ORGANISING COMMITTEE

CMC
The three organising partners of the 17th World Congress on Public Health established a Congress Management Committee (CMC) consisting of representatives of WFPHA, SItI, ASPHER and the PCO. The CMC has the full managerial and financial management responsibility for the Congress.

Chair: Walter Ricciardi

Members:
- Luis Eugenio de Souza – WFPHA
- Bettina Borisch – WFPHA
- Marta Lomazzi – WFPHA
- Italo Angelillo – SItI
- Antonio Ferro – SItI
- Roberta Siliquini – SItI
- Carlo Signorelli – ASPHER
- John Middleton – ASPHER
- Robert Otok – ASPHER

ISC
The International Scientific Committee (ISC) consists of experienced public health experts from around the world nominated by WFPHA, SItI and ASPHER. It mainly advises the ICC on scientific matters of the conference and contributes to the scientific evaluation of the conference. We would like to thank the ISC for their support.

Chair: Walter Ricciardi

Members:
- Mohannad Al Nsour (Jordan)
- Elena Alonzo (Italy)
- Woldekidan Kiffe Amde (South Africa)
- Yaneer Bar-Yam (USA)
- Maurício Barreto (Brazil)
- Stefan Buttigieg (Malta)
- Mary Codd (Ireland)
- Kasia Czabanowska (The Netherlands)
- Maria Saenz Del Rocio (Costa Rica)
- Enrico Di Rosa (Italy)
- Alberto Fedele (Italy)
- Rok Hrzic (Slovenia)
- Gregory Kolt (Australia)
- Rüdiger Krech (WHO)
- Jose M. Martin-Moreno (Spain)
- Alison McCallum (United Kingdom)
- Martin McKee (United Kingdom)
- Michael Moore (Australia)
- Jean Marie Okwo Bele (Congo)
- Gaetano Pelissero (Italy)
- Gaetano Privitera (Italy)
- Srinath K. Reddy (India)
- Malabika Sarker (Bangladesh)
- Luca Gino Sbrogiò (Italy)
- Ines Siepmann (USA)
- Giorgio Solimano (Chile)
- Emanuele Torri (Italy)
- Paolo Villari (Italy)
- Francesco Vitale (Italy)
Aim & Scope

Population Medicine is an open-access double-blind peer-reviewed scientific journal that encompasses all aspects of population, preventive, and public health research including health care systems and health care delivery. Its broader goal is to address major and diverse health issues, to provide evidence-based information to professionals at all levels of the health care system, and to inform policymakers who are responsible for the formation of health policies that can lead to evidence-based actions.

Full Journal Title: Population Medicine
Abbreviated Title: Popul. Med.
ISSN (electronic): 2654-1459
Publishing model: Open Access
Peer Review: Double Blind
Licenses: CC BY-NC 4.0
Publication Frequency: Monthly
Publication Medium: Electronic Only
Publication website: www.populationmedicine.eu

Publisher: European Publishing
Science and Technology Park of Crete, Greece

Disclaimer: All authors are responsible for the content of their abstracts and retain copyright of their abstract under an Open Access, Creative Commons License (CC BY-NC 4.0). Each abstract is citable and identifiable through its individual Digital Object Identifier (DOI).
Editorial Board

Editor-in-Chief
Evridiki Patelarou
MD, RN, MPH, PhD, Professor of Epidemiology, School of Nursing, Hellenic Mediterranean University, Greece

Editorial Board
Israel Agaku,
Lecturer, Oral Health Policy and Epidemiology, Department of Oral Health Policy and Epidemiology, Harvard School of Dental Medicine, MA, United States

Hend Alqaderi
Lecturer in Oral Health Policy and Epidemiology, Harvard School of Dental Medicine, MA, United States

Jay Atanda
Office of Science Policy and Analysis (OSPA), National Institutes of Health, United States

Kostas Athanasakis
Assistant Professor of Health Economics and Health Technology Assessment, Department of Public Health Policy School of Public Health, University of West Attica, Greece

Muath A. Aldosari
Lecturer, Oral Health Policy and Epidemiology, Harvard School of Dental Medicine, Harvard University, Boston, United States

Arzu Beklen
Department of Periodontology, Faculty of Dentistry, Eskisehir Osmangazi University, Turkey

Nurcan Buduneli
Professor, Department of Periodontology, Faculty of Dentistry, Ege University, Turkey

Aslı Çarkoğlu
Associate Professor, Department of Psychology, Kadir Has University, Istanbul, Turkey

Onyema Greg Chido-Amajuoyi
Postdoctoral Fellow, University of Texas MD Anderson Cancer, TX, United States

Daniel Erim
Director, Real World Value & Evidence, Market Access Analytics, Johnson & Johnson, United States

Wayne Gao
Associate Professor, College of Public Health, Taipei Medical University, Taiwan

Charis Girvalaki
Director, European Cancer Patient Coalition, Brussels, Belgium

Michele Hilton-Boon
Research Fellow in Feminist Economics, Glasgow Caledonian University, United Kingdom

Takashi Hanjo
Professor, Department of Community and Preventive Dentistry, Fukuoka Dental College, Japan

Bruce Kirenga
Pulmonology Unit, Department of Medicine, Makerere University, Mulago Hospital, Kampala, Uganda

Dilek Karadogan
Associate professor, Pulmonary Medicine, Department of Chest Diseases, Recep Tayyip Erdogan University, Turkey

Alexander Mathioudakis
Clinical Research Fellow and Honorary Lecturer, Division of Infection, Immunity and Respiratory Medicine, The University of Manchester, Manchester, United Kingdom

Enkeleid A. Mechili
Department of Healthcare, Faculty of Public Health, University of Vlora, Albania

Jantel Nelson
Great Life Counseling Center, United States

Revali Phalkey
Head, Climate Change and Health Unit, UK Health Security Agency, United Kingdom

Oluwakemi Odukoya
Department of Community Health and Primary Care, College of Medicine, University of Lagos, Nigeria

Krzysztof Przewoźniak
Department of Cancer Epidemiology and Prevention, Maria Skłodowska-Curie National Research Institute of Oncology, Poland

Mays Shamout
Epidemic Intelligence Service Officer, National Center for Chronic Disease Prevention and Health Promotion, CDC, United States

Kimon Stamatopoulos
Associate Professor of Clinical Therapeutics and Cardiology, School of Medicine, National and Kapodistrian University of Athens, Greece

Antigona Trofor
Professor of Respiratory Medicine, Department of Pulmonary Medicine, University of Medicine and Pharmacy “Gr. T. Popa” Iasi, Romania

Tina Tsafa
Centre for Food Technology and Research, Department of Mass Communication, Benue State University, Nigeria

Manolis Tzatzarakis
Associate Professor, Laboratory of Toxicology, Medical School, University of Crete, Greece

Uyoyo Omaduvie, Academic primary care physician/faculty, Tufts Medical Center, Boston, United States

Strategic Development Editor
Constantine Vardavas
Medical School, University of Crete, Greece & Harvard School of Dental Medicine, United States
**Table of Contents**

Musculoskeletal symptoms and disorders, and related knowledge, attitude and practices among female textile workers in Karachi, Pakistan: a cross-sectional study .......................................................... 46

Heart Health of Filipino senior workers ................................................................. 46

Awareness and practice of family planning services among married men in area of Yemen ................................................................. 46

Inequalities in primary and secondary healthcare use among people living with dementia in England ................................................................. 46

Concepts and definitions of healthy ageing: a systematic review and synthesis of theoretical models ................................................................. 46

The Adult Immunization Board (AIB): a platform to provide multidisciplinary support for the implementation and optimization of adult immunization in Europe ................................................................. 47

Impact of multimorbidity on health care utilisation in Australian older adults aged 45 years and over: a large population-based data linkage cohort study ................................................................. 47

Identifying risk factors for becoming obese: a record linkage longitudinal study in metropolitan Sydney using the 45 and Up Study ................................................................. 47

Use of wearable sensor technology to detect risk of fall in Indian older adults ........................................................................................ 48

Social wellbeing among urban elderly in India: exploring the role of multidimensional health ............................................................................. 48

How multimorbidity affects trajectories in functional limitation and quality of life among middle-aged and older adults: longitudinal findings from the 2013-2020 survey of health, ageing, and retirement in Europe ................................................................. 48

Post acute care: cui prodest? A 1-year retrospective observational study ................................................................. 48

