such as antenatal screening and timely treatment, CS continues to pose a major public health challenge globally and in South Africa. The World Health Organization (WHO) has set an elimination target of fewer than

50 cases per 100,000 live births, emphasizing early antenatal care, universal screening, and treatment completion. Understanding recent epidemiological trends is critical for guiding policy and strengthening maternal health programs.
METHODS
We conducted a retrospective analysis of national surveillance data from the National Institute for Communicable Diseases (NICD) for the period 2020–2023. Data included annual congenital syphilis incidence rates per 100,000 live births, total reported cases, and live birth figures. Trends were assessed to identify changes over time and compare them against WHO elimination targets
RESULTS
CS incidence increased dramatically over four years, from 37 per 100,000 live births in 2020 to 198 per 100,000 in 2023. Reported cases rose from 382 in 2020 to 1,739 in 2023, while live births declined from 1,035,255 to 876,972. These findings highlight a growing burden of CS despite ongoing elimination strategies and underscore the urgent need for strengthened antenatal screening, timely treatment, and robust surveillance systems. The data suggests that without intensified interventions, South Africa will remain far from achieving the WHO elimination target of fewer than 50 cases per 100,000 live births as it represents a more than a fivefold increase in incidence despite ongoing elimination strategies.
CONCLUSIONS
Urgent action is required to strengthen maternal health services and achieve elimination targets., It would therefore, be critical for South Africa to implement the Dual HIV/Syphilis modality routinely in ANC clinics in all 9 provinces to reduce the number of CS in the country.

Gender as a Determinant of Multimorbidity: Findings from the Migrant Health Follow-Up Study (MHFUS)

Tariro Ndoro[1], Carren Ginsburg[1], F. Xavier Gomez-Olive Casas[1]
[1]Medical Research Council/Wits Rural Public Health and Health Transitions Research Unit (Agincourt), University of the Witwatersrand (School of Public Health), Johannesburg, South Africa

INTRODUCTION
South Africa is experiencing an increase in chronic illness multimorbidity (MM)1, with detrimental individual and public health implications2. Social factors influence the development of MM; and can be leveraged to design healthcare interventions3. South Africa has high rates of rural/urban migration which may impact health outcomes4. However, there is a dearth of studies on internal mobility and health5. This study aims to ascertain the prevalence and determinants of MM in a mobile population.
METHODS
The study uses panel data from the first four waves of the Migrant Health Follow-Up Study (MHFUS) cohort, which was based on a simple random sample of 18–40-year-olds selected from the Agincourt Health and socio_Demographic Surveillance System platform6. The cohort includes participants residing in the Agincourt study area and those who migrated to destinations outside of it. Following descriptive and bivariate analyses, generalized linear mixed models were used to ascertain the social determinants of multimorbidity.
RESULTS
At baseline (2018), 3092 participants with a median age of 28 years (IQR=24 – 33) took part in the study, with an almost equal number of male (50.19%) and female (49.81%) participants. Over half of the participants were Agincourt residents (56.95%). At Wave 4 (2022), 6.67 % of participants were multimorbid, with obesity (16.73 %), HIV (13.55%), and hypertension (4.02%) being the most prevalent illnesses in the cohort. Agincourt residents were more likely to become multimorbid than migrants AOR=2.15 (1.54 – 4.05) p<0.001 and gender emerged as a key determinant of MM as women (8.38%) had a higher prevalence of MM than men (4.98%) with 9.72 (4.83 – 19.55) times the odds of MM (p<0.001).
CONCLUSIONS
Results indicate that women are at a disproportionately higher risk of MM than men. Future interventions should target rural-origin women. Additionally, patients presenting with hypertension or HIV should be screened for other illnesses.
Popul. Med. 2026;8(Supplement 1):A1266

ABS2355
The Social Determinants of Multimorbidity in Sub-Saharan Africa: a narrative review

Tariro Ndoro[1], Jane Goudge[2], Rumbidzai Mupfuti[1], Christine Chawhanda[3], Carren Ginsburg[1], F. Xavier Gomez-Olive Casas[1]
[1]Medical Research Council/Wits Rural Public Health and Health Transitions Research Unit (Agincourt), University of the Witwatersrand, Johannesburg, South Africa, [2]Centre for Health Policy, University of the Witwatersrand, Johannesburg, South Africa, [3]School of Public, University of the Witwatersrand, Johannesburg, South Africa

INTRODUCTION
Sub-Saharan Africa (SSA) is currently experiencing an increase in multimorbidity (MM) prevalence, posing a threat to already strained healthcare systems1. It is vital to identify social determinants of MM to tailor evidence-based interventions for MM and alleviate the strain on healthcare systems2. However, there exists a paucity of SSA specific reviews. This narrative review aims to identify existing knowledge on social determinants of MM in the SSA region.
METHODS
A review of etiology was carried out3. PubMed, ISI Web of Science, and Scopus were systematically searched for primary studies using pre-defined search terms, including: SSA (population), risk factors (exposure) and MM (outcome). Titles, abstracts, and full texts were independently screened by two reviewers from a pool of four. Data extraction was carried out using an Excel template and data were summarized in a narrative synthesis. The AXIS4 and NOS5 tools were used to assess risk of bias for cross sectional and cohort studies, respectively.
RESULTS
The initial search yielded 2547 primary publications, 27 of which were eligible for analysis. Increasing age, being divorced/widowed, food insecurity, and family history of noncommunicable diseases (NCDs) were associated with MM while male gender, fruit/vegetable consumption, and receiving a salary were protective against MM. Variables associated with socioeconomic status (SES) showed mixed results across the 27 publications.
CONCLUSIONS
Primary studies report clear relationships between physical and demographic factors and MM, while socio-economic factors present mixed associations with MM. A seminal study found evidence supporting a theory that developing nations experience a "reversal" in the association between SES and NCD prevalence over time6. This theory may explain our findings as various populations in the SSA region are experiencing different stages of development. These findings provide vital evidence needed to direct programmatic interventions to tackle MM in SSA. These should include both structural and behavioural interventions.

Epidemics as Syndemics: Global Inequities, Structural Determinants, and the Urgency of Collective Action in Global Health

Maria Eduarda Maia Vilar[1], Ana Carolina Souza Torres[1], Edson de Andrade Nhamuave[1], Florisneide Rodrigues Barreto[1]
[1]Institute of Collective Health, Federal University of Bahia, Bahia, Brazil

INTRODUCTION
The contemporary world is shaped by contexts of political instability, economic crises, environmental challenges, recurrent epidemics, and systemic injustices that generate unequal impacts on population health. In this scenario, it becomes necessary to move beyond reductionist biomedical approaches. The concept of syndemics, developed by Merrill Singer and other scholars, provides a central analytical framework for global health by demonstrating that diseases emerge from the synergistic interaction of biological, social, economic, and political factors, thereby amplifying risks, vulnerabilities, and harms.
METHODS
This is a theoretical-analytical study based on a critical review of the literature in the fields of global health, critical epidemiology, and social sciences in health. Classical and contemporary texts on syndemics, social determinants of health, and global policies for epidemic response were analyzed, with particular emphasis on the COVID-19 pandemic and on contexts marked by profound structural and geopolitical inequalities.
RESULTS
The analysis demonstrates that epidemics, when understood as syndemics, cannot be interpreted solely as events caused by isolated etiological agents. The COVID-19 pandemic revealed that poverty, income inequality, structural racism, housing precarity, lack of basic sanitation, food insecurity, and unequal access to health systems interacted with the virus, intensifying morbidity and mortality among historically marginalized populations. Furthermore, the globally unequal distribution of vaccines, technologies, and health resources exposed power asymmetries between countries, reinforcing the political dimension of health crises and the persistence of inequities in global health governance.
CONCLUSIONS
The syndemic approach highlights that addressing epidemics requires collective, intersectoral, and solidaristic action on a global scale. Strategies focused

exclusively on biomedical solutions are insufficient in contexts structured by social and economic injustices. Therefore, global health policies must incorporate equity, social justice, and resource redistribution as central principles for preventing future epidemics and reducing contemporary global health inequalities.

perceptions and experiences of early childhood development practitioners regarding menu implementation in early childhood development centers

KEGOTSHEPILE GERALD MOKUBELA[1]
[1]Human Nutrition and Dietetics, University of Limpopo, Polokwane, South Africa

BACKGROUND
Menu implementation in Early Childhood Development Centres (ECDCs) plays a critical role in promoting child nutrition, growth, and development. However, effective implementation of planned menus remains a challenge in many low- and middle-income settings. This study explored the perceptions and experiences of ECDC practitioners regarding menu implementation in ECDCs within the Polokwane Municipality, Limpopo Province.
METHODS
A qualitative, exploratory, and descriptive research design was employed. Purposive sampling was used to select 24 ECDC practitioners from rural, peri-urban, and urban ECDCs. Data were collected through one-on-one semi-structured interviews and analysed using thematic analysis following Tesch's eight steps.
RESULTS
The findings revealed that practitioners generally valued menus and considered them important tools for guiding daily operations, supporting child development, and promoting healthy eating habits. However, menu implementation differed markedly by location. Rural and peri-urban ECDCs experienced significant challenges, including inadequate and delayed government funding, inconsistent parental fee payments, logistical barriers such as load shedding and water shortages, limited storage facilities, and theft. These constraints often resulted in reduced menu quality and limited dietary diversity. In contrast, urban ECDCs, which relied on stable parental fees and had better infrastructure, reported fewer challenges and more consistent menu implementation. Practitioners adopted various coping strategies, including seasonal menu planning, bulk food storage, vegetable gardening, and reliance on stakeholder support for training and resources. While these strategies assisted in mitigating some challenges, they were insufficient to address systemic and structural barriers.
CONCLUSIONS
The study concludes that effective menu implementation in ECDCs requires more than practitioner knowledge and commitment. Sustainable improvements depend on adequate funding, reliable infrastructure, professional support, and coordinated stakeholder involvement. The study recommends strengthening ECDC nutrition subsidies, improving payment systems, expanding capacity-building initiatives, and promoting multisectoral collaboration to enhance menu implementation and child nutrition outcomes in ECDCs.

Curriculum-Based Road Safety Education as a Cost-Effective Strategy to Reduce Pedestrian Traffic Injuries in Bangladesh

Md. Mainul Hassan[1], Syeda Tasnuva Maria[1], Sohel Rahman[1], Mohammad Sabbir Ahmed[1], Fawzia Akhtar Jahan[2], Andrew Ancharski[3], Chandra Dhakal[3]
[1]Institute of Epidemiology Disease Control and Research, Dhaka, Bangladesh, [2]Management Information System, Directorate General of Health Services, Dhaka, Bangladesh, [3]CDC Foundation, Atlanta, GA 30308, United States

BACKGROUND
Road traffic injuries (RTIs) are the 8th leading cause of death globally and the primary cause among youth aged 5–29 years. Bangladesh reports 18.6 deaths per 100,000 population, exceeding the global average. In 2024, 8,543 deaths and 12,608 injuries due to road traffic incidents generated USD $1.71 billion in economic losses (0.38% of GDP). Pedestrians account for up to two-thirds of road traffic fatalities. While road infrastructure and driving culture change is needed, education for pedestrians may reduce mortality in the interim.
OBJECTIVES
To identify the most cost-effective policy intervention to reduce pedestrian road traffic injuries and deaths in Bangladesh.
METHODS
We conducted decision tree cost-utility analysis with 10-year time horizon comparing two interventions against status quo: curriculum-based road safety education for grades 1–10, and quarterly police-based awareness programs in 21 high-risk sub-districts. Data from Bangladesh Road Transport Authority informed model parameters. Outcomes were measured in disability-adjusted life years (DALYs), with baseline 334,180 DALYs annually. Costs and DALYs were discounted at 5% annually. Incremental cost-effectiveness ratios (ICERs) were calculated with sensitivity analyses.
RESULTS
Curriculum-based education was the dominant strategy, reducing DALYs from 5.77 to 0.95 per person (4.82 DALYs averted, 83.5% reduction) at incremental cost of USD $0.06 per person, yielding a negative ICER of -1.45 (cost-saving with superior effectiveness). Police-based awareness showed moderate benefits (DALYs reduced to 3.81) but was strongly associated with higher costs of USD$.09 and ICER of 3.78. Sensitivity analyses confirmed robustness.
CONCLUSIONS
Integrating road safety education into national curriculum represents the most cost-effective, scalable strategy for reducing pedestrian RTIs in Bangladesh. This intervention aligns with Sustainable Development Goal 3.6 and offers a replicable model for low- and middle-income countries. Findings support an immediate, phased implementation through curriculum revisions, teacher training and classroom instruction, beginning in high-burden urban districts.

Bridging the Surgical Divide: A Comparative Analysis of Rural Surgery Initiatives and System Integration in the Philippines

Brent Andrew Viray[1], Roberto Chacon[1], Enrique Ona[1], Teodoro Herbosa[1], Joselito Mendoza[1], Rhoel De Leon[1], Vivencio III Villaflor[1], Rodney Dofitas[1], Vicente Bernardo[1], Carlo Panelo[2], Joy Grace Jerusalem[1]
[1]Philippine College of Surgeons, Manila, Philippines, [2]Department of Clinical Epidemiology, University of the Philippines, College of Medicine, Manila, Philippines

INTRODUCTION
Despite the global mandate for Universal Health Care (UHC), two billion people worldwide lack access to essential surgical care, with low- and middle-income countries like the Philippines bearing the brunt of this inequity. While surgery is a cornerstone for treating the nation's leading causes of mortality—such as cancer and trauma—resources remain concentrated in urban centers. This comparative analysis evaluates the initial implementation of three independent Rural Surgery Programs (RSPs) in Batangas, Aurora, and Sorsogon to establish a systematic framework for scaling surgical access nationwide.
METHODS
Qualitative case series analysis of 3 separate existing rural surgery in 3 Philippine Provinces utilizing the SWOT framework, WHO Building Blocks of Health Systems, and Global Surgery Indicators
RESULTS
the study reveals that while each RSP adapted to unique local constraints, all successfully decentralized surgical delivery. Batangas demonstrated the efficacy of a university-LGU partnership, providing resident-led services and advanced minimally invasive options. Sorsogon showcased a highly institutionalized "Rotating Elective Surgery" model, utilizing patient navigators and telemedicine to integrate surgery into primary care. Aurora highlighted surgical innovation through a single-surgeon approach and a unique "surgical literacy" radio program to address community misconceptions. The analysis identifies common threats to sustainability, primarily the reliance on single-surgeon practices and the need for structured financial incentives for rotating teams.. This article provides a strategic blueprint for the Philippine College of Surgeons and the Department of Health to ensure that "no Filipino is left surgically behind," transforming surgery from a neglected priority into a fundamental pillar of primary health care.
CONCLUSIONS
It is evident that a health systems approach in addressing surgical need is the more systematic, comprehensive, predictable framework to proceed. These three ongoing RSP s should be synchronized and to consolidate all best practices in their respective implementations

ABS2562
Patient-Centred Quality of Life Measurement in Sleep Health: Closing the Gap for Public Health Equity and Policy

Billingsley Kaambwa[1]
[1]Flinders University, Adelaide, Australia

BACKGROUND
Sleep disorders affect a substantial proportion of Australians and contribute to broader burdens in mental health, productivity, and social wellbeing. Despite this, public health interventions are often evaluated using standardised quality-of-life

(QoL) instruments developed largely from clinical or expert perspectives. This may overlook patient-prioritised outcomes and weaken the equity and relevance of health policy decisions.
AIM
To examine the alignment between existing QoL instruments and the lived priorities of people with sleep disorders, and to identify additional patient-driven domains needed for more inclusive public health evaluation.
METHODS
A national survey of 1000 Australians compared 500 adults with diagnosed sleep disorders to 500 health professionals, researchers, and carers without sleep disorders. Twenty QoL domains were synthesised from ten commonly used global instruments and patient focus group findings. Domains were ranked using drag-and-drop prioritisation, Best–Worst Scaling (multinomial logit models), and Content Validity Ratios to quantify perceived relevance across groups.
RESULTS
A substantial valuation gap was observed. While the comparator group prioritised "usual activities" (ranked 3rd), individuals with sleep disorders ranked this 7th, instead prioritising "excessive daytime sleepiness" (2nd vs. 10th) and "ability to concentrate." Participants with sleep disorders also identified critical domains absent from standard tools, including stigma, fear of medicalisation, and impacts on intimacy and relationships. Only 60% of the top domains valued by the expert group were considered important by patients.
CONCLUSIONS
Current QoL metrics may fail to capture the full social and psychological burden of sleep disorders, limiting the validity of population health surveillance and risking inequitable resource allocation. Public health evaluation frameworks must incorporate patient-driven, equity-sensitive domains to ensure policies reflect community priorities and address social determinants such as stigma.

Targeting sex disparities in physical inactivity: where and when action is most needed

Gregore Mielke[1], Stephanie Duncombe[1], Tracy Kolbe-Alexander[2], Tessa Strain[3]
[1]School of Public Health, The University of Queensland, Brisbane, Australia, [2]School of Health and Medical Sciences, University of Southern Queensland, Ipswich, Australia, [3]Physical Activity for Health Research Centre, Institute for Sport, Physical Education and Health Sciences, University of Edinburgh, Edinburgh, United Kingdom

BACKGROUND
Sex differences in physical inactivity are widespread and closely linked to social and structural conditions. The aim of this study was to investigate global patterns and contextual factors associated with these differences to inform policy efforts to reduce inequality.
METHODS
Physical inactivity data were extracted from the Global Health Observatory for 197 countries and territories. For each country, overall and age-specific absolute and relative sex differences were calculated. Countries were grouped into four profiles based on their overall prevalence of physical inactivity and their relative difference in physical inactivity between males and females. Country context variables, including the Human Development Index (HDI), Gini coefficient (wealth inequality), and Gender Inequality Index (GII), were retrieved from official websites, and their associations with sex differences were assessed using polynomial regressions.
RESULTS
The median absolute difference between females and males was 6.5 percentage points, and the prevalence of physical inactivity was, on average, 31% higher among females than males (relative sex difference = 1.31). Sex differences varied by age, with the highest absolute differences in the 18–29 and 80+ year groups, and the highest relative differences in the 18–29-year group. Relative differences in inactivity were negatively associated with HDI and positively associated with the Gini coefficient and GII. Countries with both high overall inactivity and large sex gaps were concentrated in Latin America, the Caribbean, and South Asia, while lower inequality profiles were common in Central and Eastern Europe.
CONCLUSIONS
Findings from our study highlight that sex differences in physical inactivity are strongly shaped by macro-social and structural conditions, indicating that policies to reduce physical inactivity should adopt a gender-responsive approach that addresses broader inequalities in development, income, and gender equity rather than relying solely on individual-level interventions.

Racism in nursing: the racialization and commodification of internationally recruited nurses in German healthcare

Tanja Gangarova[1]
[1]National Monitoring of Discrimination and Racism (NaDiRa), German Centre for Integration and Migration Research (DeZIM), Berlin, Germany

ABSTRACT
While research in North American and Australian contexts demonstrates how encountering racism in healthcare is burdensome, the impact of racism on healthcare interactions in Germany remains underexplored. This paper draws on a study examining the intersections of interpersonal, institutional, and structural racism in the professional experiences of internationally recruited nurses in Germany who self-identify as "affected by racism." The aim is to deepen the understanding of the forms, dynamics, and effects of racism within a healthcare sector increasingly shaped by economization. Employing a qualitative research design, the study is based on 21 semi-structured interviews and 10 participant diaries. Data analysis followed an iterative process, integrating inductive and deductive approaches within a framework of qualitative content analysis, emphasizing participants' perspectives. The findings indicate that the experiences of the 21 participants are shaped by intersecting processes of racialization and commodification. Racialization manifests in assumptions of professional incompetence, experiences of bullying, and assignment to less desirable roles with heavier workloads. Institutional practices—such as the issuance of employment contracts that create dependency, the denial of training opportunities, and disregard for minimum labour standards—further exacerbate the degradation and dehumanisation described by participants, laying the groundwork for their commodification and exploitation. In the absence of support from colleagues and managers, nurses report being left to choose between silence, resistance (often at personal cost), or bolstering their credibility through extra work. The paper identifies key areas for institutional transformation and highlights the power structures that must be addressed to advance equity and justice in nursing. Priority interventions include improving working conditions, strengthening monitoring and accountability of recruitment agencies and healthcare institutions, shifting from cultural competency to anti-racist education, enhancing onboarding programs, and advancing transdisciplinary and transnational research.

Health and harmony: a collaborative knowledge-exchange platform for equitable health systems strengthening in the Khayelitsha and Eastern Substructure, Western Cape, South Africa

Rachel Coley[1], Hanani Tabana[1,2], Tamlin Petersen[1], Charné Petinger[1], Yolanda Mayman[1], Brian van Wyk[1], Mellisa Vollenhoven Vollenhoven[3,4], Erin von der Heyden[3,4], James Kruger[3,4], Riyadh Manesen[3]
[1]School of Public Health, University of the Western Cape, Cape Town, South Africa, [2]SAMRC/UWC Health Services to Systems Research Unit, South African Medical Research Council, Cape Town, South Africa, [3]Khayelitsha Eastern Substructure, Western Cape Department of Health and Wellness, Cape Town, South Africa, [4]Stellenbosch University, Stellenbosch, South Africa

INTRODUCTION
Substantial contextual knowledge and innovation exist within local health systems, particularly among frontline healthcare workers and communities most affected by health inequities. However, research conducted within these settings is often externally driven, with limited feedback, dissemination, or translation back to local stakeholders. This perpetuates a gap between knowledge generation and the potential impact of service delivery, undermining equity-oriented health system strengthening.
METHODS
South Africa's Western Cape Department of Health and Wellness' Khayelitsha and Eastern Substructure (KESS) partnered with the University of the Western Cape to design and coordinate all elements of a one-day public health research conference. The conference aimed to promote bidirectional knowledge exchange between researchers, service providers, and community stakeholders. Submitted abstracts were peer-reviewed by academics and senior clinicians working in KESS. A post-event evaluation was distributed onsite and via email to all registered attendees.
RESULTS
The conference was hosted at the University of the Western Cape on 31 October 2025, with 196 official attendees, including 82 healthcare workers, 66 staff and students from academic institutions, and 36 representatives from non-governmental organizations. A total of 59 abstracts were submitted, of which 54.2% (n=32) were accepted for oral presentation. An additional two were allocated time during the closing plenary to present on upcoming research.

Post-event evaluation responses (n=75) indicated that program content was excellent (n=43, 57.3%), good (n=30, 40.0%) or fair (n=2, 2.7%). Overall, nearly all respondents (n=72, 96.0%) reported an improved understanding of ongoing research within KESS.
CONCLUSIONS
The event demonstrated a scalable, equity-oriented model for locally relevant, intersectoral knowledge exchange. Continued iteration of this model has the potential to strengthen community–academic–government partnerships that advance progress toward health equity.

Factors Associated with Timely TB Clinic Attendance Among Household Contacts in Eastern Cape, South Africa

Dawie Olivier[1], Aaron Kipp[2], Andrew Medina-Marino[3], Kuhle Fiphaza[4], Lindsey De Vos[1], Amrita Daftary[5]
[1]Desmond Tutu Health Foundation, East London, South Africa, [2]East Carolina University, Greenville, United States, [3]University of Pennsylvania, Philadelphia, United States, [4]Foundation for Professional Development, Pretoria, South Africa, [5]York University, Toronto, Canada

BACKGROUND
Timely clinic presentation for testing is vital for effective tuberculosis (TB) prevention and treatment. Social support is acknowledged as a crucial factor affecting health-seeking behaviours among individuals with TB. To investigate whether perceived social support influences the likelihood of household contacts presenting to the clinic on time and explore any gender differences in this relationship.
METHODS
A cohort study was conducted among household contacts of TB patients in the Eastern Cape, South Africa. Perceived social support was assessed using a validated social support scale. Timely clinic presentation was defined as attending a clinic within 30 days of referral. Logistic regression analysis assessed the association between social support and timely clinic presentation, incorporating covariates such as gender, employment status, TB stigma, income, HIV status, prior TB, TB symptoms, level of education and residential type (urban/rural).
RESULTS
We enrolled 437 household contacts, of whom 22.88% presented for testing in a timely manner. We found that perceived social support was not significantly associated with timely clinic presentation (OR: 1.01; 95% CI: 0.76–1.36; p = 0.93). No significant interaction between gender and social support was found (p = 0.505), indicating no gender differences in the association. However, clinic presentation was significantly associated with rural residence (OR: 2.66; 95% CI: 1.52–4.66; p < 0.01), positive HIV status (OR: 2.49; 95% CI: 1.32–4.70; p < 0.01), TB symptoms (OR: 1.77; 95% CI: 1.04–3.01; p = 0.03) and age (OR: 1.02; 95% CI: 1.00–1.04; p = 0.01).
CONCLUSIONS
Findings suggest that interventions to improve linkage to testing should consider messaging tailored to different age groups, integrated TB and HIV services, and enhance outreach efforts, particularly targeting urban populations and asymptomatic individuals. To inform these interventions, future research should investigate additional social and system-level barriers to care-seeking.

ABS2725
A Multidisciplinary Approach for Addressing Cancer Diagnostic Inequities for People with Disabilities

Giovanni Emanuele Ricciardi[1,2], Flavia Pennisi[1,2], Rita Cuciniello[1], Lorenzo Blandi[1], Marta Bosia[1], Roberto Cavallaro[1], Consuelo Corti[1], Fabio Ciceri[1], Silvia Mangili[3], Andrea Rebecchi[3], Stefano Capolongo[3], Carlo Signorelli[1], Cristina Renzi[1,4]
[1]Vita-Salute San Raffaele University, Milan, Italy, [2]National PhD Programme in One Health approaches to infectious diseases and life science research, Department of Public Health, Experimental and Forensic Medicine, University of Pavia, Pavia, Italy, [3]Polytechnic University of Milan, Milan, Italy, [4]Research Department of Behavioural Science and Health, University College London, London, United Kingdom

BACKGROUND
People with disabilities often face barriers to early cancer diagnosis with poorer outcomes. Aligned with the Convention on the Rights of Persons with Disabilities (CRPD), this project addresses diagnostic inequities through a multidisciplinary lens, investigating socio-cultural, environmental and organizational barriers.
METHODS
In the Project Intrecci we employed a multimethods approach, bridging epidemiology, architecture, and qualitative research to identify specific barriers to early cancer diagnosis for people with disabilities. Analyzing electronic health records and cancer registry data in Lombardy, northern Italy, we compared diagnostic pathways, stage, and mortality between patients with and without various types of disabilities. Additionally, we conducted qualitative interviews with patients/caregivers and healthcare professionals, exploring lived experiences and perceptions on barriers and stigma across diagnostic pathways. Using the "Design for All A.U.D.I.T." tool, we evaluated physical, sensory, and cognitive accessibility of diagnostic centers. We engaged with disability-led organizations as project partners, supporting study prioritization, refining accessibility checklists, interpreting findings, and co-designing recommendations and implementation tools.
RESULTS
Population-based analyses showed that people with disabilities have a significantly higher risk of emergency cancer diagnosis (AOR=1.48, 95%CI: 1.39-1.58) and poorer survival, independently of stage or comorbidities. Qualitative investigations identified critical barriers, including communication difficulties, stigma-driven assumptions, fragmented care, and sub-optimal accessibility of some diagnostic equipment. Protective factors included therapeutic alliances, family involvement, and improved interdisciplinary coordination. The integrated findings are being used to inform active engagement with disability associations to co-design accessible solutions and the implementation of targeted training initiatives for medical students and nurses, fostering disability-inclusive care among future healthcare professionals.
CONCLUSIONS
The project operationalizes a CRPD-consistent approach to health equity, through active partnership with disability-led organizations and integrating population-based quantitative evidence with qualitative insights and environmental accessibility assessments. This offers actionable tools for policymakers and healthcare providers to reduce diagnostic barriers and build inclusive cancer pathways.

Impact of the covid-19 pandemic on tuberculosis occurrence according to sex in São Paulo State, Brazil

Mariana Gaspar Botelho Funari de Faria[1], Dulce Gomes[2], Rubia Laine de Paula Andrade Gonçalves[1], Alexandre Tadashi Inomata Bruce[1], Rafaele Oliveira Bonfim[1], Venisse Paschoalin Maurin[1], Rebeca Sousa Braga[1], Lívia Maria Lopes Gazaffi[3], Tatiana Ferraz de Araújo Alecrim[1], Valdes Roberto Bollela[4], Ricardo Alexandre Arcêncio[1], Maria Josefa Perón Rujula[5], Aline Aparecida Monroe[1]
[1]1Maternal and Child Health and Public Health Department, Ribeirão Preto School of Nursing, University of São Paulo, Ribeirão Preto, Brazil, [2]2Department of Mathematics, School of Science and Technology, Universidade de Évora,, Évora, Portugal, [3]3Departament of Nursing, Municipal University Centre of Franca (Uni-FACEF), Franca, Brazil, [4]4Department of Clinical Medicine, Ribeirão Preto School of Medicine University of São Paulo, Ribeirão Preto, Brazil, [5]5 Departament Comunicable Diseases, Center of Epidemiological Surveillance in Sao Paulo State, Sao Paulo, Brazil

BACKGROUND
Tuberculosis (TB) remains an important cause of morbidity and mortality, even in the presence of effective diagnostic methods and treatment options. The covid-19 pandemic intensified this scenario by disrupting health services and, consequently, causing diagnostic delays (1,2).
OBJECTIVE
To describe the sociodemographic profile and diagnostic detection patterns of pulmonary TB cases according to sex in the pre-pandemic, pandemic, and post-pandemic periods in São Paulo State, Brazil.
METHODS
A cross-sectional study was conducted using newly diagnosed pulmonary TB cases reported in São Paulo State between January 2014 and June 2024. Three periods were defined: pre-pandemic (01/01/2014–02/28/2020), pandemic (03/01/2020–04/30/2023), and post-pandemic (05/01/2023–06/30/2024). Variables analyzed included sex, age group, race/skin color, education level, and mode of case detection, using absolute and relative frequency distribution.
RESULTS
A predominance of male cases was observed (74%), with a slight increase in the proportion of women in the post-pandemic period. The highest concentration of cases occurred among individuals aged 18–40 years (58.1% among men and 56.2% among women), with a progressive reduction in the 18–30 and 51–60 age groups over the study period. Regarding race/skin color, 86.5% of men and 86.4% of women self-identified as White/Brown, with a modest increase among

Black and Brown individuals in the post-pandemic period. In terms of education, 77.7% of men and 79.1% of women had 4–11 years of schooling. Post-mortem diagnosis occurred in 1.3% of men and 1.1% of women. In the post-pandemic period, a slight increase in post-mortem detection and a reduction in in-hospital diagnosis were observed.
CONCLUSIONS
TB control strategies should incorporate gender-sensitive approaches that address specific vulnerabilities and social determinants of health (education, access to health services, working age), particularly during health crises, when the risk of exacerbating inequalities becomes greater.

Experiences and Challenges of Clean Intermittent Catheterization among Children with Spina Bifida and Their Caregivers in Uganda

Rehema Namaganda[1], Jane Nansamba[1], Esther Nasanga[1], Ronald Kamusiime[1], Jonathan Omara[1], Andrew Ssentongo Ssemata[1,2], Femke Bannink Mbazzi[1,2]
[1]Disability Research Group, Medical Research Council/ Uganda Virus Research Institute and London School of Hygiene and Tropical Medicine Uganda Research Unit, Wakiso, Uganda, [2]International Centre for Evidence in Disability,, London School of Hygiene and Tropical Medicine, London, United Kingdom

BACKGROUND
Clean Intermittent Catheterization (CIC) is a critical public health intervention for children with spina bifida, preventing urinary tract infections, kidney damage, and premature mortality while supporting continence and social participation (1, 2). In low-resource settings, however, effective implementation is constrained by health system weaknesses, limited access to supplies, and social barriers. Understanding these challenges is essential for strengthening disability-inclusive child health services, improving quality of life and reducing avoidable morbidity (3-5).
METHODS
We conducted a mixed-methods study involving 101 participants: 20 children with spina bifida, 75 caregivers, and 6 healthcare providers across four regions of Uganda. Data collection included structured interviews and daily diaries capturing CIC practices, training experiences, access to supplies, caregiving burden, and follow-up care. Quantitative data were summarized descriptively; qualitative data were analyzed thematically.
RESULTS
Despite widespread exposure to CIC training, significant gaps were identified. Variations in training content and absence of standardized guidelines resulted in inconsistent practices, affecting safety and caregiver confidence. Frequent shortages of catheters, lubricants, and essential medicines disrupted continuity of care, sometimes leading to skipped or improvised catheterization. Gaps in follow-up were evident, with many children lacking routine renal monitoring. Caregiving responsibilities were disproportionately borne by mothers, contributing to financial strain and psychosocial stress. Environmental and social barriers, including stigma, lack of privacy, and inadequate school sanitation, further limited adherence. Children and their families adopted adaptive strategies such as peer support networks and improvised solutions, reflecting resilience in the face of systemic constraints.
CONCLUSIONS
Barriers to safe and sustained CIC use among children with spina bifida in Uganda reflect broader health system and social inequities. Strengthening standardized training, ensuring reliable supply chains, integrating routine follow-up into child health services, and addressing school and community-level barriers are critical public health priorities.

Navigating Violence, Gender, and Disability: Experiences of Young People with Disabilities in Uganda

Rehema Namaganda[1], Jane Nansamba[1], Rebecca Akunzirwe[2], Amiya Bhatia[3], Colleen Howell[2], Jenny Parkes[2], Femke Bannink Mbazzi[1,4]
[1]Disability Research Group, Medical Research Council/ Uganda Virus Research Institute and London School of Hygiene and Tropical Medicine Uganda Research Unit, Wakiso, Uganda, [2]Institute of Education, University College London (UCL), London, United Kingdom, [3]Department of Social Policy and Intervention, University of Oxford, London, United Kingdom, [4]International Centre for Evidence in Disability, London School of Hygiene and Tropical Medicine, United Kingdom, United Kingdom

BACKGROUND
Violence against young people is a major public health concern with long-term consequences for physical health, mental health and social participation. Young people with disabilities face disproportionately higher risks of abuse, exclusion, and marginalization due to intersecting social and structural determinants (1, 2). The NAVIGENDI study examines how disability, gender, and social norms interact to shape experiences of violence among young people in Uganda, with implications for prevention, equity, and inclusive public health responses.
METHODS
This longitudinal mixed-methods study builds on the Contexts of Violence in Adolescence Cohort. Secondary analysis of quantitative data from three waves (2014: N=3,431; 2018: N=2,773; 2022: N=2,312) was conducted alongside qualitative interviews with 40 young people with disabilities (ages 13–30) and 40 caregivers/peers across Luwero, Masaka, and Wakiso districts. Data collection employed a dialogical approach and the 'river of life' methodology to engage participants in reflective knowledge sharing. Quantitative data were analyzed descriptively and comparatively; qualitative data underwent thematic analysis.
RESULTS
Preliminary findings indicate that youths with functional difficulties experienced higher rates of violence across all waves, highlighting persistent health inequities. Peer violence was especially pronounced, with boys reporting lower peer support, while girls faced elevated risks of sexual harassment and exploitation, including in school settings and during transit. Attitudinal barriers and stigma limited social participation and access to protective environments. Conversely, supportive relationships and inclusive school practices mitigated some negative experiences, demonstrating the potential of school and community systems to function as protective public health platforms.
CONCLUSIONS
Violence against young people with disabilities in Uganda is driven by intersecting determinants of gender, disability, and social norms, requiring integrated public health action. Strengthening peer networks, inclusive school environments, and school-community prevention responses is critical to reducing violence, promoting mental and social well-being, and advancing health equity.

Men's health - a con or a real concern? The case for a new global public health policy approach

Peter Baker[1], James Smith[2], Damian Naidoo[3], Rae Bonney[1], Natalie Leon[4], Albert Manyuchi[5]
[1]Global Action on Men's Health, London, United Kingdom, [2]College of Medicine and Public Health, Flinders University, Casuarina, Australia, [3]Centre for the AIDS Programme of Research in South Africa (CAPRISA), Durban, South Africa, [4]South African Medical Research Council, Cape Town, South Africa, [5]Mandela Institute, University of the Witwatersrand, Johannesburg, South Africa

INTRODUCTION
Men's health globally is a clear global public health challenge. Men have a lower life expectancy than women and higher mortality rates from cancer, cardiovascular disease, diabetes and suicide. They are more likely to smoke and to drink alcohol excessively but less likely to access primary care effectively. Yet men are overlooked in global and national health policies. Global Action on Men's Health's research shows men's needs are largely unacknowledged in the fields of cancer, mental health, sexual/reproductive health, and primary care. Just nine countries have national men's health policies. Men's and women's health are frequently posited as binary choices. Where men's health is addressed, individual lifestyle narratives often dominate, not systemic barriers and strengths-based solutions.
METHODS
This organised session will be in the format of a moderated panel discussion. This will enable cross-regional exchange, applied policy discussion, and practical learning. Attendees will be able to ask the panellists questions and engage in debate. The issues covered will include: 1. The state of men's health and key gaps. 2. The role of policy in addressing men's health needs. 3. Case studies of initiatives to address men's health (gender-neutral HPV vaccination and workplace mental health). Results (expected learning outcomes): Participants will be able to: 1. Describe the current state of men's health globally. 2. Explain why men's health has been overlooked in health policy. 3. Identify policy and practice opportunities to improve outcomes and achieve gender equity in their own settings. 4. Apply insights from case-studies.
CONCLUSIONS
The session will position men's health as a legitimate and significant global public health issue within health policy debates and identify concrete, policy-relevant opportunities to improve gender-just outcomes across health systems, workplaces and community settings. Addressing men's health is not a zero-sum exercise; it is a necessary component of equitable health systems.

Negotiating visibility and invisibility: South African women with neurological disabilities' experiences with transportation and health impacts

Kristi Kenyon[1], Aimee Tymkin[1]
[1]Human Rights, University of Winnipeg, Winnipeg, Canada

INTRODUCTION
Situated within a 7 year multi-country study (Engendering Disability-Inclusive Development), this collaborative project between South African and Canadian academics, Epilepsy South Africa and the South African Disability Alliance employed a baseline study of disabled peoples organisations in South Africa to identify priority areas of focus, including access to and experiences of transportation.
METHODS
Phase I of the research brought together 10-15 women with neurological disabilities in each of 4 South African provinces (Western Cape, Free State, Mpumalanga, Eastern Cape) on Transportation. Focus groups of 60-90 minutes were facilitated by Social Workers in relevant local languages (Sesotho, isiXhosa, isiZulu, Afrikaans), recorded, translated, transcribed and coded thematically.
RESULTS
Participants reported economic, structural, and attitudinal barriers impacting mobility and health. They reported challenges in: affording transportation, navigating uneven roads, boarding compact and damaged vehicles. They also reported attitudinal barriers and inaccurate perceptions by drivers and fellow passengers resulting in experiences of 'invisibility' (pressure to "hurry up" without understanding mobility limitations, lack of return transport from hospital after arriving by ambulance) and "hyper-visibility" (ridicule, staring, avoidance). Inaccurate perceptions included assumptions about destinations (doctors office, not work or school), perceptions of 'contagion (resulting in avoidance),' and being referred to and treated as "not normal."
CONCLUSIONS
Intersecting factors position women with neurological disabilities as either overlooked or excluded from the category of "regular people trying to get somewhere" placing them in unique positions of vulnerability with negative health impacts. They face heightened risks of falling due to driver inattention (ie, accelerating before able to find a seat), inappropriate touching and assault by drivers, and physical danger when refused transit (consequently travelling long distances on foot/by wheelchair after dark). Repeated experiences of othering and exclusion limit women's willingness to use shared transport, limiting their work, education and social opportunities, and leading to damaging self-stigma.

Monitoring Sustainable Health Development at the Municipal Level in Brazil: Evidence from the MSDHI

Carolina Veronesi Marinho[1], Leticia Lemos Jardim[1], Luísa da Matta Machado Fernandes[2], Matías Mrejen[1], Rõmulo Paes De Sousa[1]
[1]René Rachou Institute, Fundação Oswaldo Cruz (Fiocruz), Belo Horizonte, Brazil, [2]Ministry of Health, Brasília, Brazil

INTRODUCTION
The 2030 Agenda for Sustainable Development provides a comprehensive framework to address global challenges through their interrelated Sustainable Development Goals (SDGs). Progress toward these goals depends on policies that are sensitive to local contexts, as territories differ widely in their social, demographic, and health system characteristics. The Municipal Sustainable Development Health Index (MSDHI) was therefore developed to monitor health-related targets of the 2030 Agenda at the municipal level in Brazil.
METHODS
The MSDHI methodology followed a systematic eight-step procedure and combined multiple health-related indicators grouped into thematic subindexes: Reproductive and maternal health, Newborn and child health, (3) Infectious diseases, non-communicable diseases, Injuries and violence, (6) Environmental risks, and (7) Universal health coverage and health systems. We estimated the MSDHI for all 5,570 Brazilian municipalities, using publicly administrative data from 2018 to 2022. We conducted a set of descriptive, comparative, and dispersion analyses to examine the distribution and relative performance of the MSDHI and its subindexes across municipalities. The results were further analyzed by grouping municipalities with similar levels of population size, vulnerability, as well as through within-state comparisons.
RESULTS
The analysis reveals pronounced inequalities in MSDHI scores across Brazilian municipalities, even after stratifying by population size and vulnerability. Even among municipalities classified as having satisfactory relative performance, the subindexes reveal specific thematic areas that remain below desired levels, requiring targeted policy attention. Regarding federal states, we found substantial within-state heterogeneity in municipal MSDHI. The coefficient of variation averages 48.6%, ranging from 18.9% to 129.6%, indicating that even within the same state, municipalities may differ in their levels of sustainable health development.
CONCLUSIONS
The results highlight that monitoring inequalities trough MSDHI may help translating empirical evidence into equity-oriented policies.

Socio demographic determinants of energy drink consumption among tertiary students in Botswana

Ellen Tsholofelo[1], Oswell Khondowe[1], Kefentse Mosarwane[1], Thabang Thuto Gidion[1], Tshiamo Mosimanegape[1], Mpho Miriam Marunkwane[1], Monnye Kgamme[1], Wame Itireng[1], Sebeletsang Mosarwa[1], Kago Anthony Ditshego[1], Atlarelang Prince Kgosi[1], Tshenolo Mokgole[1], Sarah Tshepho Pona Matenge[1], Nankie Ramabu[1]
[1]Health Promotion & Education, Boitekanelo College, Gaborone, Botswana

BACKGROUND
Over the last twenty years, the global energy drink market has grown significantly, with college students becoming a key demographic. Despite their widespread use, energy drinks are associated to negative health outcomes. This study aimed to examine the sociodemographic factors influencing energy drink consumption among Boitekanelo College students.
METHODS
A cross-sectional analytical design was used to investigate energy consumption among students. An adapted self-administered structured questionnaire was used to collect data from 353 learners who were selected through stratified random sampling. Descriptive statistics were used to describe participants' characteristics and consumption patterns while Pearson's Chi-square was used to test associations between learners' and their demographic characteristics.
RESULTS
The prevalence of energy drink consumption was 59%. Although most students had moderate knowledge (54%) or good knowledge (44%) of health effects, this knowledge did not deter use. Most students (65.9%) reported consuming energy drinks 2-3 times weekly, while 14.9% reported daily intake. The primary reasons for use were staying alert (52.4%), boosting energy for physical activities (22.1%), and improving performance (18.7%). Taste (42%) and affordability (22%) were key factors influencing product choice. Consumption typically occurred anytime during the day (36%) or before/during study sessions (35%). Males reported slightly higher use (64%) than females (58%), although not statistically significant ($p = 0.142$). Higher consumption was also observed among students aged 23–27 years (64%), third-year students (66%), and degree learners (61%), but these differences were not significant ($p= 0.156$, $p= 0.156$ and $p = 0.180$ respectively).
CONCLUSIONS
Energy drink use is highly prevalent among Boitekanelo College students, despite their moderate to good awareness of the associated health risks. There is a clear need for institutional policies and targeted health promotion interventions to address these consumption patterns and mitigate potential adverse health outcomes.

Judicialization of health care in specialized care in Espírito Santo, Brazil: equity or justice?