National Recovery and Resilience Plan - using the Health Project programming tool in Sardinia: Social Health Districts’ mortality and aging index analysis from 2017 to 2021 ............................................................................. 49

Association of serum uric acid with body mass index in the United Arab Emirates UAE healthy future pilot study ................................................................. 49

Multimorbidity and out-of-pocket expenditure on medicine in Europe: longitudinal analysis of 13 European Health Systems between 2013 and 2015 ............................................................................. 49

The psoriasis comorbidome ..................................................................................... 49

Selenium exposure and oxidative stress and genotoxicity risk in a healthy Italian population: a cross sectional study ................................................................. 50

Key considerations for the implementation of active assisted living systems to support older adult care ............................................................................. 50

Importance and determinants of advance directives and healthcare proxy use among the oldest-old ............................................................................. 50

Transition to retirement impact on depressive symptoms: results from a longitudinal analysis within the Survey of Health, Ageing and Retirement in Europe (SHARE) project ................................................................. 50

Developing new models for integrated community health and social care for dependent older people: the case of Programa Maior Cuidado in Brazil ............................................................................. 51

Patient-reported outcomes in robotic total knee arthroplasty: a retrospective cohort study with ROBotic Surgical Assistant system ................................................................. 51

Empowerment of healthy ageing through integrated care managers in China ........................................................................................ 51

Predictors of Chronic Pain: comparison between older adults with and without life-long cognitive disability ............................................................................. 51

Development and validation of a dietary diversity score for French older adults ........................................................................................ 51

Association of pain and depression among middle-aged and older adults of India ........................................................................................ 52

The integrated pathways of care in the social and healthcare services: the AgICOT experience in Teramo, Italy ............................................................................. 52

Gender differences in global Disability-Adjusted Life Years (DALYs): a descriptive Analysis of the global burden of disease study 2021 ............................................................................. 53

Reliability and validity of the bone health literacy questionnaire for middle-aged and elderly women ............................................................................. 53

Serological responses up to 9 months following COVID - 19 mRNA vaccination in residents and healthcare workers of long - term care facilities: a multicenter prospective cohort study in Northern Italy ............................................................................. 53

Role of vegetarian and plant-based diet in the prevention of mild cognitive impairment and dementia ............................................................................. 53

Do meta-analyses of randomized controlled trials estimate the true population effects of multiple risk factor interventions? ............................................................................. 53

Assessing the quality of the built environment in dementia: a framework to evaluate long-term care facilities ............................................................................. 54

Longitudinal clustering of health behaviours and their association with health outcomes in older adults in England: a latent class analysis ............................................................................. 54

Suffering in Silence: Urinary Incontinence among Bangladeshi Women ........................................................................................ 54

Health outcomes and physiological adaptations of regular physical activity among young individuals ............................................................................. 54

The role of the built environment in dementia: evolution and adaptation of an innovative care model through the SARS-CoV-2 pandemic ............................................................................. 55

Socioeconomic differences in brain white matter microstructure and associated cognitive performance in middle to older adulthood ............................................................................. 55

Age Differences in Incidence Rates and In-hospital Outcomes among adults with Stroke or transient ischemic attack: a 10-year time-series analysis ............................................................................. 55

The effect of physical activity on health-related quality of life in older people living in residential care settings: preliminary results from an Italian sample ............................................................................. 56

COVID-19 vaccination among older adults in India: a case of underrepresentation ........................................................................................ 56

Socioeconomic predictors over the life course of healthy ageing index in older Eastern Europeans ............................................................................. 56

The role of folate metabolism enzymes snps in non-obstructive azoospermia: A systematic review and meta-analysis ............................................................................. 57

Prevalence and factors associated with elder abuse in an eastern state of India ........................................................................................ 57

A pilot study on evaluating relationship between steps and motion in a smart home environment ............................................................................. 57

Barriers and facilitators for the successful implementation of antimicrobial stewardship interventions in long-term care facilities: a scoping review ............................................................................. 57

Realist evaluation of the impact, viability and transferability of an alcohol harm reduction support program based on mental health recovery: the vitae study: First results ............................................................................. 58

Association between household air pollution and cognitive health among older adults in India: A multiple mediation approach through depression and insomnia ............................................................................. 58
Older adults’ risk profiles for intense care transition patterns: 15-year results from a swedish population-based study ................................................................. 60
Impact of COVID-19 on football players’ injuries................................................................................................................................. 58
Did covid-19 pandemic modify palliative care utilisation in 2020? a retrospective observational study comparing 2020 and 2019 administrative data in tuscany, Italy................................................................................................................................. 58
Community-based program focused on social support limits covid-19 mortality: a retrospective cohort study ................................................................. 59
Trends in the geriatric workforce in the romanian healthcare system................................................................................................................................. 59
A comparative analysis on the approaches of patients about stem cell treatments in turkey ......................................................................................................... 59

Musculoskeletal symptoms and disorders, and related knowledge, attitude and practices among female textile workers in Karachi, Pakistan: a cross-sectional study

Ali Hussaini1

1Ag Khan University, Karachi, Pakistan

Objectives: The aim of this study was to determine the prevalence of Musculoskeletal symptoms and disorders (MSD) and to assessment Knowledge, Attitude and Practices regarding Musculoskeletal symptoms and disorders among female textile workers in Karachi, Pakistan. Methodology: To assess the prevalence of MSD, we used the adopted version of Nordic Musculoskeletal Questionnaire (NMQ). For assessing individual and work-related factors, a structured questionnaire was developed and used. Data was be captured on EpilData and analyzed using SPSS 19. Percentages and frequencies were calculated for musculoskeletal symptoms and disorders, socio-demographic and work-related factors. Standard deviation (SD) and mean were calculated for age, duration of work and income. For KAP variables, responses were coded as “positive” or “negative”. Those scoring “positive” were considered as having good knowledge, attitude, and practices.

Results: 311 respondents participated in this study, 253 (81.4%) of the female textile workers reported musculoskeletal symptoms. The Lower back was the most frequently affected region (71.7%), followed by shoulders (70.7%), neck (43.4%), forearm and elbow (24.4%), hands and wrist (20.6%), upper arms (15.1%) and upper back (5.1%). Self-reported average difficulty of pain was moderate, and most individuals (29.6–53.1%) reported duration of pain to be between 3-5 days. Nearly 69.5% female workers were very dissatisfied with their working space. Frequency of musculoskeletal complaints were popular among 26-35 years of age bracket. Higher monthly income, up to 5 years spent working in the textile industry, marital status and lower educational attainment all correlated positively with complaints. Those with MSD complaints were more likely to have better knowledge and safer practices score. Conclusions: Here is a high prevalence of musculoskeletal symptoms and disorders among female textile workers in economically developing countries. Preventive measures and worksite interventions are needed to reduce work-related musculoskeletal disorders in this population. Health insurance, treatment and reimbursement schemes should be launched.

Health of Filipino senior workers

Meryl Quero-Asa

1Baali Obiero Foundation, Philippines

The study uses a mixed approach which includes using an online survey to quantitatively describe the cardiovascular health condition of senior working people, and its relation to access to food, medicine, and health care. The sample is taken from worker communities or neighborhoods near factory belts in the capital of the Philippines. linear regression is used to analyze the social determinants of health. The study shows the condition of hunger and poor health among the elderly amid job and livelihood insecurity that was exacerbated by the pandemic. Keywords: senior workers, elderly health, job insecurity, healthcare

Popul. Med. 2023;5(Supplement):A2
DOI: 10.18332/popmed/164819

Awareness and practice of family planning services among married men in area of Yemen

Abdulla Bagahizel

1Hadramout University, Yemen

Background and objectives: Family planning is the capacity of people and couples to expect and accomplish their ideal number of youngsters and the dispersing of timing of their births. This study aimed to assess the level of awareness and practice of family planning methods among married men were the wish for more children and the fear of side effects. Conclusions: The study concludes that most men have a piece of comprehensive knowledge. However, the practice of family planning methods still inadequate. Our study suggests directing more health education interventions and promotion to enhance the utilization of family planning Methods.

Inequalities in primary and secondary healthcare use among people living with dementia in England

James Watson

1NIHR Applied Research Collaboration North West Coast (ARC NWC), The University of Liverpool, United Kingdom

Background and objectives: In the UK healthcare services for people living with dementia (PLWD) are under pressure, and central government have not adhered to additional funding commitments. The UK population with dementia is expected to surpass 1 million by the year 2024, and the health and social care costs for PLWD set to treble by 2040, making it critical we understand how and to what extent, PLWD differentially use healthcare. This study aimed to explore social and spatial variations in healthcare use among people diagnosed with dementia (2002-2016).