Fabrício Santos Neves[1,2], Bárbara Mendes Guimarães[1], Caroline Feitosa Dibai de Castro[3], Cristiano Luiz Ribeiro de Araújo[2], Heloisa de Carvalho Torres[1], Katrini Ribeiro Tiago[2], Maria Luiza Mageski Altafim Brandão[2], Rafael Vulpi Caliari[1], Scheila Defante Peres[1], Maria Angélica Carvalho Andrade[1]
[1]Postgraduate Program in Public Health, Federal University of Espírito Santo (UFES), Vitória, Brazil, [2]Innovation and Right to Health Laboratory, Capixaba Institute of Education, Research and Innovation (ICEPi), Vitória, Brazil, [3]Higher School of Sciences of the Santa Casa de Misericórdia of Vitória (EMESCAM), Vitória, Brazil

INTRODUCTION
The judicialization of public health in Brazil is a multifactorial phenomenon in which users of the Unified Health System (SUS - Brazil's public healthcare system) resort to the judiciary to secure their constitutional rights. In Espírito Santo, this phenomenon is particularly evident in Specialized Outpatient Care (SOC), represented by demands for consultations and exams. The study analyzes

how judicial provisions reflect bottlenecks in health management, revealing management priorities and impacting resource allocation and planning.
METHODS
Descriptive, analytical, and longitudinal study with a mixed approach. Data were sourced from the Capixaba Observatory of the Right to Health and the Strategic Intelligence Center for State Management of the SUS, covering the three-year period from 2022 to 2024. Next, waiting times, access indicators, and costs of legal proceedings were compared with those of standard administrative flows.
RESULTS
The SOC accounts for the largest volume of litigation - 11846 cases in the three-year period (29.58% of the total), most of which (72.43%) focus on consultations - but its numerical relevance is low compared to the scale of the network: the litigated volume corresponds to less than 0.1% of total administrative production. The cost of judicial compliance exceeds the administrative cost by more than 340 times, revealing a cost discrepancy of 34.053% over the standard cost base. Serious difficulties were identified in accessing consultations with neuropediatricians and colonoscopy exams, procedures that have an average waiting time of 832 days.
CONCLUSIONS
Litigation in Espírito Santo embodies a a paradox of "microjustice," where individual guarantees can compromise "macrojustice" and collective planning. However, judicial demands serve as vital indicators for identifying structural bottlenecks in the network. Strengthening secondary care and implementing innovative mediation tools, such as the Center for Preventive Health Negotiation, are essential to promoting equity and reducing litigation.
Popul. Med. 2026;8(Supplement 1):A1308

ABS3138
Do individual or area-level measurements of social determinants of health perform better at predicting chronic pain?
Mubarak Abdullateef[1], Emma Parry[1], Dahai Yu[1], Ross Wilkie[1]
[1]School of Medicine, Keele University, Staffordshire, United Kingdom
ABSTRACT
Social risk factors are strongly linked to poor health, 1,2. Their measurement is crucial for efficiently guiding services and resources that improve patient and population health. The absence of individual social risk measures in electronic health records (EHRs) has led to the routine use of area-based measures as proxies for individual measures. However, this may misclassify individual social circumstances, 3,4. This study aims to assess the agreement between area- and individual-level social risk measures and to compare their predictive performance of chronic pain (CP) and high-impact chronic pain (HICP). Using the MIDAS population survey of adults aged 35 and over in North Staffordshire, England, we compared several area-based measures (IMDs) and individual indicators (income adequacy, education, food poverty, food bank usage, housing instability, poor housing quality, utility need, transport poverty, emotional support, loneliness, community participation and a derived composite SDoH index). Their agreement was assessed using Gwet inter-rater agreement. Multilevel models of area- and individual-level SDoH measures were compared. Model performance was assessed using AUC for discrimination and the Brier Skill Score for overall predictive accuracy. Of a sample of 2519 respondents, the prevalence of CP and HICP was 41.2% and 22.6%, respectively. The agreement between the IMD measures and individual measures was generally low. Individual composite SDoH index has better discriminative ability of CP than IMDs. Income adequacy and the composite SDoH index improved discrimination for HICP compared with the IMD measures. Overall predictive performance based on the Barier Skill Score, individual composite SDoH index, income adequacy, education, loneliness, transport poverty, and food poverty improved CP and HICP prediction compared with IMD measures. This study suggests a cautious use of area measures as proxies in the absence of individual-level measures. The study emphasises the need for individual measures in EHRs to improve disparity research and patient risk stratification.

Improving caregiver coping to support family members engaged in addiction and HIV treatment
Joseph Daniels[1], Li Li[2], Keenan Pituch[1], Kabelo Maleke[3], Wasipha Mthethwa[3], Fezile Buthelezi[3], William Ramasobana[3], James McIntyre[3], Sibuse Ginindza[3], Nathi Zuma[3], Albert Manyuchi[3]
[1]Arizona State University, Phoenix, United States, [2]UCLA, Los Angeles, United States, [3]Anova Health Institute, Johannesburg, South Africa
BACKGROUND
Injection drug use is expanding globally, compromising HIV prevention and treatment strategies. In South Africa, only 36% of those who inject drugs are virally suppressed, with 38% continuing on opioid substitution therapy (OST).1 Caregiver approaches to support people who inject drugs in treatment outcomes are limited, with more intervention development needed.2-4
METHODS
A pilot randomized controlled trial of a coping and communication intervention to improve HIV treatment and OST continuation was delivered, with 46 caregivers (family members) participating in the intervention arm. Family members (27-66 years, 78% were female) received four skill-building sessions in group and dyadic formats, with measures for coping, support, caregiver burden and intervention feasibility collected at Months 0 and 3. Thematic analyses was conducted on interview data, and linear mixed models was used to evaluate survey and behavioral measures.
RESULTS
Family member retention was 95% completing all sessions and study visits, with similar ratings for intervention feasibility, acceptability, willingness and safety. Many family members described value in learning with others about stress management and demonstrated improved understanding of addiction and treatment. Notably, they reported applying new skills in their support activities, reflecting resiliency behaviors. Family member coping significantly increased from baseline to Month 3 (MTime1 = 2.13, MTime2 = 2.34, p =.03, d =.36), social support improved (MTime1 = 5.04, MTime2 = 5.26, p =.29, d =.19), and caregiver burden decreased (MTime1 = 1.69, MTime2 = 1.48, p =.13, d = -.31).
CONCLUSIONS
Family member caregivers of those who inject drugs require coping and communication skills to facilitate their role in treatment engagement. The intervention demonstrates potential to harness family members to improve HIV and OST outcomes in settings where drug use is expanding and family is a key social determinant of health, with implications for clinical guidelines.

ABS3226
Temporal trends in mortality and regional inequalities of socially determined diseases in brazil, 2014–2023
Luanne Karolyne Leal dos Santos[1], Arthur Fiorati Faria[1], Yan Mathias Alves[1], Reginaldo Bazon Vaz Tavares[1], Titilade Kehinde Ayandeyi Teibo[1], Ariela Fehr Tartaro[1], Maria Eduarda Pagano Pelodan[1], Valter Caripa[1], Willie Otávio Bueno Bernardi[1], Nathalia Zini[1], Fatima Morales[2], Ricardo Alexandre Arcêncio[1]
[1]Maternal-Infant and Public Health Nursing Department, University of São Paulo College of Nursing at Ribeirão Preto, Ribeirão Preto, Brazil, [2]Department of Preventive Medicine and Public Health, University of Seville, Seville, Spain
INTRODUCTION
Socially determined diseases (SDDs) contribute substantially to mortality among socially vulnerable populations, reflecting structural inequalities. This study analyzed mortality trends from SDDs and differences across brazilian macroregions.
METHODS
An ecological study was conducted using Brazilian macroregions as the unit of analysis from 2014 to 2023. Secondary data on deaths due to tuberculosis, leprosy, viral hepatitis, schistosomiasis, Chagas disease, and malaria were obtained from the Mortality Information System (SIM). Annual mortality rates per 100000 inhabitants were calculated based on population estimates from the Brazilian Institute of Geography and Statistics (IBGE). Temporal trends were assessed using Prais-Winsten regression, estimating the Annual Percent Change (APC) and 95% confidence intervals (95%CI), using R (version 4.5.1).
RESULTS
Between 2014 and 2023, 120423 deaths from SDDs were recorded. Tuberculosis accounted for the highest number of deaths (n=48796; 40.5%), followed by Chagas disease (n=42719; 35.5%) and viral hepatitis (n=22319; 18.5%), together representing 94.5% of all deaths. Mortality was higher among men (n=77090; 64%) and individuals of mixed race ("pardo") (n=54787; 45.5%). The Central-West region showed the highest mean mortality rate (8.82 per 100000 inhabitants), whereas the South had the lowest (4.07 per 100000). Over the study period, mortality rates decreased in the South (APC -2.25%; 95%CI -2.97 to -1.53), Central-West (APC -2.01%; 95%CI -3.08 to -0.93), and Southeast (APC -1.66%; 95%CI -2.54 to -0.77). In contrast, rates remained stationary in the Northeast (APC -0.36%; 95%CI -1.41 to 0.69) and North (APC +1.02%; 95%CI -0.13 to 2.17).
CONCLUSIONS
Mortality from SDDs declined in most Brazilian macroregions, remained stable in the Northeast and North, and exhibited marked territorial heterogeneity, with a higher burden in the Central-West. These findings highlight the need for integrated interventions to reduce inequalities and strengthen health actions in the most

vulnerable territories.

Human development, inequality, and burden of socially determined diseases in brazil, 2014–2023

Luanne Karolyne Leal dos Santos[1], Arthur Fiorati Faria[1], Reginaldo Bazon Vaz Tavares[1], Yan Mathias Alves[1], Titilade Kehinde Ayandeyi Teibo[1], Valter Caripa[1], Ariela Fehr Tartaro[1], Maria Eduarda Pagano Pelodan[1], Nathalia Zini[1], Fátima Morales[2], Ricardo Alexandre Arcêncio[1]
[1]Maternal-Infant and Public Health Nursing Department, University of São Paulo College of Nursing at Ribeirão Preto, Ribeirão Preto, Brazil, [2]Department of Preventive Medicine and Public Health, University of Seville, Seville, Spain

INTRODUCTION
Socially Determined Diseases (SDDs) disproportionately affect socially vulnerable populations, highlighting social inequalities across settings. This study assessed the incidence of six SDDs and their association with human development and inequality in Brazil.
METHODS
Ecological study using brazilian states as the unit of analysis from 2014 to 2023. Annual incidence per 100000 inhabitants was estimated for tuberculosis, leprosy, malaria, viral hepatitis, schistosomiasis, and Chagas disease using data from the Notifiable Diseases Information System (Sinan). Two multiple linear regression models were fitted: model A (Gini index and Municipal Human Development Index [IDHM]) and model B (replacing overall IDHM with its income, education, and longevity subindices). Results were expressed as regression coefficients (β) and 95% confidence intervals (95% CI), with statistical significance at p<0.05. Analyses were performed in R (version 4.5.1).
RESULTS
Overall SDD incidence was negatively associated with IDHM (β=-7.85; 95% CI -11.41 to -4.30; p<0.001), indicating lower incidence in more developed contexts. Malaria showed negative associations with human development and longevity (β=-22.40; 95% CI -30.75 to -14.04; p<0.001; β=-25.14; 95% CI -36.88 to -13.41; p<0.001). Leprosy was also negatively associated with human development, longevity, and income (β=-11.91; 95% CI -14.19 to -9.63; p<0.001; β=-11.59; 95% CI -14.45 to -8.73; p<0.001; β=-6.72; 95% CI -9.78 to -3.67; p<0.001). Tuberculosis was positively associated with inequality (β=2.46; 95% CI 1.02 to 3.89; p<0.001). Viral hepatitis was less frequent in more unequal contexts (β=-3.46; 95% CI -5.64 to -1.28; p=0.002) and more frequent in states with higher human development (β=5.75; 95% CI 3.77 to 7.74; p<0.001).
CONCLUSIONS
Human development and inequality were associated with distinct incidence patterns across SDDs. Higher development and longevity were associated with lower malaria and leprosy incidence, whereas tuberculosis increased in more unequal contexts. These findings support territorially targeted policies to reduce vulnerabilities, address inequality, and strengthen public health surveillance.

ABS3278
From Algorithms to Access: Using AI to Advance SDG 3 and Health Equity

Padmini Murthy[1,2], Vina HuLamm[1]
[1]American Public Health Association, Washington/DC, United States, [2]SAGAN, LLC Consulting, New York, NY, United States

ABSTRACT
This is a proposal for an organized panel discussion to explore how rapidly advancing artificial intelligence (AI) can be harnessed to improve health and wellbeing within the framework of UN Sustainable Development Goal 3: Ensuring healthy lives and promoting wellbeing for all at all ages. Speakers will examine how AI tools, when thoughtfully designed and implemented, can strengthen public health systems, expand access to care, and advance health equity. The session will highlight real-world examples of AI-powered predictive analytics for disease surveillance and outbreak forecasting, as well as tools that support strategic resource allocation for public health interventions to improve efficiency and cost-effectiveness. In addition, case examples will showcase AI-driven telemedicine and virtual care models that extend services to remote and underserved communities, helping to reduce geographic, financial, and workforce barriers to high-quality care while supporting equity as a core public health value. At the same time, the session will critically examine key challenges to integrating AI into health and public health systems (ie data privacy and security concerns, algorithmic bias, lack of transparency etc.), and the practical difficulties of implementation in settings with limited infrastructure, training, and technical capacity. These challenges can exacerbate existing inequities if not proactively addressed. Speakers will offer concrete recommendations for policy, practice, and governance to ensure that AI initiatives are equitable, inclusive, and aligned with community needs and rights. Participants will identify the opportunities and risks of AI in health, along with actionable ideas for leveraging AI to advance SDG 3 and the 2030 pledge to "leave no one behind." Invited speakers are in the process of being identified and are pending final confirmation for inclusion in this session proposal.

ABS3310
The food environment at a South African university campus- an exploratory case study

Michelle Brear[1], Bontle Mamabolo[1], Susan Goldstein[1]
[1]SAMRC/Wits Centre for Health Economics and Decision Science – PRICELESS SA, University of the Witwatersrand, School of Public Health, Parktown, Johannesburg, South Africa

BACKGROUND
Food environments are the physical and social spaces that structure individual food practices which influence the risk of obesity and nutrition-related non-communicable diseases (NCDs). Creating healthy food environments is one way that universities can achieve their public good mandate and contribute to achieving sustainable development goals (e.g. Zero Hunger, Health) and targets (e.g. end all forms of malnutrition).
METHODS
We conducted a mixed method study, aimed at characterising the food environment of a South African university campus. Student co-researchers participated throughout the process. We collected data using key informant interviews with university management staff and food retailers, focus group discussions with students, ethnographic observations of food environments and a survey of food store inventories. Data were analysed using descriptive statistical and thematic approaches, informed by a framework which conceptualises food environments around six elements- availability, affordability, convenience, quality, promotion and sustainability.
RESULTS
Unhealthy foods and drinks, especially fried potatoes and sugary drinks, were more prominently available and promoted, compared to healthier alternatives. Healthy foods were perceived to be less tasty and satiating (both aspects of perceived "quality") and less convenient and more expensive to access than unhealthy foods. University management relied on general policies (e.g. sustainability or student success frameworks) to guide their work, in the absence of national or institutional policies focused on institutional food environments. They invoked student preferences for unhealthy options, and economic constraints, to justify the availability and promotion of unhealthy foods on campus.
CONCLUSIONS
The university campus food environment was characterised by widespread availability, affordability, convenience and promotion of unhealthy foods associated with obesity and nutrition related NCDs. An institutional policy, which sets standards to guide and govern a campus food environment that is more conducive to health, would contribute to the university's achievement of SDGs and its public good mandate.

ABS3338
Operationalising equity: A study of the challenges in aligning policy principles with performance metrics in Brazilian primary care

Felipe Szabzon[1], Zoheb Khan[1], Vera Schattan P Coelho[1]
[1]Brazilian Center of Analysis and Planning, São Paulo, Brazil

BACKGROUND
The establishment of Brazil's universal, unified health system (SUS) in 1988 represents the culmination of successful social mobilisation around the right to health. Founded on principles of equity, universality, and comprehensiveness, the SUS has progressively expanded, with significant gains in access and reductions in population-level health disparities(1–3). Nonetheless, significant inequalities persist, particularly within cities(4,5). Concurrently, Brazil's public sector has undergone extensive reform inspired by New Public Management, emphasising efficiency and performance-based accountability. In primary care, reform included contracting out of public services to non-state providers. Management contracts shape provider behaviour, influence resource allocation, and mediate how policy objectives are translated into everyday practices.
METHODS
We examine how far equity—an overarching normative principle of the SUS

informing primary care policies —is operationalised in management contracts. We developed a conceptual framework of equity grounded in national policy and the global health equity literature(6–11) and applied it to the analysis of performance contracts between municipal governments and non-state primary care providers in São Paulo and Fortaleza, two cities with extensive yet distinct approaches to contracting and performance management. Indicators were systematically examined to assess the degree to which they explicitly or implicitly incorporate equity considerations in the organisation and delivery of primary care.
RESULTS
In both cities, service volumes dominate performance indicator systems. While such measures are important for assessing inequalities in service access, other dimensions of equity—particularly sociocultural aspects of care, mechanisms for social participation, and welcoming reception and care—are largely neglected.
CONCLUSIONS
A technical approach to evaluation, where accountability inheres in compliance with centrally defined and easily quantifiable targets(12), risks reproducing inequalities by under-appreciating localised determinants of health and citizen priorities. We call for further research examining how foundational health system principles can be effectively operationalised in service delivery models.

ABS3339

Implications of USAID funding withdrawal on the progress of the SDG's among women and girls in Eswatini

Pinky Shabangu[1], Zinhle Matsebula[1], Michelle Brear[1]
[1]Independent, Manzini, Swaziland

INTRODUCTION
In Eswatini, USAID-funded health and development programmes played a crucial role in achieving Sustainable Development Goals (SDGs) that addressed poverty, hunger, inequalities, education and health, 2008-2025. Many of these programmes supported marginalised women and girls The aim of the study is to examine the implications of USAID funding cuts towards the SDGs among women who were recipients of a USAID project
METHODS
We conducted participatory ethnographic research with eight female participants aged 21-66 years from an Eswatini township. Data were collected using participant observation and interviews, and analysed thematically, using the SDGs as a guiding framework.
RESULTS
Because many USAID funded programs provided health services, and livelihood, education or economic support, their closure directly detracted from achieving SDG3 (health), SDG1 (Zero poverty) and SGD2 (No hunger) and SDG4 (Universalising quality education). Participants reported emotional stress associated with the funding cuts which led them to opt for unsustainable coping strategies that affected their social relations (e.g. reducing contact with family members). Because many USAID-funded programs targeted marginalised women and girls, they were particularly affected by the closure, setting back achievement of SDG5 (Gender equality) and SDG10 (Reduced inequalities). The sudden, unexpected closure of programs weakened partnerships (SDG17) between communities, states and funding institutions which are essential to sustain and further progress towards achieving SGDs.
CONCLUSIONS
The sudden closure of USAID detracted from achieving the SDGs in urban Eswatini, and likely other similar settings. Funding cuts have had direct and multiple effects on marginalised women and girls in Eswatini by reducing access to the essential services that are meant to bring progress towards numerous SDGs. The findings highlight the need for sustainable and gender-responsive funding approaches that protect essential community-based services and partnerships, and progress towards the SDGs.

ABS3345

A practical guide to citizen-centred evaluation for more equitable and responsive health systems

Zoheb Khan[1], Debora Bernardo[1], Frederico Haddad[1], Vera Schattan P Coelho[1]
[1]Brazilian Center of Analysis and Planning, São Paulo, Brazil

BACKGROUND
Brazil's constitutionally-recognised health councils give citizens formal powers in the governance of primary care in the Unified Health System (SUS). However, their actual influence in the design of policy and service models is limited(1,2). This is partly because evaluation of system performance follows a standardised, managerial approach that focuses on service volumes, excluding citizen perspectives and rendering localised determinants of health and experiences of vulnerable groups invisible. This reduces the system's potential to tackle inequality. This panel discussion offers a guide to a co-creation methodology, implemented in the municipalities of São Paulo and Fortaleza, to overcome this through a more democratic evaluative approach that empowers citizens to produce, interpret and act on knowledge about the performance of public policies(3–5).
METHODS
Participants will be taken through the design and results of our three-stage process: diagnosing the disconnect between participatory forums and technical accountability frameworks like state-provider contracts and municipal health plans; developing a theory of change; and (3) using nominal group and focus group techniques to identify neglected dimensions like respectful treatment by staff, health system navigability, coordinated care, and barriers to access like scheduling systems and neighbourhood violence; and then using workshops to co-produce indicators to measure them. We will also discuss strategies for validating and integrating community-generated evidence into official performance evaluation systems.
RESULTS
This session is designed for researchers, practitioners, and policymakers seeking actionable methods to transform participatory governance from a merely consultative exercise into a driver of equitable health system change.
CONCLUSIONS
Our work ensures that evaluations become more inclusive while also measuring whether services are truly reducing disparities and advancing social justice. This could provide a replicable strategy for strengthening health system governance in other contexts.

Equity Beyond Access Community Participation and Power in Health Committees in Cape Town

Natasha Ruya[1], Hanne Haricharan[1]
[1]Public Health Medicine, University of Cape Town, Capetown, South Africa

INTRODUCTION
Equitable health systems require not only access to services but also equitable participation in decision-making1,2. In South Africa, health committees were established within the public primary healthcare system to facilitate community participation, accountability, and responsiveness at facility level3. However, their roles, authority, and influence remain unevenly defined and implemented2,4. Understanding how existing participatory structures function is critical for advancing equity in health governance5. This study examined current practices of community participation in two sub-districts of the Cape Metro: Klipfontein and Khayelitsha.
METHODS
A convergent parallel mixed-methods design was employed between March and September 20246. Data were collected from 132 questionnaires and 13 focus group discussions across 19 committees representing 19 clinics. Quantitative data were analysed using descriptive statistics, while qualitative data were analysed thematically using NVivo 14. The study explored motivations for participation, operational roles, enablers and barriers, capacity limitations, power dynamics, and understanding of the National Health Insurance.
RESULTS
Committee members were primarily motivated by civic commitment, social recognition, and access to health information. Committees functioned mainly in supportive operational roles, with limited involvement in governance or strategic decision-making. Enablers included training, collaborative relationships with facility staff, incentives, and recognition. Barriers included inter-committee conflicts, lack of institutional recognition, limited logistical support, unequal power relations, and low awareness of the National Health Insurance. Participation was largely procedural rather than strategic, revealing persistent inequities in voice, power, and legitimacy within public health governance.
CONCLUSIONS
Despite the existence of formal participatory structures, health committees operate with limited decision-making authority, constraining their contribution to equity and accountability. Strengthening participation requires clearer role definition, sustained capacity building, institutional recognition, supportive policy frameworks, and adequate operational resources. These reforms are essential to position health committees as legitimate governance actors capable of engaging meaningfully with forthcoming health system reforms.

Demystifying Snakebite Envenoming in Uganda: A Cost-Effectiveness Analysis of Life-Saving Prevention Strategies

Yasiini Nuwamanya[1], Benigna Namara[1], Shem Mwebaza[1], Paul Okello[1], Andrew Ancharski[2], Chandra Dhakal[2]
[1]Uganda Public Health Fellowship Program, Uganda National Institute of Public Health, Kampala, Uganda, [2]CDC Foundation, Atlanta, United States

BACKGROUND
Snakebite envenoming (SBE) is a neglected public health crisis in Uganda, with an annual incidence of 101 bites per 100,000. Between 2020 and 2023, the country recorded 1,923 envenoming cases and 516 deaths, resulting in a staggering case-fatality rate (CFR) of 27%—six times the global average. High mortality is driven by delayed treatment-seeking and knowledge gaps among the community and community health workers (CHWs).
OBJECTIVES
This study aimed to identify the most cost-effective policy interventions to reduce SBE-related mortality, providing an evidence-based roadmap for national injury prevention and safety policy.
METHODS
The team developed a decision-analytic model using a national population cohort of 46,246,800 from the Uganda Bureau of Statistics. Using a Ministry of Health perspective over a two-year horizon, three strategic options were micro-costed: Status quo (antivenom restricted to general hospitals); Expansion of antivenom stocking to Health Center IVs combined with CHWs training; and (3) Status quo combined with SBE community awareness campaigns. Outcomes were measured by snake bite-related deaths averted and Incremental Cost-Effectiveness Ratios (ICER). Sensitivity analyses were conducted by varying input parameters.
RESULTS
Community awareness emerged as the most impactful strategy, averting 835 deaths over two years—a significant public health gain compared to other options. With an ICER of $3,003 USD per death averted, this strategy is highly cost-effective, falling well below Uganda's willingness-to-pay threshold (three times Uganda's per-capita GDP [$1,142 USD in 2024]). Conversely, expanding stock to lower-level facilities was the most expensive and least effective, averting 76 deaths.
CONCLUSIONS
Availability of antivenom does not guarantee survival if community-level barriers to care persist. Integrating community-led awareness with existing stocking policies is the most feasible and cost-effective strategy to save lives. These findings provide a scalable model for other sub-Saharan African nations to reduce the burden of neglected injuries through targeted public safety education.

Sexual Risk Behaviors among Adolescents and Young Adults in the Context of Food Insecurity: A Population-Based Cross-Sectional Analysis

Otobo Ujah[1], Rukayya Karaye[2], Olamide Asifat[3], Fidelis Nwachukwu[4], Kenneth Onyedibe[5]
[1]Department of Obstetrics and Gynaecology, Federal University of Health Sciences, Otukpo, Nigeria, [2]College of Public Health, University of South Florida, Tampa, United States, [3]Jiann-Ping Hsu College of Public Health, Georgia Southern University, Statesboro, United States, [4]Department of Biomedical Sciences, Mercer University School of Medicine, Columbus, United States, [5]Department of Biomedical Sciences, Mercer University School of Medicine, Macon, United States

INTRODUCTION
Evidence suggests that food insecurity (FI) is associated with adverse health behaviors, including sexual risk behaviors (SRBs), in adults and high-risk populations. This study examined the associations between past-year FI and SRBs among a nationally representative sample of adolescents and young adults (AYAs) in Nigeria and explored whether these relationships differ by gender.
METHODS
This cross-sectional study used data from a nationally representative sample of AYAs (15-24 years) living in Nigeria who reported sexual activity in the past 12 months who participated in Round 6 of the UNICEF-supported Multiple Indicator Cluster Survey (MICS). Weighted multivariable binomial and multinomial logistic regression analyses were conducted with FI as the exposure variable and SRBs as the outcome variable, adjusting for multiple confounders. All models were stratified by gender.
RESULTS
Of the 8618 AYAs in the sample, approximately 75% had experienced moderate or severe FI. Approximately 8.3% had multiple sexual partners while 71.1% of participants did not use a condom at their last sexual intercourse. After adjusting for multiple potential confounders, AYAs who experienced moderate FI were more likely to report engaging in multiple sexual partnerships in the past 12 months (AOR = 1.55, 95% CI = 1.09-2.21, p = 0.0151) and report engaging in both unprotected sex and having MSPs (AOR = 1.61, 95% CI = 1.04-2.49, p = 0.0347). In gender-stratified models, these patterns remained consistent for AYAs males but were absent among AYA females.
CONCLUSIONS
Food insecurity is associated with SRBs among AYAs in Nigeria. Strategies are needed to integrate FI interventions into sexual and reproductive health programming and policies for young people in order to reduce SRBs and their sequelae. Such strategies may also benefit from a gender-centered approach given the disparities in the risk of engaging in SRB with FI.

Bridging Gender Gaps in Health Equity: Insights from Women's Empowerment and Decision-Making Patterns in Nigeria Using the 2024 NDHS Data

Patrick Shaibu[1], Chidinma Okoro Obiageri[1], Kalu Nwankwo Obasi[1], Daniel Achoda[1], Vera Usigbe[1]
[1]Public Health, College of Nursing Sciences Gombe, Gombe State-Nigeria, Gombe, Nigeria

INTRODUCTION
gender equity is fundamental to achieving equitable and sustainable public health outcomes. Despite improvements in women's education and economic participation in nigeria, substantial disparities persist in autonomy and decision-making that influence health equity and inclusion.– this study examines patterns and determinants of women's empowerment in nigeria using nationally representative data from the 2024 nigeria demographic and health survey (NDHS).
METHODS
a secondary analysis of the 2024 NDHS women's dataset was conducted. Key indicators of women's empowerment included employment status, control over personal earnings, ownership of assets, participation in household decision-making, and attitudes toward wife beating, consistent with established empowerment frameworks. Weighted descriptive statistics and cross-tabulation analyses were used to assess disparities by region, urban–rural residence, educational attainment, and household wealth quintile.,
RESULTS
approximately two-thirds of married women reported working in the past year; however, only 36% participated in all major household decisions. Ownership of mobile phones (62%) and bank accounts (43%) was higher among urban, educated, and wealthier women. Marked regional disparities were observed, with only 7% of women in the north-west reporting informed sexual decision-making compared with 73% in the south-south. Acceptance of wife beating remained prevalent at 22%, reflecting persistent gender norms that constrain equity and inclusion across nigeria's socio-economic and geographic contexts.,
CONCLUSIONS
women's empowerment in nigeria remains uneven and is strongly shaped by education, wealth, and geographic location., expanding access to education, strengthening financial inclusion, and implementing gender-transformative interventions are critical to closing gender gaps and advancing health equity and sustainable public health outcomes in nigeria.

ABS3466

Tuberculosis in children and adolescents in bahia: analysis of case trends in the health macroregions of the state of bahia (brazil) between 2010 and 2024

Maria Eduarda Maia Vilar[1], Florisneide Rodrigues Barreto[1], Ana Carolina Souza Torres[1], Maria da Glória Lima Cruz Teixeira[1], Edson de Andrade Nhamuave[1]
[1]Institute of Collective Health, Federal University of Bahia, Bahia, Brazil

INTRODUCTION
Tuberculosis remains a major global health challenge, disproportionately affecting vulnerable populations. Among children and adolescents under 19, TB reflects inequalities in prevention, diagnosis, and care. In Brazil, Bahia's sociodemographic diversity and regional disparities provide a relevant setting to examine these inequities. This study aims to describe TB occurrence in individuals under 19 across Bahia's health macro-regions from 2010 to 2024.
RESULTS
Between 2010 and 2024, 5,568 new TB cases were reported in individuals under 19 in Bahia. Despite being the most economically developed region, the Eastern Macro-region concentrated 52% of cases (incidence of 15.9 per 100,000 inhabitants), followed by the Southern Macro-region. This pattern suggests that

aggregate development does not guarantee equity and may mask pockets of vulnerability and intra-municipal inequality. In contrast, the Western and North-Central macro-regions maintained significantly lower notification trends. The clinical and demographic profile showed a predominance of pulmonary TB (84%), male sex (54%), and the 15-19 age group (67% of cases), highlighting the transition from childhood to adolescent TB. Self-declared brown race/color was predominant (60%), but the high proportion of ignored or unfilled records (about 10%) limits a more precise analysis of structural racism's impact, indicating a failure in including essential data for equitable policies.
CONCLUSIONS
The results demonstrate that TB in children and adolescents in Bahia, as in Brazil, is a persistent public health challenge requiring an intersectional lens. The analysis suggests a profile marked by disparities reflecting territorial and social inequities, potentially masking vulnerability pockets. The concentration of cases in the most developed region unveils the "internal frontiers" of inequality, where aggregate wealth does not necessarily translate into universal health protection. This demands policies that identify and include vulnerable groups within these territories, ensuring equitable and sustainable health strategies.

ABS3478
The determinants and distribution of rural–urban migration among oral health professionals in South Africa
Bulela Vava[1], Yolanda Malele-Kolisa[1], Mpho Molete[2]
[1]Department of Community Dentistry, Wits Oral Health Centre/Wits University, Johannesburg, South Africa, [2]Research Department - School of Oral Health Sciences, Wits University, Johannesburg, South Africa
BACKGROUND
Oral diseases are highly prevalent, yet South Africa faces persistent rural–urban maldistribution of oral health professionals. Evidence on migration beyond a broader oral health workforce remains limited. This study therefore assessed rural–urban migration among oral health professionals by examining their demographic and professional profiles, geographic distribution, and workplace factors associated with migration, to inform more equitable oral health workforce planning and service delivery.
METHODS
A quantitative cross-sectional survey was conducted among South African oral health professionals registered in 2024/25. An online questionnaire captured demographics, migration patterns, and drivers. Data from 223 respondents were analysed using descriptive statistics, chi-square tests, and multivariate logistic regression to identify factors associated with rural–urban migration.
RESULTS
Among 223 oral health professionals (response rate 14.5%), 27.2% reported rural–urban migration. Respondents were predominantly African (73.5%), female (71.8%), and early- to mid-career, with most working in rural areas (73.1%). Migration was concentrated towards Gauteng (70%). Key reasons included employment opportunities and career growth (80% each). Multivariable analysis showed migration was significantly associated with professional category, first job post-training, area type (rural vs urban), and province size, while demographic factors were not significant.
CONCLUSIONS
This study shows that rural–urban migration among South African oral health professionals is driven mainly by workplace context, career stage, professional category, and provincial conditions rather than individual demographics. Migration was concentrated towards Gauteng, with notable variation across oral health worker categories. These findings underscore the need for context-specific, profession-sensitive workforce policies that address structural and institutional drivers to support equitable oral health service distribution.

ABS3482
Masterclass - Realizing Universal Health Coverage: understanding the central role of legal frameworks
Stephanie Dagron[1]
[1]Institute of global health, Faculty of medicine, University of Geneva, Geneva, Switzerland
BACKGROUND
Achieving health for all by 2030 is a central ambition of the Sustainable Development Goals, with Universal Health Coverage (UHC) at its core (Dagron, 2022). UHC ensures that everyone can access essential health services without financial hardship, and its importance has grown as countries increasingly recognize its role in reducing poverty, promoting gender equality, supporting education, strengthening climate resilience, and building inclusive societies (United Nations General Assembly, 2019). This commitment has been reinforced over time through multiple political declarations, including recent global agreements such as the 2025 Pandemic Agreement. Yet, despite these strong political and legal multilateral commitments, progress remains uneven. Existing global monitoring frameworks have been indispensable in tracking service coverage and financial risk, but they remain largely outcome- and finance-oriented (World Bank, World Health Organization, 2025), offering limited insight into the institutional, legal, and governance arrangements that shape national UHC trajectories. This absence of legal and governance analysis represents a significant blind spot in health systems research, limiting the ability of governments to design evidence-based, structurally grounded reforms. It is necessary to improve the knowledge of public health authorities regarding the legal determinants of UHC. Strong legal frameworks translate policy into action, support effective health system functions, define the rules for equitable access to health services and provide the means for national governments to implement coverage for all.
METHODS
This Masterclass introduces the principles and legal foundations of UHC, examining how legal frameworks shape healthcare access. Participants will be able to learn about legal instruments influencing accessibility to essential services by following the presentation and actively discussing the reality of equitable access to healthcare in their own countries.
RESULTS
By the end of the Masterclass, participants will be equipped with practical tools to analyze national legal frameworks and propose reforms that advance sustainable, rights-based progress toward UHC.
Popul. Med. 2026;8(Supplement 1):A1338

Analysis of Healthcare Accessibility and Equity from the Perspective of Health Equality: A Case Study of a City
Hongyan Zhao[1]
[1]Jilin University, Changchun, China
ABSTRACT
Objective To understand the spatial distribution of medical resources in Hangzhou, to analyze the accessibility and equality of tertiary hospitals and primary health institutions in Hangzhou, to evaluate the rationality of health resource allocation and the fairness of residents' access to health services, and to provide suggestions for the rational allocation of medical resources in Hangzhou. Methods The spatial analysis methods such as two-step mobile search and spatial autocorrelation were used to construct an evaluation index system from three aspects: spatial distribution, accessibility and balance, and the fairness of spatial distribution of medical institutions in Hangzhou was analyzed on a street basis, and the spatial coordination degree and regional differences between basic medical resources and high-quality medical resources in Hangzhou were studied. Results The medical resources in Hangzhou are concentrated in the central urban area, the high-level medical resources are insufficient and the regional distribution is not coordinated, and the access to high-quality medical care in urban areas and southwest urban areas is large, indicating poor health equity. The coverage rate of primary medical institutions is high, but it still shows an obvious core-edge binary structure. Conclusion The problem of unbalanced spatial distribution of medical resources in Hangzhou needs to be gradually solved through systematic measures such as traffic optimization, grassroots capacity improvement and resource diffusion. In the future, we should adhere to the guidance of residents' health needs, promote the sinking of high-quality medical resources, build a more fair and efficient hierarchical diagnosis and treatment system, and finally achieve the strategic goal of "Healthy Hangzhou".

ABS3512
Understanding domestic care workers' health through the lens of labour exploitation as a social determinant of health: Evidence from Brazil, Colombia and UK
Sabah Boufkhed[1], Louisa Acciari[2,3]
[1]Humanitarian and Conflict Response Institute, University of Manchester, Manchester, United Kingdom, [2]Centre for Gender and Disasters, University College London (UCL), London, United Kingdom, [3]Universidade Federal de Santa Catarina, Florianopolis, Brazil
BACKGROUND
COVID-19 brought attention to the care sector, yet domestic workers providing direct (e.g. bathing) and indirect care (e.g. cleaning) in private homes remain overlooked1. Occupational health literature on this highly feminised and

racialised workforce is scarce. Domestic workers have long been exposed to poor employment and working conditions, labelled exploitative2. In public health, labour exploitation has been examined through two main lenses: Human Rights lens focused on modern slavery; or Social Determinants of Health (SDH) focused on structural issues3. Our study assessed labour conditions and health among domestic workers using Boufkhed et al.'s (2022)3 framework, conceptualising labour exploitation as an SDH, and integrating the two lenses.
METHODS
We conducted an exploratory mixed-methods study in Brazil, Colombia, and UK (2023–2025) using non-probabilistic sampling. Fifteen focus groups (FG) were conducted with 134 participants, guided by the framework dimensions (social protection and rights; finance and migration; health and safety; personal security/abuse) and health prompts. Findings4 informed the co-design of an online survey completed by 436 respondents.
RESULTS
Participants were predominantly women (>95%) and racialised (≥70%). FG highlighted poor social protection, and two-thirds of workers surveyed in Brazil and Colombia and three-quarters in UK had no contract. Low pay was a central discussion, and the survey showed 31% incurring debt for basic needs. Injuries and chemical exposures were key health and safety concerns, reported by 20% of surveyed workers. All FG denounced abuse, and 23% of surveyed workers reported verbal, physical, or sexual abuse in the previous month. Mental health concerns (e.g. anxiety, depression) dominated discussions, with common physical pain. However, survey respondents reported relatively good self-rated health, raising measurement concerns.
CONCLUSIONS
Domestic workers' exposure to severe workplace hazards and exploitation, including widespread violence, needs urgent attention from public health researchers and policymakers. Better health measures are needed to capture this populations' experiences.

Food insecurity as an invisible frontier of health: a dialectical analysis in the context of the 2030 Agenda

Ana Claudia Garcia[1,2], Maria Angélica Andrade[1], Andreia Carvalho[2], Rita de Cássia Lima[1], Heloisa Torres[1], Jeanine Barbosa[3], Rafael Caliari[1], Caroline Feitosa Castro[4], Fabíola Magalhães[1,3], Elda Bussinguer[2]
[1]Programa Pós-Graduação Saúde Coletiva, Universidade Federal do Espírito Santo, Vitória, Brazil, [2]Faculdade de Direito de Vitória, Vitória, Brazil, [3]Escola de Saúde Pública, Instituto Capixaba de Ensino, Pesquisa e Inovação em Saúde, Vitória, Brazil, [4]Curso de Medicina, Escola Superior de Ciências da Santa Casa de Misericórdia de Vitória, Vitória, Brazil

INTRODUCTION
Through the Sustainable Development Goals (SDGs), 2030 Agenda establishes a global commitment to eradicating hunger (SDG 2) and promoting health and well-being (SDG 3). However, the persistence and expansion of food insecurity reveal structural contradictions between international human rights frameworks and the social, economic, and environmental dynamics that organize contemporary food systems. This study proposes to analyze food insecurity as an invisible frontier of health, which crosses territories, populations, and public policies, challenging the principle of health without borders.
METHODS
This is a theoretical discussion based on the dialectical method, grounded in a critical analysis of international documents on nutrition, public health, and human rights. The dialectical approach allows us to identify contradictions, mediations, and syntheses between the formal recognition of the human right to adequate food and health and the material conditions that limit its realization, considering the local, national, and global scales.
RESULTS
It was evident that food insecurity does not stem from food shortages, but from structural processes such as socioeconomic inequality, austerity policies, job insecurity, and environmental crisis. These dynamics directly impact SDG 3 indicators, such as an increase in chronic diseases, nutritional disorders, and health vulnerability. Thus, there is a disconnect between the integrated goals of the 2030 Agenda and political practices that weaken social protection and the sustainability of food systems.
CONCLUSIONS
It is concluded that the development of comprehensive public policies is essential to guarantee the human right to adequate food and achieve the goals set out in SDGs 2 and 3 of the 2030 Agenda. Thinking about health without borders requires addressing the structural contradictions that produce hunger and disease, reaffirming the centrality of human rights, equity, and sustainability in the formulation of intersectoral and global public policies.

Household Socioeconomic Inequities as Determinants of Subclinical Rheumatic Heart Disease in a Rural District of Mozambique

Yolanda Sabino[1], Elias Bascoro[2], Basilio Cumbane[3], Charles Chale[4], Ivone Teimizira[5], Janeiro Mundiara[6], Manuel Valdano[7], Ana Mocumbi[8]
[1]Programa de Residencia de Medicina Familiar e Comunitaria, Clinica Universitaria da UEM, Maputo, Mozambique, [2]Centro de Analises de Politicas, Universidade Eduardo Mondlane, Maputo, Mozambique, [3]Co-Secretariat NCDI Poverty Network, Universidade Eduardo Mondlane, Maputo, Mozambique, [4]Consulta Integrada de Doencas Cronicas, Hospital Rural de Nhamatanda, Sofala, Mozambique, [5]Cardiologia, Hospital Provincial de Maputo, Matola, Mozambique, [6]Direccao Executiva, Consultório Expresso Medical, Lda, Maputo, Mozambique, [7]Serviço de Cirurgia Cardiovascular e Torácica, Complexo Hospitalar de Doenças Cardio-Pulmonares Cardeal Dom Alexandre do Nascimento., Maputo, Mozambique, [8]Doenças Não Transmissíveis, Instituto Nacional de Saude, Maputo, Mozambique

INTRODUCTION
Social determinants of health (SoDH) strongly shape the occurrence of Rheumatic heart disease (RHD), the most preventable of all cardiovascular diseases. In endemic areas for RHD schoolchildren face overlapping social and environmental vulnerabilities that may increase susceptibility. This study aimed to compare household socioeconomic profile of schoolchildren with and without subclinical RHD.
METHODS
We used school-based echocardiographic screening to recruit 79 children with subclinical RHD and 288 age-/classroom-matched controls (total 367 students; aged 6-17 years) in the rural district of Nhamatanda, Mozambique. Questionnaires to parents were used to document the socioeconomic/household characteristics. We used Multidimensional Poverty Index (MPI) to classify deprivation and measured the associations between RHD status and socioeconomic indicators through comparative distribution and correlation analyses.
RESULTS
Age and educational distribution were similar between groups; 25.3% of participants were enrolled in 6ª grade, and school grade was not associated with RHD (r=0.04, p=0.52). We found the following socioeconomic disparities: children with RHD more often lived in larger households (≥ 6 members: 21.6% vs 13.1%) and with lower asset ownership (television/electricity: 15.2% vs 30.8%; refrigerator: 6.1% vs 23.1%). Correlation analyses confirmed that household size (r=0.31, p<0.01) and lower household income (r=-0.28, p<0.01) were associated with RHD, but school grade (r=0.04, p=0.52). RHD children attended slightly more crowded classrooms (44 students) and were in classrooms with more constrained ventilation (65%), but these differences were not statistically significant. While classroom characteristics were not independently associated with RHD, they were clustered with household-level poverty (higher MPI).
CONCLUSIONS
Subclinical RHD was linked to household poverty rather than school-level factors, underscoring the role of social determinants in disease vulnerability. Addressing RHD in endemic settings requires integrated public health strategies that combine early detection with tailored and culturally appropriate interventions to reduce household deprivation, strengthen social protection, and promote equity.

ABS3567
Social Determination of Health, access to medicines, and pharmaceutical services in Primary Health Care: a Scoping Review

Samara Jamile Mendes[1], Beatriz Hashimoto Ito[1], Felipe Tadeu Carvalho Santos[1], Marilia Berlofa Visacri[1], Livia Maria Souza Gonçalves[2], Patrícia Bernardi Sassi[2], Silvana Nair Leite[2]
[1]School of Pharmaceutical Sciences (FCF) - University of São Paulo, São Paulo, Brazil, [2]Federal University of Santa Catarina, Florianópolis, Brazil

BACKGROUND
Grounded in the Social Determination of Health framework, which conceptualizes health–disease processes as shaped by historically constructed social inequalities, this work aim to map how these dimensions interact within the access to medicines and Pharmaceutical Services in Primary Health Care (PHC).
METHODS
A scoping review is being conducted by searching PubMed, Embase, Scopus, Web of Science, LILACS, and SciELO. Study selection occurred in pairs by screening the

titles, abstracts, and full-text reading, according to the inclusion criteria, with no restrictions on language or publication date. Studies were included if they were conducted in PHC settings, addressed pharmaceutical services and/or access to medicines, and examined social determination of health or social determinants of health affecting patients. Data charting included key study characteristics related to population, setting, pharmaceutical focus, and social determinants of health. This scoping review was guided by the JBI manual for Scoping Reviews3 and the PRISMA-ScR4.
RESULTS
From the 1.871 articles found, 142 studies were included, published between 1993 and 2024. USA, UK, and Brazil were the most frequently represented countries. The populations most commonly studied were older adults, immigrants and their descendants, women, and rural populations. Two main categories emerged: (i) PHC centers, including public and private units with integrated pharmaceutical services; and (ii) community pharmacies, defined as community-based pharmaceutical establishments providing direct care and operating independently. The most frequently identified social determinants were education, income, and age, with studies predominantly focused on PHC centers. As the study is ongoing, these findings should be interpreted as preliminary.
CONCLUSIONS
The findings reveal a concentration of studies in a limited number of countries, a predominantly narrow focus on usual determinants, and little debate about social determination, which may restrict addressing the complexity of access to medicines and pharmaceutical services.
Popul. Med. 2026;8(Supplement 1):A1346

ABS3577
From Rice-Based Diets to Viand-Centered Meals: Dietary Pattern Changes among Filipino Adults, 2013–2021

Kim Cochon[1], Kim Leonard Dela Luna[2], Rodesa Naupal-Forcadilla[3], Anna Paulina Rodriguez[2], Michelle Ann D. Aguilar Aguilar[4], Katherine Reyes[5], Jellrose Mausisa[2], Patrik James Cabrera[2]
[1]Department of Clinical Epidemiology, College of Medicine, University of the Philippines - Manila, Manila, Philippines, [2]Department of Nutrition, College of Public Health, University of the Philippines - Manila, Manila, Philippines, [3]Institute of Human Nutrition and Food College of Human Ecology, University of the Philippines - Los Banos, Laguna, Philippines, [4]Department of Epidemiology and Biostatistics, College of Public Health, University of the Philippines - Manila, Manila, Philippines, [5]Institute of Clinical Epidemiology, National Institutes of Health, University of the Philippines - Manila, Manila, Philippines
INTRODUCTION
Despite the implementation of nutrition-specific and nutrition-sensitive interventions to address malnutrition and advance SDG 2.2, National Nutrition Survey (NNS)/Expanded National Nutrition Survey (ENNS) data indicate persistent inadequacies in energy and micronutrient intake, largely attributable to poor dietary diversity. Examining changes in adult dietary patterns is therefore essential for informing effective policy and program development. This study examined changes in the dietary patterns of Filipinos from 2013 to 2021.
METHODS
We conducted a secondary analysis of adults (≥18 y) using Public Use Files from the 2013 NNS and the 2018–2019 and 2021 ENNS. Dietary intake was assessed via 24-hour recall. Energy and selected micronutrients were benchmarked against the 2018 Philippine Dietary Reference Intakes (PDRI). Intakes and food-group consumption were summarized, and principal component analysis with varimax rotation derived dietary patterns by survey year. Proxies represented sodium, sugar-sweetened beverages, and processed foods.
RESULTS
The analytic sample included 11,271 adults in 2013, 95,753 in 2018–2019, and 42,667 in 2021. Adherence to recommended intakes was consistently low and worsened over time: by 2021, nearly nine in ten adults had inadequate energy intake, while inadequacy for calcium, iron, vitamin A, thiamin, riboflavin, and vitamin C exceeded 90% across years. Dietary patterns evolved substantially. In 2013, diets were dominated by a rice-based staple pattern alongside a cereal–egg–milk–sweetened foods pattern. By 2018–2019, corn emerged as an alternative staple and a protein–condiment pattern characterized by fish, meat, poultry, and condiments became prominent. In 2021, protein-rich viands paired with condiments represented the dominant dietary structure, with rice contributing more moderately. The cereal–egg–milk–sweetened foods pattern persisted across years.
CONCLUSIONS
Filipino adults experienced declining energy and nutrient intakes, persistently low dietary diversity, and a shift toward viand-centered dietary patterns between 2013 and 2021. These findings highlight structural barriers in food systems and support integrated policy responses to improve access.

Determinants of zero-dose prevalence in Southern Madagascar: Evidence from community-level data

Guillaume Demare[1], Elgiraud Ramarosaiky[2], Sandro Randrianirisoa[2], Hanna-Tina Fischer[1], Zava Rapanjato[2], Beate Kampmann[1], Nadine Muller[1,2]
[1]Charité Center for Global Health, Berlin, Germany, [2]Doctors for Madagascar, Antananarivo, Germany
ABSTRACT
Background. Zero-dose (ZD) children – defined as those who have not received a first dose of a diphtheria-tetanus-pertussis-containing vaccine (DTP1) – remain a major public health challenge. WHO/UNICEF estimates indicate that Madagascar has approximately 300000 ZD infants, placing it among the highest-burden countries globally. Within Madagascar, ZD prevalence is highest in the southern regions. This study uses secondary data from a large-scale community-based enumeration and vaccination-status verification activity to identify determinants of ZD prevalence. Methods. We analyzed data from a community-based immunization initiative implemented by a local NGO. Community health workers conducted household enumeration and vaccination-status verification of children under five across 3386 fokontany (i.e. villages) linked to 375 primary health facilities in 16 districts. ZD status was defined as absence of documented DTP1, based on written household, community registry, or facility level records. Data included aggregated fokontany-level ZD prevalence. Vaccination status and ZD prevalence were linked to community characteristics and health facility indicators of service availability and readiness. Determinants of ZD prevalence were assessed using multilevel regression models. Results. The dataset includes 368227 children under five enumerated, of whom 213173 (i.e. 58%) were DTP1 ZD. District-level ZD prevalence ranged from 23% to 85%. Preliminary analyses indicate a strong spatial gradient in ZD prevalence, increasing on average by approximately 1% for each additional kilometer from the nearest health facility. Several indicators of health facility service availability and readiness are associated with ZD prevalence, suggesting not only adaptive system-level responses in high-burden areas, but also persistent structural barriers to vaccination. Conclusion. Geographic distance and health system capacity are key drivers of ZD prevalence. Our results provide evidence to guide targeted immunization outreach and context-specific health system strengthening in high-burden, remote settings.

Oral Health Conditions, Self-Perception and Quality of Life Among Older Quilombola Adults in Northeastern Brazil

Thawan Mendonça[1], Pamella Celerino[2], Humberto Silva-Neto[1], Mariana Soares[2], Camila Silva[2], Herika Mauricio[3], Maria Helena Galvão[1], Maysa Veiga[1], Andre Oliveira[2], Carla Lins[1], Rafael Moreira[2,1]
[1]Collective Health, Federal University of Pernambuco (UFPE), Recife, Brazil, [2]Collective Health, Oswaldo Cruz Foundation (Fiocruz), Ministry of Health, Recife, Brazil, [3]Dentistry, University of Pernambuco, Recife, Brazil
INTRODUCTION
Older adults living in quilombola communities in Brazil experience health inequities. Oral health problems can substantially affect quality of life. This study aimed to investigate the relationship between oral health self-perception, clinically assessed oral conditions and self-reported quality of life among older quilombola adults.
METHODS
A cross-sectional study was conducted using a census of older adults in a quilombola community in the municipality of Bom Conselho, Pernambuco, Brazil. Data collection included structured interviews to assess sociodemographic characteristics, self-perceived oral health, perceived need for dental treatment and quality of life, as well as standardized clinical oral examinations. Descriptive and inferential statistical analyses were conducted to evaluate associations and the concordance between subjective perceptions and normative clinical findings.
RESULTS
Participants presented a marked burden of oral health problems. Sixty-five quilombola older adults were included (mean age 68.3±7.0 years; 60–92; 55.4% men). Although 90.8% reported at least one lifetime dental visit, 55.4% had not attended in over three years and 35.4% reported access barriers, mainly cost and distance (10.8% each). Tooth loss was almost universal (95.4%), with 66.2% losing more than six teeth and 26.2% presenting complete edentulism. Mean Decayed, Missing and Filled Teeth index was 17.6; caries experience reached 95.4% and

pulpal complications 24.6%. Prosthesis use was low (32.3%), despite clinical need in 96.9%. Oral conditions impacted chewing (55.4%), sleep (58.5%) and smiling (46.2%). Self-rated oral health was regular or poor in 66.2% and was significantly associated with clinical treatment need (p=0.040).
CONCLUSIONS
The findings demonstrate substantial oral health needs and significant impacts on quality of life among older quilombola adults, alongside discrepancies between clinical conditions and self-perceived oral health. These results highlight the need for culturally sensitive and equitable oral health policies focused on improving access to care, rehabilitation services and health promotion, contributing to healthier aging in quilombola communities.

ABS3641
Sustainability pathways in solidarity kitchens: challenges and perspectives from a public health–oriented experience
Amanda Oliveira[1], Natalie Dantas[1], Denise Coelho[2]
[1]Food Science and Nutrition Department, School of Food Engineering, Universidade Estadual de Campinas, Campinas, Brazil, [2]INCT Combating Hunger, National Institute of Science and Technology - INCT, São Paulo, Brazil
INTRODUCTION
solidarity kitchens are social technologies that address hunger and food insecurity among socially vulnerable populations and are primarily implemented by civil society organizations and community-based groups^1. In brazil, these initiatives are integrated into public policies within the national food and nutrition security (fns) system, which frames food as a social determinant of health and promotes social participation, family farming, and territorial sustainability^1,2. By linking food access, community engagement, and local development, solidarity kitchens contribute to reducing social vulnerabilities and strengthening public health actions^3. This study analyzes how a solidarity kitchen in the metropolitan region of campinas, são paulo, supports territorial sustainability and public health through community-based food and nutrition security practices.
METHODS
this qualitative study is based on participant observation conducted during volunteer activities in a solidarity kitchen located in a peripheral area of the metropolitan region of campinas, são paulo, brazil. Data were collected through field notes and descriptive observations of practices related to sustainability, food and nutrition security, and work organization, aiming to identify potentialities, barriers, and strategies to strengthen ongoing actions.
RESULTS
the solidarity kitchen operates as a space for articulation among social movements, religious organizations, and solidarity economy initiatives, maintaining a direct connection with local agricultural production. Observed actions include sustainable practices such as the reuse of organic waste for biofertilizer production applied in community gardens, as well as educational initiatives, including literacy and bread production activities, aimed at income generation and community autonomy. Barriers related to resource management and activity integration were identified, indicating opportunities for improvement through partnerships and new social technologies.
CONCLUSIONS
the experience demonstrates that solidarity kitchens, by addressing food as a social determinant of health, strengthen solidarity networks, promote sustainability, and contribute to territorial public health. Such initiatives show potential for replication, provided that local specificities are considered.

Socioeconomic Status Profiles using Household Indicators in Eastern Cape: A Latent Class Analysis
Priya Kosana[1], James Clifford[2], Dawie Olivier[3], Amrita Daftary[4,5], Andrew Medina-Marino[3,6], Aaron Kipp[2]
[1]1 Brody School of Medicine, East Carolina University, Greenville, NC, United States, [2]2 Department of Public Health, Brody School of Medicine, East Carolina University, Greenville, NC, United States, [3]3 The Desmond Tutu HIV Centre, University of Cape Town, Cape Town, South Africa, [4]4 School of Public Health, York University, Toronto, Canada, [5]5 TB-HIV Pathogenesis Unit, Centre for the AIDS Programme of Research in South Africa (CAPRISA), Durban, South Africa, [6]6 Department of Psychiatry, Perelman School of Medicine, University of Pennsylvania, Philadelphia, United States
BACKGROUND
Globally, tuberculosis (TB) is the leading cause of death due to an infectious agent. Little is known about the role of socioeconomic status (SES) in TB care engagement beyond income, education, and employment. Yet household wealth and capital have been proposed as important determinants of TB and HIV care. As part of a large, multi-level study on social determinants of TB care engagement, we sought to classify community households into meaningful SES profiles. Insights from this analysis can be applied to future analyses of TB care engagement.
METHODS
Households in the catchment area of 18 clinics in Buffalo City Metropolitan Health District, Eastern Cape, South Africa, were selected using a geographic cluster sampling design. Surveys were administered to n=3,869 heads-of-household. Twenty-two questions covered dwelling characteristics (n=7), household items (n=9), and individual ownership (n=6). R statistical software 4.4.1, poLCA package, was used for all analyses. The optimal number of classes was chosen using model fit statistics and conceptual salience. Demographic characteristics and TB/HIV prevalence were evaluated for each class using Chi-square tests.
RESULTS
A six-class model was identified as the most appropriate, comprising two "Higher SES" classes (20% of the study population), three "Middle SES" classes (32% in the Higher-Middle SES class; 35% in the two Lower-Middle SES classes), and one "Lower SES" class (13% of the study population). Classes correlated with urban/rural area, education level, employment, and income (all p<0.01), but also proved more informative of SES variability. Household TB prevalence (p=0.06) and household HIV prevalence (p<0.01) varied across classes, most notably for HIV prevalence which decreased as SES profiles moved from lower to higher.
CONCLUSIONS
Identified classes closely align with traditional SES variables, yet provided more informative profiles that captured SES variability. Future research will evaluate association of these profiles with engagement along the TB care continuum.

Social prescribing - bridge between evidence-based medicine and everyday life in diabetic foot prevention
Katarina Dostalova[1], Veronika Adamcova[1], Sona Wimmerova[1], Iveta Kopalova[2], Viera Donicova[3], Kristina Dostalova[4], Nadezda Jankelova[1], Peter Lipovsky[5]
[1]Faculty of Public Health, Slovak Medical University, Bratislava, Slovakia, [2]Slovak Society of Angiology, Slovak Medical Association, Bratislava, Slovakia, [3]Slovak Diabetes Society, Slovak Medical Association, Bratislava, Slovakia, [4]University Le Havre, Le Havre, France, [5]Sloval Society of General Practice, Bratislava, Slovakia
BACKGROUND
Diabetic foot syndrome (DFS) is defined as foot disease in a patient with diagnosed diabetes mellitus (DM). DM screening and patient dispensary is well established in Slovakia (5 419 451 inhabitants in 2024), but the DFS prevention remains a major challenge. Social prescribing (SP) is a person-centered approach used by healthcare workers, connects people to non-clinical community activities.
METHODS
We analysed data from the National Centre for Health Information and the Statistical Office of Slovakia.
RESULTS
The number of registered diabetics with lower limb amputations in Slovakia ranged from 3,545 to 4,272 people from 2013 to 2024. The highest number was recorded in 2016 (4,272 people) and the lowest in 2023 (3,545 people). We bring practice-based reflection of SP in DFS prevention from the communities of Bratislava III and IV districts: 1. Diet adherence: The Bratislava IV District Municipal Office (MO) provides meals for seniors in several ways depending on their health status and mobility. 2. Physical activity: MO supports physical activities for seniors in the beautiful natural environment (especially Nordic walking group). 3. Lower limb care: Foot care is often literally the Achilles heel of a diabetic. The goal is to prevent a diabetic's foot from becoming a diabetic foot. We encourage patients to inform each other about current pedicure options in their place of residence. 4. Adherence to treatment: In cooperation with MO, we organize lectures and workshops on disease prevention for senior in Bratislava District III and E. Kovacova director of Slovak League Against Cancer in Bratislava III District., where the patients exchange also their own experiences.
CONCLUSIONS
The level of knowledge in DM management is constantly improving, but it may not be accessible to patients with adverse social characteristics. SP has the potential to be an effective mediator between evidence-based medicine and diabetics.

ABS3689
Obesity, Lifestyle Behaviours and Time-Related Stress among Nursing Students in South Africa: Implications for Health Equity

and Sustainable Workforce Development

Lauren Snell-Hillermann[1]
[1]Nursing, Durban University of Technology, Durban, South Africa

BACKGROUND
The transition to university life is a critical period for shaping long-term health behaviours. For nursing students, future health professionals, this period is often marked by academic pressure, time constraints and disrupted lifestyles. In low- and middle-income settings, limited institutional support may further increase vulnerability to overweight and obesity, raising concerns for both student wellbeing and future health workforce sustainability.
METHODS
A cross-sectional quantitative study was conducted among 135 undergraduate nursing students at a South African higher education institution. Body mass index (BMI) was calculated using measured height and weight. Lifestyle behaviours, including physical activity and dietary practices, were self-reported, while academic-related stress was assessed using a validated multidimensional stress scale. Descriptive statistics and chi-square or Fisher's exact tests were used to examine associations between BMI, lifestyle behaviours and stress.
RESULTS
Almost one in two students was classified as overweight or obese (48.2%). Unhealthy lifestyle patterns were common, with over three-quarters of participants replacing meals with snacks (78.5%, p<0.001) and most reporting inconsistent physical activity (61.5%, p<0.001). Although overall stress levels were generally low, time-related stress particularly limited time spent with family was significantly associated with higher BMI (Fisher's exact=19.18, p=0.010), with obese students reporting the highest stress levels.
CONCLUSIONS
Obesity among nursing students reflects more than individual choices; it is shaped by time pressure, lifestyle disruption and broader structural constraints. Integrating equity-focused health promotion, time management support and healthy campus environments is essential to protect student wellbeing and strengthen a sustainable health workforce.

Intersectional dialogues on race, environment, and religiosity to promote public health policies for the Black population

Denize Amorim[1], Fabiana Ferreira[2]
[1]Coordenação de Redes e Coalizões, ACT Promoção da Saúde, Rio de Janeiro, Brasil, [2]DITAB - Divisão de Controle do Tabagismo, Instituto Nacional de Câncer - INCA, Rio de Janeiro, Brasil

INTRODUCTION
Structural racism produces racial inequalities that constitute central determinants of health inequities and influence access to prevention and care for noncommunicable diseases (NCDs),. These inequalities increase the exposure of the Black population to risk factors such as tobacco use, unhealthy diets, harmful alcohol consumption, physical inactivity, and air pollution, resulting in disproportionate health impacts. In this context, health equity promotion actions require intersectional and intersectoral approaches that articulate race, environment, culture, religiosity, and public policies, strengthening collective responses guided by social and environmental justice.
METHODS
This abstract presents an experience report of a hybrid event held in November 2025 by the National Cancer Institute (INCA), in partnership with ACT Health Promotion. The event brought together more than 100 participants, including civil society representatives, researchers, public health managers, religious leaders, and health professionals. Activities included a thematic panel, audience discussion, the launch of an institutional publication, and an interactive exhibition of educational materials on NCDs. Discussions adopted an intersectional approach, addressing structural and religious racism, environmental racism, risk factors, and public health policies focused on the Black population.
RESULTS
The event strengthened articulation among racial equity, public health, and environmental justice agendas and highlighted structural racism as a determinant of inequalities in access to NCD prevention. It expanded the debate on the need for public policies sensitive to racial, cultural, and religious diversity and their impacts on health.
CONCLUSIONS
The experience indicates that intersectional dialogue spaces contribute to addressing racial health inequalities and to promoting equity in NCD prevention policies. The integration of knowledge and social actors reinforces the importance of collective action and network-based collaboration for public policies committed to social and environmental justice and to the Sustainable Development Goals.

Food as a political frontier of health: contradictions between human rights, global food systems and sustainability

Ana Claudia Garcia[1,2], Maria Angélica Andrade[1], Andreia Carvalho[2], Rita de Cássia Lima[1], Heloisa Torres[1], Jeanine Barbosa[3,1], Rafael Caliari[1], Caroline Castro[4], Fabíola Magalhães[1,3], Elda Bussinguer[2]
[1]Graduate Program in Public Health, Federal University of Espírito Santo, Vitória, Brazil, [2]Faculdade de Direito de Vitória, Vitória, Brazil, [3]Capixaba Institute for Education, Research and Innovation in Health, Espírito Santo State Department of Health, Vitória, Brazil, [4]University Extension Project, Higher School of Sciences of Santa Casa de Misericordia de Vitoria, Vitória, Brazil

INTRODUCTION
The 2030 Agenda proposes the construction of sustainable development based on equity, inclusion, and the guarantee of human rights, articulating, among others, the Sustainable Development Goals related to zero hunger (SDG 2), health and well-being (SDG 3), the reduction of inequalities (SDG 10), and responsible consumption and production (SDG 12). However, the contemporary organization of global food systems reveals profound contradictions between these normative commitments and the economic dynamics that structure food production, circulation, and consumption. This study seeks to analyze food as a central political frontier for the realization of health without borders.
METHODS
This is a theoretical discussion based on the dialectical method, drawing on a critical analysis of Agenda 2030 documents, international reports, and references from public health, social sciences, and human rights. It seeks to identify structural contradictions between the normative universalism of rights and the economic and territorial particularities that organize food production, access, and consumption, whether on a local or even global scale.
RESULTS
It was evident that, although Agenda 2030 recognizes adequate food as a structural axis of sustainable development, food systems oriented by processes of commodification, economic concentration, and socio-environmental degradation still prevail. This creates invisible barriers that limit equitable access to food and negatively impact health indicators, contributing to food insecurity and widening health inequalities. On the other hand, counter-hegemonic practices are emerging, such as food sovereignty and intersectoral policies, which challenge the dominant logic.
CONCLUSIONS
It is concluded that the implementation of the 2030 Agenda depends on the recognition of food as a strategic field of ethical, political, and economic dispute. Overcoming health inequalities requires intersectoral and dialectical approaches that integrate nutrition, human rights, and sustainability, reaffirming the role of the State and civil society in building fair and inclusive food systems.

The Children are our Future: Targeting Early Adolescents for Violence prevention in the Western Cape of South Africa.

Nicolette Van der Walt[1]
[1]Violence Prevention, Western Cape Department of Health & Wellness, Cape Town, South Africa

ABSTRACT
Violence and Injury are rife in Cape Town and the Western Cape of South Africa. Cape Town consistently ranks in the top 15 most dangerous cities in the world with a high level of gang violence in low-income communities. The Western Cape Government initiated a Violence Prevention Unit (VPU) managed by the Department of Health and Wellness. The VPU aims to prevent violence through primary, upstream action in an Area-Based approach that delivers long-term, population-level impact. The unit focusses on understanding and strengthening protective factors and exploring mitigation measures for the factors that put people at higher risk to become either victims or perpetrators of violence. The flagship intervention of the VPU is Planet Youth which applies a biennial, anonymised survey process to generate evidence on young people's lived experiences across domains including family, education, peer influence, community, substance use, wellbeing, leisure, and exposure to violence. In 2025, the VPU surveyed more than 49 000 Grade 8 and 9 learners. Results showed many children have already been sensitized to violence by this age. The collective sensemaking signaled a focus on early adolescents (age 10-14 years) for impact for violence prevention activities. Through an intersectoral approach, the VPU co-ordinates the development of a

strategy and an activity network to strengthen protective factors through safe spaces, parental support, nurturing relationships and developing social-emotional skills. In applying a public health approach to violence prevention the VPU is currently unique in the South African setting. The presentation will describe the intersectoral approach, motivation, target, activities and potential impact and measurable outcomes.

Factors Associated with Food Insecurity in People Living with HIV/AIDS in a City in the Northeast of Brazil

Igor Myron Ribeiro Nascimento[1], Tarcio de Almeida Oliveira[1], Erik Asley Ferreira Abade[1], Márcio Natividade[1], Marcos Pereira[1]
[1]Institute Public of Health, Federal University of Bahia, Salvador, Brazil

ABSTRACT
Food insecurity (FI), defined as limited access to adequate and safe food due to socioeconomic constraints, is a critical concern for people living with HIV (PLHIV), whose vulnerability is often amplified by stigma intersecting with race, gender, and sexual identity2-4. This cross-sectional study analyzed factors associated with FI among 332 PLHIV in Northeast Brazil. Data were collected via questionnaires in Salvador and Lauro de Freitas. Analysis using R software involved Pearson's chi-square tests and logistic regression, with results expressed as odds ratios (OR) and 95% confidence intervals. The sample was predominantly Black/Mixed-race (90.1%), single (66.8%), homeowners (53.4%), LGBTQIAPN+ (60.1%), cisgender men (70.8%), had completed high school (39%), and had a monthly income between one and two minimum wages (41%). Dependence was found between the outcome variable FI and the independent variables: race, marital status, number of children, sexual identity, gender, socioeconomic status, education, household income, participation in the "Bolsa Família" program, and depression. The odds of FI were: 228% higher for Black individuals (OR=3.28, 95% CI: 1.27 – 9.44); 22% higher for each additional person in the household (OR=1.22, 95% CI: 1.04 – 1.45); 180% higher for socioeconomic classes C/D/E (OR=2.80, 95% CI: 1.34 – 6.04); 106% higher for basic education and illiteracy (OR=2.06, 95% CI: 1.11 – 3.87); 278% higher for moderate to severe depression (OR=3.78, 95% CI: 1.83 – 8.27); 174% higher for those who experienced gender discrimination (OR=2.74, 95% CI: 1.42 - 5.41); and 414% higher for those who experienced HIV/AIDS-related stigma (OR=5.14, 95% CI: 1.29 – 27.67). These results underscore profound intersecting inequalities, such as socioeconomic, racial, and gender-based, that significantly elevate the risk of food insecurity among PLHIV, highlighting the need for targeted, intersectional interventions.

Persistent Social Inequalities in Tuberculosis Incidence in Brazil: A Municipal-Level Ecological Study

WALTER MASSA RAMALHO[1], José Mário Nunes da Silva[2], José Alexandre Menezes da Silva[3], Livia Teixeira de Souza Maia[4], Mauro Niskier Sanchez[1], Elisabeth Carmen Duarte[2]
[1]Public Health, University of Brasilia, Brasilia, Brazil, University of Brasilia, Brasília, Brazil, [2]Center for Tropical Medicine. School of Medicine, University of Brasília, Brasília, Brazil, University of Brasilia, Brasília, Brazil, [3]CUIDA Chagas Consortium, Oswaldo Cruz Fundation, Rio de Janeiro, Brazil, [4]Public Health, Federal University of Pernambuco, Recife, Brazil

INTRODUCTION
Tuberculosis remains strongly associated with social inequalities, functioning as a sentinel event of health inequities. The analysis of its spatial distribution in conjunction with socioeconomic indicators is essential to inform equity-oriented public policies. This study aimed to assess the magnitude and persistence of social inequalities in municipal tuberculosis incidence rates in Brazil according to income inequality.
METHODS
An ecological study was conducted using Brazilian municipalities as units of analysis. Tuberculosis incidence rates (per 100,000 population) were aggregated into three biennial periods (2001–2002, 2012–2013, and 2023–2024) and spatially smoothed using the Global Empirical Bayes method to reduce random variability. Income inequality was measured using the municipal Gini index (2010). Social inequalities were assessed using simple measures (absolute and relative gaps), gradient-based measures (Slope Index of Inequality [SII] and Relative Index of Inequality [RII]), and concentration measures (absolute and relative concentration indices).
RESULTS
Across all study periods, tuberculosis incidence was consistently higher in municipalities with greater income inequality. In 2023–2024, the absolute gap was 17.71 (95% CI: 16.86–18.57) cases per 100,000 population, and the relative gap was 1.56 (95% CI: 1.52–1.60). The SII indicated an excess of 25.86 cases per 100,000 population in the most disadvantaged municipalities, while the relative concentration index was −12.1% (95% CI: -12.16%; -12.03%). The relative concentration index was −12.1% (95% CI: −12.16% to −12.03%), demonstrating a marked concentration of tuberculosis in socially vulnerable strata. Similar patterns were identified in 2001–2002 and 2012–2013, demonstrating the persistence of social inequalities over time.
CONCLUSIONS
Tuberculosis incidence shows a persistent social gradient strongly associated with municipal income inequality. These findings emphasize the need for equity-oriented, intersectoral, and territorially targeted strategies to address tuberculosis and its social determinants in Brazil.

STUNTING in young children - the height of inequality

Lisanne du Plessis[1], Ronelle Burger[2]
[1]Division of Human Nutrition, Department of Global Health, Faculty of Medicine and Health Sciences, Stellenbosch University, Parow, Cape Town, South Africa, [2]Department of Economics, Faculty of Economic and Management Sciences, Stellenbosch University, Stellenbosch, South Africa

Over the past two decades, nutrition has gained prominence on the development agenda. Sustainable Development Goal 2 aims to eliminate all forms of malnutrition, including a key objective to cut the number of stunted children under five by 40% by 2030. Issues of malnutrition in general, including main causes, challenges, and interventions are now more comprehensively understood by multiple stakeholders across different sectors at global and national levels. Despite evidence on effective interventions, growing political commitment, and financial investments, millions of women and children still, however, suffer from malnutrition, including stunting. Although stunting has been declining steadily since the year 2000 at a global level, faster progress is needed to reach the global target. In 2022, nearly all stunted children lived in Asia and Africa (52% and 43% of the global share, respectively). Addressing malnutrition in general and stunting in particular, is complex because it intersects with multiple sectors such as nutrition, health, agriculture, livelihoods, economic growth, education, and water, sanitation, and hygiene. Biological and environmental factors influence stunting, but strong political will is essential to ensure effective policy execution and adequate resource allocation. Meaningful progress therefore depends on multisectoral strategies supported by coordinated and consistent policy efforts across various sectors. In this session we propose a general introduction of childhood stunting (10 min), followed by a panel discussion on the factors and interventions that address stunted growth in young children (35 minutes). Panel members will represent various sectors, including government, academia, civil society and the private sector. Topics will include measuring stunting and tracking trends, indicators and priority interventions to address stunting. Emerging evidence on parental absence, air pollution and the role of the microbiome in stunting will also be given prominence. The panel discussion will be followed by a 15-minute participant engagement session with questions, answers and debate.

Transgender and gender nonconformingpeople's vulnerability to food insecurity:systematic review and meta-synthesis

Igor Myron Ribeiro Nascimento[1], Ana Paula dos Reis[1], Renata Tannous Sobral de Andrade[1], Marcos Pereira[1]
[1]Institute of Public Health, Federal University of Bahia, Salvador, Brazil

ABSTRACT
Transgender, travesti, and gender nonconforming (TGNC) people are morevulnerable to food insecurity due to stigma and discrimination related totheir gender identity.1-3 However, there is a lack of qualitative research on thistopic. Therefore, this study examines the vulnerability and experiences oftrans people with respect to food insecurity. A qualitative systematic reviewwas conducted by searching seven electronic databases for studies in March2024. Qualitative studies on the experience of food insecurity among transpeople were included. The quality of studies was assessed using CASP, whilethe GRADE-CERQual approach evaluated the reliability of findings, whichwere then analyzed using meta-synthesis with thematic analysis. A total of673 records were identified, of which five were selected. The most appliedtechnique was semi-structured interviews. In total, four categories emergedfrom the meta-synthesis: vulnerability to food insecurity, experience of hun-ger, repercussions, and coping strategies.

The results showed that TGNC peo-ple face high levels of stigma, discrimination, and victimization, which impacttheir food insecurity across different areas of life. Structural barriers, such aslimited access to food and stable employment, exacerbate this insecurity, withnegative consequences for physical and mental health. Factors such as skincolor/ethnicity, gender, gender-based violence and lack of safe housing alsocontribute to this situation, including forced prostitution as a result of socialbarriers. Support networks such as the "chosen family" play an important rolein reducing these effects. For trans people, the complexity of experiencing foodinsecurity is linked to transphobia, which creates barriers and violates theright to adequate food. They cope with hunger by activating support networksand seeking food assistance from institutions.

ABS3799
Migration and access to healthcare services: the legal path to equity in health
Stéphanie Dagron[1], Kailing Marcus[1]
[1]Institute of global health, Faculty of medicine, University of Geneva, Geneva, Switzerland
BACKGROUND
"Societies need stronger health systems, including Universal Health Coverage [UHC]". These words are those of the General Secretary of the United Nations at the beginning of the COVID-19 pandemics (Guterres, 2020). They reflect the relevance of both health systems and UHC towards the realisation of equity in health for all. Despite multiple legal obligations (e.g. human rights treaties) and political commitments (e.g. Agenda 2030 for sustainable development), strong disparities remain in healthcare access across the world. This is particularly the case for migrant populations, regardless of their status (Abubakar, 2018). Among the essential elements for achieving equitable and sustainable access to health care are legislative and regulatory frameworks. While many countries today struggle to achieve access for all, there is insufficient research aiming at the definition of a clear legal path towards UHC. A first step on this path is the assessment of the existing laws and legal barriers or gaps in these laws precluding individuals – and more specifically migrant populations within the scope of our study – from accessing healthcare services.
METHODS
Laws and regulations determining access to healthcare services for migrant workers in China will be analysed as a case study, including legislation applicable to diverse areas beyond health such as social protection, migration, labour etc.
RESULTS
This analysis of access to healthcare for Chinese migrant workers can be extended to other national contexts and be applied to identify the challenges faced by both internal and international migrating populations.
CONCLUSIONS
The example of access to healthcare for migrant workers in China reveals that legal research should be encouraged since the achievement of UHC understood as an essential foundation for health equity implies a coherent domestic legal framework (Dagron, 2023).

"Don't Eat My Food": Experiences of Trans Women and Travestis Regarding Food (In)Security
Igor Myron Ribeiro Nascimento[1], Ana Paula dos Reis[1], Renata Tannous Sobral de Andrade[1], Erik Asley Ferreira Abade[1], Marcos Pereira[1]
[1]Institute of Public Health, Federal University of Bahia, Salvador, Brazil
ABSTRACT
Trans women and travestis constitute a group historically subjected to various forms of prohibition and marginalization.-3 Within this context, food insecurity (FI) is more than just a lack of access to food; it is a reflection of social inequalities and a violation of human rights. The aim of this study was to understand the experiences of food (in)security among travestis and trans women in the city of Salvador, Brazil.
METHODS
This qualitative research included semi-structured interviews and the application of the Brazilian Food Insecurity Scale to identify and classify food insecurity while exploring life trajectories. Thematic analysis was used to systematize life stories, with the participation of 17 interviewees, resulting in five thematic categories.
RESULTS
The study revealed an intersection between food insecurity (FI) and gender dissidence, where FI emerges in childhood and intensifies due to racism for Black travestis and trans women, functioning as a mechanism of control over their bodies.
CONCLUSIONS
The analysis underscores the need to broaden the understanding of hunger among travestis and trans women, incorporating their specific needs and unique experiences, to develop strategies that not only provide immediate food relief but also foster long-term social and economic inclusion.

Price, Volume, and Market Power: Alcohol and Ultra-Processed Beverage Markets as Commercial Determinants of Non-Communicable Diseases in South Africa
Loyiso Maciko[1]
[1]SAMRC/ WITS Centre for Health Economics and Decision Science, Wits University, Johannesburg, South Africa
ABSTRACT
Non-communicable diseases (NCDs) are the leading cause of death globally, accounting for approximately 71% of all mortality. South Africa mirrors this transition, with NCD-related deaths increasing by nearly 60% between 1997 and 2018. Rising consumption of alcohol and ultra-processed foods and beverages (UPFs/UPBs), driven in part by Unhealthy Commodity Industries (UCIs), has been identified as a key contributor. Despite increasing attention to the Commercial Determinants of Health, policy-relevant evidence on how UCI market structures, pricing, and marketing strategies shape population exposure in South Africa remains limited. This study examines trends in sales volumes, values, and prices of alcohol and UPF, assesses market concentration within UCIs, and explores implications for NCD prevention and fiscal policy in South Africa.Secondary data on retail sales volumes, values, and prices for alcohol and soft drinks were obtained from the Euromonitor Passport Database for 2010–2025, with projections to 2029. Per capita sales volumes were estimated using national population data. Market concentration was measured using the Herfindahl–Hirschman Index based on company market shares. Trends were analysed using descriptive statistics. Alcohol markets display a pronounced divergence between physical exposure and economic value: beer dominates per-capita volumes but generates relatively low per-capita sales value, while spirits contribute disproportionately to sales value despite lower volumes. Ultra-processed beverages show substantially higher per-capita volumes and values than alcohol, with juice and 100% juice accounting for the largest economic exposure. Evidence of product differentiation and pricing power is observed across beverage categories.The findings reveal clear price and harm gradients across alcohol and ultra-processed beverage markets, highlighting the role of UCIs in shaping consumption patterns. These results support product-specific excise reform, expanded nutrition-related fiscal measures, and stronger regulation of commercial practices to reduce NCD risk and promote equity in South Africa.

Social inequalities in the use of health care services: evidences from a population-based health survey in a city in southeastern Brazil
Edige Felipe de Sousa Santos[1], Marilisa Berti de Azevedo Barros[2]
[1]Epidemiologia, Faculdade de Saúde Pública da Universidade de São Paulo, São Paulo, Brazil, [2]Saúde Coletiva, Faculdade de Ciências Médicas da Universidade Estadual de Campinas, Campinas, Brazil
BACKGROUND
The importance of addressing social inequalities in health stems from the observation of increasing income concentration worldwide, with levels in 2010 similar to those in 1910. The objective of this study is to analyze the prevalence of healthcare service use and the social inequalities present in access to healthcare services.
METHODS
This is a cross-sectional study using data from the Campinas Municipal Health Survey (ISACamp) 2022/23/24. Sampling was probabilistic, stratified, and conducted in two stages. Data were analyzed using Stata 19.5, using the survey module. Independent variables included sex, age group, and health insurance plan. Prevalence ratios were estimated using Poisson multiple regression.
RESULTS
The prevalence of medical consultations (in the last month and in the last year) was significantly higher among the elderly, women, and people with health insurance plans. Regarding hospitalizations, considering surgeries in the last year and throughout life, the differences between age groups showed statistical significance for all three indicators, with differences by sex only for surgeries and

by health insurance coverage only for any surgery in life. Most hospitalizations and surgeries were paid for through the Unified Health System (SUS), while most consultations in the last month were paid for through health insurance. The reasons for using services are mainly related to routine care and illnesses, with the elderly indicating less use for routine care; adults and people with health insurance coverage indicate less use for acute illnesses; and women indicate less use for injuries.
CONCLUSIONS
The ISACamp survey indicates that the prevalence of health service use in the city of Campinas in the last year was 80.4%, with differences according to sex, age group, and health insurance coverage. The results show the expansion of health services, particularly the SUS, but also show that inequalities in access to health services still exist.

ABS3835

Challenges in Water Quality Surveillance in Contexts of Territorial Inequality in Bahia, Brazil

Ynayara Rodrigues[1], Luisa Reis[1], Elielton Araujo[1], Manuela Santos[1], Rivia Barros[1]
[1]Bahia State Health Department, Government of the State of Bahia, Salvador, Brazil

ABSTRACT
The state of Bahia, the fourth most populous in Brazil (14,141,625 inhabitants), has national economic relevance and presents significant age and racial diversity; however, it continues to suffer from historical territorial inequalities that negatively affect the population's quality of life1-2. Approximately 85% of the state's territory is located in the semi-arid region, concentrating populations in contexts of socio-environmental vulnerability characterized by water scarcity, precarious infrastructure, and disparities in access to basic services between rural and urban areas2-3. This study aimed to compare water quality data from supply systems and alternative solutions in rural and urban areas of Bahia, based on analysis of data from the Water Quality Surveillance Information System for Human Consumption (SISAGUA). It was observed that 98.8% of municipalities have SISAGUA implemented. The Water Supply System (WSS) constitutes the main form of access to drinking water, serving 68.16% of the population (9,638,838 inhabitants), predominantly in urban areas, through structured processes of collection, treatment and distribution, facilitating monitoring. Collective Alternative Solutions (CAS) and Individual Alternative Solutions (IAS) serve 1.71% (241,398 inhabitants) and 0.21% (17,620 inhabitants) of the population, respectively. In 2024, 90% of water samples for basic parameter analysis were collected in urban areas, highlighting underrepresentation of rural areas. Regarding microbiological quality, 11.7% of rural samples showed the presence of Escherichia coli, compared to 2.6% of urban samples; in the first half of 2025, the high proportion of non-compliance in rural areas persisted, reaching 13%, while urban areas recorded 1.7%. These results indicate greater exposure of rural populations to health risks associated with water insecurity. Therefore, strengthening water quality surveillance, along with expanding equitable access to drinking water supply systems, is essential in the context of worsening climate change, which intensifies water scarcity and public health risks, requiring integrated policies of adaptation, environmental justice, and protection of public health.

Regional inequalities in dental caries: Evidence from four decades of Brazilian National Oral Health surveys

Tainá Mafra[1], Lucas Santos[1], Herika Mauricio[2], Rafael Moreira[1]
[1]Saúde Coletiva, Instituto Aggeu Magalhães, Recife, Brazil, [2]Odontologia, Universidade de Pernambuco, Recife, Brazil

INTRODUCTION
National oral health surveys reveal considerable improvements in Brazil's oral health indicators since the first survey. The percentage of caries-free 12-year-olds increased from 3.7% in 1986 to 49.9% in 2023. However, recent data indicate persistent regional inequalities in key oral health outcomes.
OBJECTIVES
To compare the evolution of caries-free prevalence among 12-year-olds across Brazilian regions in national surveys conducted in 1986, 2003, 2010, and 2023, analyzing regional inequality patterns throughout this historical series.
METHODS
Descriptive study using secondary data from national oral health surveys (SB Brasil) conducted in 1986, 2003, 2010, and 2023, focusing on 12-year-olds. We analyzed the evolution of caries-free prevalence, considering national averages and regional variations extracted from official technical reports. Comparative analysis identified patterns and changes in regional distribution of caries-free experience over time, highlighting persistent inequalities and their potential intensification despite overall indicator improvements.
RESULTS
The percentage of caries-free 12-year-olds in Brazil increased from 3.7% (1986) to 49.9% (2023). However, national improvement was not accompanied by reduced regional inequalities. In 2023, while the Southeast region showed 57.6% caries-free adolescents, the North region registered only 34.1%. The gap between these regions was 13.4 percentage points in 2003, widening to 23.5 points in 2023, evidencing worsening interregional inequalities. Additionally, the North, Northeast, and Central-West regions continue showing the lowest percentages of caries-free individuals and highest proportions of untreated caries since the first survey.
CONCLUSIONS
Although Brazil achieved significant advances in adolescent oral health, data demonstrate that regional inequalities not only persist but have intensified over time. Favorable evolution of national indicators may mask growing disparities between regions, highlighting the urgent need for context-sensitive public policies aimed at mitigating territorial inequalities in oral health outcomes.

ABS3884

Access to and use of public and private health services: evidence from a population-based survey in urban brazil

Nina Rodrigues[1], Lhais Medina[1], Margareth Lima[1], Marilisa Barros[1]
[1]Department of Collective Health, School of Medical Sciences, University of Campinas (UNICAMP), Campinas, Brazil

BACKGROUND AND OBJECTIVE
The coexistence of health care privatization and the Unified Health System (SUS) in Brazil is marked by persistent health inequities and limited evidence on population patterns of health care consumption. This study aims to analyze the profile of access to and utilization of public and private health services in Campinas, identifying sociodemographic inequalities based on data from a large and up-to-date municipal health survey (ISACAMP).
METHODS
This population-based cross-sectional study analyzed ISACAMP data stratified by socioeconomic areas. Indicators defining profiles were examined across four domains: sociodemographic and economic characteristics; health conditions and perceived needs; (3) access to, utilization of, or lack of access to health services; and knowledge and evaluation of public and private health services. Analyses were conducted in Stata software and interpreted through an intersectionality-informed framework.
RESULTS
Preliminary results indicate a strong association between health service utilization and coverage type: medical consultation was 2.13 times more prevalent among private health insurance (PHI) holders (PR=2.13; 95% CI: 1.56–2.92). Overall, PHI prevalence was 41.7% (95% CI: 35.8–47.8). Coverage did not differ by sex (p=0.210), but was higher among adults and older adults than adolescents (PR=1.31; 95% CI: 1.10–1.68). Structural disparities were evident: PHI was 1.6 times higher among White individuals compared to Black individuals (49.9% vs 30.5%; PR=1.62; 95% CI: 1.38–1.91) and nearly four times higher among individuals with complete higher education compared to those with no formal education (PR=3.98; 95% CI: 3.22–4.92).
CONCLUSIONS
Access to and use of health services are strongly associated with private financing, reinforcing persistent inequities. The same population holding PHI is also the one that reported medical consultations in the previous year. Future analyses will map these barriers and identify patterns, strengthening integration between universities, management, and communities by translating data into evidence to support territorial decision-making.

ABS3929

Physical activity security: is it time to "change the conversation" for environmental justice in Lower- and Middle-Income Country Settings?

Tracy Kolbe-Alexander[1,2], Estelle Victoria Lambert[2,1], Gregore Mielke[3]
[1]School of Health and Medical Sciences, Faculty of Health, Engineering and Sciences,, University of Southern Queensland, Ipswich, Australia, [2]Research Centre for Health through Physical Activity, Lifestyle and Sport, University of Cape Town, Newlands, South Africa, [3]School of Public Health, Faculty of Medicine,, University of Queensland, Queensland, Australia

INTRODUCTION
While the relationship between physical activity (PA) and health has been well-

established. The link between PA and sustainable development is more recent phenomenon. PA has been described as "choice-based" or "necessity-driven"(1), but we argue that environmental justice is needed for PA security(2) to be achieved in LMICs.
METHODS
We conducted a brief review (SCOPUS,1994-2024), in which "Physical Activity" was used in combination with terms "Health","Behaviour","Environment","Policy","Social determinants","Equity","Sustainable development"and"Human Rights". Secondly, we explored publicly available data (143 countries;LMIC/UMIC,N=99,HIC,N=44) including: GINI,HDI,%urban,% living in slums,life expectancy, obesity, %,deaths due to cardiovascular disease (CVD),road deaths, personal violence%,pollution, public open space (POS),human rights indices and physical inactivity (PiA). Regression analyses were conducted on factors related to environmental justice that may explain differences in PiA in HIC vs LMIC/UMIC settings.
RESULTS
In 1994,858 manuscripts related to PA were cited compared to 30565 in 2024.PA and health articles comprised 40-41% overall,whereas those related to the environment were 3.9% and 6.4%,respectively. Policy-related outputs comprised <4%,social determinants <2% and human rights <1%,even in 2024. PiA prevalence was higher in HIC (33%) vs LMIC/UMIC (25%,P<0.001). Urbanisation,POS,obesity,CVD deaths%,and life expectancy were also significantly higher. In LMIC/UMIC,deaths from air pollution, violence and road incidents were higher (P<0.001); PiA was inversely correlated to %slum dwelling (P<0.001) and positively correlated to %urbanisation. In HIC,PiA was inversely associated with POS (r=-0.46)but in LMIC/UMIC was positively associated with POS (r=0.37, P<0.001). PiA in HIC was positively mediated by %urbanisation, whereas, in LMIC/UMIC,PiA was inversely mediated by %slum dwelling and personal violence(P<0.001).
CONCLUSIONS
Results suggest that built environment attributes impact on PiA differently in HIC vs LMIC/UMIC settings.Slum dwelling persons from vulnerable communities in LMIC/UMIC settings are more physically active, reflecting "necessity-driven vs "choice-based" PA. Further, POS may not address environmental equity in LMIC/UMICs. PA security should be considered as a rights-based issue for urban planners and policy makers.
Popul. Med. 2026;8(Supplement 1):A1386

ABS3969
Experiences and challenges of substance use and misuse among Black African youth in Calgary, Canada
Odette Murara[1]
[1]Social Work, University of Calgary, Calgary, Canada
BACKGROUND
In Canada, substance use is more common among youth and young adults than older groups, with Black African youth facing heightened risk due to intersecting factors such as migration experiences, structural racism, and integration barriers. Substance use has led to severe health and social harms, including overdose-related deaths, chronic illness, housing instability, and family strain. This paper focuses on the lived experiences and structural challenges shaping substance use and misuse among Black African youth and their families in Calgary.
METHODS
A qualitative study design was used to explore experiences of substance use and misuse. In-depth interviews were conducted with 10 Black African youth aged 18 - 25 identified as at risk or in recovery, and with 10 family members. A focus group was also held with Black service providers from Black-serving organizations (n=5), Black community leaders (n=3) and religious leaders (n=2). Data were analyzed using multi-layered thematic analysis supported by NVivo software to identify cross-cutting themes.
RESULTS
Substance use experiences reflected the intersection of addiction, mental health challenges, migration stress, systemic inequities, family dynamics, and cultural contexts. Commonly used substances included alcohol, marijuana, cocaine, and vaping products. Youth described substance use as a coping response to isolation, discrimination, unemployment, educational disruption, and financial insecurity. Peer influence, pressures to assimilate, and intergenerational tensions further shaped risk. Findings show that cultural norms surrounding silence, shame, stigma, as well as lack of trust constrained early help-seeking.
CONCLUSIONS
Substance use and misuse among Black African youth must be understood within broader social, cultural, and structural contexts. The findings underscore the need for culturally responsive, community-led, and prevention-focused public health approaches that address root causes, build trust, and strengthen families before crises escalate.