Methods: Data were taken from Electronic Health Records of Clinical Practice Research Datalink General Practice patients in England (n=142,302). Healthcare contacts were standardised for the sample population, with rates of contacts per year calculated for three primary healthcare types (GP observations, and both dementia and non-dementia medications) and three secondary (Accident and Emergency (A&E) attendances, and emergency and elective hospital admissions). Generalised linear regression models, fully-adjusted for confounders enabled identification of differences in healthcare use by socio-economic, demographic and geographic factors. The sample was stratified by dementia onset, with a subsequent series of analyses generated for each healthcare type, Resulting in 12 regression models.

Results: The study highlights several social and spatial inequalities in healthcare use among PLWD. Men, PLWD from White ethnicity groups, in more deprived areas, and from rural areas, have greater use of healthcare services more closely associated with negative health outcomes, including less frequent GP contact and medications, and greater use of secondary healthcare.

Conclusions: Social and systemic measures are needed to reduce healthcare use inequalities among PLWD. These include: improved healthcare continuity, more frequent and better-quality health checks and medicines reviews, more culturally appropriate services, as well as greater and more accessible treatment and improved infrastructure for underserved communities.

Concepts and definitions of healthy ageing: a systematic review and synthesis of theoretical models

Marilyn Menassa1, Karien Stronks2, Farnaz Khatami3, Zayn Diaz4, Octavio Espinola5, Magda Gamba5, Oche Itodo5, Chepkoech Buttia6, Faina Wehrli7, Beatrice Minder8, Minerva Velarde9, Oscar Franco10

1Graduate School of Health Sciences, Institute of Social and Preventive Medicine, University of Bern, Bern, Switzerland, 2Department of Public and Occupational Health, Amsterdam University Medical Centers, University of Amsterdam, Netherlands, 3Institute of Social and Preventive Medicine, University of Bern, Switzerland, 4Public Health and Primary Care Library, University of Bern, Switzerland, 5Department of Radiology and Medical Informatics, University of Geneva, Switzerland, 6Department of Public Health, Julius Center for Health Science and Primary Care, UMC Utrecht, University of Utrecht, Netherlands

Background: Healthy ageing (HA) has been defined using multiple approaches. We aim to produce a comprehensive overview and analysis of the theoretical models underpinning this concept and its associated normative terms and definitions.

Methods: We conducted a systematic review of peer-reviewed HA models in Embase.com, Medline(Ovid), Cochrane CENTRAL, CINAHL, PsycINFO, and Web of Science until August 2022. Original theoretical papers, concept analyses, and reviews that proposed new models were included. Operational models/definitions, lifespan development psychology theories and mechanisms of ageing were excluded. We followed an iterative approach to extract the models’ characteristics and thematically analyze them based on the approach of Walker and Antv. The protocol was registered in PROSPERO (CRD42021238796)
Results: Out of 10,741 records, we included 59 papers comprising 65 models/definitions, published in English (1960-2022) from 16 countries in Europe, Asia, and America. Human ageing was described using 12 normative terms, mainly (models ()): successful (34 (52%)), healthy (eight (12%)), well (five (8%)), and active (four (6%)). We identified intrinsic/extrinsic factors interacting throughout the life course, adaptive processes as attributes, and outcomes describing patterns of ageing across objective and subjective dimensions (number of models/definitions): cognitive(62), psychological(53), physical (49), social (49), environmental (19), spiritual (16), economic (13), cultural (eight), political (six), and demographic (four) dimensions. Three types of models emerged: health-state outcomes (three), adaptations across the life course (31), or a combination of both (31). Two additional sub-classifications emphasized person-environment congruence and health promotion.

Conclusions: HA is heterogeneous and conceptualized multidimensionally as adaptive processes of dynamic person-environment interactions to ageing, health-state outcomes, or both. Congruence with the living environment and health promotion/empowerment are emphasized. Our model classification provides a basis for harmonizing conceptual terms and dimensions that can guide research and comparisons of empirical Findings. This would inform social and health policies enabling HA for populations in various contexts.

The Adult Immunization Board (AIB): a platform to provide multidisciplinary support for the implementation and optimization of adult immunization in Europe
Jade Pattyn1, Marco Del Riccio2, Angela Bechini3, Greet Hendrickx1, Sara Boccalini1, Pierre Damme1, Paolo Bonanni2
1Centre for the Evaluation of Vaccination, Vaccine & Infectious Disease Institute, University of Antwerp, Belgium, 2Department of Health Sciences, University of Florence, Italy, 3Centre for the Evaluation of Vaccination, Vaccine and Infectious Disease Institute, University of Antwerp, Belgium

Background: The low adult vaccination coverage and the barriers experienced during the implementation of the COVID-19 vaccination strategies in almost all European countries underline the need for a thorough reflection on adult immunization programs in Europe. Therefore, the teams of Prof. Bonanni - University of Florence and Prof. Van Damme - University of Antwerp joined forces to create an adult immunization board (AIB) based on years of experience with the Viral Hepatitis Prevention Board (created in 1992) and the HPV board (created in 2015). The AIB will be an independent, international, and multidisciplinary group of experts in adult immunization. The experts will set the strategy and define the actions of the AIB.

Materials: AIB operates by organizing two yearly meetings: 1) Technical meeting covering technical aspects of adult immunization such as tailored vaccine services and communication for adults, electronic vaccine registries, adult immunization schedules, vaccine equity, coadministration of vaccines etc. 2) Country meeting to discuss country/region-specific aspects of adult immunization together with local experts.

Results: In November 2022, the AIB secretariat organized a Kick-off meeting with experts to establish the basic structure/functions of the Board, discuss the main Objectives, and plan future meetings. Experts from different disciplines/sectors welcomed the AIB initiative. It was indicated that it is timely to have a closer look into adult vaccination and it was recognized that immunization needs a lifelong course and does not end after childhood. The new platform was well received and endorsed as an appropriate and effective way to share information and exchange ideas and experiences across disciplines and borders. In Q2/Q4 2023, the first AIB technical/country meetings are scheduled.

Conclusions: AIB will be a platform that brings together the different key European stakeholders on adult immunization in order to effectively contribute towards the implementation and optimization of adult immunization in Europe.

Identifying risk factors for becoming obese: a record linkage longitudinal study in metropolitan Sydney using the 45 and Up Study
Alamgir Kabir1, Kylie Vuong2, Damian Conway3, Margaret Williamson4, Mark Harris4, Margo Barr3
1Centre for Primary Health Care and Equity, University of New South Wales, Australia, 2School of Medicine and Dentistry, Griffith University, Australia, 3School of Medicine and Dentistry, Griffith University, Australia, 4South Eastern Sydney Local Health District, Population and Community Health Directorate, Australia, 5Centre for Primary Health Care and Equity, University of New South Wales, Kensington, Australia

Background: Obesity is the fourth leading cause of mortality globally. Australia has one of the world's highest rates of adult obesity, with 31% being obese in 2017/2018, and increasing. If this trend continues, the Australian Bureau of Statistics predicts 18 million Australians will be obese or overweight by 2030. We aimed to identify risk factors for becoming obese among people aged 45 years and older. Methods: A record linkage longitudinal study of people from metropolitan Sydney was undertaken using data from the: 45 and Up Study at baseline (2005-2009) and first follow-up (2012-2015); Medicare Benefits Schedule; Pharmaceutical Benefits Scheme; and deaths registry. We examined risk factors for becoming obese (Body Mass Index [BMI]>30) at follow up (5-7 years after baseline), separately for people within the: healthy weight range (BMI:18.5-<25), and overweight range (BMI: 25-<30) at baseline. We considered demographics, modifiable behaviours, health status, primary care usage, and medication use as covariates. Crude and adjusted relative risks (RR) were measured using Poisson regression model.

Results: At follow up, in the healthy weight range cohort, 1.1% (180 of 16,205) people became obese, and in the overweight range cohort, 12.7% (1939 of 15266) people became obese. In both cohorts, the following were associated with an increased risk of becoming obese: current smokers, physical functioning limitations, allied health services use through team care planning and use of psychiatric medications, while alcohol consumption and adequate physical activity were found to be protective. In the healthy weight cohort, high psychological distress was associated with an increased risk of becoming obese. In the overweight cohort, being female and full-time work were associated with increased risk, while older age was found to be protective. Conclusions: These findings should assist primary care clinicians to identify patients with characteristics that place them at risk of becoming obese for intervention.