Community-Led Financial Platforms as Public Health Infrastructure: Leveraging Informal Savings Groups (Stokvels) to Improve Food Security and Dietary Equity in Urban South Africa
Olufunke Alaba[1,2], Vicki Lambert[2], Louise Foley[3], Zulfah Albertyn-Blanchard[2], Feyi Odunitan-Wayas[2], Emma Frew[4], Denis Okova[1]
[1]Health Economics Unit, School of Public Health, University of Cape Town, Cape Town, South Africa, [2]Research Centre for Health through Physical Activity, Lifestyle and Sport, Human Biology Department, University of Cape Town, Cape Town, South Africa, [3]MRC Epidemiology Unit, University of Cambridge, Cambridge, United Kingdom, [4]Centre for Economics of Obesity, Department of Applied Health Sciences, University of Birmingham, Birmingham, United Kingdom
BACKGROUND
Food insecurity and diet-related non-communicable diseases (NCDs) are major public health challenges in low- and middle-income countries. Although social protection and food subsidy programmes are central to public health policy, they often fail to leverage existing community institutions. Informal savings groups, known as stokvels in South Africa, are widespread, trusted, self-governing communities of practice with untapped potential for public health delivery.
METHODS
We implemented a quasi-experimental intervention among 24 women-led stokvels across three low-income communities in Cape Town. All groups received monthly food vouchers (ZAR2000 per group for three months) to subsidize fruit and vegetable purchases. Of the three arms, two intervention arms addressed structural access barriers: last-mile distribution support for bulk produce purchases, and a bilingual mobile application providing nutrition guidance, food storage tips, and cost-saving strategies. Outcomes included household food insecurity (HFIAS), food purchasing and consumption patterns measured at baseline and over three months.
RESULTS
A significant decline in household food insecurity was observed across all groups (p<0.003), with the largest effect in the last-mile distribution arm. Fruit and vegetable consumption increased substantially, particularly for citrus, tomatoes, and potatoes, without compensatory increases in unhealthy foods. Qualitative findings indicated shifts in household food priorities, collective problem-solving, and increased confidence in sustaining healthy food practices.
CONCLUSIONS
Informal savings groups can function as a scalable community-level public health infrastructure by integrating financial, logistical, and informational support for healthy food access. Embedding food and nutrition interventions within existing social institutions offers a cost-effective, equity-enhancing strategy to strengthen food systems, reduce diet-related risk, and advance urban public health policy in resource-constrained settings.

Persistence of limitations in activities of daily living after COVID-19: the role of social determinants and clinical conditions in the Brazilian population
Francisca Elisângela Teixeira Lima[1], Victor Caetano Rodrigues[1], Andrezza Rayana Alves Delmiro[1], Brena Shellem Bessa de Oliveira[1], Glaubervania Alves Lima[1], Luis Angel Cendejas Medina[1], Sara Emilly Lima Sombra[1], Maryanne Cardoso Ponte[1], Fabiano Andrade da Costa[1], Monyka Brito Lima dos Santos[1], Patricia Neyva da Costa Pinheiro[1], Lanese Medeiros de Figueiredo[2]
[1]Departamento de Enfermagem, Universidade Federal do Ceará, Fortaleza/Ceará, Brazil, [2]Departamento de Morfologia, Universidade Federal do Ceará, Fortaleza/Ceará, Brazil
BACKGROUND
Evidence suggests that post-COVID-19 condition is associated with persistent limitations in activities of daily living (ADLs) and poorer quality of life, especially among individuals with a higher burden of comorbidities and social vulnerabilities. This study aimed to analyze the association between social determinants of health and the impact on ADLs in the Brazilian population diagnosed with COVID-19 at least one year prior.
METHODS
An exploratory, cross-sectional, quantitative study was conducted across all Brazilian states with a sample of 419 participants. Data collection took place between June and November 2024, utilizing patient monitoring software to gather sociodemographic data, lifestyle factors, social determinants of health, clinical conditions, and quality of life scales.

RESULTS
A greater impact on ADLs was observed in women compared to men (65.1% vs. 53.8%; p=0.038). Physical activity proved to be a protective factor (p<0.0001), while sleep difficulties were associated with greater functional impairment (p=0.004). Social networks, education, and income showed no statistical significance (p>0.05). Among clinical conditions, the following were associated with greater impairment: cardiovascular disease (76.7% vs. 60.6%; p=0.046), diabetes mellitus (up to 90% with impact; p=0.009), respiratory allergy (p=0.002), dermatological diseases (p=0.001), neurological disease (82.8%; p=0.018), pulmonary disease (100%; p=0.001), severe respiratory failure (83.9%; p=0.010), and muscle weakness (78.2% vs. 54.9%; p<0.0001).
CONCLUSIONS
Even after a minimum interval of one year since diagnosis, the impact on ADLs remains relevant and is more strongly related to female sex, sedentary lifestyle, sleep disorders, and multiple clinical conditions than to economic indicators. These findings highlight the need for continuous rehabilitation strategies and multiprofessional follow-up, focusing on clinically vulnerable groups and the promotion of healthy habits over time.

ABS 4118
Accessibility and Universal Design in the World Health Organization Healthy Cities Initiative: A Qualitative Analysis of Strategies, Language, and Urban Planning Frameworks

Sara Bahen[1]
[1]McMaster University, Hamilton, Canada

BACKGROUND
Urban environments play a critical role in shaping population health, yet many cities remain inaccessible to people with disabilities and aging populations, contributing to health inequities through barriers in housing, transportation, and public space design.– Although the World Health Organization (WHO) Healthy Cities Initiative promotes equity, participation, and sustainable urban development, the extent to which accessibility and universal design are embedded within its strategic frameworks remains unclear.– This study examines how accessibility is explicitly and implicitly addressed within WHO Healthy Cities documentation and evaluates the presence and application of universal design principles in global urban health governance.
METHODS
A qualitative document analysis was conducted using WHO Healthy Cities policy and strategy documents published between 1986 and 2025.– Documents were identified through a structured search of the WHO online repository and screened using predefined inclusion criteria. Documents were reviewed using thematic content analysis in ATLAS.ti, with a coding framework informed by the United Nations Convention on the Rights of Persons with Disabilities, the Sustainable Development Goals, and universal design principles.–
RESULTS
Accessibility was referenced more frequently in later Healthy Cities phases, particularly through concepts such as inclusive governance, functional ability, and age-friendly environments., However, explicit references to persons with disabilities and universal design principles remained limited and inconsistently applied across documents., Universal design was primarily implicit and rarely operationalized through standardized indicators or planning tools.,
CONCLUSIONS
While the WHO Healthy Cities Initiative demonstrates a growing rhetorical commitment to inclusion, accessibility and universal design remain insufficiently institutionalized within its planning and evaluation frameworks.– Embedding clear accessibility standards, universal design frameworks, and participatory accountability mechanisms is essential to advancing equitable, healthy, and inclusive cities globally, in alignment with international human rights and sustainable development commitments.–

Spatial interaction of covid-19 and tuberculosis in Brazil: syndemic cluster evidence

Reginaldo Bazon Vaz Tavares[1], Yan Mathias Alves[1], Nathalia Zini[1], Ariela Fehr Tártaro[1], Thaís Zamboni Berra[1], Maria Eduarda Pagano Pelodan[1], Mariana Gaspar Botelho Funari de Faria[1], Daniele de Moraes Pinheiro[1], Luanne Karolyne Leal dos Santos[1], Aline Aparecida Monroe[1], Jaqueline Garcia de Almeida Ballestero[1], Ricardo Alexandre Arcêncio[1]
[1]Department of Maternal and Child Nursing and Public Health, Ribeirão Preto School of Nursing at University of São Paulo, Ribeirão Preto, Brazil

INTRODUCTION
The covid-19 pandemic has intensified existing social and health inequities, particularly in low- and middle-income countries. In Brazil, tuberculosis (TB) faced additional challenges during the pandemic. This study aimed to identify areas with spatial dependence between covid-19 and TB outcomes, incorporating the Social Progress Index (SPI) as a proxy for social vulnerability.
METHODS
Ecological study using TB cases and deaths from TBWeb and covid-19 data from the Coronavirus Panel, covering municipalities in São Paulo State, Brazil, from February 2020 to December 2023. Notification and mortality rates for both diseases were calculated. Bivariate Local Moran's I was applied to assess spatial autocorrelation between TB and covid-19 rates and the SPI.
RESULTS
There were 36,145 TB cases and 5,389,217 COVID-19 cases, with 2,700 and 168,223 deaths, respectively. Bivariate spatial analysis revealed heterogeneous spatial dependencies across the state. High-High clusters for TB and COVID-19 incidence (Map A) and mortality (Map B) were mainly observed in northern and central regions. TB mortality also overlapped spatially with COVID-19 outcomes (Maps C and D), especially in the northwest and coastal areas. Municipalities with low SPI and high TB mortality (Map E) were mostly along the southeastern coast. Similarly, low SPI and high COVID-19 incidence (Map F) were found in the São Paulo metropolitan area and southern municipalities. These patterns reflect a syndemic interaction shaped by social disparities. Figure 1 – Bivariate spatial autocorrelation between COVID-19 incidence and TB incidence and mortality rates, and Social Progress Index, the state of São Paulo, Brazil (2020–2023).
CONCLUSIONS
The intersection of TB, covid-19, and social vulnerability reflects a syndemic process, in which the co-occurrence and interaction of diseases are driven by structural inequalities. Recognizing these overlapping spatial patterns and their links to social conditions is essential to inform equitable and integrated public health responses to eliminate TB.

Association of age group, religion, and educational level with mental health among Brazilians in post–COVID-19 conditions

Francisca Elisangela Teixeira Lima[1], Maryanne Cardoso Ponte[1], Sara Emilly Lima Sombra[1], Alice Passos do Nascimento[1], Sabrina de Souza Gurgel Florencio[1], Maria Gabriela Miranda Fontenele[1], Maria Williany Silva Ventura[1], Juan David Dussan Chaux[1], Lilia Jannet Saldarriaga Sandoval[1,2], Ana Paula Oliveira Queiroz[1], Cristiana Brasil de Almeida Rebouças[1], Livia Maia Pascoal[3]
[1]Departamento de Enfermagem, Universidade Federal do Ceará, Fortaleza/Ceará, Brazil, [2]Enfermeria, Universidad Nacional de Tumbes, Tumbes, Peru, [3]Departamento de Enfermagem, Universidade Federal do Maranhão, Imperatriz/Maranhão, Brazil

BACKGROUND
Health is influenced by social conditions and determinants that impact quality of life, such as age group, religion, and educational level. In the post–COVID-19 period, the presence or absence of symptoms and sequelae has distinct repercussions on the mental health domain, manifesting differently according to these social determinants. Therefore, this study aimed to verify the existence of an association between age group, religion, and educational level of Brazilians in post–COVID-19 conditions and the mental health domain, as assessed by the Short Form Health Survey-36 (SF-36).
METHODS
An exploratory, cross-sectional, quantitative study conducted across all Brazilian states, with a sample of 854 participants. Data collection was carried out using the Software for Monitoring People with COVID-19, which included an instrument for characterizing individuals in post–COVID-19 conditions and the SF-36, an instrument that assesses quality of life based on eight domains; only the mental health domain was considered in this study. The study was approved by the Research Ethics Committee under opinion No. 6,709,120.
RESULTS
In the mental health domain, statistically significant associations were observed with age group in both groups: participants with symptoms and sequelae (p=0.001) and those without symptoms and sequelae (p=0.010). Religion showed a significant association in both groups: participants with symptoms and sequelae (p=0.012) and participants without symptoms and sequelae (p=0.002). Educational level showed a significant association only in the group without symptoms and sequelae (p=0.005), with a progressive increase in scores according to higher levels of education.
CONCLUSIONS
Mental health in the post–COVID-19 context is intrinsically linked to age group

and religious beliefs, while educational level acts as a positive predictor of mental health in the Brazilian population.

Health Service Utilization and Access in the Municipality of São Paulo: A Contribution from a Population-Based Survey

Marilia Louvison[1], Cristian Arnecke Schroder[1], Alvaro Elias Nunes Mineiro[1], Katia Cristina Bassicheto[1], Edige Felipe de Souza Santos[1], Breno Souza de Aguiar[1,2], Iracema Ester do Nascimento Castro[1,2], Zilda Pereira[1], Moises Goldbaum[1,3], Chester Luiz Galvão Cesar[1]
[1]Faculdade de Saúde Publica da Universidade de São Paulo USP, São Paulo, Brazil, [2]Secretaria Municipal de Saúde de São Paulo, São Paulo, Brazil, [3]Faculdade de Medicina da USP, São Paulo, Brazil

ABSTRACT
Context: This study is based on the ISA-Capital, a population-based health survey and analyzes the use and access to health services, based on an analysis of regional and generational inequalities related to health insurance coverage.
OBJECTIVES
To analyze regional and generational inequalities in access to and use of outpatient health services within the Unified Health System (SUS) in the city of São Paulo in 2024.
METHODS
Data were extracted from representative samples of adolescents, adults, and older adults (10 years or older) participating in a population-based health survey conducted in São Paulo (ISA-Capital) in 2024 (n=5472). Outcomes included the use of health services in the past year and private health insurance. Prevalence estimates and 95% confidence intervals (95% CI) were calculated.
RESULTS
In 2024, 37.8% (95% CI: 33.6% - 42.2%) of the population had private health insurance. Coverage was 43.4% (38.2% - 48.8%) among the elderly and 32.2% (27.3% - 37.5%) among adolescents. Regarding service utilization, 85.0% (83.0% - 86.9%) of the total population had a consultation in the last year, with rates of 92.0% (89.9% - 93.6%) among the elderly and 82.6% (79.2% - 85.6%) among adolescents. Of those who had a consultation, 57.3% (52.6% - 61.8%) used the Unified Health System (SUS). This proportion was 65.7% (59.7% - 71.2%) among adolescents and 54.7% among the elderly. 30.9% (21.5% - 42.3%) in the Central Region and 69.6% (58.7% - 78.7%) in the Southern Region.
CONCLUSIONS
The study identifies significant use of the SUS, with regional and generational inequalities, smaller in regions with smaller populations with private health insurance, such as the elderly population and the population of the Central Regional Health. The study provides important evidence and indicates the relevance of the SUS in promoting equity in public policies that guarantee access to health services.

ABS4178
Reframing Tobacco Control in Africa: Inequality, Industry Power, and Policy Innovation

Olalekan Ayo-Yusuf[1], Anesu Marume[1], Zunda Chisha[2], Winnie Olwal[3], Betina Edziwa[4]
[1]Africa Centre for Tobacco Industry Monitoring and Policy Research, School of Health Systems & Public Health, University of Pretoria, Pretoria, South Africa, [2]Research on Economics of Excisable Products (REEP), University of Cape Town, Cape Town, South Africa, [3]AMREF Health Africa, Nairobi, Kenya, [4]Africa Capacity Building Foundation, Harare, Zimbabwe

BACKGROUND
More than two decades after the adoption of the WHO Framework Convention on Tobacco Control, Sub-Saharan Africa faces a complex tobacco control landscape shaped by persistent socioeconomic inequalities, aggressive tobacco industry interference, and emerging challenges related to youth and gender. At the same time, governments are under pressure to mobilise domestic resources for health and advance sustainable development. This panel reframes tobacco control in Africa as a core equity, governance, and sustainability issue rather than a narrow regulatory concern.
METHODS
This organised panel symposium brings together complementary empirical, policy, and political-economy perspectives. The session is chaired by Betina Edziwa (Africa Capacity Building Foundation, Zimbabwe), who frames tobacco control as an equity and sustainability challenge in Africa. Panellist presentations include: Anesu Marume (University of Pretoria, South Africa) on socioeconomic inequalities in smoking following FCTC implementation in Sub-Saharan Africa; Lekan Ayo-Yusuf (University of Pretoria, South Africa) on lessons from five years of monitoring tobacco industry interference across African countries; (3) Zunda Chisha (University of Cape Town, South Africa) on the political economy of tobacco taxation and opportunities for domestic health financing; and Winnie Olwal (AMREF, Kenya) on why youth and gender must shape Africa's tobacco control agenda. The session concludes with an interactive, moderated discussion to draw cross-country lessons and identify policy priorities.
RESULTS
Despite policy progress, across settings, evidence shows widening socioeconomic gradients in smoking, sustained industry interference undermining policy implementation, under-utilisation of tobacco taxation for health financing constrained by political and institutional barriers rather than technical feasibility, and growing vulnerabilities among youth and women driven by targeted marketing and novel products.
CONCLUSIONS
Equitable and sustainable tobacco control in Africa requires confronting commercial power, strengthening governance, and centering youth and gender in policy design. Cross-sectoral, politically informed strategies are essential to accelerate progress and protect future generations.

ABS4192
Food Insecurity in Urban Brazil: Implications for Health Promotion and Intersectoral Action

Silvana Silva[1]
[1]Instituto de Saúde Coletiva, Universidade Federal da Bahia, Salvador, Brasil

INTRODUCTION
Food is recognized as a social determinant of health, and both are human rights. Achieving the Sustainable Development Goal (SDG) on Good Health and Well-Being is closely linked to strengthening food and nutrition security aimed at overcoming hunger, as established by the SDG on Zero Hunger. In Brazil, food insecurity (FI) remains a relevant public health issue, requiring territorial analyses. This study aimed to analyze the prevalence of food insecurity across the Health Districts of Salvador, Bahia, which function as territorially based management units of the Unified Health System (SUS).
METHODS
This cross-sectional study used data from the survey "Quality of the Urban Environment of Salvador (QUALSalvador)," conducted between 2019 and 2021, with a representative sample of 15,187 households distributed across all neighborhoods of the city. Food insecurity was measured using the Brazilian Food Insecurity Scale and analyzed in aggregate for the 12 Health Districts.
RESULTS
Most Health Districts presented food insecurity prevalence rates equal to or higher than 40%, revealing significant inequalities within the urban territory, with greater vulnerability among women and Black populations.
CONCLUSIONS
This scenario highlights the need to strengthen health promotion and prevention actions within the SUS, in accordance with the National Food and Nutrition Policy, including food and nutrition surveillance and the promotion of breastfeeding. It also underscores the importance of articulating cross-cutting policies, such as the National Policy for the Comprehensive Health of the Black Population, the National Policy for Women's Health Care, and the National Food and Nutrition Security Policy, as well as intensifying intersectoral strategies. In the urban context, initiatives such as the School Health Program, the National Strategy for Food and Nutrition Security in Cities, and the United Nations' New Urban Agenda are essential for promoting equity, improving quality of life, and ensuring the Human Right to Adequate Food.

"Positive Signage and Certification as Complementary Strategies for Tobacco-Free and Health-Promoting Environments: Experiences from Switzerland"

Susann Koalick[1]
[1]Network Forum Nikotinprävention und Beratung Schweiz (FNBS), Zurich, Forum Nikotinprävention und Beratung Schweiz (FNBS), Zurich, Switzerland

INTRODUCTION
the forum nikotinprävention und beratung schweiz (fnbs) is a national network

that develops and implements evidence-based strategies for tobacco and nicotine prevention in various institutional settings. its aim is to anchor health-promoting environments in a sustainable way. fnbs collaborates with hospitals, universities, hotels, and other organizations, combining practical expertise with internationally recognized standards.
METHODS
a central tool of fnbs is positive signage, guided by the principle "guidance instead of prohibition." the signs rauchfrei – smoke free® and raucherzone – smoking area® provide clarity for staff, patients, guests, and visitors. the "signalisieren" process includes consultation, situational analysis, selection and design of the signs, as well as support during implementation and follow-up. this makes institutional rules visible and increases acceptance. as a complementary process, fnbs also offers the international gnth certification (bronze/silver/gold) for healthcare institutions. this certification assesses leadership and strategy, treatment, staff training, workplace health promotion, communication, public engagement, and the implementation of smoke-free environments. re-certification every four years ensures sustainability.
RESULTS
between 2021 and 2025, signs were successfully introduced in hospitals, hotels, and universities of applied sciences. feedback indicates clearer orientation in daily routines, fewer conflicts between smoking and non-smoking individuals, and greater visibility of preventive messages. institutions that additionally completed the certification process reported strengthened internal structures and increased credibility externally. the combination of visible signage and quality-assured certification proved to be particularly effective.
CONCLUSIONS
fnbs integrates network expertise, innovative positive signage, and international quality standards. experiences in switzerland demonstrate that this combination effectively supports the creation of health-promoting environments. the model shows strong potential for transfer to other countries and contexts and contributes to the global public health goals of equity, sustainability, and inclusivity.

School Nutrition Programs in Dubai: A Landscape Analysis
Nour Abu Mahfouz[1]
[1]College of Medicine, Mohammed Bin Rashid University of Medicine and Health Sciences, Dubai Health, Dubai, United Arab Emirates
INTRODUCTION
Little is known about the execution of School Nutrition Programs (SNPs) within schools across the public and private sectors in Dubai, United Arab Emirates. This highlights the importance of capturing an inside perspective about the specificities of the SNPs to ensure their effective, efficient, and equitable implementation across schools, irrespective of whether they are public or private.
OBJECTIVE
The overall purpose of this study was to develop insight into SNPs in Dubai and to investigate the difference in characteristics of those SNPs between the public and private sectors.
METHODS
This study relied on a quantitative, tailor-made survey. The data were analyzed using SPSS; descriptive analysis consisted of computing the proportions for all the variables. In terms of inferential analysis, chi-square test of independence was selected to determine whether there are associations between the categorical variables (i.e., the various characteristics of the SNPs, and whether the corresponding schools are public or private).
RESULTS
Out of 75 school representatives who were invited to participate in the current study, 60 responded, of whom 48 school representatives indicated that their respective schools had SNPs. These 48 SNPs had varying implementation scopes and program compositions of Parents' Involvement, Lunch Box, Educational Curriculum, Hydration, Awareness Activities, School Canteen, and/ or Food Safety and Hygiene. The stakeholders involved in developing and maintaining the respective SNPs and the intended outcomes of those programs also differed across the schools.
CONCLUSIONS
This study highlights the importance of the proposed reformation around SNPs in Dubai to consider the governance structure on the local and national levels, quality assurance measures, stakeholder engagement, and programs' intended outcomes and compositions. It proposes the enactment and maintenance of holistic, school-level healthy living programs that include nutrition as part of a more comprehensive approach to fostering the students' individual and collective wellbeing.

ABS0545
Universal health coverage implementation in sub-saharan Africa: challenges, reforms, and policy recommendations for national sustainability
Olubunmi Ogbodu[1], Constance Rusike[1]
[1]Department of Human Biology, Walter Sisulu University, Mthatha, Eastern Cape, South Africa
BACKGROUND
Universal health coverage is a global health agenda aimed at improving health outcomes, reducing poverty, and promoting economic reforms needed to transform the country's healthcare system by improving access, quality, and equity. Despite its laudable objectives, multifaceted challenges have been reported with the implementation in different African countries. African countries are making conscious efforts to achieve universal health coverage (UHC) through healthcare reforms to reduce out-of-pocket expenditure (OOP) and improve access to quality health services for their citizens.
METHODS
Using the Preferred Reporting Items for Systematic Reviews and Meta-Analyses (PRISMA) guidelines, the review synthesises evidence from electronic databases; Scopus, African Journal Online, PubMed and ScienceDirect, covering studies from 2000 to 2025. From a pool of 99 journal articles that met the inclusion criteria, 12 were identified as directly relevant.
RESULTS
The review describes challenges involved in driving the UHC agenda and lessons learned from UHC implementation in African countries, specifically in Rwanda, Ghana, Kenya, South Africa, and Nigeria. Key drivers of reforms, such as healthcare financing reforms and multi-stakeholder initiatives, aimed at strengthening the healthcare system and improving health outcomes, were discussed. Common barriers to UHC in selected sub-Saharan African countries: structural, financial, political, and social factors were described.
CONCLUSIONS
This paper supports policy reforms and decision-making towards universal health coverage, attainment, and sustainability in Sub-Saharan Africa.

ABS0561
We can't talk about it: Youth voices on SRH in Nepal
Sabitra Kaphle[1], Om Baral[1], Catherine O'Mullan[1]
[1]Public Health, Central Queensland University, Melbourne, Australia
Sexual and reproductive health (SRH) remains a culturally sensitive and often stigmatized topic among youth in Nepal. Despite growing access to formal education and digital platforms, young people continue to face significant barriers in acquiring accurate SRH knowledge, accessing services, and engaging in open dialogue. This qualitative study explores the lived experiences of 40 Nepali youth across diverse genders and socio-cultural contexts to identify the key factors shaping their SRH understanding and practices. The results suggest that young people knowledge is shaped by myths and anecdotes, with limited formal education on SRH topics and their preference for informal and digital sources, such as family, peers, and online platforms, is often driven by privacy concerns and mistrust in formal systems. There is a strong influence of gendered cultural and social norms, including menstruation-related restrictions and stigma surrounding premarital sex that creates barriers to open discussion and healthcare access, and constantly rooted in shame, fear, and social taboos. There is an aspiration for youth-driven solutions that focus on community engagement, family-inclusive approaches, and youth-friendly, culturally sensitive SRH education. This study highlights the urgent need for multi-level interventions that integrate formal education, digital literacy, and community-based support. Centering youth voices is essential to dismantling harmful norms and fostering inclusive, equitable SRH outcomes in Nepal and similar socio-cultural contexts.

Strategies to enhance the approach to prostate cancer screening of South African black men in the Free State: a Delphi study
Matthew Olukayode Abiodun Benedict[1], Wilhelm Johannes Steinberg[1], Frederik Claassen[1], Nathaniel Mofolo[1]
[1]Family Medicine, University of the Free State, Bloemfontein, Free State province, South Africa
BACKGROUND
The incidence and mortality of prostate cancer (PCa) are rising disproportionately

among black men in South Africa. Emerging evidence suggests that prostate-specific antigen (PSA) screening offers greater net benefit for black men than for the general population. However, gaps in Knowledge, Attitudes, and Practices (KAP) regarding PCa screening persist among both primary healthcare providers (HCPs) and healthcare users (black men). In addition, there is limited research on strategies to address these gaps. This study aimed to identify complementary strategies to strengthen the approach to PCa screening for African men in the Free State province of South Africa, from the perspectives of primary HCPs and healthcare users.
METHODS
A three-round modified Delphi survey was conducted to achieve this aim. Consensus was defined a priori as ≥70% agreement among panel members.
RESULTS
Nineteen multidisciplinary experts participated in the survey. Consensus was reached on 34 strategies to improve the approach to PCa screening in the study context. Proposed strategies focused on community health education, including priority topics, methods of delivery, appropriate venues, and key personnel to provide the education. In addition, continuing education topics and preferred instructional methods were recommended for primary HCPs.
CONCLUSIONS
Given the documented KAP gaps related to PCa screening among primary HCPs and black male healthcare users, this study established expert consensus on a set of complementary strategies to enhance the approach to PCa screening for South African black men in the Free State province.

Understanding Family Planning Dynamics: Knowledge, Usage, and Challenges among women in Makurdi, Benue State, Nigeria

Pauline N Atser[1], Mercy E Ochigbo[1], Sandra T Ortsega[1], uchenna Benedine Okafor[2], mildred mooi[2], Daniel Ter Goon[3]
[1]Nursing Sciences, Benue State University, Makurdi, Nigeria, [2]Nursing Science, Walter Sisulu University, Umthata, South Africa, [3]Public Health, University of Limpopo, Polokwane, South Africa

BACKGROUND
Family planning remains a cornerstone of reproductive health1,2, contributing to maternal and child survival, reducing unintended pregnancies, and improving socio-economic outcomes3. Despite these benefits, utilisation of family planning services in many parts of Nigeria remains suboptimal, often influenced by socio-cultural and religious factors.4–8.
OBJECTIVE
This study assessed the knowledge, utilisation, and challenges associated with family planning methods among women attending the Family Support Clinic in Wadata, Makurdi.
METHODS
A descriptive cross-sectional study was conducted among 80 women of reproductive age, selected purposively. Data were collected using a structured questionnaire on socio-demographic characteristics, knowledge, utilisation, and challenges of family planning. Findings were analysed using descriptive statistics and presented in frequencies and percentages.
RESULTS
Respondents showed a strong understanding of family planning, correctly identifying natural, hormonal, and permanent methods (100%) and barrier methods (91%). Key benefits mentioned included preventing unwanted pregnancies (95%), reducing pregnancy-related complications (81%), and enhancing maternal and child health (68%). Usage was also high, with 91% reporting ever using a method and 94% currently using one. Barrier methods (81%) and hormonal methods (71%) were the most common, with no reports of permanent methods. Challenges faced included religious beliefs (84%), cultural perceptions (73%), and access to services (100%). Partner involvement was prominent, as all respondents (100%) reported discussing family planning with their spouses.
CONCLUSIONS
The study showed high knowledge and utilisation of family planning among respondents, although socio-cultural and religious barriers still exist. Nurses and other healthcare providers need to enhance culturally sensitive health education, improve service accessibility, and encourage male involvement to maintain progress in family planning use.

Implementation of the Italian National Prevention Plan 2020-2025 at local level: strategies, outcomes, and future perspectives

Piera Ceschi[1], Franco Finato[2], Verena Baumgartner[1], dennis Ramus[3], Catalina Doina Cristofor[1], Lorella Zago[4], Ivo Paris[4], Antonio Fanolla[5], Dagmar Regele[3]
[1]Department of Prevention - Epidemiological Surveillance Unit, South Tyrolean Healthcare Services, Bressanone/Brixen (BZ), Italy, [2]Staff of Project Management, South Tyrolean Healthcare Services, Bolzano/Bozen, Italy, [3]Department of Prevention, South Tyrolean Healthcare Services, Bolzano/Bozen, Italy, [4]Office for Prevention and Health Promotion, Automous Province of Bolzano/Bozen, Bolzano/Bozen, Italy, [5]Health Observatory, Automous Province of Bolzano/Bozen, Bolzano/Bozen, Italy

Background The Italian Public Health Service provides universal coverage for all citizens and residents and the main operational tool for planning cross-cutting public health strategies is the National Prevention Plan (NPP). In South Tyrol, the Local Prevention Plan 2021–2025 has been implemented in alignment with the NPP. This abstract describes strategies, outcomes, and future perspectives related to the implementation of the local plan over the past five years and to the development of the upcoming local Plan. Methods The implementation of the local plan promotes a multisectoral and integrated vision, adopts a life-course approach, and applies a health equity lens, supporting the achievement of the Sustainable Development Goals (SDGs). In line with the NPP, the local plan was developed across six main macro areas: chronic non-communicable diseases, substance addiction and related issues, road and domestic accidents, occupational accidents and diseases, environment, climate and health, and infectious diseases. A dedicated group was institutionalized at local level to monitor progress toward the defined goals. Results The implementation of the local Plan was ensured through its legal transposition into a local decree in 2021. From 2022 to 2025, the initiatives were regularly implemented and monitored. Translating national strategies into concrete, community-level actions that directly address local health needs and determinants proved crucial for making prevention more effective and sustainable. The local Plan was adapted to address the demographic and socioeconomical determinants of health, relying on data provided by the local health and equity profile. Outcomes were reported every six months to the local policymakers and annually to the Ministry of Health for national evaluation. Conclusion The Local Prevention Plan 2021-2025 enabled the implementation of interventions aligned with the national governance. This Plan provides a solid foundation for the development of the next local Prevention Plan 2027-2031.

Improving access to sexual and reproductive health services for boys and young men: a systematic review

Mary Luwedde[1], Moses Tetui[2], Zelalem Mengesha[3], Anke Rotsaert[4], Bernadette Hensen[4], Mazen Baroudi[1]
[1]Department of epidemiology and global health, Umeå University, umeå, Sweden, [2]School of Public Health Sciences, University of, Waterloo, Canada, [3]Health Research Institute, University of Canberra, Canberra, Australia, [4]Department of Public Health, Institute of Tropical Medicine, Antwerp, Belgium

INTRODUCTION
Adolescent boys and young men (ABYM) face heightened sexual and reproductive health (SRH) risks yet remain underserved by existing health systems.
METHODS
This systematic review synthesized evidence from 32 studies published between 2000 and 2024 that evaluated interventions to improve ABYM's access to SRH services globally. Guided by the ecological framework of healthcare access, interventions were categorized across five levels – individual, healthcare encounter, organizational, community, and policy – and assessed against the dimensions of approachability, acceptability, adequacy, affordability, and quality.
RESULTS
Findings reveal that successful interventions combined multiple strategies, including peer-led education, male-friendly service redesign, digital platforms, and community mobilization. Key determinants of effectiveness included confidentiality, gender-responsive provider training, integrated referral systems, and culturally aligned programming. Conversely, programs that lacked male-specific components, relied solely on digital tools, or failed to address stigma and gender norms demonstrated limited impact. Persistent challenges include deep-rooted cultural expectations, insufficient institutional capacity, inadequate male-oriented training, and underrepresentation of low-income contexts in the evidence base.
CONCLUSIONS
The review highlights the need for coordinated, gender-transformative approaches that span individual, organizational, and policy domains. Expanding male-centered strategies within inclusive health systems offers the strongest pathway toward

equitable, sustainable SRH access for ABYM

Exploring participants insights on the adoption of plant-based diets: South African context
Vhushavhelo Nedzingahe[1], Mthokozisi Kwazi Zuma[2], Nelene Koen[1], Xikombiso Gertrude Mbhenyane[1]
[1]Division of Human Nutrition, Stellenbosch University, Cape Town, South Africa, [2]Impact and Partnerships Division, Agricultural Research Council, Pretoria, South Africa
INTRODUCTION
Plant-based diets focus on eating more foods derived from plants, such as fruits, vegetables, grains, nuts, and seeds, while reducing the consumption of animal products like meat and dairy (WHO, 2021). Shifting the focus to plant-based food sources can lower non-communicable diseases prevalence and can contribute to the environmental impact sustainability (FAO et al, 2025). This study explored the participants insights on a strategy that aims to promote the consumption of plant-based diets for their health and environmental benefits.
METHODS
The study design was a Participatory Action Research, using qualitative approach. A total of eight co-creation workshops were conducted in four South African provinces. Data were analysed using ATLAS.ti 24 software, employing systematic coding and a thematic analysis approach to identify patterns, generate themes, and interpret the findings in relation to the study objectives.
RESULTS
Participants mentioned various factors that should be considered for plant-based diets adoption in South Africa, as the country has a meat-eating culture. Discussions centred on four key areas: enabling consumption, proposed solutions, stakeholders and implementors. To enable consumption, participants highlighted the need for greater affordability and accessibility of plant-based options. Proposed solutions included public awareness campaigns focused on health and environmental benefits, culinary education and supportive government policies. Participants emphasised that a successful strategy requires the involvement of various stakeholders, including government bodies, the food industry, healthcare professionals' educational institutions and media/influencers. Finally, the group identified implementors as key organisations and individuals, such as public health agencies, NGOs focused on sustainability and food, food service providers and community leaders, who would be responsible for putting the actions into practice at local and national levels.
CONCLUSIONS
Promoting plant-based diets requires a collaborative effort from various stakeholders. The collaborative effort can be through awareness campaigns, workshops, education and policy implementation to encourage healthier food environments.

Oral Health Status of School Children in South Africa: Quasi Experimental Research
Tshifhiwa Netshapapame[1]
[1]Public Health and Health Systems, University of Limpopo, Polokwane, South Africa
BACKGROUND
The global prevalence of oral disease including dental caries varies sig-nificantly across different regions, and South Africa is no exception. Although dental caries is a major public health concern, it is largely preventable through the promotion of proper oral hygiene practices and screening. The study aimed to assess the oral health status of school children within selected primary schools in the Tshwane District, South Africa.
METHODS
The study used a quasi-experimental design employing a quantitative research approach, structured into three phases: a pre-test assessment, the implementation of the intervention, and a post-test evaluation. Dental screening was conducted on 390 primary school children selected from five selected primary schools. and participated willingly in the study. Data analysis was conducted using IBM SPSS, incorporating both descriptive and inferential statistical tools.
RESULTS
Prior to screening, 75.9% of partici-pants exhibited dental caries, while only 24.1% showed no signs of tooth decay. The participants' oral hygiene care improved after reported high plaque score (19.0%) pre intervention which decreases (1.8%) post intervention, those with poor oral hygiene reduce (30.1%) pre intervention as compared (16.2%). The hygiene care improved after reported high plaque score (19.0%) pre intervention which decreases (1.8%) post inter-vention. The proportion of dmft in primary teeth recorded 37.3% pre intervention higher than post intervention (23.2%). Additionally, the record of DMFT in permanent teeth (49.2%) pre intervention compared to the post intervention (40.8%). The study reported similar percentage on the treatment during pre and post intervention (75.9%). Conclu-sion: Dental screening intervention yielded promising short-term results, particularly in plaque reduction and caries detection. However, its long-term success hinges on inte-grating school efforts with parental support and improving access to follow-up dental care. A comprehensive, multi-stakeholder approach remains essential to ensure lasting oral health benefits for children

ABS1133
Perceptions and Attitudes of Students Regarding Contraceptive Use at the University of Limpopo
Tshifhiwa Netshapapame[1]
[1]Public Health and Health Systems, University of Limpopo, Polokwane, South Africa
INTRODUCTION
Contraceptive use among university students remains a vital aspect of promoting sexual and reproductive health. Despite the availability of contraceptive methods and awareness campaigns, unintended pregnancies and sexually transmitted infections (STIs) continue to be reported among students. Understanding students' perceptions and attitudes towards contraceptives is crucial for improving uptake and guiding educational interventions.
AIM
The study aimed to explore the perceptions and attitudes of students regarding contraceptive use at the University of Limpopo.
METHODS
A qualitative, descriptive research design was employed to examine the perceptions and attitudes amongst students at the University of Limpopo. Participants were selected using a non-probability purposive sampling technique. The study population comprised university students aged 17–24 years. Data were collected through focus group discussions consisting of 8 to 9 participants per group, with a total of 5 focus group discussions conducted. Data analysis followed Tesch's open-coding approach. To ensure the trustworthiness of the study, the principles of credibility, transferability, dependability, and confirmability were rigorously applied.
RESULTS
Three main themes and twelve sub-themes emerged from the data analysis. The findings revealed that students possessed varying levels of knowledge about contraceptives, with some demonstrating misconceptions and reliance on peer information rather than professional guidance. Perceptions about contraceptive effectiveness and side effects influenced their willingness to use them. Cultural norms, partner influence, and social stigma were identified as key factors shaping attitudes toward contraceptive use.
CONCLUSIONS
Extensive educational campaigns regarding sexual and reproductive health need to be strengthened on campus to provide clear, accurate, and easy-to-understand information on contraceptive methods

ABS1136
Healthcare utilisation among adult men in Mbombela Subdistrict, Mpumalanga Province, South Africa: A mixed method analysis
Tshifhiwa Netshapapame[1]
[1]Public Health and Health Systems, University of Limpopo, Polokwane, South Africa
BACKGROUND
Men in marginalised communities face barriers to accessing healthcare, resulting in poor health outcomes.
OBJECTIVE
This study assessed healthcare service utilisation and explore strategies to improve access among adult men in the Mbombela Subdistrict, Mpumalanga, South Africa.
METHODS
An explanatory sequential mixed methods was employed. Quantitative data from 398 adult men purposively selected, were analysed using SPSS. Qualitative data from 20 in-depth interviews were analysed thematically using ATLAS.ti.
RESULTS
Majority of responded were between 25-49 years old (69.09%) and most (63.57%)

accessed health facilities and 79.9% found clinics accessible and utilisation remains limited due to socio-economic challenges, 61.05% were unemployed, 51.51% had no income, 50.75% smoked, and 70.35% consumed alcohol. Qualitative findings revealed reluctance to fear of diagnosis, stigma, masculinity norms, long waiting times and unfriendly treatment further.
CONCLUSIONS
Despite positive perceptions of utilisation of health clinics among men, socio-economic and cultural barriers persist. Strengthening health clinic services, expanding mobile services, and addressing undesirable masculinity norms can improve access and outcomes.

A model for improving pastoral support and care for church members living with human immunodeficiency virus and/or acquired immunodeficiency syndrome in Limpopo Province

Tshifhiwa Netshapapame[1]
[1]Public Health and Health Systems, University of Limpopo, Polokwane, South Africa

BACKGROUND
Human immunodeficiency virus (HIV) continues to be a major public health issue, with high infection rates and significant mortality. The role of churches in HIV prevention has been largely debated, particularly concerning the use of condoms.
AIM
The model's objective was to assist pastors in enhancing support and care for individuals living with HIV, ultimately improving their quality of life.
METHODS
Data were collected using a semi-structured interview guide. Thematic analysis revealed four major themes: pastors' experiences regarding HIV and/or AIDS, pastors' knowledge of HIV and/or AIDS, pastors' attitudes towards HIV and/or AIDS and pastors' practices concerning HIV and/or AIDS.
RESULTS
The findings highlighted challenges in pastoral care because of a lack of knowledge and training, alongside negative attitudes and practices towards people living with HIV. A model was developed to combat HIV and/or AIDS, improve pastoral care and counselling, enhance the quality of life for people living with HIV and reduce new HIV infections among church members. The model's development was guided by the Context, Input, Process and Output (CIPO) theory system.
CONCLUSIONS
The research findings underscore the importance of integrating people living with HIV in HIV and/or AIDS prevention efforts within church settings and enhancing pastoral care and counselling

Impact of a Nationwide Youth-Led Anti-Tobacco Campaign Initiative in Nepal

Nishant Pandey[1], Shambhawi Adhikari[2], Aayush Bist[3], Prajjwal Pyakurel[4], Pradish Poudel[5]
[1]MBBS, Manipal College of Medical Sciences, Pokhara, Nepal, [2]Department of Public Health, B.P. Koirala Institute of Health Sciences, Dharan, Nepal, [3]Department of Surgery, Nepalgunj Medical College, Kohalpur, Nepal, [4]Massachusetts General Hospital, Harvard Medical School, Boston, United States, [5]Harvard Medical School, Boston, United States

BACKGROUND
Tobacco causes over 27,000 deaths annually in Nepal, with adolescent initiation driving lifelong addiction. Despite strong legislation - 90-100% pictorial health warnings (2024), bans on sales to minors, and restrictions near schools, weak enforcement and e-cigarettes/vapes sustain adolescent tobacco use. In response, Nepal Health Corps (NHC), and the World Federation of Public Health Associations (WFPHA), implemented a nationwide school-based anti-tobacco campaign to improve adolescents' tobacco-related knowledge, attitudes, and advocacy.
METHODS
The Nationwide Anti-Tobacco Campaign 2025 was conducted from February to July 2025 across all seven provinces of Nepal. Trained medical and public health student volunteers delivered standardized 1–2-hour interactive sessions in 90 public and private schools to students in Grades 6–12. A pre–post questionnaire design assessed knowledge of tobacco harms, addiction, passive smoking, and willingness to engage in peer advocacy. Aggregated quantitative data were analyzed descriptively and complemented by qualitative stakeholder insights.
RESULTS
A total of 6,160 students participated (55% boys, 45% girls), representing 90 schools (60% public, 40% private) from urban (80%) and rural (20%) settings. Correct identification of nicotine as the addictive component of tobacco increased from approximately 70% pre-session to 98% post-session. Knowledge of passive smoking improved from ~50% to ~90%, while correct identification of non-smoking tobacco products increased from ~60% to ~95%. Willingness to participate in peer support and tobacco-free advocacy rose from ~55% pre-session to ~85% post-session with 2,968 students (48.18%) volunteered to serve as "Tobacco Champions" post-session. Persistent challenges included easy access to tobacco near schools, peer pressure, and normalization of vaping.
CONCLUSIONS
This large-scale, youth-led school-based intervention improved tobacco-related knowledge and advocacy intentions among adolescents across Nepal, supporting peer-driven tobacco control strategies for health equity and reinforcing evidence on the effectiveness of similar-age peer education in schools.

Effects of Forest Therapy on Quality of Life among Middle-aged and Older Adults: A Comparative Analysis by Age Group and Socioeconomic Status

Sieon Kim[1], Minseo Park[1], Dahye Kim[1], Changyeop Oh[1], Yebin Kang[1], Gaeun Kwon[1], Choong-hee Park[2], ChangHyou Kim[2], JeongHo Choi[2], Geonwoo Kim[1]
[1]Department of Forest Environmental Resources, Gyeongsang National University, Jinju, Republic of Korea, [2]Korea Forest Welfare Institute, Daejeon, Republic of Korea

INTRODUCTION
Middle-aged and older adults face increasing vulnerability to chronic disease, functional decline, and social isolation with aging. These challenges are complex to address through medical treatment alone, underscoring the need for preventive approaches that enhance physical and mental well-being in daily life. Nature-based interventions(NBIs), including forest therapy, have demonstrated psychological and physiological benefits for older adults; however, evidence on differential effects by age and socioeconomic status remains limited. This study compared the effects of a forest therapy program across age groups and examined effect sizes by income level and self-rated health.
METHODS
A pre–post intervention study was conducted with 939 middle-aged and older adults participating in a forest therapy program operated by the Korea Forest Welfare Institute. Participants were categorized into two age groups: 50s–60s(n=459) and 70s–80s and older(n=480). Quality of life was assessed using the World Health Organization Quality of Life-BREF(WHOQOL-BREF). Subgroup analyses by income level and self-rated health were conducted using paired t-tests, one-way ANOVA with Tukey HSD post-hoc tests, and multiple regression analysis.
RESULTS
Quality of life improved significantly in both age groups($p<0.001$). The 70s–80s and older group showed larger effect sizes(Cohen's d=0.92, CI: 0.81-1.02) than the 50s–60s group(d=0.60, CI: 0.50-0.70). Low-income participants in the older group exhibited the greatest improvement(+1.90, d=1.19). Participants with poor self-rated health demonstrated larger effects (d=1.16 in the older group). Multiple regression analysis showed that self-rated health(β=-0.42, $p<0.001$) and age group(β=0.17, $p<0.001$) significantly predicted improvement(R=0.49).
CONCLUSIONS
Forest therapy, as a non-pharmacological intervention, significantly improved Quality of life among middle-aged and older adults, with the strongest effects observed in low-income individuals aged 70 and older. These findings suggest that the benefits of forest therapy vary by age and socioeconomic status. NBIs may represent an effective public health strategy to promote healthy aging and advance health equity.