Impact of multimorbidity on health care utilisation in Australian older adults aged 45 years and over: a large population-based data linkage cohort study
A.Y.M. Kabir1, Sameera Ansari1, Damian Conway2, Joel Rhee3, An Tran4, Margo Barr3
1Centre for Primary Health Care and Equity, University of New South Wales, Sydney, Australia, 2School of Population Health, University of New South Wales, Kensington, Australia, 3Population and Community Health Directorate, South Eastern Sydney Local Health District, Australia, 4School of Population Health, University of New South Wales, Kensington, Australia

Background: Multimorbidity (MM), co-occurrence of two or more chronic health conditions in an individual, is often used in the assessment of complex healthcare needs and their impact on health outcomes. Management of MM is complex, but little is known about the impact of MM on health care services. Methods: We conducted a cross-sectional study among people aged 45+ years in New South Wales, Australia, who completed baseline questionnaires in the 45 and Up Study between 2005-2009. Baseline questionnaire data were linked to hospital, primary care Medicare billings, emergency department (ED), and deaths registry data. Our outcome of interest was high use of health care services within the 3-year baseline period (averaged over the years before, during and after recruitment). People who died during that period were excluded. High use was defined as: ≥11 General Practice (GP) visits, ≥2 ED visits, and ≥2 hospital admissions. Prevalence ratios (PRs) were used to measure the impact of MM, and Poisson regression models were used to estimate adjusted and unadjusted PRs with 95% confidence intervals.

Results: Among 251,689 participants (46.5% male, and 46.1% aged <60 years), the overall prevalence of MM was 44.1% and prevalence increased with age: 32.2% in 45-59 years, 50.3% in 60-74 years, and 63.3% in 75+ years. After adjusting for confounding, MM was associated with high service use: adjusted PR (95% CI) was 2.27 (2.06-2.51) for high hospital use, 2.02 (1.98-2.06) for high GP use, and 2.04 (1.90-2.21) for high ED use. The impact of MM on health care utilisation was higher among the younger age group. Conclusions: This study illustrates the burden of multimorbidity on service use within the health system. It also highlights the need to examine and rationalise service provision and utilisation across the health system to assist people with multimorbidity efficiently manage their conditions.

Use of wearable sensor technology to detect risk of fall in Indian older adults
Snehal Kulkarni
School of Public Health, Faculty of Sustainability Studies, MIT-World Peace University, India

Background and Objectives: Approximately 28-35% of people aged 65 and older fall every year. As most of the falls occur during walking, evaluation of gait and balance impairment are considered as the most prevalent and sensitive predictors of fall. The population of older adults is expected to increase 193 million by 2050 in India. However, no such programme fall prevention programme exists to date in India. Therefore, the present study was undertaken to establish normative reference gait parameters for Indian older adults and identify older adults at risk of fall using wearable sensors. Methodology: This cross-sectional study was conducted in the Pune city, India among 659 community-dwelling older adults. Participants performed the Timed-up and go test (TUG) test fitted with the wearable sensors, which measured 59 gait parameters. Seven parameters were standardized for Indian older adults and fall risk of each individual was computed. Independent t-test, and one-way ANCOVA were used to establish normative gait parameters and predict risk of fall.

Results: The study reported a fall prevalence of 24.7%, with a mean stride length of 123.00 ± 15.19 cm and stride velocity of 110 ± 17.57 cm/s respectively. Significantly (p<0.05) shorter stride length was observed in participants above 80 years of age (109.01±18.08 cm). Using these gait parameters, the study found that 20% of the study participants were at low risk of fall, 30.5% medium risk, 25.5% had high risk and 24.1% were at very high risk of falling. The sensor reported a sensitivity of 85.71% (CI: 69.74% - 95.19%) and 56.02% (CI: 49.82% - 62.07%) specificity to predict falls. Conclusions: Wearable sensors are a dependable tool for identifying older adults at risk of falling in community settings with limited resources and expertise.

Social wellbeing among urban elderly in India: exploring the role of multidimensional health
Raghunath Mandi, Dhananjay Bansod
Department of Public Health and Mortality Studies, International Institute for Population Sciences, Mumbai, India, Department of Public Health and Mortality Studies, International Institute for Population Sciences (IIPS), Mumbai, India

Background: Globally, the share of the population aged 65 and above is projected to rise from 10 percent in 2022 to 16 percent in 2050. India too will become the home for more than 350 million elderly by 2050. With ageing, people experience various crisis like loss of physical, mental, and social status and modification in their roles and responsibilities within family and society and paving their way towards dependency in life. This dependency on others deteriorates the quality of life and well-being among the geriatric population. The present study examines the influence of multidimensional health on the well-being among urban-dwelling elderly in India aged 60 and above.

Methodology: The sample was obtained from first wave of the Longitudinal Ageing Study in India (LASI). Social well-being was asssed based on the SWLS scale (Diener et al., 1985) among the urban elderly in India. Multivariate linear regression analysis was used to investigate the association between multidimensional health, sociodemographic variables and life satisfaction.

Results: The overall mean well-being score was 24.94 (SD=7.20) which is more than many developed countries like Spain, Mexico and China. Elderly with good physical, functional and mental health have been associated with higher well-being while having any depressive symptoms or any impairment was associated with lower life satisfaction among urban elderly. Apart from that, life satisfaction score significantly by socio-demographic characteristics (marital status, living arrangement, wealth and educational status).

Conclusions and Discussion: During old age a sense of companionship and good social networks are essential in enhancing well-being, whereas, perceived physical, mental and functional health are equally important in facilitating self-perception of ageing. Therefore, well-being among urban elderly should be looked not only from the perspective of individual factors (like health and socioeconomic status) but a broad socio-cultural dimensions should be inquired extensively to achieve successful aging.

How multimorbidity affects trajectories in functional limitation and quality of life among middle-aged and older adults:

longitudinal findings from the 2013-2020 survey of health, ageing, and retirement in Europe
Piotr Wilk
Western University, Canada

Background and Objective: The increased burden of multimorbidity is impacting the lives of people worldwide, restricting the ability of individuals to live autonomously and leading to a poorer quality of life. Improving or maintaining a good quality of life can be an important coping mechanism for individuals living with multimorbidity and functional limitation. This study assessed how multimorbidity affects the trajectories in functional limitation and quality of life as well as the relationship between these two trajectories in a sample of middle-aged and older adults.

Methods: Longitudinal prospective data came from the survey of health, ageing, and retirement in Europe, conducted in Luxembourg between 2013 and 2020, distributed across two age cohorts: 50-64 years old (n=897) and 65 years old and over (n=688). Multimorbidity was defined as the co-existence of two or more chronic conditions. Functional limitation was assessed by the summed score from the (instrumental) activities of daily living scales. Quality of life was assessed by the control, autonomy, self-realization and pleasure scale. We used latent growth curve modelling techniques to conduct the analysis.

Results: Our results suggest that, throughout the life course, middle-aged and older adults living with multimorbidity experienced poorer quality of life, were at a higher risk of functional limitation, and had a higher number of functional limitations than those without multimorbidity. At baseline and across time, functional limitation had a negative impact on quality of life. We also found that the impact of multimorbidity on functional limitation and quality of life varies across the life course.

Conclusions: The previously observed cross-sectional associations between multimorbidity, functional limitation, and quality of life are more persistent and can affect adults over the life course. Any future research on the interrelationship between multimorbidity, functional limitation, and quality of life should assess these effects separately for middle-aged and older adults.

National Recovery and Resilience Plan - using the Health Project programming tool in Sardinia: Social Health Districts’ mortality and aging index analysis from 2017 to 2021

Federica Cadoni1, Sara Pani1, Luigi Minerba2
1School of Hygiene and Preventive Medicine, Medicine Faculty, University of Cagliari, Italy, 2School of Hygiene and Preventive Medicine, University of Cagliari, Cagliari, Italy

Background and Objective: A better reorganization of territorial assistance responses depends on identifying the specific social welfare needs of both individuals and collectivity. Focusing on Sardinia Region, in line with recent Italian National Recovery and Resilience Plan indications, Population Medicine setting and Health Project programming tool, we should take into account its peculiar heterogeneity: population’ size and demographic characteristics; variation in mortality; oro-geographical aspects of the Social-Health Districts (SHD).