Impact of an educational intervention on knowledge, attitude and practices of community members on schistosomiasis in Nelson Mandela Bay, South Africa

Prince Campbell[1], Janine Adams[2], Melusi Thwala[3], Opeoluwa Oyedele[4], Paula Melariri[1]
[1]Environmental Health, Nelson Mandela University, Gqeberha, South Africa, [2]Institute for Coastal and Marine Research and Department of Botany, Nelson Mandela University, Gqeberha, South Africa, [3]Academy of Science of South Africa, Pretoria, South Africa, [4]Computing, Mathematical and Statistical Sciences, University of Namibia, Windhoek, Namibia

BACKGROUND

schistosomiasis disproportionately affects populations living in low socio-economic settings with inadequate access to safe water, sanitation, and hygiene (WASH). Transmission is closely linked to community knowledge, attitudes, and practices (KAP) related to water contact and disease prevention, with health education playing a critical role in behaviour change. This study assessed community KAP on schistosomiasis in Nelson Mandela Bay, Eastern Cape, and evaluated the impact of a targeted educational intervention.
METHODS
a quantitative cross-sectional design with pre- and post-intervention assessments was employed in the Kariega and Kwa Nobuhle communities. Adults aged 18–65 years residing within 5 km of selected water bodies were recruited. A structured questionnaire was administered before the intervention and repeated three months afterwards. Data were collected using questionpro and analysed using microsoft office 365 (2019) and r software (v4.3.1).
RESULTS
a total of 380 participants completed both assessments (51.1% males; 48.7% females). Prior to the intervention, 91.3% of respondents reported no knowledge of schistosomiasis. Post-intervention, mean knowledge scores increased significantly (mean difference = 7.2 ± 2.5; $p < 0.001$), alongside improvements in attitudes (mean difference = 1.2 ± 1.1; $p < 0.001$). Mean practice scores declined from 12.0 ± 2.5 to 2.1 ± 0.5, reflecting a substantial reduction in high-risk behaviours ($p < 0.001$). Knowledge and attitude were positively correlated pre-intervention ($r = 0.23$; $p < 0.001$), while post-intervention attitudes were negatively correlated with unsafe practices ($r = -0.13$; $p = 0.013$). Higher educational attainment predicted greater knowledge, while longer residence duration was associated with poorer practices. Several socio-demographic factors influenced post-intervention attitudes.
CONCLUSIONS
the educational intervention significantly improved KAP related to schistosomiasis. Sustained recall of key prevention messages after three months underscores the effectiveness of community-based health education in endemic settings.

Beyond pilots: sustainability strategies in the tuscan living lab's healthy eating promotion activities

Chiara Ferravante[1], Francesca Milani[1], Fabio Consalez[2], Anant Jani[3], Eluisa Lo Presti[1], Valeria Massei[1]
[1]Azienda USL Toscana Nord Ovest, Pisa, Italy, [2]Sustainable Food Systems - ICLEI European Secretariat, Freiburg im Breisgau, Germany, [3]Heidelberg Institute of Global Health - University of Heidelberg, Heidelberg, Germany
INTRODUCTION
Promoting healthy and sustainable eating behaviors in youth is recognized as a public health priority and a shared global challenge1. Although evidence exists on effective strategies to support healthy eating, ensuring long-term sustainability remains a challenge, particularly when interventions need to scale into consistent and sustained practices2. To address this need, the Tuscan Living Lab, within the European FEAST project, implemented and scaled a successful intervention co-created with middle and high school students while also ensuring the long-term sustainability of a public outpatient clinic for the treatment of youth overweight/obesity.
METHODS
School-based project: 110 students participated in co-creating the intervention, dissemination strategies were identified to share seven thematic modules, which included theoretical and practical lessons on healthy eating developed during the intervention. Outpatient clinic: after successfully testing the planned care pathway, a process was established to support its long-term implementation and funding. A workshop with key district level professionals consolidated agreement on the need for the clinic, after which a formal request was submitted to the Health Directorate to include it within the ambulatory specialist service package, highlighting its proven ability to respond to local needs.
RESULTS
A toolkit for teachers was developed, available in both English and Italian; it included: a slide deck; set of interactive activities; and a booklet providing, for each slide, key concepts to convey and tips. The toolkit has been disseminated and preliminary pathways for replication are in place, supported by active contacts with potential adopters. Since January 2026, the clinic has become a permanent public service within the Piana di Lucca District Zone and has been further strengthened with the addition of a psychological service.
CONCLUSIONS
The Living Lab experience demonstrates how targeted strategies can transform pilot initiatives into replicable, sustainable interventions integrated within local health and educational services.

Primary Health Care in remote rural municipalities: context, organization, and access to integral care in the Brazilian National Health System

Marcia Fausto[1], Patty Almeida[2], Lucas Cabral[3], Adriano Santos[4], Juliana Lima[5], Aylene Bousquat[6], Helena Seidl[1], Ligia Giovanella[1]
[1]Escola Nacional de Saúde Publica Sérgio Arouca, Fundação Oswaldo Cruz, Rio de Janeiro, Brazil, [2]Instituto de Saúde Coletiva, Universidade Federal Fluminense, Niterói, Brazil, [3]Instituto Leonidas e Maria Deane, Fundação Oswaldo Cruz, Manaus, Brazil, [4]Instituto Multidisciplinar em Saúde, Universidade Federal da Bahia, Vitória da Conquista, Brazil, [5]Instituto de Saúde Coletiva, Universidade Federal do Oeste do Pará, Santarém, Brazil, [6]Faculdade de Saúde Pública, Universidade de São Paulo, São Paulo, Brazil
ABSTRACT
The historical concentration of goods and services in more economically developed urban centers poses enormous access difficulties for populations living in remote rural areas1, 2. Making health services accessible and opportune in small communities dispersed over a vast territory implies facing difficulties in attracting the workforce, transportation costs and lack of service provision3, 1, 4. The objective of the study is to analyze the specificities of the organization and access to primary health care (PHC) in the Brazilian National Health System (SUS) in remote rural municipalities (MRR). To that end a study with a qualitative approach, based on a multiple case study in 27 MRR was carried out5. Thematic content analysis of 211 semi-structured interviews with managers and health professionals and a triangulation of information to explore and recognize the forms of organization, strategies, and challenges for the access to health were performed.
RESULTS
It was identified that the geographical access barriers involve great distances, times, costs, poor road conditions, and transportation; the characteristics of remote rural contexts condition the provision of PHC; there are differences in the ways of offering health actions and greater gaps in care coverage in the most rarefied and remote areas of the municipalities; organizational accessibility is hindered by the insufficient offer of consultations, exams, medications, restrictions on the days of operation, and itinerant actions, accentuated by the high professional turnover; the support for specialized care is precarious, with difficulties in supply, regulation, transportation, and communication; there are contradictions between national PHC funding and the characteristics of territories marked by population sparseness and long distances; and the shortage of the workforce is a common challenge among the cities studied. It is, thus, necessary to consider the territorial, social, and access characteristics to health services to propose public policies that meet the needs of the MRR.

ABS1733

Mapping mental health awareness programs among adolescents in South Africa: a scoping review

Tshisikhawe Mahada[1]
[1]department of health, University of Limpopo, Polokwane, South Africa
BACKGROUND
Globally, 10–20% of adolescents face mental health disorders, with 14% affected in South Africa. Despite existing policies and school-based frameworks, significant gaps remain in implementation, particularly in awareness and early intervention. Schools offer a platform for mental health promotion, yet few well-documented, adolescent-focused awareness programs exist.
METHODS
The scoping review followed Arksey and O'Malley's framework, and a systematic search was conducted in Sabinet, ScienceDirect, Google Scholar, and Wiley Online Library, covering English-language studies published between January 2020 and January 2025. A total of 4881 records were identified, including 20 from manual searches, with 39 articles meeting the inclusion criteria for final synthesis.
RESULTS
Study findings discovered several programs in South Africa to enhance mental health awareness among adolescents. The Integrated School Health Policy was implemented across all nine provinces which provides comprehensive school health and psychosocial support through collaboration among various stakeholders. The Early Adolescent Skills for Emotions program which targets 10-15 with internalizing disorders like anxiety and depression was implemented in 4 Cape Town schools. In Khayelitsha, the Health Action in Schools for Thriving

Adolescent Generation program was implemented to support learners aged 11-15 by fostering thriving school environments and peer support. Despite these efforts, challenges such as inconsistent attendance, logistical barriers, insufficient resources, concerns about sustainability, and inadequate school capacity to address critical learner vulnerabilities were identified. This results in the high prevalence of anxiety and depression.
CONCLUSIONS
The review highlights a clear gap in the implementation and evaluation of structured mental health awareness programs for adolescents in South Africa. Strengthening school-based mental health initiatives, training educators, and addressing systemic barriers are essential steps toward improving adolescent mental health outcomes and closing the existing treatment gap
Popul. Med. 2026;8(Supplement 1):A1456

ABS1791

Impact of educational intervention on hygiene-knowledge and practices of sanitation workers globally: A systematic review

Alive Ntunja[1], Wilma ten Ham-Baloyi[2], June Teare[3], Oyedele Opeoluwa[4]
[1]Environmental Health, Nelson Mandela University, Port Elizabeth, South Africa, [2]Nursing Science, Nelson Mandela University, Port Elizabeth, South Africa, [3]Environment and Health Research, South African Medical Research Council, Johannesburg, South Africa, [4]Computing, Mathematical and Statistical Science, School of Science, University of Namibia, Windhoek, Namibia

BACKGROUND
Sanitation workers are also known as “garbage workers” who play a significant role in the sanitation chain. For many generations sanitation workers’ level of knowledge regarding hygiene practices has remained low due to a lack of educational programmes on hygiene. As a result, they are widely exposed to hygiene-related diseases such as cholera, skin infections and various other diseases, increasing their risk of mortality to 40%. This review aims to explore the global impact of educational programs on the hygiene knowledge and practices of sanitation workers.
METHODS
The systematic literature search was conducted for studies published between 2013 and 2023 using the following databases: MEDLINE (via EBSCOHost), PubMed, and Google Scholar to identify quantitative studies on the subject. Study quality was assessed using the Joanna Briggs Institute Critical Evaluation Instruments. Data extracted from the included articles was presented using a summary of findings table and presented graphically through charts and tables, employing both descriptive and inferential statistical methods. The PRISMA flow diagram was used to present the article selection process.
RESULTS
The systematic review included 15 eligible studies from a total of 2777 articles. At least 60% (n=9) of the reviewed studies found educational programmes relating to hygiene to have a positive impact on sanitation workers’ hygiene knowledge and practices. However, most (n=7) studies indicated that the efficacy of programmes on hygiene knowledge and practices is indirectly influenced by educational background, age and work experience (predictor factors).
CONCLUSIONS
Educational programmes regarding hygiene have the potential to significantly improve sanitation workers’ knowledge and practices. Findings also suggest the implementation of active and intensive intervention programmes to improve sanitation workers’ hygiene knowledge and practices.
Popul. Med. 2026;8(Supplement 1):A1457

Impact of Different Recovery Strategies on Perceived Fatigue and Recovery Experience

Ivi Vaher[1], Anette Laureen Linnuste[1], Iris Nurmsoo[1], Kirkke Reisberg[1], Aleksandra Vähi[1], Marit Salus[1]
[1]Physiotherapy and Environmental Health, Tartu Applied Health Sciences University, Tartu, Estonia

BACKGROUND
Lower limb fatigue impairs performance and delays recovery in high-demand sports. Athletes require rapid recovery, as insufficient rest increases the risk of overuse injuries and muscle stiffness1,2. Manual massage is widely used but requires skilled personnel and time, prompting interest in device-based methods such as massage chairs. Mechanical devices may offer advantages including accessibility, cost-effectiveness, personalization, and unrestricted time use3,4, yet evidence comparing manual and device-based recovery modalities remains limited. This study aimed to evaluate the effects of fatigue-inducing exercise and three recovery strategies—hand massage, massage chair, and passive lying—on perceived fatigue and recovery experience.
METHODS
A randomized within-subject design was used. Ten female premier-league football players (mean age 21.4 ± 2.7 years; VOmax 48.7 ± 6.7 mL·kg·min) completed a standardized fatigue protocol followed by three recovery interventions in counterbalanced order: hand massage, massage chair, and passive rest. A minimum of 48 hours separated sessions. Each intervention lasted 15 minutes. Perceived fatigue was measured post-exercise, post-intervention, and at 24 hours using a visual analog scale. Recovery effectiveness and pleasantness were rated on a 5-point Likert scale.
RESULTS
Fatigue significantly increased in all muscle groups post-exercise ($p \leq 0.012$). Following interventions, fatigue decreased most after hand massage, with massage chair producing moderate reduction; passive rest was least effective. At 24 hours, fatigue remained above baseline in all conditions ($p \leq 0.017$), though massage chair yielded lower fatigue, suggesting sustained benefit. Hand massage received the highest ratings for perceived effectiveness and pleasantness and showed the greatest likelihood of reuse.
CONCLUSIONS
Hand massage provides the strongest immediate reduction in perceived fatigue, while massage chair demonstrates more prolonged recovery benefits over 24 hours. Massage chairs may therefore serve as an accessible alternative to manual techniques when resources or trained personnel are limited.

ABS2133

An Integrated School-to-Community Model for Adolescent Substance Use Prevention and Health Risk Reduction in India

KAUSHIK BISWAS[1], S Dasgupta[1]
[1]Programme, Plan International (India Chapter), Delhi, India

BACKGROUND
Adolescent substance use is an emerging public health concern in India and a critical upstream determinant of poor mental health, unsafe sexual practices, and increased vulnerability to HIV and other sexually transmitted infections. Early initiation of tobacco and alcohol weakens decision-making, increases peer-driven risk behaviours, and reduces engagement with preventive health services. Plan India is implementing a comprehensive, community-based adolescent substance use prevention and wellbeing initiative implemented across schools and villages in the block. The programme integrates life-skills and refusal-skills education, peer-led engagement, mental health screening, family and community mobilization, and strengthened referral pathways to adolescent-friendly health and counselling services, positioning substance use prevention as a core component of adolescent health and HIV risk reduction.
METHODS
Implementation is monitored through a robust results framework capturing behavioral, psychosocial, community norm, and systems-level indicators. Mixed methods-; including pre–post adolescent surveys,, service utilization tracking, vendor surveillance, and institutional process monitoring; are used to assess reach, quality, and outcomes. Outcomes: Ujjwal Dadri aims to delay initiation of substance use, reduce current tobacco and alcohol consumption, strengthen refusal skills and help-seeking behavior among adolescents, shift community norms, and institutionalize sustainable prevention and referral systems within schools, communities, and local governance structures. A paired-sample t-test was conducted to assess changes in knowledge following the training intervention. Results showed a significant increase in mean scores from pre-test ($M = 7.50$, $SD = 2.27$) to post-test ($M = 9.50$, $SD = 1.43$). This improvement was statistically significant ($p = 0.003$), with a large effect size indicating effectiveness of the training.
CONCLUSIONS
The Ujjwal Dadri model demonstrates a scalable, systems-oriented approach to adolescent substance use prevention that integrates behavioural change, community ownership, and service responsiveness in high-risk settings.

Study on existing health promotion, education and training needs in 10 SEAR countries in 2025

Supa Pengpid[1]
[1]Health Education and Behavioural Sciences, Faculty of Public Health, Mahidol University, Puthamonthon, Thailand

ABSTRACT
Abstract Health promotion is a critical yet underdeveloped discipline in many

countries of South-East Asia Region (SEAR), where structured training pathways and competency-based education remain limited. Although global and regional frameworks such as the Bangkok Charter for Health Promotion and the Geneva Charter for Well-being emphasize capacity building, leadership, and multisectoral action, systematic information on existing health promotion services, education, and workforce training needs across SEAR countries has been lacking. This study aimed to assess the current health promotion system, education, and training needs across ten SEAR countries. A mixed-methods, multi-country study was conducted between 2024 and 2025, comprising three components: a health promotion situation analysis and capacity mapping; an assessment of existing health promotion curricula across medical schools, health promotion departments, nursing schools, and teacher training institutions; and (3) a regional training needs assessment. Data were collected through document reviews, qualitative interviews, focus group discussions, and quantitative surveys involving key informants from ministries of health, other government sectors and academia. Standardized tools were adapted from WHO frameworks, the Ottawa Charter action areas, and the Galway Consensus competencies. Quantitative data were analyzed using descriptive statistics, while qualitative data underwent thematic analysis. The study captured perspectives from a diverse and experienced cohort of health promotion practitioners, educators, and decision-makers across the region. Findings provide a comprehensive overview of existing capacities, gaps in education and training, workforce challenges, and priority areas for strengthening health promotion systems. The results are expected to inform regional and national strategies, support competency-based curriculum development, and guide future investments in health promotion workforce development across SEAR countries. The results of this study will be formally presented, and an electronic book (e-book) version of the full report will be disseminated to participants upon request.

From Risk Communication to Testing Uptake: Mapping Barriers and Facilitators to HCV Testing Among Key Populations

Nyeleti Chauke[1], Tivani Mashamba-Thompson[1], Evans Duah[1], Smangaliso Morerwa[1], Kuhlula Maluleke[1]

[1]School of Health Systems & Public Health, University of Pretoria, Centre for Development and Implementation of Point-of-Care Diagnostics (CPOC-Dx), Pretoria, South Africa

INTRODUCTION

Hepatitis C virus (HCV) continues to pose a significant global health challenge, disproportionately affecting key populations due to higher exposure risks and social vulnerabilities. Despite advancements in treatment, testing, and diagnosis, these remain suboptimal, largely due to various barriers. This scoping review systematically mapped barriers and facilitators influencing risk communication and HCV testing among key populations to guide intervention strategies with potential global impact.

METHODS

The review followed Arksey and O'Malley's methodological framework, as enhanced by Levac et al., and was reported using the PRISMA-ScR checklist. A comprehensive search strategy was applied to multiple databases and grey literature, with data screening and extraction conducted independently by two reviewers.

RESULTS

Thematic analysis revealed five major themes: knowledge and misconceptions about HCV, stigma and discrimination, accessibility of testing services, communication strategies and peer-led interventions, and integration of HCV testing with other health and community services. Key facilitators included targeted educational campaigns, peer-led approaches, culturally sensitive and confidential services, mobile testing, and integration with trusted platforms such as HIV clinics and opioid treatment programmes.

CONCLUSIONS

These findings underscore the importance of decentralised, integrated, and stigma-free services to strengthen global HCV testing and diagnosis efforts. Addressing persistent gaps in communication, stigma reduction, and sustainable service delivery is vital for achieving the WHO Global Health Sector Strategy on viral hepatitis (2022–2030) and advancing Sustainable Development Goal 3 on health and well-being. Ultimately, improving HCV testing uptake among key populations contributes to reducing health inequities and improving global public health outcomes.

ABS2320

The Practicality of conducting multi- domain disorders screening in preschools from low income communities in South Africa: A cross-sectional observational study

Vuyelwa Zandile Peter[1], Mershen Pillay[2], Yougan Saman[3]

[1]Audiology, University of KwaZulu-Natal, Durban, South Africa, [2]Speech-Language Pathology, University of Massey, Auckland, New Zealand, [3]Institute of Neurology, University College London (UCL),, London, United Kingdom

BACKGROUND

The lack of ongoing developmental surveillance in Africa hampers early detection of multidomain disorders related to vision, speech, language, and hearing impairments [1-2]. Early Childhood Development Centres (ECDC) could serve as community-based platforms for screening; however, practical implementation evidence in resource-limited settings remains scarce and warrants systematic investigation [3-4]. Setting: In Africa, multidomain developmental screening at ECDC is uncommon.

AIM

This study examines the practical considerations influencing the implementation of a multi-domain developmental screening program within low-resource ECDCs in South Africa, based on cross-sectional observational data collected during screening.

METHODS

A quantitative, descriptive, observational study was conducted across 30 public ECDCs in low-income areas of Durban, South Africa, including Phoenix, Inanda, Ntuzuma, and KwaMashu. Using proportional geographical sampling to identify ECDC for inclusion, census testing screened 731 children, and data on logistics, environmental factors, and screening outcomes were collected using a self-developed observational tool.

RESULTS

While screening uptake was high, environmental and logistical challenges especially in rural sites posed barriers. Median screening times were efficient; however, high noise levels affected the accuracy of communication assessments. Findings support utilizing low-cost, portable tools combined with environmental modifications are necessary to improve early detection and equitable access to interventions.

CONCLUSIONS

Multidomain screening is feasible in low-resource ECDCs. Sustainable implementation requires innovative service delivery models that address logistical, environmental, financial, and referral pathway challenges. Careful planning and adaptation are essential to scale screening within existing health and education systems. Contribution: Effective, scalable screening in resource-poor contexts depends on meticulous logistical planning and contextual adaptations, informing integration into public health and educational frameworks.

Taxation of sugar-sweetened beverages: Perspectives of adults and nursing practitioners in Makhanda, Eastern Cape, South Africa

Nelene Koen[1], Lanine Herman[1]

[1]Division of Human Nutrition, Department of Global Health, Stellenbosch University, Cape Town, South Africa

BACKGROUND

High sugar-sweetened beverage (SSB) consumption has been linked to the rising prevalence of obesity and non-communicable diseases (NCDs) in South Africa. In April 2018, the country introduced a SSB tax—known as the Health Promotion Levy (HPL)—as a fiscal measure to reduce excessive sugar consumption. National data reported changes in reformulation. Yet, evidence on community-level awareness and perceptions, particularly in low-socioeconomic settings, remains limited. This study aimed to explore both the public and professional understanding of the SSB tax in a rural South African context, i.e. Makhanda, Eastern Cape, South Africa.

METHODS

The research employed a multi-method, cross-sectional design. Quantitative data were collected from adults (n = 275) at seven PHC facilities through an interviewer-administered questionnaire. Qualitative data were obtained from semi-structured interviews with nursing practitioners (n = 10) employed at the same facilities. Data were analysed using descriptive statistics and thematic analysis, then integrated for interpretation.

RESULTS

Most adults (96%) were unaware of the SSB tax, while 97.8% reported no change in consumption since its introduction. Although nursing practitioners displayed limited awareness of the tax's rationale and timing, they supported taxation as a public health strategy. Both groups identified affordability, entrenched consumption habits, and insufficient health education as key barriers to the SSB

tax's effectiveness.
CONCLUSIONS
Perspectives from adults and nursing practitioners in Makhanda highlight that the SSB tax, in its current form, has limited perceived impact. Complementary strategies—including stronger community education, awareness campaigns, and policy enforcement—are necessary to enhance its effectiveness.

ABS2352
Towards systematic assessment of health governance: a framework-based assessment of the South African National Health Insurance (NHI) Governance Structure
Timothy Tucker[1,2], Geetesh Solanki[1], Mina Haji[1], Reno Morar[3], Susan Cleary[1]
[1]School of Public Health, University of Cape Town, Cape Town, South Africa, [2]SEAD Consulting, Cape Town, South Africa, [3]Nelson Mandela UNiversity, Gqeberha, South Africa
BACKGROUND
Governance is an important but under-assessed determinant of health system performance, particularly in low- and middle-income countries (LMICs). While existing literature speaks to the impact of the 'micro-practices' of governance, there is limited literature examining governance implications of 'macro-practices'. We aimed to develop and demonstrate the value of systematically evaluating governance implications of health sector legislation, using South Africa's National Health Insurance (NHI) Act as a case study.
METHODS
A bespoke governance assessment framework was developed using a combination of South Africa's King IV Report on Corporate Governance; and the Organisation for Economic Co-operation and Development Guidelines on the Governance of State-Owned Enterprises. Four pillars of governance were defined: leadership and composition; accountability and oversight; (3) transparency and public engagement; and integrity and risk management. The governance design of the NHI Act (2023) structures was assessed using a qualitative framework analysis.
RESULTS
Application of the framework to the NHI Act highlights an over-concentration of authority in the Minister of Health, who is able to determine, or overtly influence all key appointments to senior NHI positions, creating structural risks for political interference and a reduction in operational autonomy. The analysis also demonstrates the lack of parliamentary oversight and an absence of independent citizen redress mechanisms. These results indicate risks to health system performance.
CONCLUSIONS
This study illustrates how governance assessment frameworks can be applied to understand the implications of the 'macro-practices' of governance. This case study demonstrates deviations in the NHI Act from governance norms, with resultant over-centralisation of authority in NHI governance structures creating risks for political interference, weakened operational autonomy and compromised independence of dispute resolution. The study highlights the importance of developing a consensus international framework for ex-ante analysis which provides a replicable methodology for governance assessment, offering a tool for LMICs legislating reforms.

ABS2402
Evaluation of the operationalization of health promotion in primary health care
Izaltina Adão[1], Claudia Flemming Colussi[1], Dais Gonçalves Rocha[2]
[1]Department of Public Health, Federal University of Santa Catarina, Santa Catarina/Florianópolis, Brazil, [2]Department of Public Health/Faculty of Health Sciences, University of Brasília, Federal District, Brasília, Brazil
INTRODUCTION
Health Promotion, although strategic within Primary Health Care (PHC) of Brazil's Unified Health System (SUS) for addressing social determinants, faces operational and evaluative challenges1-4. Thus, this study aimed to assess the operationalization of Health Promotion in Primary Health Care of SUS.
METHODS
This is a mixed-methods evaluative study with an implementation analysis across different contexts5, conducted from 2023 to 2025 in two stages: an evaluability study6, including document analysis, literature review, theoretical-logical modeling, and the development and validation of an evaluative matrix; and a multiple case study in three PHC Units in a municipality in southern Brazil, selected according to the Brazilian Deprivation Index. Data collection included questionnaires and semi-structured interviews with professionals and managers. Quantitative data were analyzed using descriptive statistics, and qualitative data were analyzed through Content Analysis7, supported by ATLAS.ti® software.
RESULTS
The evaluative model comprised four dimensions, 17 subdimensions, 45 indicators, and 84 measures, with classification of the degree of operationalization ranging from incipient to advanced. Its application revealed weaknesses in Health Promotion, particularly in intersectoral action, the rational use of medicines, physical activity practices, and the addressing of tobacco, alcohol, and other drug use, in addition to structural limitations. Interviews revealed a restricted conception of Health Promotion, often associated with prevention, as well as barriers such as low institutionalization, inequalities in access, and a focus on spontaneous demand. Notably, the unit located in a high-deprivation area showed better performance, indicating that work organization, team articulation, and participatory strategies were more determinant than resource availability.
CONCLUSIONS
Health Promotion actions in PHC show an intermediate level of operationalization and rely largely on individual initiatives, compromising their sustainability. The evaluative model demonstrated robustness and applicability, with potential to strengthen planning, monitoring, and evaluation of practices, contributing to the reduction of vulnerabilities and the promotion of health equity.

[1]Medical Board of Directors, ULSS 6 Euganea, Hospital of Cittadella, Cittadella, Italy, [2]Physical Medicine and Rehabilitation, ULSS 6 Euganea, Hospital of Cittadella, Padua, Italy, [3]Occupational Medicine Medical Director, ULSS 6 Euganea, Padua, Italy, [4]Community Family Health Service, ULSS6 Euganea, Padua, Italy, [5]Health Profession Service, ULSS 6 Euganea, Hospital of Cittadella, Padua, Italy, [6]Sports and Exercise Medicine Unity, University of Messina, Messina, Italy, [7]Mental Health Department, Hospital of Cittadella, Padua, Italy, [8]Stakeholder "Altre Parole", Cittadella, Italy
INTRODUCTION
Physical illnesses and mental/relational disorders are main causes of impairment of working capacity. It is our mission, to reduce these conditions among our healthcare workers.
METHODS
We proposed a training program to achieve improved working capacity by acquiring interpersonal skills and promoting conscious adherence to health prevention programs. During 2025, at the hospital of cittadella (padua, italy - 1186 employees) we provided 6 training interventions (frontal lessons and practical activities managed by expert trainers): 1. Progressive muscle relaxation, aimed at healthcare workers of pneumology, intensive care unit, and emergency medical services; 20 participants joined 10 meetings; event recurred 4 times/y; 2. Balint groups, aimed at healthcare workers of general medicine, psychiatry, intensive care unit, and emergency medical services; 12 participants, 10 meetings, 6 times/y; 3. Empathic communication, aimed at human resource managers and public relation officers; 20 participants, 5 meetings, 3 times/y; 4. Mindfulness relaxation (gaia protocol, pisa university, italy), aimed at all workers; 15 participants, 10 meetings, 4 times/y. 5. Health promotion, aimed at all workers; 50 participants, 4 meetings, 2 times/y; 6. Prevention by nutrition (mediterranean diet), aimed at all workers; 20 participants, 4 meetings, 2 times/y.
RESULTS
We achieved broad participation: 258 trained; 192 F; 76 M; mean age 48 y; mean seniority 17 y. The overall effectiveness indicator considered is percentage of participants who have successfully completed the events they choosed and registered for (94%). There was significant correlation between joining events focused on communication and relational skills by males (p 0,0214 – OR 1,74) and seniority < 15y (p 0,0032 – OR 1,94). Subjects aged >45y preferred topics related to health promotion (p 0,0072 – or 1,88).
CONCLUSIONS
Corporate training investment in communication and relational skills is desired, sustainable and effective in enhancing work performance.

ABS2446
Drivers of inequality in physical activity participation: the role of automatic and conscious self-regulation processes, physical environment, across populations with lower and higher

socioeconomic status

Dominika Wietrzykowska[1], Hanna Zaleśkiewicz[1], Natalia Paduszyńska[1], Anna Kornafel[1], Aleksandra Łuszczyńska[1]
[1]SWPS University, Warszawa, Poland

INTRODUCTION
The study investigates how automatic regulatory processes (habit, referring to the behaviour automaticity), conscious processes (self-regulation, encompassing self-monitoring, awareness of standards, and regulatory effort), and physical environment (perceived physical activity-supporting environment in the neighbourhood, perceived physical activity-supporting environment at home, perceived sedentary behaviour-supporting environment at home) operate together in explaining moderate-to-vigorous physical activity (MVPA). It is also examined whether these associations are moderated by socioeconomic status (SES, a combined indicator of income and education).
METHODS
Participants (N = 738; M age = 40.14, SD = 17.85, 64.4% women) provided data three times, spanning two weeks between Time 1 (T1) and Time 2 (T2), and eight months between T2 and Time 3 (T3). MVPA time was assessed using ActiGraph GT3X-BT accelerometers. Moderated mediation models were fit.
RESULTS
High availability of MVPA-supporting physical environment facilities in the neighbourhood (T2) was associated with more minutes spent on MVPA (T3), but only among participants with high SES. Conversely, high availability of sedentary behaviour-supporting environment at home (T2) was associated with less MVPA (T3), but only within the subsample with low-to-medium SES. Direct and indirect effects of conscious and automatic regulatory processes were not moderated by SES.
CONCLUSIONS
The findings suggest that SES may moderate the effect of environment perceptions on MVPA, highlighting potential drivers of inequalities in MVPA participation. Physical activity promotion actions may need to address different environmental changes, depending on the economic status and education of the target groups.

Assessing the inclusion of people with disabilities in the health system in Ethiopia.

Desta Debalkie Atnafu[1], Femke Bannink Mbazzi[1], Jane Jane[1], Abdmagidu Menya[1], Mezgebu Yitayal[1], Hannah Kuper[1]
[1]Department of Population Health, London School Of Hygiene & Tropical Medicine, London, United Kingdom

BACKGROUND
Over 1.3 billion people globally live with disabilities and experience substantial health disadvantages. Yet evidence on how health systems in low-income countries respond to their needs remains limited. This study aimed to assess disability inclusion within Ethiopia's health system.
METHODS
We applied a mixed-methods approach. A systematic review assessed life expectancy differences between people with and without disabilities in low- and middle-income countries. Quantitative analysis of nationally representative Ethiopian Socio-Economic Panel Survey data examined inequalities in health status, healthcare utilisation, and expenditure by disability status. Qualitative in-depth interviews with 30 adults with disabilities in Ethiopia explored their healthcare access experiences. An audit evaluated compliance of primary healthcare facilities with disability accessibility standards in Bahir Dar, Ethiopia. Finally, a policy content analysis using the Equi-Frame tool assessed the integration of disability rights within national health policy documents.
RESULTS
The systematic review found substantially lower life expectancy among people with disabilities (58 years) compared with those without (71 years). Ethiopian national survey data showed that people with disabilities were more likely to report illness (AOR = 2.91; 95% CI: 1.56–5.43) and incurred much higher healthcare costs (US$134 vs. US$38; p = 0.04). Yet, these greater needs were not matched by increased healthcare utilisation. Qualitative findings identified intersecting barriers to care, including inaccessible infrastructure, negative provider attitudes, unaffordable services, and limited rehabilitation services. Facility audits confirmed poor accessibility (median score = 35%), particularly for rural facilities. Policy analysis revealed fragmented disability integration, and critical gaps in references to financing, information systems, and fundamental human rights within the policies.
CONCLUSIONS
Persons with disabilities remain systematically excluded from Ethiopia's health system. Addressing these gaps requires coordinated, rights-based reforms grounded in lived experience and implemented through a twin-track approach to ensure health equity and that no one is left behind.

ABS2667

The impact of hospital structure and process measures on quality of care in intensive care units in Namibian Hospitals: a questionnaire survey

Edith Shiwovanhu Hamukwaya[1], Siedine K. Coetzee[2], Hans Justus Amukugo[1]
[1]Department of Medical Sciences, University of Namibia, Windhoek, Namibia, [2]School of Nursing Science, North-West University, Potchefstroom, South Africa

BACKGROUND
Providing quality care is a fundamental principle of healthcare delivery globally. Although substantial research has examined the relationship between hospital structure and process measures and the quality of healthcare, evidence from intensive care unit (ICU) settings remains limited. This study examined the impact of hospital structure and process measures on the quality of healthcare services in ICUs of Namibian hospitals.
METHODS
A cross-sectional survey was conducted in six hospitals, comprising 11 (n=11) ICUs from both the public and private sectors. A total sampling method of all categories of nurses (n=110) was used, with a survey response rate of 73%. Descriptive and inferential statistics were derived using ANOVA-type hierarchical linear modelling.
RESULTS
Most ICUs were general units (n=5; 45.5%), with a mean unit size of nine beds and high occupancy rates (88%). The nursing workforce was predominantly composed of bachelor's-prepared registered nurses (n=87; 81.3%), most of whom had three or more years of clinical experience (n=39; 37.9%). The nurses rated the overall patient safety and quality of care as good (M=2.8, SD=1.2). However, they reported moderate occurrences of adverse events. It was found that process measures seemed to have more and larger effects than structure measures, specifically the practice environment and the subscales of nurse participation in hospital affairs, nurse foundations of quality of care, nurse manager ability, leadership and support for nurses, and collegial nurse-physician relations. Regarding the hospital structure unit type, unit size, bed occupancy and nurse-patient ratios had effects on the quality of care.
CONCLUSIONS
To improve the quality of care in the ICU, greater emphasis is needed on hospital process measures, particularly the practice environment. In addition, ICU quality improvement should prioritise structural factors, including unit type, unit size, bed occupancy, and nurse–patient ratios.
Popul. Med. 2026;8(Supplement 1):A1492

ABS2673

Association between selected nurse outcomes and the quality of care in Intensive Care Units in Namibia: A Cross-Sectional Study

Edith Shiwovanhu Hamukwaya[1], Siedine K. Coetzee[2], Hans Justus Amukugo[1]
[1]Department of Medical Sciences, University of Namibia, Windhoek, Namibia, [2]School of Nursing Science, North-West University, Potchefstroom, South Africa

BACKGROUND
Nurse outcomes such as burnout, job and career satisfaction, and turnover intention are theorised to affect healthcare quality, yet empirical evidence from intensive care unit (ICU) settings, particularly in Namibia, remains limited. This study examined the impact of these nurse outcomes on nurse-perceived quality of healthcare in Namibian ICUs.
METHODS
A cross-sectional quantitative study surveyed 110 ICU nurses across 11 units in six Namibian hospitals (eight public, three private) between December 2023 and April 2024, achieving a 73% response rate. Descriptive statistics summarised respondents' characteristics, and ANOVA-type hierarchical linear modelling examined associations between nurse outcomes and perceived healthcare quality.
RESULTS
Most respondents were registered nurses (81.3%, n=87) working in general ICUs within public hospitals. Although high levels of burnout were reported, the majority expressed satisfaction with their jobs (87%; n=94) and careers (92.7%; n=101). Burnout and job dissatisfaction were significantly associated with lower confidence in managerial support, higher incidences of healthcare-associated infections, and increased complaints and verbal abuse from patients and their families. By contrast, career satisfaction was linked to higher overall patient safety ratings, while intention to leave the profession showed no significant association

with perceived quality of care. These findings highlight the critical role of nurse well-being in ensuring safe and effective healthcare delivery.
CONCLUSIONS
Burnout as well as job and career dissatisfaction are associated with negative perceptions of quality of care. Organisational strategies aimed at reducing burnout and improving job and career satisfaction are essential to support a stable and effective ICU workforce.

Codesigning a culturally responsive trauma informed health promotion framework: improving healthcare equity, inclusion and access for Indigenous peoples

Kimberley A Jones[1], Michelle Kennedy[2], Paul Gray[3], Jamie Bryant[2], Isabella Freijah[1], Alana Storey[4], Michelle Stankovic[4], Trish Ratajczak[5], Melissa O'Donnell[6], Jacynta Krakouer[6], Simone Sherriff[7], Sally Brinkman[6], Zoe Bradfield[8], Rhonda Marriott[5], Ee Pin Chang[1], Catherine Chamberlain[1]
[1]Indigenous Health Equity Unit, Onemda: Aboriginal and Torres Strait Islander Health and Wellbeing, University of Melbourne, Melbourne, Australia, [2]University of Newcastle, Callaghan, Australia, [3]University of Technology Sydney, Sydney, Australia, [4]Gippsland Regional Public Health Unit, Latrobe Regional Health, Traralgon, Australia, [5]Murdoch University, Perth, Australia, [6]University of South Australia, Adelaide, Australia, [7]University of Sydney, Sydney, Australia, [8]Curtin University, Perth, Australia

INTRODUCTION
Colonisation and its associated violence and oppression of Indigenous peoples has created cycles of intergenerational trauma and systemic health inequities. Health promotion can help restore social and emotional wellbeing, and reduce health disparities, by creating environments that empower communities to lead healthy lives. While culturally responsive strategies have been developed, the influence of trauma on engagement with health promotion initiatives remains under-explored. We aimed to develop a framework that supports practitioners in creating culturally responsive, trauma-aware, healing-informed health promotion programs to improve accessibility and close gaps in health disparities.
METHODS
Our Indigenous-led project had two components. First, a narrative review examined frameworks at the intersection of social and emotional wellbeing, trauma and health promotion for Indigenous peoples. Literature was identified through a non-systematic snowballing search of peer-reviewed and grey sources, with prioritisation of evidence most relevant to project aims. Frameworks were analysed for thematic commonalities and synthesised into a pilot framework. This was refined through iterative consensus-building with project investigators and piloted by mapping against existing health promotion programs. Second, a co-design workshop with Indigenous and non-Indigenous health promotion experts identified what healing-informed practice looks like and which principles should underpin a framework. Findings were triangulated to produce the final framework.
RESULTS
A clear consensus emerged on guiding principles: community governance and partnership; empowerment; culture; holistic wellbeing; connectedness and relational approaches; cultural and emotional safety; and transparency and accountability.
CONCLUSIONS
This project provides a critical step toward a more inclusive and accessible approach to health promotion. The framework acknowledges the impacts of colonisation while strengthening individual, family and community capacity. It emphasises safety, recovery and community-led healing, while avoiding re-traumatisation, rejecting pathologization of behaviours and addressing structural barriers to behaviour change. It has the potential to support more inclusive health promotion policy and practice globally.

ABS2798

Applying a community change process to achieve sustainable community health change

Luke Profitt[1,2], Sentebeleng Seitshiro[2], Klaus Von Pressentin[2], Kaneez Sayed[2]
[1]Health and Wellness, Western Cape Government, Vredenburg, South Africa, [2]Family, Community and Emergency care, University of Cape Town, Cape Town, South Africa

BACKGROUND
Healthy Futures South Africa (HFSA) is a University of Cape Town (UCT) programme within the Mastercard Foundation's higher education Africa Health Collaborative. HFSA is guided by the Community-oriented primary care (COPC) framework to effect change and uplift communities, focusing on youth, health and employment. The Saldanha Bay HFSA site is using established Community Change Processes (CCP) to create sustainable change and move the health system from reactive to proactive stance. CCP is a COPC and development tool that is represented as a cycle with the elements of Relationship Building, Concern Identification, Concern Exploration, Decision making, Action, and Reflection and Review.
METHODS
The study uses a qualitative process evaluation to show progress. We invited key stakeholders to a local community hall, where people collaborated around tables to actively identify community assets and concerns using a consensus-building methodology. Subsequently, concerns were explored and the decision-making process facilitated. Community engagements were approached with an asset-based mindset as a meeting of equals.
RESULTS
Analysis focuses on the first steps of the cycle: from Relationship building to decision-making. Community engagement with stakeholders, non-government organisations (NGO), community members, and the local government enabled the facilitation and development of the community change process. Relationships were built with local government, NGOs, key community leaders, representatives of vulnerable groups, and youth. Identified concerns included substance abuse, family crises, unemployment, mental health, safety and crime. A small-group exercise explored and prioritized themes, mapping for decision making.
CONCLUSIONS
The findings demonstrate that the community change process cycle remains relevant for creating sustained change. Meaningful stakeholder engagement enabled community members to take ownership of identifying their concerns; as a result, we aim to work with the community in a joint decision-making process for sustainable, accountable implementation.

Participatory development and pilot implementation of self-care support groups for chagas disease in primary health care in brazil's unified health system

Valentina Carranza Weihmuller[1], Javier Augusto Abi-Saab Arrieche[1], Lucélia Pereira dos Santos Cardoso[1], Diego Franck dos Santos Souza[1], Thaís Alves Severo Tadeo[1], Sabrina de Oliveira Henriques[1], Andréia Alves Castilhano[1], Uanderson Gonçalves de Magalhães[1], Marize Conceição Ventin Lima[1], Gustavo Silva Salgado[1], Andréa Silvestre de Sousa[1], José Alexandre Menezes da Silva[1], Eliana Amorim de Souza[1], Debbie Vermeij[1], Danielle Portella Ferreira[1]
[1]CUIDA Chagas Project, Evandro Chagas National Institute of Infectious Diseases, Oswaldo Cruz Foundation, Rio de Janeiro, Brazil

INTRODUCTION
Chagas disease (CD) is a neglected chronic condition in which stigma, fragmented care pathways, and limited psychosocial support can undermine quality of life and engagement with care. Primary health care (PHC) is a strategic setting to integrate clinical care with health promotion actions that strengthen autonomy, shared knowledge, and the right to health within public health systems.
METHODS
The CUIDA Chagas project,3 through a participatory approach, developed a practical guide to support the implementation of Selfcare Support Groups (SSG) for people living with CD. The guide offers a structured adaptable package, including key concepts, operational recommendations, a proposed cycle of 10 1.5-hour sessions, and tools for planning, monitoring, and evaluation. The methodology is organized around three pillars (clinical management, lifestyle, and socio-emotional aspects), supporting an integral health promotion framework.4
RESULTS
In 2024 and 2025, four SSG cycles were implemented in three Brazilian municipalities of the CUIDA Chagas implementation study. Eight facilitators were trained, all PHC nurses. Cycles achieved an average of eight participants per meeting, consisting of women living with CD, family members and others health workers. Reported strengths included local government and health management support, effective mobilization strategies for participants, increased self-confidence regarding selfcare in CD, and strengthened social bonds over time. A common challenge was participant's adherence and schedule compatibility. Facilitator engagement was crucial for session quality and continuity. Pilot experience informed refinements to facilitation, logistics, and session dynamics.
CONCLUSIONS
Developing and piloting this methodology supported the implementation of an innovative, scalable health promotion strategy for CD in PHC within Brazil's Unified Health System. As the first group-based comprehensive approach for people living with CD, its step-by-step structure and adaptability support replication across

diverse territories. Sustainability and scale-up depend on continued institutional support, expanded facilitator training, and mechanisms for local adaptation.

ABS3000
Integrating sexual and reproductive health services into existing tuberculosis care: a qualitative study

Sabrina Binta Salam[1], Fariha Haseen[2], Hridi Hedayet[2], Zubaida Nasreen[3]
[1]Community Medicine, Manikganj Medical College, Manikganj, Bangladesh, [2]Department of Public Health and Informatics, Bangladesh Medical University, Dhaka, Bangladesh, [3]Directorate General of Health Services, Ministry of Health and Family Welfare, Dhaka, Bangladesh

INTRODUCTION
patients with tuberculosis (TB) frequently encounter sexual and reproductive health (SRH) issues due to the disease itself and its associated medication, creating a double burden. In bangladesh, fragmented services across different tiers of the health system have resulted in unmet SRH needs among TB patients. This study aimed to explore the integration of SRH services into existing TB care to enhance comprehensive patient management and improve health outcomes.
METHODS
this qualitative study, guided by grounded theory, was conducted in dhaka city. Participants included adult TB patients from dots centres, health care providers (HCPs) from selected dots centres and hospitals, and stakeholders directly involved in TB-related policy making in bangladesh. Purposive sampling was applied to select study sites and participants. Data collection involved 14 in-depth interviews (IDIs) with TB patients and 15 key informant interviews (KIIs) with HCPs and stakeholders, supplemented by observation and informal discussions. Transcripts were analyzed manually using thematic analysis following braun and clarke.
RESULTS
five themes emerged through iterative coding: SRH service needs and utilization, psycho-social and cultural dynamics, knowledge, attitude and perception, barriers to access and affordability, and solutions towards TB-SRH integrated services. Challenges were identified at patient, community, service, and health system levels in accessing SRH services. Participants highlighted multiple opportunities for integration, emphasizing revised guidelines, trained hcps, and strengthened referral linkages as priority interventions.
CONCLUSIONS
triangulation of findings suggests that integrating SRH services into TB care through dots centres and mhealth platforms, tailored to socio-cultural contexts and cost-effectiveness, could significantly improve SRH outcomes among TB patients. The study underscores the need for policy-level commitment and capacity building to ensure sustainable TB-SRH integrated services in bangladesh.