Methods: Retrospective observational study on the Italian and Sardinian resident population from 2017 to 2021. Population (Istat demographic data detailed for each municipality to depict Sardinian SHD) divided into 21 age groups, each including five years (0-4/100+). Ratios: Aging index and age-adjusted standardized mortality ratios (SMRs) calculated for the period 2017-2019, for 2020 and 2021, divided by SHD (age groups 0-64/65+). Standardized death rate calculated for the 21 age groups (reference: Italian population, same year). The excess mortality compared to the average baseline deaths calculated for the years 2020 and 2021 (group 0-100+; 0-64; 65+).

Results: The regional trend of standardized mortality rate shows an increase in 2020 and a slight decrease in 2021, confirmed by the excess mortality analysis. The SMRs show instead an overall increase in all Districts from 2020 to 2021, except in 7 of them, for the 0-64 range. The aging index is progressively increasing in all Districts, more incisively in some areas.

Conclusions: Sardinia has the highest Italian aging index, with uneven dynamics across the Districts. The demographic aging will heavily test healthcare and social security costs. Health professionals and policymakers should therefore work together using as key concepts healthy aging and aging in-place, and paying attention to the elders’ idea of health as “the ability to adapt and self-manage”, focusing more on social environments and ability to use resources and manage restrictions.

Association of serum uric acid with body mass index in the United Arab Emirates UAE healthy future pilot study

Mitha Balushi1,2, Amar Ahmad1,2, Syed Javaid3, Fabio Piano2,4, Ayasha Dhaheri5, Abdishakur Abdulle6, Fatma Al-Maskari7, Raghib Ali8
1Public Health Research Center, New York University Abu Dhabi, Abu Dhabi, United Arab Emirates, 2Institute of Public Health, College of Medicine and Health Sciences, United Arab Emirates University, Al Ain, United Arab Emirates, 3New York University Abu Dhabi, Abu Dhabi, United Arab Emirates, 4Department of Psychiatry and Behavioral Sciences, College of Medicine and Health Sciences, United Arab Emirates University, Al Ain, United Arab Emirates, 5New York University, Abu Dhabi, United Arab Emirates, 6Department of nutrition sciences, College of Medicine and Health Sciences, United Arab Emirates University, Al Ain, United Arab Emirates, 7Institute of Public Health, College of Medicine and Health Sciences, United Arab Emirates University, United Arab Emirates

Background and Objective: The UAE Healthy Future Study (UAEHFS) is the first large prospective cohort study and one of the few studies in the region which examines causes and risk factors for chronic diseases among the nationals of the UAE. Body Mass Index (BMI) has been showed to be associated with serum uric acid level in many societies. This study investigates the association of serum uric acid with BMI among the UAEHFS pilot participants.

Methods: We analyzed the UAEHFS pilot data to investigate the association between serum uric acid levels and BMI. The predictors were BMI, age, gender and age*gender using multivariate quantile regression models. The quantiles to be estimated was between 25th and 75th varied by 5th. The effect of BMI was estimated with corresponding 95% confidence interval (95% CI).

Results: Data from 487 eligible participants (67.8% male) with a median age of 30 years (Interquartile Range: 23-38) was used in the sensitivity analysis. Of these, 406 (83.4%) were included in the complete case analysis. The estimated effect of BMI on the serum uric acid level in the fitted multivariate quantile regression models was positive and statistically significant. The estimated effect of BMI in the median (50th quantile) was 0.047 (95% CI: 0.033-0.070). Conclusions: Our Results shows that higher BMI was positive and statistically significantly associated with higher serum uric acid levels. Additional research is needed, using the main UAEHFS data (after recruitment is complete), to validate these results. The main finding of this study could add to the future direction of the field of public health research.

Multimorbidity and out-of-pocket expenditure on medicine in Europe: longitudinal analysis of 13 European Health Systems between 2013 and 2015

Raffaele Palladino1, Tianxin Pan4, Stewart Mercer1, Rifat Atun5, Barbara MCapke6, Fabiana Rubba7, Maria Triassi8, John Lee9
1Department of Primary Care and Public Health, Imperial College of London, United Kingdom, 2Health Economics Unit, Center for Health Policy, Melbourne School of Population and Global Health, University of Melbourne, Australia, 3Centre for Population Health Sciences, The Usher Institute, The University of Edinburgh, United Scotland, 4Department of Global Health and Population, Harvard T H Chan School of Public Health and Department of Global Health and Social Medicine, Harvard Medical School, Harvard University, United States, 5Nossal Institute for Global Health, Melbourne School of Population and Global Health, University of Melbourne, Melbourne, Australia, 6Department of Public Health, Public Health University “Federico II” of Naples, Italy, 7Nossal Institute for Global Health, Melbourne School of Population and Global Health, The University of Melbourne, Melbourne, Australia

Background: Many European health systems are implementing or increasing levels of cost-sharing for medicine in response to the growing constraints on public spending despite their negative impact on population health due to delay in seeking care. Objective: this study aims to examine the relationships between multimorbidity (two or more coexisting chronic diseases, CDS), complex multimorbidity (three or more CDS impacting at least three different body systems), and out-of-pocket expenditure (OOPEx) for medicine across European Nations. Methods: this study utilized data on participants aged 50 years and above from two recent waves of the survey of health, ageing, and retirement in Europe conducted in 2013 (n=55,806) and 2015 (n=51,237). Pooled cross sectional and longitudinal study designs were used, as well as a two-part model, to analyze the association between multimorbidity and OOPEx for medicine. Results: the prevalence of multimorbidity was 50.4% in 2013 and 48.2% in 2015. Nearly half of those with multimorbidity had complex multimorbidity. Each additional cd was associated with a 34% greater likelihood of incurring any OOPEx for medicine (odds ratio=1.34, 95% ci=1.31 - 1.36). The average incremental OOPEx for medicine was 26.4 euros for each additional cd (95% ci=25.1 - 27.7), and 32.1 euros for each additional body system affected (95% ci 30.6 - 33.7). The average incremental OOPEx for medicine was higher for those in the lowest socio-economic position group, as compared with those in the highest. Conclusions: Between 2013 and 2015 in 13 European health systems increased prevalence of CDS was associated with greater likelihood of having OOPEx on medication and an increase in the average amount spent when occurred. Monitoring this indicator is important considering the negative association with treatment adherence and subsequent effects on health. This study provides additional evidence to the erosion of the universal health coverage in European health systems.

The psoriasis comorbodime
Andrea Miatton1, Alessandra Buja1, Claudia Cozzolino1, Giovanni Diamanti1,2, Arnon Cohen1
1Università degli Studi di Padova, Italy, 2Università degli Studi di Padova, Padua, Italy, 3Istituto Oncologico Veneto, Università degli Studi di Padova, Padua, Italy, 4University of Milan, Italy, 5Clalit Health Services Israel, Israel

Background and Objective: Psoriasis is a multifactorial, chronic, systemic inflammatory disease. Current evidence suggests that psoriasis is associated with many chronic inflammation-related morbidities, but epidemiological studies on the specific characteristics of the psoriasis comorbodime are still lacking. The aim of the present article is to compare the multi-morbidity profile between patients with and without psoriasis.

Methods: In a matched case-control study, we extracted data on 57,228 patients and 125 morbidities from the Clalit Health Services Israeli insurance database.
Selenium exposure and oxidative stress and genotoxicity risk in a healthy Italian population: a cross sectional study

Teresa Urbano1, Tommaso Filippini2, Marcella Malavolti1, Bernhard Michalke3, Silvia Fustinoni6, Marco Vinceti7,8

Popul. Med. 2023;5(Supplement):A16
DOI: 10.18332/popmed/165253

**Selenium exposure and oxidative stress and genotoxicity risk in a healthy Italian population: a cross sectional study**

**Background and Objective:** The relation between selenium and cellular redox status is a greatly debated topic in human health. 8-oxo-7,8-dihydro-2'deoxyguanosine (8-oxodG) is an oxidized derivative of deoxyguanosine and a sensitive biomarker of oxidative stress and genotoxicity. The present study assessed the extent to which selenium status was associated with urinary 8-oxodG concentrations in a Northern Italian population.

**Methods:** Of 148 eligible subjects, 137 healthy and non-smoking blood donors living in the Reggio Emilia province during 2017-2019 were enrolled. We measured urinary 8-oxodG concentrations and used restricted cubic spline regression analyses to investigate the association between selenium status (estimated using food frequency questionnaires, urinary concentrations, and serum concentrations of selenium and selenium species) and 8-oxodG/g creatinine.

**Results:** Median age of our population was 48.2 years. Median urinary selenium and 8-oxodG levels (n=137) were 22.02 µg/L and 3.21 µg/g creatinine, respectively. Median total serum (n=104) concentrations were 116.50 µg/L, while median dietary intake (n=137) was 78.7 µg/day. Little association between dietary, serum, or urinary selenium with 8-oxodG concentrations emerged in the overall population. Urinary selenium positively correlated with 8-oxodG levels in men, while in women an inverted U-shaped association emerged. Total organic selenium and selenoprotein P levels were positively associated with 8-oxodG until 100 µg/L and then the association became slightly inverse in both sexes. In males, glutathione peroxidase-bound selenium and selenomethionine were positively correlated with 8-oxodG, while negative associations emerged for inorganic species. In females, positive but weak associations emerged for organic selenium species.

**Conclusions:** Results of our study suggest that even though total selenium exposure seems not associated with 8-oxodG, selected selenium species may largely differ in their association with this oxidative stress biomarker, and that effects modification by sex was encountered. Selenomethionine-bound selenium was the organic compound most strongly associated with 8-oxodG.

**Keywords:** Selenium, oxidative stress, genotoxicity, redox status, urinary selenium, 8-oxodG.

**Key considerations for the implementation of active assisted living systems to support older adult care**

**Gaya Noon1, Thoko Phiri1, Laura Fadrique1, Jennifer Teague2, Plinio Morita1

1University of Waterloo, Canada, 2Canadian Agency for Drugs and O

**Background and Objective:** Active Assisted Living (AAL) refers to internet-connected systems designed to improve quality of life, aid in independence, and create healthier lifestyles. As the population of older adults grows, there is a pressing need for additional supports in their daily lives and for non-intrusive, continuous, adaptable, and reliable health monitoring tools. AAL has great potential to support these efforts, but additional work is required to address the feasibility of the integration of AAL into care. The objective of this project is to address core issues with AAL system implementation, including user concerns, data governance, and building requirements for smart living environments.

**Methods:** To understand the concerns and opportunities regarding AAL, as well as to validate our data governance framework, 18 semi-structured group interviews were held with stakeholders representing different parts of an AAL ecosystem. Each group comprised of several participants from the same organization. These were categorized as (1) care organizations, (2) technology developers, (3) technology integrators, and (4) potential care recipients or patient advocacy groups. Furthermore, a review of 136 smart home technologies was conducted to understand what their technical requirements are and what issues may be faced by users trying to implement them.

**Results:** There is a critical need to acknowledge the trade-off inherent in AAL use between the benefits of the technology, their encroachment on privacy, and their cost in terms of time and finances. This trade-off is influenced by several factors, including the care context and what resources care recipients have available to them.

**Conclusions:** A greater consistency in oversight is needed, including clearer definition in access and who can access and is responsible for acting on data from AAL systems. Further work is necessary to address these needs, as well as set standards for AAL technologies and explore the equity of AAL access.

**Keywords:** Active Assisted Living (AAL), care organizations, technology developers, technology integrators, potential care recipients, data governance.

**Importance and determinants of advance directives and healthcare proxy use among the oldest-old**

**Judith Wenner1, Ferzaneh Fakdani1, Susanne Zank1

1University of Cologne, Germany

**Background and Objective:** Making advance directives or deciding on a healthcare proxy are common instruments to assure that end-of-life care is in line with one’s own wishes. Correctly specified, these instruments help health professionals and relatives to act in the best interest of the patient. We use two large population-based datasets from Germany to explore if the oldest-old (80+) make use of these instruments and what determines this use.

**Methods:** Analyses are based on two population-based studies among persons aged 80 years and older in Germany. We perform descriptive and subsequently logistic regression analyses to identify who makes use of these instruments. In line with theoretical assumptions on healthcare behavior, we consider age, gender, education, (functional and cognitive) health, institutionalization, social embeddedness, and personal attitude (towards spirituality, assisted suicide and death) as determinants of using advance directives or deciding on a healthcare proxy.

**Results:** The majority in both studies had either advance directives or decided on a care proxy (76.2% and 87.4%). Often participants used both (62.8%). In the large nation-wide sample, higher age, good functional health, a partnership, and a strong focus on self-determination at the end of life increased the odds of using these instruments while cognitive impairment decreased their use. In the smaller regional sample, only cognitive impairment was significantly associated with (lower) use.

**Conclusions:** Most persons aged 80 years and older in Germany make use of advanced directives and decide on a healthcare proxy. This shows that the oldest-old want to have a say in their end-of-life care and want their alleged wishes to be considered. Persons with cognitive impairment – and thus potentially in need of these instruments – had considerably lower odds of using them. Targeted information for persons with beginning cognitive decline within the healthcare setting could thus be helpful.

**Keywords:** Advance directives, healthcare proxy, older adults, older age, Germany.

from a longitudinal analysis within the Survey of Health, Ageing and Retirement in Europe (SHARE) project

Giacomia Vigezzi,1 Giacomio Vigezzi1, Gianantonio Mosconi,1 Paola Bertuccio1, Andrea Amerio,1 Anna Odone1

1Department of Public Health, Experimental and Forensic Medicine, Università degli Studi di Pavia, Italy, 2Department of Neuroscience, Rehabilitation, Genetics, Maternal and Child Health (DINOGM), Università degli Studi di Genova, Italy

Background and Objective: In an ageing society, with people living longer years after retirement, pension impacts on mental health outcomes should be carefully assessed. Scant evidence is available from longitudinal studies on the short and long-term impact on depressive symptoms and suicidal ideation.

Methods: We conducted a longitudinal study based on the Survey of Health, Ageing and Retirement in Europe (SHARE) data from 28 European countries collected between 2004 and 2020. To estimate the relative risk (RR) and corresponding 95% confidence intervals (CI) for depression (derived from the EURO-D scale as a binary outcome) and suicidality at seven different time intervals since retirement, we fitted generalised estimating equation models for repeated measures.

Results: We selected a cohort of 6,998 individuals employed at baseline and retired at follow-up (median follow-up time: 9 years; maximum: 16 years). Considering the “year of retirement” as the reference category, the risk of depression ten years or more before retirement resulted being about 17% higher (RR: 1.17; 95%CI: 1.03-1.32) compared to the year of retirement whereas - tough estimated not statistically significant – as retirement approached. Compared to the year of retirement, we observed a 9% (RR: 0.91; 95%CI: 0.82-1.00) to 11% (RR: 0.89; 95%CI: 0.81-0.99) reduction in risk in the following three years, and a gradual rise thereafter. Because their risk patterns did not overlap, suicidality and depression stood out as clinical entities that do not necessarily cooccur and require different preventive strategies.

Conclusions: Longitudinal data suggest that transitioning to retirement reduces the risk of depression in the first years after the withdrawal from work, in the so-called honeymoon phase. As retirement seems to have an independent and protective effect on mental health, it may be identified as a target moment for preventive interventions to promote well-being in older ages and boost the observed impact.

Developing new models for integrated community health and social care for dependent older people: the case of Programa Maior Cuidado in Brazil

Karla Giacomini1
1Oswaldo Cruz Foundation (Fiocruz), Brazil

This paper offers a case study of the development, implementation, evaluation and national scale-up of a novel intervention for dependent older people living in vulnerable families. It also identifies key lessons for other countries facing similar health service challenges. Since 2011 Programa Maior Cuidado (PMC) has been supporting care-dependent older people living in poor neighbourhoods of Belo Horizonte. Local health posts and social assistance centres work together to identify eligible families and provide integrated support. Trained paid family-support caregivers, recruited from similar communities, provide families 10 to 40 hours of help a week. This offers family caregivers respite from round-the-clock care-work, and PMC carers also promote family care-giving skills. PMC carers monitor older peoples condition and report back to monthly case reviews jointly conducted by staff at health and social assistance posts. Over the past five years, there have been an ongoing process and impact evaluation of PMC, including both before and during the COVID-19 pandemic. These have generated broadly positive Findings, including evidence that PMC is cost effective, promotes more effective use of health services and benefits both older people and their families. This had led the Ministry of Health to support PMCs national roll-out, and PMCs identification as a model of best practice by WHO, World Bank and other agencies.