ABS3059
Artificial Intelligence for Patient Safety: Strengthening Clinical Pharmacy Practice in Primary Health Care within Brazil's Unified Health System

Daniela Cristina Faccio[1], Ana Helena Ulbrich[1], Henrique Dias[1]
[1]Instituto de Inteligência Artificial na Saúde, NoHarm.ai - Instituto de Inteligência Artificial na Saúde, Porto Alegre, Rio Grande do Sul, Brazil

ABSTRACT
Context The Brazilian Unified Health System (SUS) Primary Health Care (PHC) faces socioeconomic and clinical resource gaps in the North and Northeast regions, potentially driving preventable adverse events. Implementing systematic medication reviews offers an opportunity to strengthen patient safety. The NOHARM- Intelligence for Patient Safety project was implemented across territories totaling 85000 km with a GDP of $5.6 billion,. For comparison, Austria has a similar area (83000 km) but a GDP of $520 billion,. These complex territories feature dispersed populations, predominantly rural areas, and restricted access to health services.
METHODS
This implementation evaluation study focused on 20 municipalities (16 operational during the analysis), prioritizing areas with high social vulnerability and physician density below 1 per 1000 inhabitants. The intervention utilizes the NOHARM platform integrated with Electronic Health Records, featuring an AI-based clinical pharmacy module for automated prescription review, drug interaction detection, and dosing alerts. Implementation included structured training for SUS managers, continuous technical support, and infrastructure adaptations to ensure long-term PHC capacity.
RESULTS
Between March and December 2025, 37000 patients had prescriptions reviewed by pharmacists triggered by NOHARM alerts (representing ~10% of total prescriptions). This resulted in over 8000 pharmaceutical interventions, with a 99% physician acceptance rate for prescriber-correctable recommendations. In one municipality, prescription verification capacity quadrupled. AI-supported clinical pharmacy reinforced patient safety, prevented medication errors, and qualified care for vulnerable populations.
CONCLUSIONS
AI implementation in PHC improved patient safety by structuring clinical pharmacy and mitigating risks. By reducing preventable errors, the model optimizes resource use and strengthens SUS sustainability. Implemented in highly vulnerable territories, NOHARM is a scalable and adaptable solution for PHC systems, promoting efficiency, equity, and quality in public health care.

Social inequalities and care experience in primary health care in complex urban contexts

Caroline Feitosa Dibai de Castro[1], Kélly Testa Santorio[1], Maria Clara Alves dos Santos[1], Myllena Victoria Zucolotto Scottá[1], Vitoria Pereira Santos[1], Cláudia Gomes Rossoni[1], Fabiola Fernandes Bersot Magalhães[2], Fabricia Maria Milanezi[1], Francine Alves Gratival Raposo[1], Glaucia Rebeca Barbosa Ramos Klein[1], Henriqueta Tereza do Sacramento[1], Lainerlani Simoura de Almeida[1], Leonardo Gomes da Silva[1], Mateus Nague de Souza[2], Thiago Antônio da Silva Fontoura[1]
[1]Medical Graduation, Higher School of Sciences of the Santa Casa de Misericórdia of Vitória - EMESCAM, Vitória, Brazil, [2]Postgraduate Program in Public Health, Federal University of Espírito Santo, Vitória, Brazil

BACKGROUND
Primary Health Care (PHC) is internationally recognized as the cornerstone of universal health systems, playing a central role in promoting equity and care coordination. However, even in urban contexts with high human development, significant disparities persist in the experience of care, influenced by social determinants and the territorial organization of health services.
METHODS
This study aimed to analyze inequalities in the experience of care in PHC, considering health indicators, access, problem-solving capacity, and users' perceptions across different urban territories in the municipality of Vitória, Espírito Santo, Southeastern Brazil. This cross-sectional study was conducted in Vitória, a municipality characterized by a high Human Development Index and a territorialized PHC network. A total of 641 adult users (≥18 years) linked to eight health units were interviewed. Sociodemographic profile, health indicators, access to services, and perceived problem-solving capacity were assessed using structured questionnaires. Data were analyzed using IBM SPSS software, version 31.
RESULTS
The sample was predominantly female (68%) and low-income, with 42.6% earning up to two minimum wages. A marked gradient of territorial inequality was observed. More socially vulnerable regions showed higher prevalences of physical inactivity (58.1%) and obesity (35.8%). Statistically significant differences were found in perceived problem-solving capacity (p=0.000). Areas with higher educational levels and access to private health insurance reported problem-solving capacity above 67%, whereas more vulnerable territories presented the lowest levels (40.3%) and lower overall satisfaction. Community Health Workers were highly valued across all strata, emerging as key actors in trust-building and access facilitation.
CONCLUSIONS
It is concluded that the experience of care in PHC is strongly shaped by social determinants. Even in municipalities with high human development, strengthening universal health systems requires equity-oriented territorial strategies, asymmetric investments, and the recognition of community-based work in the organization and daily management of PHC.

ABS3178
Leveraging private sector pick-up points to strengthen public chronic medicine delivery in South Africa: Lessons from the central chronic medicines dispensing and distribution programme

Nishana Ramdas[1], Maggie Munsamy[1], Merlin Pillay[1]
[1]National Department of Health, Pretoria, South Africa

INTRODUCTION
Public health systems in low- and middle-income countries face increasing pressure from rising chronic disease burdens and constrained facility capacity.

South Africa's Central Chronic Medicines Dispensing and Distribution (CCMDD) programme incorporates private-sector pick-up points (PuPs) as a strategic mechanism to expand access to medicines while preserving public sector resources. This model represents one of the largest public-private health partnerships in the country.
METHODS
We conducted a descriptive analysis of national programme data from Quarter 3 2025/26, focusing specifically on the contracting and utilization of private-sector pick-up points. The review included an assessment of patient distribution across delivery channels, adherence to standardized service level agreements, and regulatory compliance records. Operational performance indicators were analyzed to evaluate the scale, geographic coverage, and integration of private partners into the public service delivery network.
RESULTS
By Quarter 3 2025/26, over 3.7 million patients were actively enrolled, with approximately 61% collecting medicines from external pick-up points, the vast majority of which are situated in the private sector. These partner facilities operate under nationally standardized contracts and Good Pharmacy Practice requirements, ensuring consistent quality of care across diverse provinces. This engagement has successfully expanded geographic reach into retail and community pharmacy networks, significantly reducing congestion at public facilities. However, the analysis identified challenges in contract management at scale and variable partner uptake in rural versus urban districts.
CONCLUSIONS
The programme demonstrates that structured private-sector engagement can play a critical role in strengthening public health service delivery without privatizing the cost to the patient. Embedding private pick-up points within a regulated, nationally coordinated model offers a scalable and replicable approach for improving chronic medicine access while maintaining public-sector oversight. These findings provide valuable governance lessons for countries seeking to leverage private capacity to support universal health coverage goals.

From Evidence to Policy: Rapid Evidence Syntheses as a Governance Instrument for Evidence-Informed National Clinical Guidelines in the Management of Sexually Transmitted Infections

Cláudia Gonçalves Siqueira[1], Italo Vinicius Albuquerque Diniz[1], Katherine Jeronimo Lima[1], Romina do Socorro Marques de Oliveira[1], Mayra Gonçalves Aragón[1], Pâmela Cristina Gaspar[1]
[1]Department of HIV/AIDS, Tuberculosis, Viral Hepatitis, and Sexually Transmitted Infections, Ministry of Health of Brazil, Brasília, Brazil

INTRODUCTION
The development of clinical guidelines takes place in a context of increasing complexity of scientific production and growing demand for timely decision-making within health systems. Evidence-Informed Policies (EIPs) aim to bridge evidence and decision-making processes, and rapid systematic reviews have emerged as strategic instruments to support decisions and the development of clinical guidelines based on the best available evidence.
METHODS
This is an experience report from the General Coordination of Surveillance of Sexually Transmitted Infections (CGIST/DATHI/SVSA/Ministry of Health of Brazil) on the institutionalization of EIPs within the process of developing and updating Clinical Protocols and Therapeutic Guidelines (PCDTs) in the Brazilian Unified Health System (SUS), in accordance with the national guideline development framework. A structured workflow for the production of rapid systematic reviews was implemented to respond to decision-making demands in a timely manner. The workflow includes scope definition and formulation of research questions, systematic searching, study selection and data extraction, methodological quality appraisal using validated tools, evidence synthesis, and knowledge translation into concise products to support deliberations by Technical Advisory Committees. Methodological decisions are explicitly documented, ensuring transparency and reproducibility.
RESULTS
Rapid systematic reviews became the main technical input for discussions and deliberations of Technical Advisory Committees in the processes of developing and revising PCDTs. Reviews were produced internally by CGIST and by partner centers, under technical coordination of the unit. Between 2024 and 2026, fourteen reviews were conducted, contributing to reduced response time to institutional demands, methodological standardization, and systematic incorporation of EIPs into decision-making processes.
CONCLUSIONS
This experience demonstrates that rapid evidence syntheses constitute a feasible, sustainable, and institutionally robust strategy for operationalizing Evidence-Informed Policies within public health systems. The adopted model strengthens evidence-use governance and enhances the development of national clinical guidelines, promoting more equitable, transparent, and needs-oriented decision-making within the SUS.

The work of community health workers in a pandemic context: narratives, care, and equity in primary health care

Gabriela De Brito Martins[1], Andre Dos Santos Pimentel[1,2], Ariane Silva Carvalho[1], Fabiola Fernandes Bersot Magalhães[1], Jeanine Pacheco Moreira Barbosa[1], Manuella Ribeiro Lira Riquieri Ribeiro Lira Riquieri[1], Marcos Vinícius Da Silva Cordeiro[1], Maria Angélica Carvalho Andrade[1], Rita De Cássia Duarte Lima[1], Stephania Mendes Demarchi[1]
[1]Ppgsc, Ufes, Vitória, Brazil, [2]Ppgeh, Ifes, Vitória, Brazil

ABSTRACT
This study analyzes the work activity of women community health workers (CHWs) in the municipality of Vitória, Espírito Santo, Brazil, in the context of the COVID-19 pandemic, based on a qualitative and intervention-oriented approach within the field of Collective Health. Grounded in the activity clinic and inspired by the concept of escrevivências (writing from lived experience), the research constructs narratives produced by the workers themselves as a strategy for analysis, self-care, and the expansion of their power to act. The study employed focus groups, interviews, participant observation, and letter writing, understood as ethical-political devices for producing meaning about work, life, and health care. The results highlight the dilemmas, overloads, and precarious working conditions intensified by the pandemic, as well as the intersections of being a woman, a worker, and a caregiver in territories marked by social inequalities. At the same time, practices of resistance, reinvention, and solidarity emerge that affirm life in the everyday work of health care. The study argues that the collective construction of narratives and escrevivências constitutes a powerful strategy for strengthening care, equity, and inclusion within Primary Health Care. By giving visibility to the voices and experiences of CHWs, the study contributes to the debate on health without borders, recognizing women's work in health as central to the sustainability of public systems and to the promotion of care practices committed to equity and social justice.

The influence of children on parental food purchases during supermarket shopping in Pretoria, South Africa: The perspectives of parents

Mnene Nkomo[1], Yolande Smit[1], Nelene Koen[1]
[1]Division of Human Nutrition, Department of Global Health, Stellenbosch University, Cape Town, South Africa

BACKGROUND
Children have a major influence on purchasing decisions by using pester power to request certain food items from their parents. This study aimed to determine parents' perspectives of the self-reported influence their children have on their food-purchasing behaviour during grocery shopping.
METHODS
A quantitative descriptive cross-sectional study was conducted. Parents of children between three to twelve years of age doing grocery shopping at selected supermarkets in Pretoria (N=400) were recruited using convenience sampling. Interviewer-administered questionnaires were used to collect data.
RESULTS
More than half (55%, n=221) of parents indicated that their children influenced their grocery shopping decisions. The majority of children used verbal requests (70.1%, n=281) and pointing (46.1%, n=185) to exert influence over their parent's purchases. They mostly influenced chocolate (69.6%, n=279), sweets (63.3%, n=274), ice cream (67.8%, n=272), potato chips (46.1%, n=185) and yoghurt (46.1%, n=185) purchases. More than one third of participants (38.5%, n=154) always wrote a grocery list before going shopping; however, they hardly stuck to these because of being tempted by special offers. More than one third (37.4%, n=150) of participants felt the store layout sometimes affected their shopping, while 32.3% (n=129) felt that the store layout did not affect their shopping. Some parents reported that their children (44.4%, n=178) always asked for food at the checkout lane, while others (44.1%, n=165) sometimes asked for food at the checkout lane. The majority of parents (61.5%, n=246) sometimes bought food items at the checkout lane.

CONCLUSIONS
Children often use pester power to influence their parents' purchasing decisions regarding food. To address this, parents should be empowered and supported to make healthier food choices during grocery shopping. In addition, regulation of food marketing to children is essential to mitigate the adverse effects of television advertising, food packaging, and in-store product placement.

ABS3322
The Influence of Patient Health Literacy on Lung Cancer Care Journeys in the Western Cape, South Africa

Aliyha Martin-Lewis[1], Patrick Redmond[2], Conor Murphy[2], Melinda Onverwacht[1,3], Ntobeko Nywagi[1,3], Jennifer Githaiga[1,3], Sarah Day[3]
[1]Division of Social and Behavioural Sciences, School of Public Health, University of Cape Town, Cape Town, South Africa, [2]Royal College of Surgeons Ireland, Dublin, Ireland, [3]Division of Public Health Medicine, School of Public Health, University of Cape Town, Cape Town, South Africa

BACKGROUND
Lung cancer is a leading cause of cancer deaths globally, especially in low- and middle-income countries like South Africa. Late diagnoses are common due to limited public awareness, poor healthcare access, socio-cultural barriers, and unequal healthcare infrastructure. This study explores how patients' health information and health literacy shape their cancer care health journeys in the Western Cape, South Africa.
METHODS
Using patient journey mapping and semi-structured interviews, lung cancer patients and their families and caregivers were recruited from a tertiary and secondary hospitals in the Western Cape, South Africa. Data from patient medical records was used to assess patient diagnosis and staging information. We recruited 50 patients and their families and/or caregivers. Data were analysed using thematic analysis.
RESULTS
The preliminary analysis of data suggests there is a considerable variation in participants' understanding of their health conditions, treatment plans, and care pathways. Differences in health literacy appeared to shape patients' sense of autonomy, agency, and participation in decision-making. Participants with limited understanding of health information often reported confusion, reliance on informal support networks, a reduced confidence in navigating the health system, and passive acceptance of the health care they received. Health worker communication practices, including the use of technical language and limited opportunities for clarification, strongly influenced patients' comprehension and engagement with care.
CONCLUSIONS
This study highlights the central role of health information and communication in shaping patient cancer care journeys in South Africa. Understanding how health literacy interacts with health system practices may inform interventions aimed at improving patient engagement, shared decision-making, and equity in health care delivery in resource-constrained settings.

Evaluation of the effect of the national oral health policy on the provision of dental prostheses in primary care in the state of Bahia, Brazil

Samilly Miranda[1], Inglide Silveira[1], Vinicius Mendes[1], Marcio Natividade[1], Bruna Dantas[1], Erika Aragão[1]
[1]Federal University of Bahia, Salvador, Brazil

BACKGROUND
The National Oral Health Policy (PNSB) enabled the incorporation of prosthetic rehabilitation into Primary Care through the implementation of the Regional Dental Prosthesis Laboratories (LRPD). This study aimed to evaluate the effect of the PNSB on the provision of dental prostheses in Primary Care in the state of Bahia, considering the different types of LRPD accreditation between 2008 and 2019.
METHODS
The study was conducted in two stages. First, a descriptive ecological study was carried out with an analysis of outpatient production of dental prostheses according to the quantity produced and the temporal evolution of municipalities with accredited LRPDs throughout the study period. In the second stage, the effect of the PNSB on the provision of dental prostheses was analyzed through a linear regression model.
RESULTS
The results showed greater production of maxillary and mandibular prostheses, both complete and partial, while the production of crown and temporary prostheses showed non-significant values. The time-trend analysis indicated an increase in the percentage of municipalities with accredited LRPDs between 2010 and 2011, followed by a reduction between 2012 and 2013. From 2014 onward, a new growth trend was observed, with 2019 being the year with the highest number of accreditations. An effect of the PNSB on prosthesis production was observed in municipalities in the state of Bahia with LRPDs accredited by the Ministry of Health (MS), with higher statistical significance, as well as in those accredited by both the MS and the Expansion Plan list. Conversely, a low-magnitude effect was observed in municipalities with accreditation exclusively through the Expansion Plan.
CONCLUSIONS
The PNSB contributed to the expansion of prosthetic rehabilitation services in Primary Care, especially through the accreditation of LRPDs based on MS ordinances.

Financial Accessibility to Quality Hospital Care: Experience with the Implementation of a Subsidised Flat-Rate Payment System at Isangi General Referral Hospital, Tshopo Province, Democratic Republic of Congo

Aloys Zongo[1], Roger Bisimwa Balyahamwabo[1], Alpha Ngandru Kiza[2]
[1]Enabel, Kisangani, Congo, Democratic Republic of the, [2]Tshopo Provincial Health Division, Kisangani, Congo, Democratic Republic of the

BACKGROUND
To address challenges related to the financial accessibility of quality hospital care, Enabel (Belgian developpement agency) supports the Tshopo Provincial Health Division in the implementation of a subsidised flat-rate payment system at Isangi General Referral Hospital (GRH), while ensuring the financial sustainability of the facility. This approach aims to reduce out-of-pocket payments for patients referred to hospital care, including provisions for indigent patients.
METHODS
A descriptive evaluative study was conducted at Isangi GRH from 1 October 2024 to 31 March 2025. The evaluation covered ten hospital services included in the subsidised flat-rate payment system. Only patients referred from primary health care centres to the GRH were eligible for the scheme. Three types of evaluation were carried out: (i) service volume assessment; (ii) technical quality assessment; and (iii) perceived quality of care assessment.
RESULTS
A total of 1076 services were delivered compared to 642 planned for the study period, corresponding to an achievement rate of 167%. Among indigent patients, only 2 services were provided out of 32 planned (6.2%). Technical quality verification assessed seven health system pillars using the DQI framework, resulting in a quality score of 60.2%. Community verification combined with patient satisfaction surveys improved from 67% at baseline to 72% six months after implementation. Staff satisfaction increased from 49% at baseline to 70.1%. The overall quality score, integrating the DQI, patient satisfaction, and the complementary flat-rate assessment tool, was 60.6%. From a financial perspective, USD 29913 were spent against a projected budget of USD 21272, corresponding to an execution rate of 140.6%.
CONCLUSIONS
The implementation of the subsidised flat-rate payment system was considered satisfactory in terms of service utilisation and quality improvement. However, several challenges were identified, particularly regarding coverage of indigent patients and financial forecasting, leading to recommendations to further strengthen and optimise the scheme.

contribution of human resource management interventions to health care worker performance in buyende district, uganda

Daniel achoda[1], Kalu Nwankwo Obasi[2], Chidinma Okoro Obiageri[3], Vera Usigbe[4], Patrick Shaibu Yila[5]
[1]Masaka school of comprehensive nursing Uganda, Masaka school of comprehensive nursing Uganda, Masaka, Uganda, [2]Clinicals, Heirs Energies, Rivers, Nigeria, [3]Orthopaedic, University of Calabar Teaching Hospital, Calabar, Nigeria, [4]Directorate of Health Services,, National Assembly, Abuja., Abuja, Nigeria, [5]Public Health, College of Nursing Sciences Gombe, Gombe State-Nigeria, Gombe, Nigeria

INTRODUCTION
human resource management (HRM) interventions are critical to improving health care worker (HCW) performance and strengthening health system effectiveness.–

however, gaps in the implementation of key HRM practices continue to affect service delivery in many district health systems. this study examined the contribution of HRM interventions, with specific focus on continuous capacity building and performance appraisal, to the performance of health care workers in buyende district.,–

METHODS

a cross-sectional research design employing both quantitative and qualitative approaches was adopted. data were collected from 80 randomly selected direct and indirect health care workers, achieving a response rate of 78.8%, as well as six key informants. primary data were collected using structured questionnaires and interview guides. data analysis involved descriptive statistics, correlation analysis, and regression analysis to establish relationships between HRM interventions and health worker performance and to test the study hypotheses.–

RESULTS

regression analysis revealed that HRM interventions significantly influenced health worker performance (F = 66.574, p = 0.000). continuous capacity building demonstrated a stronger effect on performance (β = 0.583) compared to performance appraisal (β = 0.336), indicating that training and professional development were more influential in improving employee output.– however, both quantitative findings and key informant interviews identified implementation gaps, including limited access to training due to inadequate funding, time constraints, weak strategic planning, and misalignment of training programs with staff needs. performance appraisals, though regularly conducted, were often delayed and their recommendations rarely implemented.,

CONCLUSIONS

HRM interventions significantly influence health worker performance in buyende district, with continuous capacity building having a greater impact than performance appraisal. addressing implementation gaps is essential to maximizing the benefits of these interventions and strengthening workforce performance.,–

The South African Health Promotion Levy: Navigating Public Health Gains, Economic Realities, and Future Directions

Anam Nyembezi[1]

[1]School of Public Health, University of the Western Cape, Bellville, South Africa

INTRODUCTION

To address the escalating prevalence of obesity and its associated co-morbidities, the South African government announced a tax on sugar-sweetened beverages (SSBs) in 2016, aligning with World Health Organisation (WHO) recommendations. Formally implemented on April 1, 2018, as the Health Promotion Levy (HPL), this policy targets sugar content to disincentivise consumption and mitigate the increasing incidence of obesity and type 2 diabetes. Since its inception, the HPL has generated substantial revenue and established South Africa as a global leader in utilising fiscal mechanisms for public health. However, the levy remains a subject of intense discourse regarding its efficacy, broader economic impact, and potential for expansion.

METHODS

The Public Health Association of South Africa (PHASA) Health Promotion Special Interest Group (HP SIG) convenes this session to elucidate the public health gains, economic realities, and future strategic directions of the HPL. The panel consist of a diverse group of experts and health promotion advocates, academics, government and civil society organisations to critically review the first eight years of the HPL and explore the "next generation" of health taxes. The discussion will triangulate clinical realities, econometric evidence, and fiscal mechanics to chart a path forward. We will move beyond the binary debate of "jobs vs. health" to discuss ring-fencing revenue for health promotion.

CONCLUSIONS

The rapidly increasing prevalence of non-communicable diseases (NCDs) continues to strain the healthcare system, raising urgent questions for policymakers: Has the HPL succeeded in changing consumer behaviour? Should the levy be increased or expanded to include other commodities such as fruit juices and ultra-processed foods? How are these HPL funds accounted for? Furthermore, how do current excise duties on alcohol align with the "health promotion" philosophy, and is there a case for a unified "sin tax" strategy that harmonises the approach to sugar and alcohol?

Essential Surgery Capability of Non-Tertiary Hospital Facilities in the Philippines (The Philippine Surgical Capacity Study -Phase 1)

Brent Andrew Viray[1], Teodoro Herbosa[1], Enrique Ona[1], Joselito Mendoza[1], Rhoel De Leon[1], Vivencio III Villaflor[1], Rodney Dofitas[1], Roberto Chacon[1], Vicente Bernardo[1], Panelo Carlo[1,2], Joy Grace Jerusalem[1]

[1]Philippine College of Surgeons, Quezon City, Philippines, [2]Department of Clinical Epidemiology, University of the Philippines, College of Medicine, Manila, Philippines

INTRODUCTION

" Surgery for All" as espoused by the Philippine College of Surgeons compels a more in-depth analysis of surgical care in the Philippines. Decongestion of tertiary hospitals capable of essential surgical procedures is prompted through relocation to secondary or ambulatory surgical centers. Further discourse should be encouraged with stakeholders to determine the list of essential surgeries in the Philippine context. This study will investigated the capacity of non-Level 3 hospitals to provide essential surgical procedures, through utilizing a health systems framework approach.

METHODS

This will be a scoping study of the capability of all non-Level 3 hospitals in the Philippines. This study utilized secondary data of The Philippine Health Insurance Corporation (Philhealth) claims from 2022-2024. Results and discussion There were a total of 1202 combined government and private-owned non level 3 hospitals in the 18 regions of the Philippines. All hospitals included in the analysis were able to claim reimbursements for rendering essential surgical care procedures like cesarian section and laparotomy. Regions in the east have less surgical service delivery compared to the regions in the west. This might be because oof typhoon or more challenging landscape/terrain. There is a clear and persistent divide in which level of institution handles the majority of surgical claims, varying significantly by region. Level 2 institutions consistently dominate in major urban centers like NCR (53.30% in 2024) and Region 7 (63.05% in 2024), whereas Level 1 facilities are the primary providers in regions such as Region 8 (73.03% in 2024) and Region 2 (58.51% in 2024).

CONCLUSIONS

While the challenges of surgical service access in the Philippines persist because of surgical manpower maldistribution and urban-centrism, this study proves that essential surgical procedures are rendered in more-peripherally located and resource-limited hospitals (non-level 3)in the Philippines.

Forest therapy and its measurable effects on psycho-emotional state and mood regulation

Maria Kashutina[1], Aleksandra Antsiferova[1], Dinara Mukaneeva[1], Vladimir Kutsenko[1], Anna Kontsevaya[1], Oxana Drapkina[1]

[1]Public Health, National Research Center for Therapy and Preventive Medicine, Moscow, Russian Federation

INTRODUCTION

The use of green spaces to mitigate risk factors for chronic diseases is well-established. Forest therapy (FT) is a structured approach validated in East Asia, but its effects on the Russian population are understudied, prompting this project [1-3]. Aim. To evaluate the impact of FT on psycho-emotional state and objective health parameters.

METHODS

A dedicated 2 km trail was created at at the Gorki Leninskiye Museum-Reserve in the Moscow region, Russia (July-September 2025). Adult visitors (n=796) participated in guided or independent walks. Before and after the walk, the POMS questionnaire was used to assess psycho-emotional state, medical professionals measured blood pressure (BP), heart rate (HR), and oxygen saturation. Statistical analysis included descriptive and comparative statistics (Mann-Whitney U, Fisher's exact, Wilcoxon, McNemar) and linear regression, $p<0.05$ was used.

RESULTS

Participants (28.3% male; mean age 39.8±11.1 years; 32.4% guided) showed significant improvement in all six POMS mood subscales as a result of FT: anxiety decreased by 4.86±4.52 points, depression by 3.24±4.36, anger by 2.71±3.41, fatigue by 2.93±3.88, confusion by 2.87±3.17 points (all $p<0.001$). Vigor was unchanged ($p=0.55$). Total Mood Disturbance index fell from 39.7±22.32 to 23.13±15.19 points ($p<0.001$). Self-rated health improved by 6.64±11.47 points ($p<0.001$). Guided walks reduced anxiety more than independent walks (-5.41±4.40 vs. -4.59±4.55 points, $p=0.016$). Objective health parameters also improved: systolic BP decreased by 3.31±6.96 mmHg, diastolic BP by 1.11±4.72 mmHg, oxygen saturation increased by 0.26±1.31% ($p<0.001$), HR decreased by 1.01±7.69 bpm ($p=0.004$), HR reduction was greater in guided walks (-2.51±8.36 vs. -0.25±7.22 bpm, $p<0.001$). No other differences in objective parameters were significant ($p>0.05$).

CONCLUSION
The concurrent improvement in psycho-emotional state, self-perceived well-being, and key physiological markers confirms the health-promoting effect of structured forest therapy. These results support scaling FT in Russia as a novel public health tool to address major noncommunicable diseases risk factors: hypodynamia and stress.

ABS3674
Implementation of the PACK protocol in Primary Health Care in Porto Alegre: an experience report on strengthening evidence-based clinical practices
Martha Collares[1], Leticia Pazinato[1], Juliana Boscato[1], Inaiá Bonfadini Gomes[1]
[1]Primary Public Health, Conceição Hospital Group, Porto Alegre, Brazil
ABSTRACT
Primary Health Care (PHC) is the structural axis of the Unified Health System (SUS) network, requiring constant qualification of clinical and managerial practices. In this context, the implementation of evidence-based clinical protocols represents a strategy to strengthen care practices. The Practical Approach to Care Kit (PACK) was developed in South Africa to support health professionals in low- and middle-income countries in making standardized, safe, and resolutive clinical decisions. In Brazil, its implementation began in 2015 in Florianópolis (SC), showing positive results in improving the work processes of PHC teams and encouraging its dissemination. This is an experience report developed during the training process, using participant observation, local management records, and field notes from workshops and training sessions In Porto Alegre, the Municipal Health Department began implementing PACK in the second half of 2025, with the training of municipal leaders, local multipliers, and subsequently, the qualification of teams from 134 health units in the city.. The stages included the training of 25 municipal leaders, 147 local trainers (physicians and nurses), and the initiation of workshops in the units, discussing clinical cases based on PACK flowcharts. The tool was well accepted, especially for its practicality and integration across different clinical areas. Challenges included the need for adaptation to local contexts, workload, and adjustment of care flows. Initial assessments indicate PACK's potential to enhance standardization of conduct and patient safety. The implementation of PACK in Porto Alegre represented progress in consolidating evidence-based clinical practices in PHC, promoting professional qualification and improving problem-solving capacity. Continued training and result monitoring are essential to ensure the sustainability of this initiative.

Tobacco smoking habits, attitudes and associated factors among women in the United Arab Emirates
Dima Alwardat[1,2], Basema Saddik[3], Jayadevan Sreedharan[1]
[1]College of Medicine, Gulf Medical University, Ajman, United Arab Emirates, [2]Department of Public Health, Ministry of Health, Amman, Jordan, [3]Department of Public health and Epidemiology, Khalifa University of Science and Technology, Abu dhabi, United Arab Emirates
INTRODUCTION
Despite ongoing control efforts, tobacco smoking continues to remain a serious public health burden due to its wide-ranging health consequences. This study examined the prevalence and patterns of tobacco use among women in the United Arab Emirates (UAE), with a focus on various forms of smoking.
METHODS
A cross-sectional study was conducted among adult women residing in the UAE. Eligible participants included UAE nationals and expatriates aged 18 years and older who were able to read Arabic or English and provided informed consent. Participants were recruited through online platforms and in-person distribution at universities, hospitals, and public venues. Data were collected using a structured, self-administered questionnaire developed for this study and content-validated by experts. Data analysis was performed using SPSS, applying descriptive statistics and inferential tests.
RESULTS
Overall, 21.4% of respondents reported ever smoking, and 15.1% were current smokers. The most commonly used products included traditional cigarettes, electronic cigarettes, and waterpipes. Higher smoking prevalence was observed among younger women and those who were employed. Key factors associated with continued smoking included peer pressure, emotional stress, low awareness of health risks, and exposure to smoking behaviors via family or media. Female smokers demonstrated lower levels of knowledge regarding specific health risks associated with smoking when compared to nonsmokers.
CONCLUSIONS
Tobacco use remains a notable public health concern among women in the UAE, particularly among younger and employed populations. The findings highlight the persistence of multiple forms of smoking and reveal important gaps in knowledge regarding smoking-related health risks among female smokers. Social and psychosocial influences, play a significant role in sustaining tobacco use. These results underscore the need for targeted tobacco control strategies that combine health education, stress management, and social interventions to effectively reduce smoking prevalence among women in the UAE.

Perception of quality of life among primary health care users in a brazilian municipality
Caroline Feitosa Dibai de Castro[1], Maria Clara Alves dos Santos[1], Kélly Testa Santorio[1], Myllena Victoria Zucolotto Scottá[1], Vitoria Pereira Santos[1], Fabricia Maria Milanezi[1], Henriqueta Tereza do Sacramento[1], Leonardo Gomes da Silva[1], Mateus Nague de Souza[2], Fabiola Fernandes Bersot Magalhães[2], Thiago Antônio da Silva Fontoura[2], Thais Campolina Cohen Azoury[1]
[1]Medical Graduate, Higher School of Sciences of the Santa Casa de Misericórdia of Vitória, Vitoria, Brazil, [2]Potsgraduate Program in Public Health, Federal University of Espírito Santo, Vitoria, Brazil
BACKGROUND
Quality of life (QoL) is an important public health indicator, as it reflects physical, psychological, social, and economic conditions of the population. In Primary Health Care (PHC), assessing users' perceptions helps identify vulnerabilities and strengthen comprehensive care strategies, especially in urban settings marked by social inequalities. Despite its relevance, studies addressing QoL from users' perspectives remain limited in local contexts, particularly in middle-income countries.
METHODS
A cross-sectional, descriptive study conducted with 641 adult users attended at Family Health Units. Data were collected through semi-structured interviews using a questionnaire based on validated instruments, including questions adapted from the WHOQOL-100. Sociodemographic variables, financial perception, physical activity, sleep characteristics, use of sleep medication, access to health services, and self-rated quality of life were analyzed using descriptive statistics.
RESULTS
There was a predominance of females (68%), married individuals (41.3%), and participants with children (77.5%). Most had an income between one and two minimum wages (42.1%) and did not have private health insurance (68.6%). Regarding self-rated quality of life, 55.3% assigned a score of eight or higher. However, 32.8% reported financial insufficiency to meet basic needs. Physical activity was reported by 52.3% of participants. Regarding sleep, 73.9% slept less than eight hours per night, and 23.6% used sleep medication.
CONCLUSIONS
Although overall perception of quality of life was positive, factors such as economic vulnerability, sleep deprivation, and medication use reveal significant fragilities, reinforcing the importance of integrated actions within PHC.

From Policy to Practice: Implementing Nutritional Interventions to Improve Adherence to School Meals in Northeastern Brazil
Ilana Bezerra[1], Maria Taiany Cavalcante[1], Jose Anael Neves[1], Sara Maria Verde[1]
[1]Universidade Estadual do Ceará, Fortaleza, Brazil
INTRODUCTION
Brazil faces persistent challenges related to food and nutrition insecurity, marked by the coexistence of malnutrition and increasing childhood obesity. The National School Feeding Program (PNAE) aims to ensure access to healthy meals in public schools; however, adherence to and acceptability of school meals remain critical challenges. The objective of this work was to evaluate the implementation of a multicomponent nutritional intervention and its effects on adherence to and acceptability of the main school meal in the public school system of a municipality in Northeastern Brazil.
METHODS
This implementation study was conducted with a 5th-grade class at a public elementary and secondary school in Tauá, Ceará. The study was developed in three stages: a diagnostic phase, including focus groups with students and parents; implementation of a multicomponent intervention involving changes in the school food environment, food and nutrition education actions, improvements in the organization and operation of the school food service, and gastronomic

interventions; and (3) an evaluation phase based on the Proctor implementation outcomes taxonomy. Quantitative and qualitative data were collected, including plate waste and clean leftovers, nutritional status, socioeconomic characteristics, and lifestyle indicators. Data were analyzed using mixed methods.
RESULTS
The multicomponent intervention showed a positive impact on both adherence to and acceptability of school meal preparations, particularly those previously reported as less accepted. The actions were well received by students and the school community, were low-cost, sustainable throughout the study period, and directly addressed barriers identified in the diagnostic phase. Active and collaborative engagement of school stakeholders was a key element contributing to the observed improvements.
CONCLUSIONS
Multicomponent nutritional interventions in the school environment are feasible, effective, and potentially replicable strategies to improve adherence to and acceptability of school meals, contributing to the promotion of adequate and healthy eating in public schools.

Addressing barriers to sexually transmitted infection information and care for adolescent girls and young women in South Africa: A health promotion approach within universal health systems

Bongiwe Paka-Huysamer[1], Zoe Duby[1], Kate Bergh[1], Kim Jonas[1], Cathy Mathews[1]
[1]South African Medical Research Council, Cape Town, South Africa

INTRODUCTION
Adolescent girls and young women (AGYW) in South Africa experience a disproportionately high burden of sexually transmitted infections (STIs), shaped by gender inequality, stigma, and structural barriers within health services. Despite high prevalence, STI prevention and care remain marginalised within HIV-centric programming, limiting comprehensive sexual and reproductive health (SRH) promotion. Strengthening health promotion within universal health systems is essential to improve equitable access to information, prevention, and timely treatment for AGYW
METHODS
This study draws on data from the HERStory3 mixed-methods study conducted across eight South African provinces. Quantitative data were collected through a household survey with over 5,000 AGYW aged 15–24 years. Qualitative data was generated through in-depth interviews with 68 AGYW. The analysis explored STI knowledge, communication practices, health-seeking behaviours, and experiences of accessing public healthcare services.
RESULTS
Although many participants reported experiencing STI-related symptoms, only 16% had been diagnosed with an STI. Among those under 18 years, more than a quarter did not seek treatment. When clinics were perceived as unwelcoming, some AGYW turned to peers, the internet, or traditional healers. Participants described embarrassment and fear of judgement, with reports of negative provider attitudes. However, others experienced care, support, and dignity when treated respectfully in clinics or pharmacies. Most indicated willingness to seek clinic-based care if assured of privacy, confidentiality, and non-judgemental services.
CONCLUSIONS
Embedding health promotion within universal, youth-friendly health systems is critical to addressing barriers to STI information and care. Integrated SRH services that prioritise confidentiality, non-judgmental care, and health literacy—supported by schools, families, peers, and digital platforms—can reduce stigma, strengthen care-seeking, and advance equitable, people-centred primary healthcare for AGYW.

Smoking profile and associated factors among primary health care users in a brazilian municipality

Caroline Feitosa Dibai de Castro[1], Myllena Victoria Zucolotto Scottá[1], Vitoria Pereira Santos[1], Kélly Testa Santorio[1], Maria Clara Alves dos Santos[1], Cláudia Gomes Rossoni[1], Henriqueta Tereza do Sacramento[1], Lainerlani Simoura de Almeida[1], Leonardo Gomes da Silva[1], Mateus Nague de Souza[2], Thais Campolina Cohen Azoury[1]
[1]Medical Graduation, Higher School of Sciences of the Santa Casa de Misericórdia of Vitória - EMESCAM, Vitória, Brazil, [2]Postgraduate Program in Public Health, Federal University of Espírito Santo, Vitória, Brazil

BACKGROUND
Smoking remains an important public health problem, associated with high morbidity and mortality and significant impacts on quality of life. In Primary Health Care (PHC), identifying the profile of smokers is essential for planning preventive actions and tobacco cessation strategies.
METHODS
This is a cross-sectional, descriptive, and quantitative study conducted with users aged over 17 years attending Primary Health Care Units in Vitória, Espírito Santo, Brazil between September 2024 and September 2025. Data were collected using a structured questionnaire based on validated instruments, including items from the Brazilian National Cancer Institute (INCA) questionnaire for clinical analysis of smoking. Sociodemographic, clinical, and tobacco use–related variables were analyzed. Smoking was defined as the use of any form of tobacco. Statistical analysis was performed using IBM SPSS, version 31, with descriptive statistics and chi-square tests, adopting a significance level of $p<0.05$.
RESULTS
A total of 641 users participated, with a mean age of 52.1 years, a predominance of females (68.1%), and a higher concentration of individuals aged 60 years or older. Current smokers accounted for 13.9% of participants, while 18.7% were former smokers. The mean age of smoking initiation was 18 years, and the average exposure was 17.75 pack-years, ranging up to 165 pack-years. The predominant form of tobacco use was conventional cigarettes (22.2%). Smoking showed a statistically significant association with male sex, lower educational level, lower family income, single marital status, and Black race/ethnicity.
CONCLUSIONS
Smoking prevalence among PHC users in Vitória remains relevant, the identified profile indicates greater vulnerability among men and individuals in less favorable socioeconomic contexts, reflecting social health inequalities. These findings highlight the need for targeted and intersectoral strategies for smoking prevention and cessation, strengthening the role of PHC in addressing tobacco use in the Brazilian context.

Scaling Decentralized, Integrated HIV Services for Mobile Populations: Evidence from India's One Stop Centre Model

Kaushik Biswas[1], B Borah[1]
[1]Programme, Plan International (India Chapter), Delhi, India

BACKGROUND
Although overall adult HIV prevalence in India remains low, it is nearly five times higher among long-distance truckers (1.00%; 95% CI: 0.78–1.21). Truckers and migrant workers function as critical bridge populations due to high mobility, occupational risk, and limited continuity of healthcare access. To support India's National AIDS Control Programme (NACP) goals, Plan India implemented a One Stop Centre (OSC) intervention across 15 states to expand integrated, community-led service delivery for these mobile populations.
METHODS
The OSC intervention was guided by three strategic
OBJECTIVES
(i) expanding service coverage beyond HIV to include TB, STI, viral hepatitis, and NCDs; (ii) creating enabling environments to reduce stigma and discrimination; and (iii) strengthening community empowerment through awareness, skills development, and social protection linkages.
RESULTS
Between 2022–23 and 2024–25, HIV testing coverage increased steadily from 76.3% to 86.0%, reflecting strengthened integration of HIV services within decentralised outreach models. Overall, 190,327 truckers and migrants were registered during the study period, with 76.6% first reached through hotspots and 16.7% outreach sites, underscoring the importance of non-facility platforms. Integrated service delivery achieved substantial scale, including TB screening for 188,164 clients, STI screening for 134,814, viral hepatitis screening for over 35,000, and NCD screening for blood pressure (139,539) and blood sugar (73,284). While decentralised outreach achieved wider population coverage with lower HIV positivity yield, facility-based services identified higher-risk clients (OR = 2.38; 95% CI: 1.89–2.99; $p < 0.001$).
CONCLUSIONS
The OSC model demonstrates that decentralised, integrated service delivery can be rapidly scaled among highly mobile trucker and migrant populations. The complementary strengths of outreach-led coverage and facility-based diagnosis support hybrid delivery models as an effective pathway to improve early detection, continuity of care, and equity; directly advancing NACP objectives through mobility-responsive HIV programming.

ABS3891

Alcohol consumption patterns and associated factors among primary health care users in a brazilian municipality

Caroline Feitosa Dibai de Castro[1], Vitoria Pereira Santos[1], Myllena Victoria Zucolotto Scottá[1], Kélly Testa Santorio[1], Maria Clara Alves dos Santos[1], Cláudia Gomes Rossoni[1], Fabricia Maria Milanezi[1], Francine Alves Gratival Raposo[1], Henriqueta Tereza do Sacramento[1], Lainerlani Simoura de Almeida[1], Leonardo Gomes da Silva[1], Mateus Nague de Souza[2]

[1]Medical Graduation, Higher School of Sciences of the Santa Casa de Misericórdia of Vitória - EMESCAM, Vitória, Brazil, [2]Postgraduate Program in Public Health, Federal University of Espírito Santo, Vitória, Brazil

BACKGROUND

Alcohol consumption is a risk factor for several chronic diseases and adverse social outcomes. In Primary Health Care (PHC), understanding alcohol consumption patterns and the profile of individuals who consume alcohol is essential to support health promotion and harm prevention strategies.

METHODS

This is a cross-sectional, descriptive, quantitative study conducted with users aged over 17 years of age attended at Unidades Básicas de Saúde - UBSs (Basic Health Centers) in the city of Vitória, Espírito Santo, Brazil. Data collection took place between September 2024 and September 2025 using a structured questionnaire based on validated instruments, including items from the Alcohol Use Disorders Identification Test. Statistical analyses were performed using IBM® SPSS software, version 31, applying descriptive statistics and the chi-square test to analyze associations, with a significance level set at 5%.

RESULTS

Among the 641 participants, 37.7% reported current alcohol consumption and 18.9% reported being former drinkers.The most commonly consumed beverage was beer or draft beer (25.7%), followed by wine (7.8%) and distilled spirits (5.5%). Regarding frequency, consumption two to four times per month was the most prevalent (42.7%), although a relevant proportion reported weekly or more frequent intake (19.9%). In terms of quantity, 36% consumed between two and five drinks per occasion, and 34.7% reported consuming more than five drinks. Alcohol use showed a significant association with male sex, ages 18-44 years, single individuals, and higher education.

CONCLUSIONS

Alcohol consumption was frequent among PHC users in Vitória, with patterns that may represent health risks. The higher prevalence among young, single men and individuals with higher educational levels highlights the need for targeted preventive strategies and for strengthening early identification and brief counseling within PHC.

From universal coverage to comprehensive care: The essential role of health education in healthcare systems

Tainá Faustino Mafra[1], Lucas Santos[1], José Silva[2], Herika Mauricio[3], Rafael Moreira[1]

[1]Saúde Coletiva, Instituto Aggeu Magalhães, Recife, Brazil, [2]Centro Acadêmico de Vitório de Santo Antão, Universidade Federal de Pernambuco, Recife, Brazil, [3]Odontologia, Universidade de Pernambuco, Recife, Brazil

INTRODUCTION

The Beveridge and Bismarck healthcare models have inspired universal health systems worldwide. Following the Alma-Ata Declaration, Primary Health Care (PHC) became the foundation of these systems, where oral health education plays a fundamental role in health promotion and inequality reduction. Healthcare models influence service delivery practices, thereby shaping health education approaches in communities.

OBJECTIVES

To analyze how healthcare systems in five countries influence the provision of oral health education (OHE), highlighting its importance as an intersectoral practice in health promotion and inequality reduction.

METHODS

This descriptive-analytical study was conducted through a narrative literature review. Scientific articles, official documents, and institutional reports addressing healthcare systems in Brazil, United Kingdom, New Zealand, Cuba, and South Africa were selected. Analysis focused on healthcare system organization, oral health education strategies, and intersectoral practices, examining how these elements contribute to health promotion in PHC and inequality reduction.

RESULTS

The analyzed healthcare systems present specificities that impact OHE provision. Brazil offers OHE through PHC, but the predominant private oral health sector weakens these initiatives. The United Kingdom provides universal public oral healthcare through co-participation of private practices, which limits OHE since oral health is not fully integrated into public health teams. New Zealand provides public coverage only for children and youth, favoring OHE exclusively for these age groups. South Africa presents sporadic school-based OHE activities. Cuba adopts a community-based model ensuring oral health integration with other team members, strengthening OHE in social spaces and households.