Patient-reported outcomes in robotic total knee arthroplasty: a retrospective cohort study with Robotic Surgical Assistant system

Daniele Cerciotti1, Matteo Ratti1, Rhabib Bibi1, Riccardo Rescinito1, Massimiliano Panella1

1Università del Piemonte Orientale, Italy, 2Università del Piemonte Orientale, Pakistan

Background and Objective: Even if RATKA (Robotic assisted total knee arthroplasty) is a widely used surgery, there is still a gap of knowledge about patient reported outcomes. The aim of this study was to compare self-reported outcomes in patients who underwent RATKA (with ROSA - “Robotic Surgical Assistant system”)- technique and patients who underwent the manual surgery (traditional technique).

Methods: We compared 73 patients operated with ROSA technique with 62 operated with traditional technique. The data were collected with WOMAC (Western Ontario and McMaster University Osteoarthritis index), a self- administered questionnaire that investigates pain, stiffness, and functionality of the patients. We performed two surveys, the first was before the intervention and the second was 6 months after the surgery. We evaluated the absolute and percentage differences between the two groups. Statistical analysis were performed with two-tailed T-test and chi-squared test.

Results: After the 6 months follow-up, we observed lower PROM scores in both groups. In particular, the total WOMAC score in the ROSA group dropped from 66.0 to 32.5, while in the other group it decreased from 62.4 to 24.6. The post-operative absolute difference between the WOMAC scores of two groups was 7.9 points (95%CI: -12.49 to -3.23) in favor of conventional technique. On the other hand, the analysis of the percent improvement, despite still slightly in favor of the conventional group (54.1% vs 47.8%), failed to reach statistical significance (p=0.23). The post-operative percentage difference was 6.3% (95%CI: -4.0% to 16.7%).

Conclusions: These findings indicate that a clear superiority of RATKA to conventional TKA is not yet demonstrated. Moreover, a knowledge gap about the proper methodology to analyze the patient reported outcome measures may exist. Also, given the recent evolution of the technology, an urgent need to conduct studies with longer term outcome evaluation is compelling.

Empowerment of healthy ageing through integrated care managers in China

Ninie Wang1
1Pinetree Care Group, Chaoyang District, China

With over 200 million people over the age of 65 by the end of 2021 and around 50 million being care dependent, China faces the enormous challenge of reforming the system and strengthening primary health care to meet the needs of older adults, aiming for better prevention and reduction of care dependency as part of the nation’s healthy ageing strategies. While people-centered integrated care (PCIC) has been set as the key model for improving the health and care systems in coming decades, World Health Organization’s ICOPE (integrated care for older people) is being implemented first in Beijing, then in a multi-center pilot across China. Health and social care workers went through modular training sessions before becoming “integrated care managers” to carry out screening, assessment and care plans in primary care settings following the ICOPE care pathways that are adapted to fit locally available resources. Incentives are designed for them to receive additional income and recognition from delivering personalized care plans. Despite their heavy duty of pandemic control-related tasks, primary health care workers reported high levels of satisfaction and interest in continuing as the front-line providers of integrated care, supported by multi-disciplinary teams from hospitals, nursing care and higher education institutions. Coordinated teams leveraged tele-care tools to empower each other when working against the risks of intrinsic capacity decline and functional ability loss among community and home-dwelling older adults. The ICOPE implementation pilot in China might provide some reference for feasibility and impact of integrated care on the health and social well-being of the ageing population in low resource settings. Advocating a policy shift from disease-oriented approach to one that promotes holistic care continuum often demands locally relevant and applicable innovations.

Predictors of Chronic Pain: comparison between older adults with and without life-long cognitive disability

Rafat Hussain1, Stuart Wark2, Trevor Parmenter2, Matthew Janicki1
1School of Medicine and Psychology, Australian National University, Canberra, Australia, 2School of Rural Medicine, University of New England, Armidale, Australia, 3Centre for Disability Studies, University of Sydney, Australia, 4University of Illinois, United States

Background and Introduction: Chronic pain is a major public health issue globally, adversely affecting quality of life (QoL) of older adults. It constitutes a ‘silent epidemic’ in many countries including Australia. Amongst those with life-long cognitive impairments, are people with intellectual disability (PwID), who experience multiple socioeconomic and health disadvantages. This comparative study aims to examine concurrent underlying social and health factors as predictors
of chronic pain in older PwID cohort compared to their normative age peers (i.e., older non-PwID cohort). Methods: Data were derived from cross-sectional surveys on demographic, socioeconomic, health and health-services measures across Australia’s two most populous states – New South Wales and Queensland. The sample included older adults aged 60+ years (PwID: N=391; non-PwID=920). The PwID cohort required face-to-face interviews to mitigate comprehension limitations that could confound results. Non-PwID cohort completed paper/online survey forms. No observable errors were found in response validity by variation in survey modality.

Results: PwID cohort was younger (mean: 65.2y, SD: 4.4y) compared to non-PwID (mean: 71.9y, SD: 7.7y). Chronic pain was reported by both PwID (26.9%) and non-PwID (24.1%) groups. Univariate logistic-regression for both cohorts showed chronic pain to be associated (p < 0.05) with arthritis, gum disease, falls, and sleep-disturbance, whereas cancers (past & current) were not significantly associated. Anxiety, depression, and adverse life-events were also statistically significant. Multivariable regression modelling showed that significant variables (p<0.05) for PwID cohort included arthritis and adverse life-events, whereas for the non-PwID cohort arthritis, falls, adverse life-events, and depression were significant.

Conclusions: Despite its relatively younger age-profile, PwID cohort had higher levels of chronic pain. There was also similarity of factors associated with chronic pain in both cohorts. The presentation will highlight importance of better understanding and managing predictors of chronic pain for maintaining or enhancing quality of life of older adults.

Development and validation of a dietary diversity score for French older adults
Anne-Fleur Jacquemot1, Rosalie Prat1, Rozenn Gazan2, Christophe Dubois3, Nicole Darmon3, Catherine Feart4, Eric Verger5
1INSERM, BPH, UMR1219, F-33000, Université de Bordeaux, Bordeaux, France, 2Inserm, France, 3Université de Bordeaux, Bordeaux, France, 4Centre Epidemiologie Sante Populaire, France, 5Inserm, France, 6MoISA, Univ Montpellier, CIRAD, CIHEAM-INRAE, Institut Agro, IRD, Montpellier, France

Adopting healthy dietary habits, including higher dietary diversity, has been associated with healthy aging. Several scores have been developed to assess the dietary diversity, but none specifically among older adults. Therefore, the present work aimed to develop and validate a healthy dietary diversity score (DAS) in a sample of older adults enrolled in a representative national survey. The studied sample was constituted of 696 older adults aged 60y and over, from the latest cross-sectional French Individual and National Food Consumption study (INCA3). The dietary survey included three 24 hours recalls and a Food Propensity Questionnaire. The occurrence of consumption of 20 food groups weighted by positive (for whose consumptions are healthy and should be encouraged) or negative (for whose consumptions are unhealthy and should be limited) points composed the 20 score components whose sum defined the DAS. The validity of the DAS was assessed by describing its association with the food score components, energy intake, solid energy density (SED), probability of adequate nutrient intake assessed by the PANDiet and with educational and physical activity levels. The DAS ranged from -35 to 115. Higher DAS were positively and significantly associated with more points in healthy score components like Fruits or Vegetables (r= 0.51, p<0.0001 and r= 0.54, p<0.001 respectively). The DAS was not significantly associated with the total energy intake (r= 0.02, p<0.6). The DAS was significantly positively associated with the PANDiet (r= 0.43, p<0.001) while inversely associated with the SED (r = -0.37, p<0.001). Higher DAS were observed among participants with higher educational and physical activity levels as expected. The DAS we developed is validated to assess the healthy dietary diversity score of French older adults. Beyond, it could be a useful tool to assess the impact of public health nutritional trials.

Association of pain and depression among middle-aged and older adults of India
Amit Goyal1, Amit Goyal1, Sanjay Mohanty1
1International Institute for Population Sciences, Mumbai, India

Background and Objective: India is ageing and it is estimated that the population age 45 and above will account over 40% of the population by 2050. Ageing is associated with high burden of chronic diseases. Approximately one third of the population aged 45+ are also suffering from pain and depressive symptoms. Epidemiological studies have shown that pain and depression are closely related. We didn’t find any nationally representative study establishing this relationship of pain and depression. This study aims to examine the association between pain and depression among middle-aged and older adults of India.