CONCLUSIONS

Universal systems are fundamental, but effectiveness in oral health requires strengthening educational and intersectoral actions. These systems must include health education as an essential pillar of service provision. By integrating educational programs into healthcare systems, it becomes possible to promote healthy habits from childhood, transforming the epidemiological reality of communities and reducing health inequalities across populations.

Translating Population Medicine Levels of Prevention to the Patient Care Continuum and Clinician Bedside: A Roadmap for Preventive and Promotive Population Health Practice

Tshegofatso Maimela[1], Sipho Sigcau[2]

[1]Department of Community Health, School of Public Health, University of the Witwatersrand, Parktown, Johannesburg, South Africa, [2]Public Health Medicine, Monitoring & Evaluation Directorate, Information Management Unit, Charlotte Maxeke Johannesburg Academic Hospital, Gauteng Department of Health, Parktown, Johannesburg, South Africa

BACKGROUND

Levels of prevention (primordial, primary, secondary, tertiary and quaternary) are foundational to population medicine and public health planning. However, at the clinical bedside, these perceived abstract concepts perpetuate fragmented care, an increasing reliance on hospital-centric and episodic disease management models, rising costs, and missed opportunities for upstream risk reduction. In an era of constrained health budgets, increasing non-communicable disease burden, and heightened pandemic risk, there is an urgent need to translate population prevention frameworks into actionable clinical practice across the patient care continuum.

METHODS

This interactive workshop presents a bedside translation framework that reframes levels of prevention as dynamic clinical lenses applied throughout the patient journey—from admission and acute care, through discharge, to community reintegration. Using real-world clinical scenarios, participants will work in multidisciplinary groups to: - map population levels of prevention to bedside clinical questions and decisions; - align lifestyle medicine, early risk detection, social prescribing, and continuity planning with each prevention level; and - identify promotive and preventive opportunities embedded within routine clinical workflows. The workshop integrates systems thinking and population health principles with clinical reasoning, demonstrating how preventive medicine can be operationalised without increasing clinical burden (4, 5).

RESULTS

Participants will co-develop a Preventive Care Bedside Continuum, including a clinical heuristic, patient-flow roadmap, and implementation checklist linking population risk reduction strategies to individual patient care. Outputs will illustrate how promotive and preventive actions can be delivered across acute, subacute, and ambulatory settings, while supporting equity, continuity of care, and health system resilience (2, 3).

CONCLUSIONS

By translating population health concepts into bedside practice, this workshop positions preventive medicine as a clinically grounded discipline of population health. This enables clinicians, managers, and policymakers to align everyday patient care with whole-of-society prevention goals, strengthening resilient, pandemic-prepared health systems while improving patient outcomes and responsible resource stewardship.

Behavioral and Lifestyle Determinants of Poor Glycemic Control Among Adults with Type 2 Diabetes in Lesotho: Implications for Public Health in Low-Resource Settings

Sibusiso Nomatshila[1], Matseko Moseneke[1]

[1]School of Public Health, Walter Sisulu University, Mthatha, South Africa

ABSTRACT

Type 2 diabetes mellitus (T2DM) is a growing public health challenge worldwide, disproportionately affecting populations in low- and middle-income countries

(LMICs). Poor glycemic control contributes significantly to the global burden of non-communicable diseases (NCDs), increasing morbidity, mortality, and healthcare costs. Understanding behavioral and lifestyle determinants is critical for designing effective public health strategies, particularly in resource-limited settings such as Lesotho. A cross-sectional population-based study was conducted among 184 adults with T2DM attending the out-patient department of Maluti Adventist Hospital, Lesotho. Data was collected using a structured questionnaire and analyzed descriptively with SPSS 26 Variables assessed included sociodemographic, dietary practices, physical activity, behavioral risk factors and self-care knowledge. Participants were predominantly aged 45–69 years (65.2%), with an equal sex distribution. Hypertension was the most prevalent comorbidity (65.2%). Risk factor exposure was widespread, 100% consumed fewer than five daily servings of fruits/vegetables, 95.1% reported insufficient physical activity, and 88.0% had elevated blood pressure. Overall, 86.4% had three or more NCD risk factors. Knowledge levels were intermediate, with 33.2% scoring poor, 52.7% moderate, and only 14.1% good. Glycemic control was suboptimal, with 40.8% uncontrolled. This study highlights the urgent public health need to address lifestyle and behavioral determinants of poor glycemic control in Lesotho. Tailored interventions focusing on dietary education, physical activity promotion, and routine monitoring are essential to reduce NCD risks and improve outcomes. The findings have broader implications for achieving Sustainable Development Goal 3.4 on reducing premature NCD mortality in LMICs. Strengthening culturally sensitive health promotion, community-based interventions, and integrated chronic disease care models could significantly advance diabetes prevention and control in low-resource settings.

ABS3993

Scaling Up HIV Testing Through Community Leadership: Evidence from a One Stop Centre Model for Transgender Populations in India

Kaushik Biswas[1]
[1]Programme, Plan International (India Chapter), Delhi, India

BACKGROUND

HIV prevalence among transgender (TG) populations in India remains disproportionately high at 4.78% (HSS 2021). Structural stigma, identity-related marginalization, unstable livelihoods and limited access to sexual and reproductive health (SRH) services impede timely HIV testing and diagnosis. Plan India, is implementing a community-led One Stop Centre (OSC) model to scale up HIV testing through decentralized, integrated and differentiated service delivery for TG populations across 13 states.

METHODS

The OSC intervention is guided by three

OBJECTIVES

(i) expanding HIV testing to reach unreached and newly identified TGs; (ii) creating an enabling environment to reduce stigma and discrimination; and (iii) strengthening community empowerment through awareness and social protection linkages. Community-driven OSCs deliver an integrated service package comprising HIV testing, SRH services, STI, TB and viral hepatitis screening, mental health counselling, legal awareness and access to social welfare schemes.

RESULTS

Out of a total 10,912 previously unreached Transgender were registered, and HIV testing coverage increased steadily over three years: 84.9% (n=5,964) in 2022–23, 91.3% (n=9,223) in 2023–24 and 93.3% (n=10,912) in 2024–25, demonstrating sustained scale-up through decentralized, community-led platforms. 68% were aged 19–29 years and over 83% were below 34 years. Educational attainment was low, with 74% educated up to secondary level or illiterate. Livelihood insecurity was common, with 66% dependent on informal work and 11% unemployed. Moe than one third of HIV testing was delivered through community-based platforms while 23.5% at OSCs. Altogether, 428 TG clients were newly identified as HIV-positive and successfully linked to antiretroviral therapy.

CONCLUSIONS

Community-led OSCs provide an effective implementation pathway to scale up HIV testing among transgender populations through decentralized, integrated and stigma-reducing service delivery. Sustained improvements in testing coverage, high ART linkage and enrolment of previously unreached TGs highlight the value of community leadership and differentiated service options.

Assessment of fruit and vegetables consumption among teenagers in some selected basic schools in a low middle income country: Implications for health promotion

Abigail Quartey[1], Portia Riverson[1], Frank Hayford[1]
[1]Department of Dietetics, University of Ghana, Accra, Ghana

BACKGROUND

Fruits and vegetables are emphasized in dietary guidelines due to their high content of dietary fibre, vitamins, minerals, and antioxidants, and aids in malnutrition and diet-related non-communicable diseases prevention. Adequate intake during adolescence is particularly important, as dietary habits formed at this stage often persist into adulthood. However, evidence suggests that consumption among adolescents in low- and middle-income countries remains suboptimal. This study assessed the quantity and frequency of fruit and vegetable consumption among teenagers attending selected basic schools in the Greater Accra Metropolis of Ghana.

METHODS

A cross-sectional study design was used, involving 105 students selected through quota and simple random sampling. Data were collected using a structured questionnaire capturing socio-demographic characteristics and patterns of fruit and vegetable intake. Data was analysed using SPSS version 26.0. Descriptive statistics were generated, and Pearson's chi-square test of independence was applied to examine the relationship between frequency and quantity of consumption, with statistical significance set at $p \leq 0.05$.

RESULTS

Most respondents were 13-year-olds (41.0%), and 52.4% were males. Majority lived with their nuclear family (93.3%), and most parents were fully employed (91.4%). Fruit and vegetable intake ranged mainly between two to three times weekly, with most respondents consuming only one serving per day. The main reasons for consumption were perceived nutritional benefits and maintaining good health. Identified barriers included high cost, poor availability, low attractiveness, and preference for other foods. Significant association was found between frequency and quantity of fruit intake ($p = 0.027$) and vegetable intake ($p = 0.043$).

CONCLUSIONS

Fruit and vegetable consumption among teenagers was generally low. The significant relationship between frequency and quantity suggests that improving regular access may enhance overall intake. Coordinated efforts involving parents, schools, and health professionals are needed to promote sustained fruit and vegetable consumption through targeted nutrition education and school-based interventions.

Diagnosis of the public helthcare network for leprosy patients: A cross-sectional study

Thamires Laet Cavalcanti e Silva[1], Greice Quele dos Santos Cruz[1], Eleuzina Falcão da Silva Santos[1], Natália Cristina Oliveira[2], Luiz Eduardo Nunes Ferreira[2]
[1]Bahia State Health Department, Directorate of Epidemiological Surveillance, Salvador, Brazil, [2]University of Guarulhos, Guarulhos, Brazil

INTRODUCTION

Leprosy represents a major challenge for health managers and professionals. It is a neglected disease affecting patients with social and economic vulnerabilities, associated with social stigma and prejudice. The objective of this study is to diagnose the healthcare network for patients with suspected or confirmed leprosy, highlighting the weaknesses of the assistance network in the state of Bahia.

METHODS

This is a cross-sectional observational study. A mixed-method (qualitative-quantitative) questionnaire was developed, addressing healthcare characterization, diagnostic and examination networks, treatment, and surveillance actions. The instrument was applied electronically via Google Forms, sent to regional health bases, and forwarded to the epidemiological surveillance unit of each municipality. Data were tabulated in Microsoft Excel and analyzed using SPSS v.26 for Windows.

RESULTS

Health macro-regions contain municipalities where care is centralized in specialized services. In the South macro-region, 28.33% of municipalities do not perform leprosy diagnosis or consultations in Primary Health Units (UBS); of these, 58.82% are from the Itabuna regional base and 41.18% from the Ilhéus base. Macro-regions with a higher percentage of centralized care showed higher treatment dropout indicators. There is a need for professional qualification in the Northeast and North-Central macro-regions to perform simplified neurological assessments. Furthermore, an overload on tertiary care was observed.

CONCLUSIONS

Leprosy remains a public health problem that must be prioritized through the creation of strategies and public health policies. Establishing a Care Line with

assistance flows and the definition of secondary care in the state is a strategy to guarantee integral care for leprosy patients.

ABS 4090
Impact of stress on food choice behavior of health science students at the university of Ghana: implications on healthy lifestyle behavior practices

Jormor Botchway[1], Eunice Nortey[1], Frank Hayford[1]
[1]Department of Dietetics, University of Ghana, Accra, Ghana

BACKGROUND
University life exposes students to various stressors, including adapting to new social environments, academic demands, and lifestyle changes. Stress has been shown to influence food choices, often directing individuals towards highly palatable, energy-dense sugary and fatty foods. Excessive intake of such foods increases risk of weight gain and obesity-related diseases among students. This study aimed to determine the food choice behaviour of Allied Health students at the University of Ghana based on their stress levels.
METHODS
A cross-sectional study was conducted among 230 Health Science students at the University of Ghana, Legon and Korle-Bu campuses. Data was collected using an online food frequency questionnaire to assess socio-demographic characteristics and food choice patterns. Stress levels were measured using the 10-item Perceived Stress Scale, while food choice behaviour was assessed using the Three-Factor Eating Questionnaire (TFEQ). The chi-square test was used to determine associations between stress and food choice behaviour. Statistical significance was set at $p < 0.05$.
RESULTS
Majority of respondents were males (55.2%), and most (98.2%) were aged between 18 and 27 years, with mean age of 21.9 ± 2.3 years. Most students (83.5%) experienced moderate stress. High proportion reported frequent consumption of fried foods, with 55.6% consuming them at least once weekly, while fruit intake was generally low, with 21.7% consuming fruits once weekly. Stress was significantly associated with fried food consumption ($p = 0.007$) and exercising for more than 30 minutes ($p = 0.019$). Feeling very hungry significantly predicted uncontrolled eating during stressful situations ($p = 0.003$).
CONCLUSIONS
Food choice behaviour was not broadly affected by stress, except when students felt very hungry, which led to uncontrolled eating. High fried food intake and low physical activity were associated with stress. Health promotion interventions are needed to encourage healthy eating and regular physical activity, particularly during stressful periods.

Changes in the national primary health care policy: perceptions of community health workers in northeastern Brazil

Rafael Bezerra Duarte[1], Antonio Rodrigues Ferreira Júnior[1], Olga Maria de Alencar[2], Leidy Dayane Paiva de Abreu[1], Mirna Neyara Alexandre de Sá Barreto Marinho[3], Thayza Miranda Pereira[4], Maria Rocineide Ferreira da Silva[1]
[1]Graduate Program in Public Health, Universidade Estadual do Ceará (UECE), Fortaleza, Brazil, [2]Professional Master's Degree in Family Health, Universidade Federal do Tocantins, Palmas, Brazil, [3]Nursing Department, Universidade Regional do Cariri, Iguatu, Brazil, [4]Nursing Department, Universidade Federal do Tocantins, Palmas, Brazil

INTRODUCTION
Community health workers play a central role in health promotion and in linking communities with primary health care services. The National Primary Health Care Policy, published in 2017, introduced relevant changes in the professional work process, generating challenges that affect community bonding, continuity of care, and professional identity. This study aimed to understand the perceptions of community health workers in northeastern Brazil regarding the changes resulting from the National Primary Health Care Policy.
METHODS
This was an exploratory and descriptive study with a qualitative approach, conducted with ten community health workers working in Family Health Strategy teams in urban áreas of a municipality in northeastern Brazil. Data were collected in September 2021 through online focus groups. The narratives were analyzed using thematic content analysis. The study complied with the ethical and legal principles established by Resolution No. 466 of 2012 of the National Health Council.
RESULTS
Participants reported significant transformations in the work process, particularly related to the expansion of responsibilities and the intensification of administrative and bureaucratic tasks guided by performance indicators. These changes reinforce a productivist logic, perceived as dehumanizing care and undermining work quality. Role deviation weakens historically constructed practices, compromises community bonds, and delegitimizes professional identity, traditionally grounded in health education, health promotion, and mediation between communities and health services. The centrality of technicist practices was associated with feelings of distress, insecurity, and professional threat.
CONCLUSIONS
The findings highlight the need for permanent spaces for training, dialogue, and participation of community health workers in the development and implementation of public policies, in order to reaffirm their professional identity and strengthen humanized care practices in the territories within the Brazilian national health system.

Disparity between curative and preventive oral health actions in Brazilian primary care: an analysis of the 2024 national census of primary health care units of the unified health system

Márcio Affonso[1], Simone Schenkman[1], Patty Almeida[2], Aylene Bousquat[1]
[1]Política, Gestão e Saúde, Faculdade de Saúde Pública - Universidade de São Paulo, São Paulo/SP, Brazil, [2]Planejamento em Saúde, Instituto de Saúde Coletiva - Universidade Federal Fluminense, Rio de Janeiro/RJ, Brazil

ABSTRACT
The provision of oral health services is a challenge faced by several countries. In Brazil, approximately half of the population uses oral health services through the Unified Health System. Among these services, Primary Health Care Units (PHCU) stand out as the setting where Oral Health Teams (OHT) operate. In 2024, the National Census of Primary Health Care Units of the Unified Health System was conducted, aiming to produce evidence for the monitoring and qualification of services. Thus, this study aims to identify the most frequent individual and collective oral health actions in PHCU. This is a cross-sectional study based on secondary data from the Census. Through an electronic form, PHCU workers and managers completed a questionnaire covering multiple dimensions, including the provision of oral health actions. The responses were analyzed and described using absolute and relative frequencies. A total of 33,404 PHCU with OHT were identified across the Brazilian territory, representing 74.33% of all evaluated units (44938). The most frequent individual promotion and prevention actions were the screening of schoolchildren with timely scheduling and prophylaxis, performed in 23702 (71%) and 29018 (87%) units, respectively. Regarding individual restorative actions, spontaneous demand care (31971; 96%), restorations (31652; 95%), and extractions (31198; 93%) were the most common. The collective action of health education in schools and daycares was carried out in 30289 (91%) units. The findings demonstrate that oral health is integrated into most PHCU, with a robust provision of actions. However, a high frequency of curative treatments is observed compared to prevention and promotion actions. Such evidence highlights the need for strategic planning to strengthen public policies that encourage health promotion and prevention, without neglecting curative treatment when necessary, aiming for comprehensive care in the provision of oral health services.

ABS 4200
From Global to Local: Youth-driven public health actions

Gustavo Henrique Nicoletti Dalle Cort[1]
[1]International Federation of Medical Students' Associations, Amsterdam, Netherlands

INTRODUCTION
The International Federation of Medical Students' Associations (IFMSA) promotes student-led Public Health activities through its Standing Committee on Public Health (SCOPH). To access and publicize innovative activities from their National Member Organizations (NMOs), a Google Form was created for NMOs to register their activities, the "SCOPH Spotlights".
METHODS
We performed a descriptive, cross-sectional content analysis of SCOPH Spotlights submissions during November and December 2025. Interventions were coded using a pre-defined analytic framework across: public health thematic area; intervention modality (health promotion/education; screening with counselling and/or referral; training/capacity-building; advocacy/community mobilization; service linkage); (3) implementation setting (community venues, public spaces, multi-site outreach, and digital platforms); and partnership ecosystem, derived

from the "externals involved" field. Self-reported output and reach indicators (e.g., participant counts, tests performed, registrations) were extracted.
RESULTS
The 23 submissions demonstrate heterogeneous intervention modalities with recurrent scalable features, including delivery in high-footfall community settings and integration of prevention, counselling, and referral pathways. Reported activities included 1,603 blood glucose measurements with referral as needed and a multi-city preventive campaign, conducting 4,579 tests across seven cities. Community mobilization achieved substantial participation, with up to 500 participants in a gender-based violence awareness walk. Service-navigation interventions reached scale, including an organ donation campaign with >12,000 visitors and 6,793 registered donors, with subsequent transplants reported. Multisectoral partnerships were frequently described as enabling reach and continuity.
CONCLUSIONS
Youth-driven public health actions within IFMSA demonstrate diverse, scalable intervention models with measurable reach and outputs across multiple settings and themes. The integration of prevention, service linkage, and community mobilization, supported by multisectoral partnerships, highlights the capacity of student-led initiatives to translate global public health priorities into impactful local action and contribute to health system strengthening.

Operationalising Global Chronic Care Frameworks in Africa: Innovative Integrated Service Models from Namibia, Botswana, and Ethiopia

Ozayr Mahomed[1], Abebe Sorsa Badacho[1], Gabalape Arnold Sejie[1], Ndeshiteelela Conteh[1]
[1]Public Health Medicine, University of KwaZulu Natal, Durban, South Africa

BACKGROUND
Sub-Saharan Africa faces a double burden of disease: persistent HIV and tuberculosis (TB) alongside rapidly rising non-communicable diseases (NCDs) and mental health disorders. Health systems designed for vertical, episodic care struggle to meet these complex, lifelong needs, resulting in fragmented services, inefficiency, and poor outcomes. The World Health Organization's Innovative Care for Chronic Conditions (ICCC) framework and South Africa's Integrated Chronic Disease Management (ICDM) model offer roadmaps for integrated, people-centred chronic care, yet practical guidance for diverse low- and middle-income country (LMIC) contexts remains limited.
METHODS
We synthesised three doctoral implementation studies that adapted ICCC and ICDM principles to distinct service gaps: the Integrated Mental Health and HIV (IMH&HIV) model in Namibia; the Community TB Care Strengthening and Sustainability (CTBCSS) model in Botswana; and (3) the Integrated Hypertension/Diabetes–HIV for People Living with HIV model in Ethiopia.Each applied structured implementation science methods—Triple C change management,Logic Model planning,and/or the RE-AIM (Reach, Effectiveness, Adoption, Implementation, Maintenance) framework.
RESULTS
All three models successfully operationalised ICCC and ICDM under resource constraints. Namibia increased mental health screening and reduced stigma via task-shifting and facility reorganisation. Botswana strengthened community TB care by addressing all six WHO health system building blocks and aligning financing with workforce retention. Ethiopia integrated hypertension and diabetes screening into HIV clinics, embedding RE-AIM evaluation and securing essential commodities. Cross-cutting lessons include contextual adaptation, proactive change management, simultaneous system strengthening, early monitoring and evaluation, and policy/financing alignment to build health system resilience.
CONCLUSIONS
Locally led African innovation is translating global chronic care frameworks into actionable, sustainable models. These experiences provide a practical roadmap for LMIC policymakers and implementers to strengthen primary health care for complex chronic conditions and move beyond short-term pilots toward financed, system-wide scale-up.

ABS0243

Access to Primary Health Care in the Asia-Pacific Region: Determinants, Impacts, and Strategic Interventions for Improved Equity Background

Sabitra Kaphle[1], Rasanthika Gunawardhana[1]
[1]Public Health, Central Queensland University, Melbourne, Australia

BACKGROUND
Primary health care (PHC) is a fundamental component of universal health coverage (UHC), serving as the first point of contact within health systems. In the Asia-Pacific region (APR), access to PHC is influenced by a complex interplay of socioeconomic, geographic, and policy factors. These determinants significantly affect health outcomes and the ability to achieve health equity across diverse populations. Understanding these factors is essential for designing effective health system responses that can address disparities and improve overall health status in the region.
METHODS
Employing a structured scoping review methodology, a total of 68 articles focused on the APR were systematically analysed. The review was organised into four key domains: the contexts of PHC implementation and access, determinants affecting access, impacts of disparities or improvements in access, and strategies and interventions designed to enhance access. This approach facilitated a nuanced understanding of the multifaceted challenges and opportunities within the region, providing insights into effective policy and responses.
RESULTS
The review reveals substantial disparities in PHC access across the APR, primarily driven by geographic barriers, socioeconomic inequalities, and fragmented health systems. Limited access to PHC services is associated with poorer health outcomes and exacerbates existing inequities. Conversely, innovative interventions such as community-led healthcare models, digital health technologies, and policy reforms demonstrate promising potential to address these challenges. These strategies can improve the accessibility, quality, and sustainability of PHC services, thereby contributing to more equitable health outcomes in the region.
CONCLUSIONS
To enhance access to primary health care in the APR, it is crucial to adopt context-specific, equity-focused strategies. Emphasising integrated, sustainable approaches to health system strengthening can facilitate more equitable health outcomes and reduce disparities across diverse populations. Policymakers and health system stakeholders should prioritise innovative, adaptable solutions that address regional disparities and promote health equity.

ABS0422

Spatial Spillover Effects of Resource Allocation on Service Volume and Expenditure in Secondary versus Tertiary Hospitals, China

Jing Liu[1], Xiaoqian Gong[1], Tao Zhang[2]
[1]Administrative Office, Yuebei People's Hospital, Medical College, Shantou University, Shaoguan, China, [2]Department of Health Policy and Management, School of Public Health, Hangzhou Normal University, Hangzhou, China

BACKGROUND
China's healthcare system faces significant challenges in resource distribution, with a pronounced bias toward higher-level facilities. This study investigates the spatial spillover effects of resource allocation on hospital service volume and expenditures, comparing secondary and tertiary hospitals across different regions.
METHODS
Utilizing a comprehensive dataset from 95 urban public hospitals (54 secondary, 41 tertiary) in Shanxi Province (2013-2019), we employed the spatial Durbin model to analyze the impact of resource allocation on outpatient visits, inpatient admissions, and associated expenditures. Resource allocation metrics included hospital-level indicators (registered physicians, operational beds, high-value medical equipment, government subsidies) and prefecture-level indicators (hospital distribution, bed allocation, physician distribution). Spatial relationships were determined using geolocation data.
RESULTS
The analysis revealed complex spatial interdependencies. While resource levels positively correlated with service outputs within individual hospitals, significant spillover effects were observed: Tertiary hospital bed capacity negatively impacted outpatient visits ($\beta = -0.108$, $p < 0.05$); Secondary hospital physician numbers reduced local outpatient visits ($\theta = -96.433$, $p < 0.05$) while increasing neighboring secondary hospitals' outpatient expenditures ($\theta = 1.433$, $p < 0.01$); (3) Tertiary hospital bed concentration decreased neighboring prefectures' inpatient expenditures ($\theta = -146.734$, $p < 0.01$); Tertiary hospital physician concentration reduced neighboring prefectures' inpatient admissions ($\theta = -48.130$, $p < 0.01$) but increased expenditures ($\theta = 104.094$, $p < 0.05$); Secondary hospital concentration boosted neighboring prefectures' tertiary hospital admissions ($\theta = 818.423$, $p <$

0.01).
CONCLUSIONS
Increasing resources enhances local hospital services and generates spillover effects on neighboring facilities. While the spillover effects from tertiary hospitals may benefit neighboring regions dominated by secondary hospitals, government efforts to control rising medical expenditures by strengthening secondary hospitals may encounter challenges. These insights emphasize the necessity for system-level planning that considers spatial relationships in resource allocation to optimize healthcare outcomes and mitigate unintended consequences.

Effective coverage of the integrated management of acute malnutrition (IMAM) program in six districts of Ethiopia
Alinoor Farah[1], Samson Gebremedhi[1], Aweke Kebede[2], Kemeria Barsenga[2], Tefara Darge[1], Tafara Ndumiyana[2], Robert Ackatia-Armah[2], Hiwot Darsene[3], Beza Yilma[1], Seifu Hagos Gebreyesus[1]
[1]School of Public Health, Addis Ababa University, Addis Ababa, Ethiopia, [2]Nutrition, World Food Program, Addis Ababa, Ethiopia, [3]Nutrition, Ministry of Health, Addis Ababa, Ethiopia
BACKGROUND
Evidence shows that increased care-seeking does not always translate into the receipt of quality care, underscoring the need to strengthen both access to and quality of treatment services. Thus, the objective of this study is to estimate the effective coverage of the integrated management of acute malnutrition (IMAM) program. Data and
METHODS
We estimated effective coverage of the Integrated Management of Acute Malnutrition (IMAM) program in a six-district cross-sectional study by linking household surveys with health facility assessments. Multistage cluster sampling was used to select 727 households, and 72 health posts were randomly sampled for facility assessments. Effective coverage was calculated as the product of health facility service readiness and contact coverage using a generalized linear model on an appended dataset, with confidence intervals derived via the delta method. Using multivariable logistic regression with cluster-robust standard errors, we assessed the association between district-level health facility readiness and wasting service coverage, adjusting for household and health system characteristics.
RESULTS
The contact coverage for wasting management service was 17% for severe acute malnutrition (SAM), 24.2% for moderate acute malnutrition (MAM), and 21.7% for global acute malnutrition (GAM) or combined SAM and MAM. Facility readiness was 57.9% for SAM, 53.9% for MAM, and 56.1% overall. Readiness-adjusted coverage was 9.8% for SAM, 13.1% for MAM, and 12.2% for GAM. In the multivariable analysis, coverage of wasting management services was significantly higher in households visited by Health Extension Workers (OR=1.90, p=0.048) and significantly lower among children of caregivers aged 25-34 years (OR=0.31, p=0.006).
CONCLUSIONS
The study revealed suboptimal readiness-adjusted coverage for wasting management services in the study area. Strengthening the health system, particularly through investments in the health workforce, service capacity, quality, and equitable access, emerges as a strategic priority for achieving the goals of the Global Action Plan on Child Wasting.

ABS0743
Quality of essential newborn care practice at public health facilities in Sidama Regional State, Ethiopia, 2024: Institution based study
Yemisrach Deneke[1], Abiyu Assefa[1], Selam Tafesse[1], Kefyalew Garie[2], Meskerem Jisso[1], Yusuf Haji[1], Dubale Dulla[1], Achamyelesh Gebretsadik[1]
[1]Public Health, Hawassa University, Hawassa, Ethiopia, [2]Department pediatrics and child health, Hawassa University, Hawassa, Ethiopia
BACKGROUND
Essential newborn care is a technology-free routine practice in the care of the newborn, particularly at the time of birth and over the first hours of life. Despite essential newborn care service being a known intervention in the prevention of neonatal mortality, its utilization and quality are not optimal and not well known.
OBJECTIVE
To evaluate the quality of essential newborn care in labor and delivery room in Sidama Regional State, 2023/2024
METHODS
A cross-sectional study was conducted from February 1st, 2023, to March 1st, 2024, in selected public health facilities of Sidama Region. Forty public health facilities and 510 newborns were selected by employing multistage sampling. Bivariable and multivariable logistic regression were conducted with adjusted odds ratios with 95% confidence intervals reported.
RESULTS
The magnitude of good essential newborn care quality of input was 47.5%, process 70.1%, and outcome 53.9%. Factors associated with good quality of essential newborn care include being a male newborn [AOR] = 2.38, 95% [CI]: 1.52, 3.72), four or more years of experience (AOR = 2.04, 95% CI: 1.25, 3.33), using a partograph (AOR = 2.12, 95% CI: 1.27, 3.55), providing a high level of friendly service (AOR = 0.10, 95% CI: 0.06, 0.17), and categorizing the facility's inputs as good (AOR = 1.95, 95% CI: 1.11, 3.44).
CONCLUSIONS
Implementation quality of essential newborn care provision was low in the study settings. Poor input, inadequate friendly care, being a male newborn, lack of experience, and insufficient monitoring during labor were linked to a decline in the process quality of essential newborn care. To enhance the quality of essential newborn care, it is crucial to provide necessary service inputs, maintain experienced health care providers, enhance paragraph usage, and educate the society about gender equality.
Popul. Med. 2026;8(Supplement 1):A1593

ABS0903
Towards equity in healthcare workforce distribution: regional progress and remaining gaps in türkiye, 2007–2023
Berrak Itır Aylı[1], Nüket Paksoy Erbaydar[2]
[1]Faculty of Health Sciences, Hacettepe University, Ankara, Turkey, [2]Department of Public Health, Hacettepe University, Ankara, Turkey
BACKGROUND
Türkiye has historically had weaker healthcare workforce distribution compared to European neighbours. Following comprehensive health system reforms in 2003, the country substantially expanded health services. However, the effects of these reforms on regional distribution of healthcare resources over time remains incompletely quantified.
METHODS
Publicly available Turkish Statistical Institute data were used to construct a regional panel for 2007–2023 using annual counts of physicians by cadre, nurses, and hospitals. Densities per 100,000 population were calculated for each of Turkey's 12 statistical regions. Population-weighted Gini coefficients quantified inequality for each indicator, with linear regression estimating temporal trends.
RESULTS
National workforce densities increased substantially between 2007 and 2023: specialist physicians rose from 77.1 to 118.6 per 100000 (+53.7%), general practitioners from 49.0 to 64.3, residents from 27.5 to 56.3, and nurses from 134.1 to 290.8. Population-weighted Gini coefficients declined significantly for general practitioners (0.13 to 0.05, -63%), nurses (0.11 to 0.06, -43%), and specialists (0.21 to 0.15, -30%) (all p≤0.008). However, regional disparities persisted: in 2023, specialist density ranged from 73.0 (Southeast Anatolia) to 170.5 (West Anatolia) per 100000. Inequality in university hospitals increased (Gini 0.37 to 46).
CONCLUSIONS
Türkiye's health system has undergone continuous transformation since 2003, most notably with the introduction of the Family Medicine System in 2010 as part of nationwide health reforms [2,3]. However, even though these reforms contributed to the expansion of the health workforce and improvements in geographical equity; regional disparities are persistent. Increasing concentration of tertiary care facilities, disparities in specialist services and continued gaps compared to OECD standards indicate that the reforms have not fully addressed the dual challenge of workforce scarcity and inequality. Targeted policies to strengthen specialist services and tertiary infrastructure in underserved regions therefore remain critical priorities.
Popul. Med. 2026;8(Supplement 1):A1603

ABS0981
Overcoming stumbling blocks: harnessing partnerships to improve mental health outcomes in rural south Africa
Enock Zibengwa[1], Kate Rees[1]
[1]Anova Health Institute, Johannesburg, South Africa
INTRODUCTION
Mental health conditions are a profound burden in rural South Africa, where they are intensified by intersecting social determinants such as poverty and

geographic isolation. Strong collaboration among government and other stakeholders is necessary to address challenges of resource scarcity, fragmented care pathways, and inadequate referral systems. To strengthen intersectoral cooperation in support of the Department of Health (DOH), the Sishen Iron Ore Company–Community Development Trust (SIOC-CDT) funds Anova Health Institute to implement a Mental Health Integration Programme. Launched in 2023, Ke Botlhokwa (meaning "I Matter") operates across 15 rural clinics and 20 villages in the Northern Cape and Limpopo Provinces. We aim to describe the programme's results on shared indicators.
METHODS
Informed by in-depth mapping of the multi-stakeholder partnership (MSP) ecosystem and led by a programme manager, the programme established strong partnerships with key government departments, including the DOH and the Department of Social Development, five non-governmental organisations (NGOs), community-based groups, and local media. Quarterly participatory stakeholder meetings ensured the programme remained responsive to needs. Programme data was collected and reported monthly using REDCap.
RESULTS
Data from the 15 supported clinics show that the programme created an MSP ecosystem that strengthened resource sharing and integrated referral pathways, leading to improvements in access to mental health services. Mental health screening rates in DOH clinics increased by 200%, with 85% of identified clients (n = 2200) successfully linked to care. This included 1200 psychosocial interventions and 800 substance-use treatment referrals. By 2025, the programme reached over 3000 service users, representing a 150% increase from the 2023 baseline of 1200.
CONCLUSIONS
Strategic partnerships among government, NGOs, and community stakeholders can dismantle barriers to mental health care. By prioritising integrated care pathways and community ownership, the programme offers a replicable model aligned with Sustainable Development Goal 3.8 for universal health coverage.

Burnout prevalence, determinants, perceived organizational drivers, and coping processes among health workers in Abu Dhabi, United Arab Emirates

Iffat Elbarazi[1], Emad Masuadi[1], Yasir Ahmed Mohammed Eldahi[1], Aminu Abdullahi[1], Souheila Ali Hassan[1,2], Maytha Alshamsi[1], Hind Mohammed Salem Alhashmi[1], Muneera Almarzouqi[1], Hajer Alkarbi[1], Mohammed Khogali[1], Marlia Silva Paulo[3], Balazs Adam[1]
[1]Institute of Public Health, United Arab Emirates University, Al Ain, AbuDhabi, United Arab Emirates, [2]Abu Dhabi Service Company, SEHA, Abu Dhabi, United Arab Emirates, [3]Department of Occupational and Environmental Health, Escola Nacional de Saúde Pública, Lisbon, Portugal
ABSTRACT
Burnout is a work-related syndrome reflecting chronic, inadequately managed occupational stress and is associated with adverse clinician, organizational, and patient outcomes. Evidence from the Gulf region suggests substantial but heterogeneous burnout burden, yet context-specific determinants and recovery processes. We assessed burnout prevalence and determinants among healthcare workers in Abu Dhabi Emirate in the United Arab Emirates and explored perceived organizational drivers and coping processes. We conducted a convergent mixed-methods study within a large semi government health care services network in Abu Dhabi. The quantitative component comprised an anonymized online survey of HCWs providing direct patient care (N = 415). Burnout was measured using the Maslach Burnout Inventory–Human Services Survey (MBI-HSS)). Univariate analyses and multivariable logistic regression identified independent predictors, reported as adjusted odds ratios (AOR). The qualitative component involved purposive sampling of survey respondents for semi-structured interviews (n = 30; 10 physicians, 10 nurses, and 10 allied health professionals). Interviews continued until thematic saturation and were analyzed using reflexive thematic analysis. Overall burnout prevalence was 18.8%. Subscale burden was substantial: 44.8% reported high emotional exhaustion, 25.5% high depersonalization, and 67.7% low personal accomplishment. In adjusted models, burnout was independently associated with age <40 years (AOR 1.76), interpersonal conflict with colleagues (AOR 2.17), and chronic neck pain (AOR 2.24). Qualitative findings identified six themes, workload without recovery, moral/emotional weight of care, recognition and fairness, expanding roles and invisible work, silenced voice and leadership climate, and coping/meaning-making (including faith), clarifying pathways linking early-career vulnerability, relational strain, and musculoskeletal symptoms to burnout. In Abu Dhabi's public healthcare setting, One in five HCWs met criteria for burnout, with broader subscale burden indicating widespread strain. Integrated findings highlight actionable organizational levers, including protective scheduling, conflict management and psychological safety, leadership development, ergonomic supports, and stigma-sensitive mental health pathways.

ABS1100

What measures, frameworks and criteria are used to evaluate the scale-up of health systems strengthening interventions? A scoping review

Ruth Cornick[1], Christy-Joy Ras[1], Opeyemi Babatunde[2], Agumasie Semahegn[3]
[1]Knowledge Translation Unit, University of Cape Town, Cape Town, South Africa, [2]School of Medicine, Primary Care Centre Versus Arthritis, Keele University, Keele, United Kingdom, [3]CDT-Africa, Addis Ababa University, Addis Ababa, Ethiopia
INTRODUCTION
Many effective health system interventions fail to scale. Our research collaboration plans to evaluate the scale-up of PACK (Practical Approach to Care Kit), a health systems strengthening (HSS) intervention implemented in six low- and middle-income countries (LMICs). To inform our evaluation methodology, we conducted a scoping review to identify criteria, measures, and frameworks used to evaluate scale-up of HSS interventions.
METHODS
We followed the Preferred Reporting Items for Systematic Review and Meta-Analyses extension for Scoping Reviews (PRISMA-ScR) and Arksey and O'Malley framework. We systematically searched Pubmed, Cinahl, Cochrane and Google scholar, identifying additional sources via snowball methodology. Eligibility criteria included primary studies and reports from stakeholder organisations (e.g. WHO) focusing on evaluation of primary care HSS scale-up. The criteria included low- and high-income countries and did not restrict by disease. Covidence, a web-based tool, was used to screen by pairs of reviewers. Discrepancies were resolved by discussion. A customized extraction tool was developed to collate data. Data extraction and analysis are ongoing to derive a consolidated list of methodologies. A stakeholder meeting is planned to contribute to appraisal and interpretation of findings.
RESULTS
The search identified 1129 articles for screening. 77 progressed to full-text review; ultimately, 16 satisfied eligibility criteria. All but one had an LMIC focus. Six were disease-agnostic, nine covered a clinical topic and one focussed on scale-up of a health system management strategy. A range of approaches were identified, including conceptual frameworks, scale-up models and pragmatic checklists.
CONCLUSIONS
Our scoping review is ongoing but the evidence landscape for evaluating scale-up of HSS initiatives appears heterogeneous. A critical appraisal of what works and how will inform future HSS evaluation methodology and contribute to the scale-up literature.

ABS1114

Mapping the strategies to address the gender gap in youth clinic utilization in Sweden; explorative survey and follow up interviews.

Moses Tetui[1], Emma Bernard Stenmalm[2], Mazen Baroudi[2]
[1]University of Waterloo, Waterloo, Canada, [2]Umeå University, Umeå, Sweden
BACKGROUND
Despite Sweden's universalist health model and a long-standing network of youth clinics offering free sexual and reproductive health (SRH) services, boys and young men (BYM) remain significantly underrepresented among clinic users. This gender gap is driven by structural and cultural barriers, including masculine norms, female-oriented service environments, and limited institutional guidance for engaging male adolescents. Clinics have piloted strategies to improve BYM's access, efforts have not been systematically documented or evaluated. The study aimed to systematically map and analyze the strategies used by Swedish youth clinics to improve access and participation among BYM.
METHODS
An exploratory mixed-methods design, combining an online survey with follow-up semi-structured interviews. The survey distributed to all 240 youth clinics in Sweden between September and November 2024, with 75 responses representing 110 clinics (45% clinic-level response rate). Quantitative data were analyzed descriptively, while qualitative data from open-ended responses and interviews (24 interviews) were analyzed using inductive content analysis.
RESULTS
BYM accounted for 9.5% of clinic visits, with 87% of clinics expressing dissatisfaction with this level. 58% of clinics reported using strategies to attract BYM, only 34% evaluated their effectiveness, and institutionalization was limited.

Four strategy categories emerged: staff capacity-building for male-inclusive care, environmental adaptations to create inclusive spaces, (3) digital outreach and marketing to enhance visibility, and collaboration with schools and community settings to reach BYM. Clinics using strategies were more likely to report increased male attendance, though implementation remained inconsistent and often project based.
CONCLUSIONS
This study provides the first national-level mapping of strategies to engage BYM in Sweden and contributes to global discussions on inclusive, adolescent-centered SRH care. Swedish youth clinics largely operate within a gender-neutral framework that fails to address BYM's specific needs. A shift toward gender-responsive care, anchored in policy, training, and service design, is urgently needed.
Popul. Med. 2026;8(Supplement 1):A1615

ABS1116

How can the health system respond to aftercare needs? An integrated model of aftercare for people with substance use disorder in Kwazulu-Natal, South Africa

December Mpanza[1,2], Pragashnie Govender[2], Anna Voce[1]
[1]Public Health, University of KwaZulu-Natal, Durban, South Africa, [2]Occupational Therapy, University of KwaZulu-Natal, Durban, South Africa

BACKGROUND
There is currently a high global burden of substance use, which is burdensome to the public health and welfare system. Adequate treatment, including aftercare services, is often limited worldwide. In South Africa (SA), substance abuse contributes considerably to morbidity and mortality and treatment services are not only limited but also fragmented among stakeholders. This study aimed to propose an integrated model of aftercare for individuals with substance use disorders following the inpatient treatment phase in a public facility in KwaZulu-Natal, South Africa.
METHODS
A qualitative study in two phases. The first phase involved policy analysis, and the second phase consisted of two stages. Stage one was semi-structured and included focus group interviews with forty-six participants (n=46) representing all five levels of Beer's Viable System Model, drawn from governmental and non-governmental organisations. Stage two consisted of semi-structured interviews with five persons with SUDs and their family members (n=5). Data was analysed thematically.
RESULTS
Findings indicated that South African policies did not provide clear guidelines on aftercare. Aftercare was found to be lacking, fragmented, poorly coordinated among service providers and not well integrated into the substance use treatment system. The needs of service users demonstrated the extent and nature of aftercare required.
CONCLUSIONS
The extent and nature of aftercare services warrant integrated, lifelong, and responsive aftercare services within SUD treatment systems, tailored to meet the needs of individuals with SUDs and their families. An integrated recovery management model of care is proposed, along with relapse management strategies essential for healthcare practitioners.

"They need to feel at home not in a home." Experiences of residents and carers in mental health residential facilities: In-depth case studies from the Sedibeng district, South Africa

Samantha Mhlanga[1]
[1]Centre for Health Policy, University of Witwatersrand, JNB, South Africa

INTRODUCTION
Since the 1990s, the relocation of psychiatric patients from long-stay institutions to community-based supported living has increased globally. However, most evidence on suitable residential services comes from high-income countries, with little from low- and middle-income contexts. This study explored the experiences of residents and carers in three residential care homes for people living with serious mental illness in Sedibeng District, South Africa.
METHODS
Three organisations were purposefully selected as in-depth case studies. Ninety-one face-to-face qualitative interviews were conducted with service providers, residents, and family members between October 2022 and June 2023.
RESULTS
Residents described severe psychosocial disability when living with families, but improved functioning in residential homes. Organisations 1 and 3 operated small 3–4-roomed houses in township areas, accommodating 21 and 40 residents respectively, who had community access and social interaction. In Organisation 3, residents formed romantic relationships, undertook paid work, and lived semi-independently. Organisation 2, a repurposed school-like building with four large dormitories for 86 residents, imposed strict movement controls; medication was used to manage behaviour, and caregivers reported safety concerns.
CONCLUSIONS
Smaller residential homes offer more autonomy and integration than large dormitory-style facilities. Policies and funding should support smaller, community-based supported accommodation for people with serious mental illness.
Popul. Med. 2026;8(Supplement 1):A1622

ABS1335

South-South collaboration to strengthen primary care: supporting the localisation of South Africa's Practical Approach to Care Kit (PACK) for Indonesia

Christy-Joy Ras[1], Ruth Cornick[1], Daniella Georgeu-Pepper[1]
[1]Knowledge Translation Unit, University of Cape Town, Cape Town, South Africa

BACKGROUND
In 2022, the World Bank engaged the University of Cape Town's Knowledge Translation Unit (KTU) to support the Indonesian Ministry of Health (MoH) to prepare PACK, a South African-developed health system intervention1 comprising a clinical decision support tool, training curriculum and implementation strategy. Supporting National Health Insurance (JKN) reforms, the project aimed to address clinical protocols that were not integrated, up to date or standardized, and training gaps causing poor primary care performance.
METHODS
The project utilized a mentorship model to build sustainable in-country capacity2. The KTU and MoH conducted over 30 virtual interpreted meetings, were in regular email correspondence and held an in-person meeting in Indonesia to prepare for the launch of the programme. The KTU facilitated deliberations amongst Indonesian clinicians, policymakers and professional body representatives to align the tool's clinical recommendations with local disease burden, formularies, and policies. Concurrently, the teams localized and translated the case based training curriculum for the MoH's online learning management system to focus on local health system priorities. High-level endorsement was achieved by positioning PACK as a key component of the national promotion/prevention/screening strategy.
RESULTS
The collaboration produced a comprehensive 158-page, localised clinical decision support tool integrating management for 40 common symptoms and 24 chronic conditions in Bahasa Indonesian. The accompanying online course featured ten clinical cases covering TB and diabetes diagnosis and care, and urgent management of hypertension in pregnancy. The intervention has demonstrated scalability: Since 2024, 6179 (35%) of 17 656 primary health facilities across Indonesia have been trained. World Bank and MoH representatives have subsequently joined a research collaboration formed by KTU of countries implementing the PACK programme.
CONCLUSIONS
This intervention demonstrates south-to-south collaboration and shared learning. Evaluation is planned to assess impact as well as to identify systemic effects to inform future scale-up in large lower-middle-income countries.

Strengthening Health systems capacity in Africa for Pandemic Equity and Responsiveness (SHARPER): Why ethics, human rights, and population benefits matter.

Leslie London[1], Marlise Richter[1], John Adekeye[2], Christopher Baguma[3], Margaret Kaseje[4], Moses Mulumba[3], Adamson Muula[5], Syntia Nchangwi[6], Lauren Paremoer[1], Godfrey Tangwa[6], Ademola Ajuwon[2]
[1]School of Public Health, University of Cape Town, Observatory, Cape Town, South Africa, [2]Department of Health Promotion, University of Ibadan, Ibadan, Nigeria, [3]Afya aa Haki, Afya na Haki, Kampala, Uganda, [4]Tropical Institute of Community Health, TICH, Kisumu, Kenya, [5]Public Health, Kamuzu University of Health Sciences, Blantyre, Malawi, [6]Cameroon Bioethics Initiative, CAMBIN, Yayounde, Cameroon

BACKGROUND
Rigorous ethical norms in research are essential to foster accountability, respect, fairness and trust in knowledge production, and are required for evidence-based public health programmes. However, global pandemic preparedness efforts that prioritize technological innovation without careful consideration of ethics, human rights, and socio-cultural factors can reproduce global health inequities, as illustrated with vaccine apartheid during the COVID-19 pandemic. Without

foregrounding such considerations, research does not always further justice, equity, or the right to health, particularly for populations in the global south.
METHODS
The Strengthening Health Systems Capacity in Africa for Pandemic Equity and Responsiveness (SHARPER) project is a six-year multi-country network, involving institutions in Cameroon, Kenya, Malawi, Nigeria, South Africa, and Uganda. Drawing on African philosophical traditions such as Ubuntu/Bihwir and eco-bio-communitarianism, as well as human rights theories, SHARPER will undertake regional analyses of the policy landscape and current and past practices in ethical oversight addressing population benefits; as well as scoping studies to identify strategies to address gaps in research governance for population-level benefit sharing. To ensure leadership and intellectual sustainability, SHARPER is prioritising capacity-building activities for early-career researchers.
RESULTS
Although many research studies take place in Africa, transparent arrangements to ensure wider population benefits from research are lacking. While some research protocols include post-trial benefits for participants, there is no systematic ethical and/or regulatory oversight that addresses benefits for the broader host population or that incorporates African values related to communitarianism. This means that the right to Enjoy the Benefits of Scientific Progress contained in Article 15 of the International Covenant on Economic, Social and Cultural Rights, ratified by most African countries, remains out of reach of most African populations.
CONCLUSIONS
A strengthened research ecosystem in Africa must incorporate African values in its ethical and regulatory environment to emphasise the collective benefits of health technologies.
Popul. Med. 2026;8(Supplement 1):A1635

ABS1365
If we really want Pandemic Preparedness, we must ensure equity and justice – how Ethics Committees and researchers in Africa can promote population benefits from health research

Leslie London[1], Marlise Richter[1], John Adekeye[2], Christopher Baguma[3], Margaret Kaseje[4], Moses Mulumba[3], Adamson Muula[5], Syntia Nchangwi[6], Lauren Paremoer[1], Godfrey Tangwa[6], Ademola Ajuwon[2]
[1]University of Cape Town, Observatory, Cape Town, South Africa, [2]Department of Health Promotion, University of Ibadan, Ibadan, Nigeria, [3]Afya na Haki, Afya na Haki, Kampala, Uganda, [4]Tropical Institute of Community Health, TICH, Kisumu, Kenya, [5]Public Health, Kamuzu University of Health Sciences, Blantyre, Malawi, [6]Cameroon Bioethics Initiative, CAMBIN, Younde, Cameroon
BACKGROUND
Health research in LMICs often fails to translate into benefits to the local populations. Part of the reason is the absence of standards that foreground African communitarian values as reflected in the idea and practice of Ubuntu/Bihwir and the failure of ethical oversight to hold researchers and sponsors accountable to such standards. This workshop will explore how researchers should conceptualise post-study benefits as part of their professional responsibilities and how ethics committees can better exercise their responsibilities in ways that reflect African communitarian values to maximise population benefits from health research.
METHODS
The workshop will be participatory in design and start with a short scene-setting input, identifying the key issues for ethical oversight of health research. Participants will be given three vignettes to work through, illustrating the key decision-making points where ethical oversight could better address the risk-benefit analysis in ways that deliver population benefits explicitly and valorise a framework of African values.
OUTCOMES
At the end of this workshop, participants should be better able to identify why and how population benefits should be integrated in protocol design and in the process of ethical oversight of health research, and to suggest ways to implement such ethical oversight to ensure African populations benefit. Participants will also be introduced to regional efforts to harmonise ethical oversight of health research in ways that advance justice and equity through African values, with the opportunity to participate in such efforts.
CONCLUSION
A strengthened research ecosystem in Africa must incorporate African values in its ethical and regulatory environment to emphasise the collective benefits of health technologies for those who, by their participation, help make them possible.

ABS1398
Strengthening primary care through PACK: contextualising evidence-based, comprehensive clinical guidance to support primary care health systems strengthening in five low- and middle-income countries

Daniella Georgeu-Pepper[1], Ruth Cornick[1], Christy-Joy Ras[1], Lara Fairall[2,1]
[1]Knowledge Translation Unit, Department of Medicine, Faculty of Health Sciences, University of Cape Town, Cape Town, South Africa, [2]School of Life Course & Population Sciences, King's College London, London, United Kingdom
INTRODUCTION
The Practical Approach to Care Kit (PACK) programme is a health system strengthening strategy designed to support primary care reforms in low- and middle-income countries. Developed by the Knowledge Translation Unit (KTU) in South Africa over two decades in collaboration with policymakers, managers, and health workers, PACK provides a comprehensive, symptom-based clinical decision support guide aligned with local policies, resources, and disease burden. PACK implementation includes e-learning content designed for completion by individuals or facility teams that embed the guide into routine care while addressing broader health system challenges. Since 2015, PACK has been localised and implemented in South Africa, Nigeria, Ethiopia, Brazil, and Indonesia (3-5) and these countries have formed a PACK collaboration.
METHODS
The collaboration convenes regularly, both online and in person, to share lessons on clinical content localisation, training delivery, programme scale up, and health system strengthening activities reported by ministries of health across the diverse LMIC settings implementing PACK.
RESULTS
Evidence-based guidance, integrated training, and collaborative approaches can drive primary care reforms and health system strengthening in multiple LMIC health systems. Localised PACK programmes ensure that the guide is more than clinical decision support, acting as a central reference for scope of practice delineation, levels of care and mandated services. Regular PACK update processes catalyse discussions between different levels of the health system, embedding its role as a facilitator of systems change and its ownership by local stakeholders.
CONCLUSIONS
The PACK collaboration has demonstrated the value of south-to-south learning, adapting PACK to local contexts, and fostering partnerships to support scale-up and sustainability. These lessons will support policymakers, health leaders, clinicians, and others translating evidence into practice within learning health systems.

Reconceptualizing Integrated People-Centred Health Services: Towards a Mechanism-Sensitive Model Using Realist Evaluation

Usangiphile Buthelezi[1,2], Arvin Bhana[2], Zamasomi Luvuno[2], Tasneem Kathree[1], Sanah Bucibo[2], Noxolisa Radebe[2], Mosa Moshabela[1,3], Inge Petersen[4], André J van Rensburg[2]
[1]School of Medicine, University Of KwaZulu-Natal, Durban, South Africa, [2]Centre for Research in Health Systems, University of KwaZulu Natal, Durban, South Africa, [3]Vice Chancellor, University of Cape Town, Cape Town, South Africa, [4]Institute of Global Health, University College London, London, United Kingdom
BACKGROUND
The World Health Organization's Framework on Integrated, People-Centred Health Services (IPCHS) proposes five interdependent strategies to guide health system transformation. In low- and middle-income countries (LMICs), implementation of IPCHS is often fragmented due to limited understanding of how its strategies interact in practice. This study aimed to reconceptualise how IPCHS strategies interact in practice by identifying the underlying mechanisms that enable or constrain people-centred care, using CHW performance as an analytical entry point.
METHODS
This study used a multi-phase realist approach, which focuses on understanding what works, for whom, and under what conditions, integrating a realist synthesis and two realist evaluations in KwaZulu-Natal, South Africa. Findings from each phase contributed to refining an initial programme theory into a dynamic, mechanism-sensitive model that captures how IPCHS strategies function interdependently. Data were analysed using context–mechanism–outcome (CMO) configurations. Systems thinking tools, including causal loop diagrams, were used to visualise mechanism chaining and feedback loops across system levels and strategies.
RESULTS
Three cross-cutting meta-mechanisms: trust, motivation, and professional legitimacy (with institutional support) were found to underpin CHW performance across all five IPCHS strategies. These mechanisms interacted recursively,

meaning activation or erosion of one affected others. People-centred care is not the outcome of any single strategy but rather emerges from the alignment and interaction of mechanisms triggered by multiple strategies in different contexts. When mechanisms align, they reinforce CHW performance and advance IPCHS; when misaligned, they contribute to system fragility and poor outcomes.
CONCLUSIONS
People-centred care is an emergent property of aligned, interacting IPCHS strategies, as opposed to isolated interventions. The proposed mechanism-sensitive model provides policymakers and implementers with a practical approach to move beyond fragmented reforms towards a more coherent, people-centred health system transformation. Further research should test and refine the proposed mechanism-sensitive approach to implementing the IPCHS framework.

Optimizing reach for mental health services through campaigns in rural South Africa
Enock Zibengwa[1], Kate Rees[1]
[1]Anova Health Institute, Johannesburg, South Africa
INTRODUCTION
In rural South Africa, mental health services remain underutilised despite growing need, due to limited awareness, persistent stigma, staff shortages, and weak linkages between communities and health facilities. Campaigns and health talks are often treated as peripheral "awareness activities" rather than prioritised as core service delivery strategies. Campaigns refer to structured, community-based engagement activities that intentionally link communities to screening, counselling, referral, and care pathways. To address this gap, and in support of the Department of Health (DoH), the Sishen Iron Ore Company–Community Development Trust (SIOC-CDT) funds Anova Health Institute to implement a Mental Health Integration Programme in the Northern Cape and Limpopo provinces.
METHODS
Between 2023 and 2025, mental health campaigns and structured health talks were delivered through clinics, mobile outreach, workplaces, schools, local media, and community platforms, embedded within existing HIV, TB, and chronic care services. Implementation was strengthened through partnerships with social and behaviour change organisations. Routine programme data were analysed to identify associations between campaign activity and mental health screening volumes, counselling and treatment uptake, and referral completion. Qualitative reflections from providers and community members contextualised quantitative findings.
RESULTS
Campaigns and health talks reached 39459 community members. Periods of intensified campaign activity aligned with increases in mental health screening and counselling uptake. A total of 9862 individuals were screened, of whom 2201 received counselling and were successfully linked to appropriate clinical and psychosocial care. Service-use patterns shifted, with men and youth demonstrating increased engagement. Qualitative narratives during campaigns reflected reduced stigma, improved mental health literacy, and help-seeking behaviour.
CONCLUSIONS
Well-designed campaigns and health talks are powerful drivers of mental health access in rural settings. When locally grounded and clearly linked to service pathways, they transform awareness into service utilisation. Campaigns shape trust, perceptions, and help-seeking behaviours, influencing individuals' engagement with clinical care.

ABS1723
Closing the gap between public health and primary care: strengthening health systems to ensure equity in South Africa
Ilona Matthew[1], Michelle Viljoen[1], Jane McCartney[1], Angeni Bheekie[1]
[1]School of Pharmacy, Faculty of Natural Science, University of the Western Cape, Cape Town, South Africa
BACKGROUND
South Africa's primary healthcare (PHC) system experiences ongoing inequities, with an escalating burden of non-communicable diseases (NCDs), demanding long-term, people-centred models of care. These inequities are deeply intertwined with social determinants of health, further exacerbating disparities in health outcomes. Individuals from lower socio-economic backgrounds have a higher prevalence of NCDs, highlighting where policy interventions must focus. Against this backdrop, large-scale interventions like the Western Cape's Chronic Dispensing Unit (CDU) and the national COVID-19 vaccination campaign offer contrasting lessons about how public health policies translate into PHC practice. The aim was to assess the implementation of two large-scale public health interventions (CDU and COVID-19 vaccination) within South Africa's PHC system, and to identify how the factors influencing their effectiveness, equity, sustainability and service design could be used to reduce the burden of NCDs.
METHODS
A mixed-methods research was undertaken. (i) A qualitative evaluation of the CDU used semi-structured interviews, with purposively selected stakeholders from across primary care, operational, management, and policy-levels. Thematic analysis followed a deductive–inductive strategy. (ii) A retrospective, population-based assessment of the COVID-19 vaccination campaign examined speed, equity, uptake, and death trends using publicly-available secondary National Department of Health data.
RESULTS
The CDU achieved substantial reach, service efficiencies, reduced waiting times and decongested facilities, while strengthening prescribing governance. Sustainability risks included fragmented data systems and non-collection of medicine, limiting the monitoring of clinical outcomes. COVID-19 vaccination coverage plateaued below national aims, with geographic and demographic inequities in uptake. Integration of vaccination into routine PHC and community outreach improved access but did not fully address hesitancy, distribution, and data integration gaps.
CONCLUSIONS
To ensure equity is more than just an inspiration, it is essential to track progress through measurable indicators. Policy-to-practice translation in South Africa is feasible and impactful when PHC interventions are data-enabled, integrated, community-embedded, and sustainably financed.

Mother's Touch, Baby's Lifeline: Improving Neonatal Outcomes through Kangaroo Mother Care Down-Referral and Integrated Health Services in Gauteng, South Africa
Lamisa Naushin[1], Tabea Phashe[1], Derisha Pillay[2], Khanyisile Rose Phayane[2], Mantwa Chisale Mabotja[1]
[1]Public Health Medicine, University of Pretoria, Pretoria, South Africa, [2]Paediatrics and Child Health, University of Pretoria, Pretoria, South Africa
BACKGROUND
Overcrowding in tertiary neonatal units is a persistent health system challenge in low- and middle-income countries, leading to reduced nurse-to-patient ratios, increased hospital-acquired infections, and preventable neonatal mortality. Tembisa Provincial Tertiary Hospital (TPTH) in Gauteng, South Africa, routinely operates beyond its approved neonatal bed capacity. In August 2024, a structured Kangaroo Mother Care (KMC) down-referral intervention was implemented to optimise patient flow by transferring clinically stable mother–infant pairs to under-utilised district-level KMC units. This study evaluated the impact of the intervention on overcrowding and key neonatal outcomes at TPTH.
METHODS
A retrospective comparative study was conducted using routinely collected hospital data. Neonatal indicators were compared across two six-month periods: pre-intervention (February–July 2024) and post-intervention (September 2024–February 2025). Outcomes included mean monthly neonatal headcount, bed utilisation rate, neonatal mortality rate, absolute number of neonatal deaths, and hospital-acquired infections. August 2024 was treated as a pilot month and excluded from the analysis. Descriptive statistics and independent t-tests were used to assess differences between periods.
RESULTS
Between August 2024 and February 2025, 236 neonates were down-referred to district KMC units. Following implementation, the mean monthly neonatal headcount decreased significantly from 160.3 to 122.5 ($p=0.029$), while bed utilisation declined from 159.8% to 141.2% ($p=0.009$), indicating a substantial reduction in overcrowding. Neonatal mortality rates, absolute neonatal deaths, and hospital-acquired infection rates demonstrated downward trends in the post-intervention period; however these reductions were not statistically significant.
CONCLUSIONS
The implementation of a structured KMC down-referral model significantly reduced overcrowding in a high-volume tertiary neonatal unit and demonstrated clinically favourable trends in mortality and infection outcomes. Strengthening district-level KMC capacity including human resource support and formalising integrated referral pathways represent feasible, low-cost health system strategies to improve neonatal care and optimise the use of scarce tertiary resources in resource-constrained settings.

Global Health and Latin America: Challenges to Health Systems in an Unequal World

Cristiani Machado[1], Analice Braga[2], Evangelina Martich[3], Eduarda dos Anjos[4]
[1]Department of Health Planning and Administration, Sergio Arouca National School of Public Health/ Oswaldo Cruz Foundation (Ensp/Fiocruz), Rio de Janeiro, Brazil, [2]Vice-presidency of Education, Information and Communication, Oswaldo Cruz Foundation (Fiocruz), Rio de Janeiro, Brazil, [3]Universidad Camilo José Cela, Madrid, Spain, [4]Centre for Data and Knowledge Integration for Health (CIDACS), Oswaldo Cruz Foundation (Fiocruz), Salvador, Brazil

INTRODUCTION
The COVID-19 pandemic has widened disparities between and within countries and revealed the limitations of global health governance and multilateral agencies in implementing international solidarity mechanisms. Moreover, it exposed weaknesses in national health systems in managing health emergencies and meeting healthcare needs. Latin America, a region that reflects inequalities often worsened by political, economic, and social instability, was deeply impacted by the pandemic (2-5).
METHODS
The research explores the connections between changes in global health and in Latin American health systems from 2010 to 2025, including the periods before, during, and after the COVID-19 pandemic. At the international level, it focuses on the governance mechanisms and agendas of the World Health Organization (WHO) and the Pan American Health Organization (PAHO). At the national level, it explores recent changes in the health systems of Brazil, Mexico, and Argentina in a comparative perspective. The research was primarily based on analysis of official documents from the World Health Assemblies, the WHO, the PAHO, and national governments, complemented by a literature review and secondary data analysis.
RESULTS
Changes in the global, regional, and national health agendas were observed in the studied period. At the global and regional levels, even before the pandemic, a growing emphasis on emergency preparedness and health systems' resilience was observed. At the national level, health policies were influenced by both international and domestic variables. Besides structural conditions, the health systems' institutional legacies and government orientations played an important role, with differences between the three countries.
CONCLUSIONS
Emphasizing emergency preparedness and the health system's resilience is relevant, but insufficient to address complex health challenges faced by Latin American countries. Comprehensive multilateral strategies and national policies to promote structural change and strengthen public health systems in the Global South are crucial to reducing inequalities across and inside countries.

ABS1811

Addressing Health Systems Quality Gaps: Empowering Health Service Managers Through a Formal Academic Program

Juliet Charity Yauka Nyasulu[1], Maureen Tshabalala[1], Rene English[1]
[1]Division of Health Systems and Public Health, Stellenbosch University, Cape Town, South Africa

ABSTRACT
Implementation Science (IS) provides a systematic approach for translating evidence into practice, critical for improving health service delivery, particularly in resource-constrained settings. Quality Assurance (QA) and Quality Improvement (QI) are central to health system strengthening; however, many health service managers lack formal training in these disciplines. Consequently, QI initiatives are often fragmented, short-lived, and poorly institutionalised, limiting sustainability and impact (WHO, 2018). To address this gap, Stellenbosch University, in collaboration with the Institute for Healthcare Improvement (IHI), integrated a structured QI module into its Postgraduate Diploma in Health Care Management to build practical IS and QI capacity among frontline health managers. We evaluated the implementation of the QI module among the 2023–2024 PGDip cohort. Fifteen South African health service managers participated in training covering IS principles, QA frameworks, and QI methodologies, including the Model for Improvement. Each participant identified a real-world health system gap within their workplace and designed a context-specific QI project to address it. Continuous mentorship and coaching were provided throughout project implementation to support application of theory to practice. All fifteen participants successfully developed and implemented QI projects within their respective health system contexts. Projects addressed diverse service delivery gaps and were presented to key institutional stakeholders, including senior health managers, enhancing organisational engagement and accountability. Importantly, participants were also supported to document their projects in a publishable format, promoting knowledge sharing and the potential replication of effective interventions beyond the immediate settings. Embedding a structured QI and IS module within a formal academic Programme significantly strengthens the capacity of health service managers to identify, implement, and sustain system-level improvements. This approach supports institutionalization of continuous quality improvement and contributes meaningfully to health system strengthening. Formal partnerships between academic institutions and implementation partners such as IHI offer a scalable and sustainable model for building QI leadership within health systems, particularly in low- and middle-income country contexts.

Nudging Sub-Saharan African Primary Health Care Systems Toward Preventive and Promotional Care: Project Design and Conceptual Framework for the Development of Remote Functions

Hans Onya[1], Barimwotubiri Ruyobeza[1], Emmanuel Okereke[2], Davison Munodawafa[3], Henry Uro-Chukwu[4], Tshifhiwa Netshapapame[1]
[1]Department of Public Health and Health Systems, University of Limpopo, South Africa, Polokwane, South Africa, [2]Biomedical Engineering Research Centre, University of Cape Town, Cape Town, South Africa, [3]Department of Community Medicine, Midland State University, Gweru, Zimbabwe, [4]College of Medical Sciences, Alex Ekwuene Federal University, Ikwo - Abakaliki, Nigeria

BACKGROUND
Primary Health Care (PHC) systems in Sub-Saharan Africa (SSA) remain heavily oriented toward reactive, curative services despite the urgent need to shift toward preventive and proactive care. Although digital health solutions have been expanding, most still reinforce treatment-based models rather than address systemic factors that could facilitate preventive care. This article presents the rationale behind a research project examining the development of a conceptual framework of remote functions - a group of new, hypothetical services delivered to citizens away from healthcare facilities, including Virtual Queuing and Chronic Condition Management, Health and Wellness Promotion, and (3) Local Outbreak and Epidemiological Information Dissemination. The research will be conducted across South Africa, Zimbabwe and Nigeria. The aim is to generate robust, actionable evidence on how preventive - and promotional PHC functions can be incorporated into sub-Saharan African primary health care systems.
METHODS
The project adopts a muti-study mixed method research design. The overall design integrates comparative case studies, qualitative and quantitative surveys, co-designed and participatory approaches and a Delphi process to capture systemic, workforce, community-level perspectives across sequential and interlinked research phases. Analysis will produce coding protocols, scenario-testing outputs and empirically supported refinements of the framework, linking adoption potential to operational and workforce feasibility considerations; consolidate evidence from all prior phases to validate the conceptual framework and associated pathways.
CONCLUSIONS
Drawing on the Framework for the Adoption and Scaling of Remote Patient Management Systems (FRPMS), the study will investigate: the intention–expectation gaps among policymakers, providers, and citizens; task–skills fit in the workforce; and sociotechnical norms and imaginaries shaping prevention versus treatment approaches. Findings will generate new practical and empirical insights into determinants and levers of SSA's PHC system transformation. Outputs will include a validated framework supporting broader awareness and uptake of preventive and promotional PHC approaches across SSA.

Implementing training strategies for primary health care teams to improve child development surveillance: a pilot study

Juliana Araujo Teixeira[1], Sonia Isoyama Venancio[2], Maria Beatriz Martins Linhares[3], Rogério Lerner[4], Naércio Aquino Menezes-Filho[5,6], Débora Falleiros de Mello[7], Cpapi Cpapi[5]
[1]School of Public Health, University of São Paulo, São Paulo/SP, Brazil, [2]Ministry of Health, Brasilia/Federal District, Brazil, [3]Ribeirão Preto Medical School, University of São Paulo, Ribeirão Preto/SP, Brazil, [4]Psychology Institute, University of São Paulo, São Paulo/SP, Brazil, [5]Insper, São Paulo/SP, Brazil, [6]Department of Economics, University of São Paulo, São Paulo/SP, Brazil, [7]Ribeirão Preto College of Nursing, University of São Paulo, São Paulo/SP, Brazil

BACKGROUND
This study examined a training program designed to increase primary healthcare professionals' awareness and strengthen the use of the Child Health Booklet

(CHB) for child development (CD) surveillance. The intervention was evaluated in terms of effects, feasibility, and acceptability.
METHODS
A pre–post design was applied among professionals from all primary care units in a small municipality in São Paulo state, Brazil. In parallel, caregivers of children aged 0–3 years were interviewed and CHBs were audited before (G1, n = 225) and after (G2, n = 219) the intervention. Focus groups with a subset of professionals explored implementation barriers and facilitators using the RE-AIM framework1.
RESULTS
Of the 77 eligible professionals, 92.8% accessed the online module and 30.1% completed it. Thirty-seven participated in in-person training, with attendance rates above 78%, demonstrating good feasibility and engagement. After the intervention, caregivers in G2 more frequently reported that professionals inquired about CD (53.2% vs. 39.1%) and provided related guidance (79.4% vs. 62.9%). Advice to read the CHB (60.8% vs. 41.5%) and explanations about its content (28.8% vs. 15.6%) also increased. Adjusted analyses showed the likelihood of caregivers being asked and receiving information about CD increased by 1.37 (95% CI: 1.12-1.69) and 1.27 times (95% CI: 1.12-1.43), respectively. Professionals were 46% more likely to advise CHB reading (95% CI: 1.15–1.86) and 88% more likely to provide content guidance (95% CI: 1.17–3.04). Audits revealed a 4.65-fold increase (95% CI: 1.62-13.2) in complete documentation of developmental milestones. Focus groups indicated improved motivation to use the CHB, recognizing its role in family guidance and care quality. In addition, suggestions for improving training and barriers to implementation emerged.
CONCLUSIONS
The training strategy was feasible, well accepted, and associated with meaningful improvements in CD surveillance practices in primary healthcare settings.

Development and pilot testing of Our Practice Advisories to improve access to Chronic Kidney Disease treatment and care

Kimberly Jacob Arriola[1], Nicole Franks[2], Candace Sapp[1], Rhonda D. Harris[2], Janice Lea[2], Bobby Howard[3], Megan Urbanski[2], Sydney Odion-Smith[1], Alexis Smith[1], Collins Airhihenbuwa[4], Emily August[1], Tamara Y. Walker[5]
[1]Rollins School of Public Health, Emory University, Atlanta, United States, [2]School of Medicine, Emory University, Atlanta, United States, [3]LifeLink of Georgia, Peachtree Corners, United States, [4]School of Public Health, Georgia State University, Atlanta, United States, [5]American Kidney Fund, Rockville, United States
INTRODUCTION
Despite advances in diagnosis and management, disparities persist in the burden of end-stage kidney disease (ESKD); Black patients in the U.S. Experience almost a 4X higher incidence than white patients.1 Among other reasons, this disparity stems from delayed identification of chronic kidney disease (CKD), hindering timely referral to nephrology specialists and medical interventions that improve outcomes. Structural racism has been implicated as a driver of these disparities. We present preliminary data on the implementation of a systems-level intervention that seeks to reduce inequities in access to CKD/ESKD treatment and care. Specifically, clinical practice alerts aimed at mitigating against implicit bias in referral practices, termed Our Practice Advisories (OPAs) were launched.
METHODS
The OPAs were built into the Epic Electronic Medical Record in order to identify patients being discharged from the emergency department or hospital meeting one of two criteria: 1) eGFR <45 triggered a prompt for primary care referral; 2) eGFR <29 triggered a prompt to refer to nephrology.
RESULTS
During the 11-week study period, the OPA fired 3,060 times (eGFR <29: n=520; eGFR <45: n=2,540). The affected population was predominantly Black (64%) and female (60%). Total provider response rate was 2% (n=53). Of those responding, Internal Medicine providers accounted for the majority (68%; n=36), followed by Critical Care (13%; n=7). Among the 53 responders, 40 (76%) completed a follow-up action. Key actions included: problem list updates, referral/order placement, and clinical integration. Thirty-six providers (68%) added CKD to the patient's problem list, 36 (68%) placed a referral order, and 32 (60%) completed the combined action of adding the diagnosis while simultaneously placing a referral.
CONCLUSIONS
We must educate providers on the utility of using OPAs. They serve as a tool for identifying patients who have diminished kidney functioning to expedite access to care, which may help reduce disparities.

ABS1922

Realising the Life Course Approach in primary health practice towards optimising person-centred care in the Western Cape, South Africa

Vanessa Mudaly[1], Caro-Lee Jaftha[1], Nafeesa Saldulker[1], Nathirah Bosch[1], Kelly Sweatman[1]
[1]Clinical content, Knowledge Translation Foundation, Cape Town, South Africa
BACKGROUND
The Western Cape health department has adopted a life course approach to service delivery, acknowledging that key phases, transitions and events shape the trajectory of an individual's health over their lifespan. Accordingly, the disease burden of each life stage should be linked to appropriate health promotion, prevention and disease management strategies to optimise opportunities for person-centred health and well-being. The Practical Approach to Care Kit (PACK) is a clinical decision support (CDS) tool implemented at primary care facilities that translates evidence-based guidelines into a simplified algorithmic format. The "PACK Adult" guide comprehensively covers adult care, however the scope of the Integrated Management of Childhood Illness (IMCI) guide used for children is limited and lacks guidance for children over 5 years. In addition, the health needs of adolescents differ significantly from that of children and adults. We describe the process of bridging these important gaps.
METHODS
The "PACK Adult" strategy consisting of policy-aligned guidance, a training package, implementation support and health system strengthening activities3 was expanded to include the "PACK Child" and "PACK Adolescent and Youth" guides. Content was developed by localising available high-quality, evidence-based, age-appropriate policies and integrating inputs from health managers, specialists and primary care practitioners about health priorities, content relevance and clinical practice.
RESULTS
The PACK guides provide person-centred point-of-care CDS integrated with health promotion and prevention strategies aligned to the life course approach. The range of content includes commonly occurring symptoms, immunisation, routine care for children, sexual and reproductive health, mental health conditions, long-term health conditions and palliative care. Annual review ensures policy alignment, incorporation of end user feedback and updated medicine information.
CONCLUSIONS
Building on an existing, trusted methodology used to strengthen health service delivery for adults has been an acceptable and feasible way of operationalising a life course approach.
Popul. Med. 2026;8(Supplement 1):A1676

ABS1926

Evaluating the Implementation of Adolescent- and Youth-Friendly Services in the Selected Primary Healthcare Facilities in Vhembe District, Limpopo Province

Mukovhe Rammela[1], Lufuno Makhado[2]
[1]Nursing, University of Pretoria, Pretoria, South Africa, [2]Public Health, University of Venda, Thohoyandou, South Africa
BACKGROUND
The adolescent- and youth-friendly services (AYFS) programme has the potential to address several diverse problems within adolescents' healthcare systems by improving the quality, accessibility, efficiency, and effectiveness of healthcare services. The country continues to suffer from structural and systemic factors that hinder the effective provision and implementation of AYFS despite its comprehensive legal and policy framework and commitment to enhancing young people's health. Therefore, the objective of this study was to evaluate the implementation of AYFS against the World Health Organization (WHO) global standards for quality healthcare services for adolescents to strengthen these services in Vhembe District, Limpopo.
METHODS
A cross-sectional study was used to evaluate the implementation of AYFS against the WHO global standards for quality healthcare services for adolescents in Vhembe District, Limpopo. Evaluating the implementation of AYFS was conducted through questionnaires distributed to healthcare providers in the selected primary healthcare facilities in Vhembe District. For descriptive statistical analysis, research data were analysed using Statistical Package for the Social Sciences (SPSS).
RESULTS
The AYFS have been evaluated in depth across eight WHO global standards for quality health-care services for adolescents, with areas of success and areas for improvement identified. Provider competency reveals a disparity, with a majority (67.0%) of healthcare providers trained in effective communication with

adolescents. In comparison, significantly fewer have received specific training in AYFS (16%) or on Pre-Exposure Prophylaxis (PrEP) (25.9%), underscoring the need for a more balanced approach to training focus.
CONCLUSIONS
Research findings highlight the strengths and gaps of AYFS in Vhembe District, aligned with government and WHO priorities for adolescent health. Addressing the identified gaps is vital to ensuring that healthcare facilities are adolescent- and youth-friendly, easily accessible, and can be implemented effectively to address adolescent and youth health challenges in Vhembe District.

Development and Validation of an Integrated HIV/STI, and Pregnancy Prevention Programme: Improving Adolescent Sexual Health Outcomes

Mukovhe Rammela[1], Lufuno Makhado[1,2]
[1]Nursing, University of Pretoria, Hatfield, South Africa, [2]Public Health, University of Venda, Thohoyandou, South Africa

ABSTRACT
In developing countries, adolescent girls and young women (AGYW) continue to experience high rates of unintended pregnancy and sexually transmitted infections (STIs), including Human Immunodeficiency Virus (HIV). Several healthcare services are available at the primary level of healthcare to address the sexual and reproductive needs of adolescents in South Africa. Healthcare providers often face challenges such as limited resources, inadequate funds, and inadequate training, which hinder their ability to provide integrated care. In response to increasing international calls for developing and implementing integrated person-centered care, which addresses both quality and access to care, this paper aims to develop and validate an integrated HIV/STI, and pregnancy prevention program for adolescent girls and young women in the Vhembe District. Multiphase mixed methods were employed in this study. This study consisted of three interconnected phases. As part of phase 1 of this study, a comprehensive literature review was conducted. In phase 2, an empirical study conducted using a concurrent triangulation strategy to collect and analyze both qualitative and quantitative data as a form of confirmation, dis-confirmation, and cross-validation of the findings. Consequently, a conceptual framework was developed using qualitative and quantitative analysis by merging, comparing, and interpreting the results. The findings of phase 2 interface were analyzed using the Political, Environmental, Social, and Technological (PEST) and Strength, Weakness, Opportunity, and Threat (SWOT) analyses. Additionally, the outcomes of the Logical Framework Analyses (LFA) informed the development of an integrated programme aimed at preventing HIV, STIs, and teenage pregnancy. Several stakeholders and experts (n = 35) were consulted as part of the Reduce the Risk (RTR) Coalition to validate the proposed integrated programme with an average of 94.3% on acceptability, feasibility, and appropriateness. In the Vhembe District, there has been no published study that has developed an integrated HIV, STIs, and pregnancy prevention programme.

A Conceptual Framework for Integrating HIV, STIs and Pregnancy Prevention Services in Vhembe District, Limpopo, South Africa: Improving Teenagers' Health Outcomes.

Mukovhe Rammela[1], Lufuno Makhado[2]
[1]Nursing, University of Pretoria, Hatfield, South Africa, [2]Public Health, University of Venda, Thohoyandou, South Africa

ABSTRACT
Against the backdrop of increasing international calls for the development and implementation of integrated person-centered care that address both quality and access issues to improve adolescent and youth health services, this paper aims to develop a conceptual framework for integrating Human Immunodeficiency Virus (HIV) and Sexually Transmitted Infections (STIs) prevention into pregnancy prevention routine services in Vhembe District, to improve teenagers' health outcomes. A convergent triangulation mixed methods design was used for comparing and contrasting of quantitative and qualitative data to determine the extent of agreement between the two data types to generate contextual findings. In this study, employing both quantitative data were collected through questionnaires on a sample of healthcare workers (n=112) providing Adolescent and Youth-Friendly Services to evaluate programme effectiveness on the high rate of teenage pregnancy and HIV infection among youth in Vhembe District. Qualitative data were collected using face-to-face interviews with nurses (n=24) and teenagers aged 14-19 yrs (n=28) on the barriers and facilitators of integrating HIV, STI and pregnancy prevention services. Quantitative data were analysed using frequencies and percentages, and qualitative data were analysed using thematic analysis. The findings of the study point out that the integrated HIV, STIs and pregnancy prevention service uptake among adolescents is likely to be influenced by social and institutional factors. Provider competency reveals a disparity, with a majority 67.0% of healthcare providers trained in effective communication with adolescents with 95% Confidence Interval of [0.57-0.75] (n=112), suggesting a high level of adoption in the population. In comparison, significantly fewer have received specific training in AYFS 16% with 95% Confidence Interval of [0.09-0.24] (n=112), underscoring the need for a more balanced approach to training focus. The empirical findings provide evidence on challenges unique to low-resource, rural settings, contributing to global discourse on HIV and Sexual Reproductive Health (SRH) integration.

From Policy to Practice: The implementation and scaling of HIV Self-Screening amongst Adolescents and for client on Oral PrEP in South Africa

Tebogo Maomela[1], Alarice Marsh[1], Dr Thato Chidarikire[1]
[1]Health: South Africa, Ministry of Health South Africa, Pretoria, South Africa

BACKGROUND
HIV Self Screening (HIVSS) is testing modalities that the National Department of Health (NDoH) adopted after the STAR project. The commodities are currently being funded through domestic funding and support from Global Fund. The country recently updated the HIV Testing Services (HTS) policy, expanding the modality to all eligible clients aged 12 -17 years for directly assisted within healthcare facilities. The modality was also integrated into the PrEP program. These changes aimed to increase testing coverage among adolescents aged 12 -17 years who can provide consent and to high-risk populations who have successfully completed their oral PrEP for more than 4 months.
AIM
Implementing this was also aimed at reducing the number of visits to the healthcare facilities amongst clients who were on PrEP and scaling the modality to adolescents aged 12 -17 years.
METHODS
We reviewed retrospective data on the number of HIVSS test kits that were distributed from April 2024 – October 2025. These HIVSS test kits were distributed across the public health facilities, community distribution points, and PrEP service sites. Performance was benchmarked against the national targets
RESULTS
The annual national HIVSS target is 333 333 across the country. These targets were set based on the various aspects and the performance is reviewed annually from April to November 2025. The current data indicated that the current performance is at 90%.
CONCLUSIONS
HIVSS implementation for adolescents and PrEP users has demonstrated feasibility and acceptability, with a performance of 90 % which includes usage and distribution to both adolescents and clients who are on PrEP.

Health Without Borders: Governance, Equity, and Priority Setting for Essential Medicines and Diagnostics in sub-Saharan Africa – A Systematic Review

Trudy D Leong[1,2], Lumbwe Chola[3], Andrew G Parrish[4], Thandokazi Mvelashe[2], Natasha Gloeck[1], Sumayyah Ebrahim[5,1], Tamara Kredo[1,6]
[1]Health Systems Research Unit, South African Medical Research Council, Cape Town, South Africa, [2]Division of Health Systems and Public Health, Department of Global Health, Stellenbosch University, Stellenbosch, South Africa, [3]Department of Health Management and Health Economics, University of Oslo, Oslo, Norway, [4]Department of Internal Medicine, Faculty of Health Sciences, Walter Sisulu University, Mthatha, South Africa, [5]Department of Surgery, Nelson R Mandela School of Medicine, College of Health Sciences, Durban, South Africa, [6]Division of Epidemiology and Biostatistics, Department of Global Health, Stellenbosch University, Stellenbosch, South Africa

BACKGROUND
Health Without Borders requires priority-setting that promotes equitable, inclusive, and sustainable resource allocation. In sub-Saharan Africa (SSA), limited resources, cross-border health challenges, and donor financing complicate trade-offs in selecting essential medicines and diagnostics for primary healthcare (PHC). Health Technology Assessment (HTA), Multi-Criteria Decision Analysis (MCDA), and procedural justice approaches may strengthen transparency and

accountability, but their role in SSA is poorly documented.
METHODS
We systematically reviewed empirical applications of explicit priority-setting and economic evaluations for selecting PHC essential medicines and diagnostics in SSA. Bibliographic databases and grey literature were searched from January 2000 to 8 July 2025. Information was extracted in duplicate and analysed thematically. Carroll's framework was used to assess implementation fidelity against global standards for HTA, MCDA, Accountability for Reasonableness (A4R), and Evidence and Values: Impact on Decision-Making. We appraised reporting quality using the Consolidated Health Economic Evaluation Reporting Standards 2022 checklist and explored policy uptake through ministry repositories.
RESULTS
In 84 included studies, cost-effectiveness analysis predominated (n=59); deliberative approaches were rarely applied (MCDA, n=3; A4R, n=1; Program Budgeting and Marginal Analysis, n=0). Few studies used primary data; 68% relied on secondary sources. Among studies reporting cost-effectiveness thresholds (55%), gross domestic product–based rules were frequently used (57%). Ministries of Health participated in 7% of evaluations, and stakeholder engagement was mentioned in 6%. Equity, feasibility and budget impact were rarely addressed. Governance fragmentation and donor dependence constrained decision uptake, but deliberative participation in some cases suggested potential for more responsive and regionally coherent Universal Health Coverage (UHC).
CONCLUSIONS
Evidence-informed priority-setting tools have been used inconsistently to guide essential medicine and diagnostic selection in SSA. Strengthening domestic capacity and integrating equity, affordability, and feasibility criteria in ministry-led deliberative processes may foster legitimate, sustainable resource allocation, supporting the extension of UHC to marginalised and mobile populations.

ABS2034
Establishing a learning health system at the sub-district level: Healthy Futures South Africa

Steve Reid[1], Tracey Naledi[1]
[1]Family, Community and Emergency Care, University of Cape Town, Cape Town, South Africa

AIM
A partnership between the University of Cape Town and the Western Cape Government Department of Health and Wellness has received a generous grant from the Mastercard Foundation under the Africa Health Collaborative, to strengthen primary health care by empowering and preparing young people for employment and health entrepreneurship in three sub-districts over eight years. This created the opportunity to co-design and co-develop a learning health system as a joint venture between a health service and a higher education institution. This chapter outlines the initial steps in setup and design including data from the first two years of operations.
METHODS
In this project, each of the three sub-districts has established a "learning circle" that includes representatives from the health services, communities, non-governmental organizations and the university. In addition, a "Learning Forum" has been initiated to bring together the reflections from all 3 sites to generate appropriate interventions and research questions. Research methods included initial interviews in the first 6 months that explored participants' understanding and experience with the development of the project. Secondly, we reflected on the Learning Circles and Learning Forums to understand the trajectories of learning across the system in the first two years of implementation.
RESULTS
Data from key informant interviews in a participatory action research project, together with reports from the learning circles, are presented to illustrate the issues and learnings that have emerged in the early stages of the project.
CONCLUSIONS
The HFSA project shows that building a learning health system is an iterative social and political process, not merely a technical one. Learning circles have fostered inclusive reflection and emerging innovation, particularly through youth engagement and narrative approaches. Long-term sustainability depends on leadership, investment, and embedding learning as core health system infrastructure.

Effects of Continuity of Care on Avoidable Hospitalization in Hypertensive Patients: A Retrospective Analysis in High-altitudes of China

Junyi Chen[1], Ting Ye[1], Changli Jia[1], Qiao Yang[1], Sisi Zhong[1]
[1]School of Medicine and Health Management, Tongji Medical College, Huazhong University of Science and Technology, Wuhan, China

INTRODUCTION
In recent years, the hospitalization rate in China has continued to rise, with an increasing prevalence of avoidable hospitalizations. While developed countries have extensively studied avoidable hospitalization, research in China remains limited, particularly regarding the impact of continuity of care on avoidable hospitalization, which has yet to yield consistent conclusions. The objective of this study was to investigate the effects of continuity of care on avoidable hospitalization in hypertensive patients.
METHODS
Using claims data from basic medical insurance in three cities in high-altitude areas of China, from 2022 to 2023, we identified 13831 patients aged ≥18 years with at least three hospital visits for hypertension-related conditions in 2022. By analyzing whether these patients experienced avoidable hospitalizations due to hypertension in 2023 and evaluating continuity of care (COC, UPC, and SECON indicators) using 2022 data, the aim was to determine the association between continuity of care and avoidable hospitalizations. Logistic regression analysis was performed, adjusting for age, sex, ethnicity, region, insurance type, and number of hospital visits.
RESULTS
Among the 13831 patients, 425 (3.1%) experienced avoidable hospitalization for hypertension. Higher continuity of care was associated with a significantly lower risk of avoidable hospitalization: COC (OR=0.253, 95% CI: 0.164–0.383, p<0.001), UPC (OR=0.230, 95% CI: 0.140–0.374, p<0.001), and SECON (OR=0.335, 95% CI: 0.238–0.469, p<0.001).
CONCLUSIONS
Enhanced continuity of care is associated with reduced avoidable hospitalizations in hypertensive patients. Strengthening healthcare system capacity, improving longitudinal patient management, and fostering strong patient-physician relationships may be effective strategies to mitigate unnecessary hospitalizations.

Rapid Responsive Evidence Synthesis for Decision-making for Lenacapavir: Evidence-to-decision (E2D) Collaboration

Sumayyah Ebrahim[1,2], Natasha Gloeck[1], Zahiera Adam[3,4], Gayle Tatz[5], Jeremy Nel[6,7], Phumla Sinxadi[5,8], Halima Dawood[9,10], Tamara Kredo[1,11], Karen Cohen[5]
[1]Health Systems Research Unit, South African Medical Research Council, Cape Town, South Africa, [2]Discipline of General Surgery, Nelson R Mandela School of Medicine, College of Health Sciences, University of KwaZulu-Natal, Durban, South Africa, [3]Clinton Health Access Initiative, Pretoria, South Africa, [4]Affordable Medicines Directorate, National Department of Health, Pretoria, South Africa, [5]Division of Clinical Pharmacology, Department of Medicine, Faculty of Health Sciences, University of Cape Town, Cape Town, South Africa, [6]Division of Infectious Diseases, Department of Medicine, Faculty of Health Sciences, University of the Witwatersrand, Johannesburg, South Africa, [7]Infectious Diseases and Oncology Research Institute, University of the Witwatersrand, Johannesburg, South Africa, [8]South African Medical Research Council/University of Cape Town Platform for Pharmacogenomics Research and Translation, South African Medical Research Council, Cape Town, South Africa, [9]Infectious Diseases Unit, Grey's Hospital, Pietermaritzburg, South Africa, [10]Centre for the AIDS Programme of Research in South Africa (CAPRISA), Doris Duke Medical Research Institute, Nelson R Mandela School of Medicine, University of KwaZulu-Natal, Durban, South Africa, [11]Division of Epidemiology and Biostatistics, Department of Global Health, Faculty of Medicine and Health Sciences, Stellenbosch University, Cape Town, South Africa

BACKGROUND
To describe the collaborative processes and results of a review that enabled evidence-informed, context-specific recommendations for the use of lenacapavir for HIV pre-exposure prophylaxis (PrEP) in South Africa.
METHODS
Trustworthy guidance products require actionable statements (recommendations) supported by structured, transparent, evidence-informed decision-making processes. The National Department of Health Essential Medicines Programme, the South African Medical Research Council and Stellenbosch University established the Evidence-to-Decision (E2D) collaboration to facilitate timely evidence synthesis and promote broader stakeholder engagement in policy decisions. Efficacy and safety of lenacapavir, compared with oral PrEP, were prioritised for a rapid evidence review conducted according to a registered protocol specifying