Methods: This study uses the individual level data from the Longitudinal Ageing Survey of India (LASI), Wave 1, 2017-18. This study is restricted to 59416 individuals who have responded to all the variables of interest. We used the Center for Epidemiologic Studies Depression (CES-D) Scale short form to measure the depression with threshold of ≥4 symptoms. Pain is measured by a polar question i.e. “Are you often troubled with pain?”. Descriptive statistics were reported by proportions or mean. Independent chi-square tests were used to compare the categorical variables between those with and without pain and depression. The estimates for the prevalence of depressive symptoms were adjusted for age-sex considering the national age and sex composition as reference. The logistic regression model was used with depression as outcome variable and pain and socio-demographic covariates as predictor variables.

Results: Depressive symptoms typically affects 25% of the middle aged and older adults without pain, but among patients with pain, 32% experience depression. The predicted probability of depression among those with pain was 0.31 compared to 0.25 among those without pain Considering the older adults with pain, there is huge variation in the prevalence of depression among states of India ranging from 56.5% in Jammu and Kashmir to 8.8% in Mizoram. This will be done via SLIDO and via personal interventions of the delegates. Also, delegates from public bodies and from older adults of academic institutions will be invited to attend and actively contribute to improve cross-country exchange and learnings in population health from a planetary perspective. The integrated pathways of care in the social and healthcare services: the AgICOT experience in Teramo, Italy
Marco Del Riccio1, Stefano Greco2, Valerio Profeta3, Chiara Lorini4, Nicoletta Persiani5, Santa Remigis6, Guido Angelil7, Dimitrios Kaliakoudas8, Eleonora Sparvieri9, Guglielmo Bonaccorsi10, Martina Giusti11, Patrizio Zanchini12, Maurizio Giosia13
1Department of Health Sciences, University of Florence, Italy, 2Department of Epidemiology and Territorial Services, Local Health Unit of Teramo, Italy, 3Department of Experimental and Clinical Medicine, University of Florence, Italy, 4Anesthesia and Intensive Care, Teramo Hospital, Local Health Unit of Teramo, Italy, 5Medical Direction, Teramo Hospital, Local Health Unit of Teramo, Italy, 6Counselling Center, Local Health Unit of Teramo, Italy, 7Internal Medicine, Teramo Hospital, Local Health Unit of Teramo, Italy, 8Local Health Unit of Teramo, Italy

Background and Objectives: The process of population ageing leads to greater needs for local welfare services. This projects main Objective is to strengthen the hospital-territory integration by establishing Hospital - Territory Agencies of Continuity and Integration (AgICOT) in the Local Health Unit (ASL) of Teramo. The specific target of the project is frail elderly people aged 65 years or more. Methods: A multidisciplinary working group (health professionals from the Local Health Unit of Teramo and academics from the University of Florence) has set up an organizational plan and a training course for all the health professionals working in AgICOT. The innovative tools used by AgICOT are the Life Project (LP), a document that collects clinical, social, psychological, and linguistic-communicative assessments of the followed person, and the Healthcare Budget (HB), which is the sum of all healthcare, social and relational resources and services used for this person. Individuals followed by AgICOT are monitored and/or re-evaluated continuously, and LP and HB are updated in each of these situations.

Results: Between April and October 2022, the working group defined the organization of AgICOT and its kick-off, and at the same time prepared and implemented a training course on the topics of primary care and transition care management. The first AgICOT was inaugurated in October 2022 and started working on 20 cases, which represent the first group of patients served by the new Agency. Conclusions: AgICOT takes care of the frail elderly by defining a care pathway that is comprehensive of both social- and health-related aspects. The re-evaluations and continuous monitoring guarantee that every need is better assessed and can find a proper answer outside the hospital. AgICOT will not only improve the integration between the hospital and the territorial services, but it will also improve an effective and efficient use of the latter.

DOI: 10.18332/popmed/165708
Gender differences in global Disability-Adjusted Life Years (DALYs): a descriptive Analysis of the global burden of disease study 2021
Vedavati Patwardhan1, Luisa Fiori1, Emmanuela Gakidou2
1Institute for Health Metrics and Evaluation (IHME) University of Washington, Seattle United States, 2Institute for Health Metrics and Evaluation (IHME) University of Washington, Seattle United States
Background & Objective: Gender inequalities in society result in gender differences in the social determinants of health and health risk factors, and have lifelong health consequences. However, little research systematically examines the magnitude and nature of gender differences in health across the life course.
Methods: We used data from the Global Burden of Disease Study (GBD) 2021 to conduct a descriptive analysis of gender differences in the top-20 causes of male and female Disability-Adjusted Life Years (DALYs) globally and across world regions for four age groups (10-24, 25-49, 50-69, and 70+ years).
Results: Across the lifespan, female DALY rates are higher than males (p<0.05) for mental, neurological, and musculoskeletal disorders globally. For depressive, anxiety, and headache disorders, the female-male gap emerges at an early age and continues over the life course. The gender gap in low back pain widens with age and is highest at 70+ years. Girls and women aged 10-49 years have higher DALYs due to HIV/AIDS compared to men, and the most pronounced gap is in sub-Saharan Africa. On the contrary, for several conditions with a higher male burden (p<0.05), gender gaps emerge after 50 years, for e.g., for COVID-19, ischemic heart disease, and lung cancer. Among younger males (10-24 years), road injuries are the top cause of global DALYs, with the largest male-female gap in Latin America. We also find that women and girls are more affected by conditions with a higher morbidity burden throughout their lifespan. On the other hand, men and boys of all ages bear a disproportionate mortality burden.
Conclusions: Our study highlights the need for policy interventions to promote well-being and reduce gender disparities in health at all stages of life, in line with the United Nations Sustainable Development Goals (SDGs) 3 and 5.

Reliability and validity of the bone health literacy questionnaire for middle-aged and elderly women
Biao Xu1, Chenyang Jin1, Yue Zha1, Hong Jiang1, Biao Xu1
1Fudan University China
Objective: To develop a questionnaire for assessing bone health literacy among perimenopausal and postmenopausal women in Shanghai, and to evaluate reliability and validity of the questionnaire and to provide scientific evidence for generalizing the application of the questionnaire in the elderly METHODS The questionnaire was developed based on the integrated theoretical model of health literacy proposed by Regional Office for Europe of World Health Organization in 2012. Using relevant questionnaires in domestic and abroad literatures for reference, through two rounds of expert consultation, 45 items of bone health literacy questionnaire were formed. After evaluating the repeatability and effectiveness of the questionnaire, a questionnaire on bone health literacy for middle-aged and elderly women was formed. 40 items of bone health literacy questionnaire for perimenopausal and elderly women were summarized. Cronbachs a and split-half reliability were calculated to evaluate the reliability of bone health literacy questionnaire, and content, discriminant, convergent and structural validity were performed to measure the validity of the questionnaire RESULTS A total of 447 community women aged 45-65 were investigated. The overall Cronbachs a of bone health literacy questionnaire was 0.763 and the split-half reliability was 0.793. The correlation coefficient of each sub-questionnaire with the total questionnaire was 0.403–0.703. The bone health literacy questionnaire had good content validity, with the success rate of calibration experiment of 57.50% and 86.25% respectively. Confirmatory factor analysis showed that the goodness of fit index (GFI) and other indicators reached the adaptation standard, and the structural validity was good.
Conclusion: The questionnaire has good reliability and validity, and can be used as a simple tool to measure and evaluate bone health literacy.

Serological responses up to 9 months following COVID - 19 mRNA vaccination in residents and healthcare workers of long - term care facilities: a multicenter prospective cohort study in Northern Italy
Valerio Bordino1, Costanza Vicentini1, Alessandro Cornio1, Noemi Marengo1, Davide Meddis1, Jacopo Garlasco1, Savina Ditommaso1, Monica Giacomuzzi1, Carla Zotti1, Gabriele Memoli1, Maria Gianino1
1Università di Torino Italy
Background and Objective: Long-term care facilities (LTCFs) were severely affected by COVID-19, in particular in Northern Italy. We aimed to assess antibody responses among residents and healthcare workers (HCWs) of 13 LTCFs through serum samples collected at three time points: prior to, two weeks, and 9 months after receiving Pfizer/BNT162b2 SARS-CoV-2 mRNA vaccine (respectively t0, t1, and t2).
Methods: IgG antibodies targeted towards the S1 domain of the spike protein were measured, and results were expressed in binding antibody units (BAU/mL). Friedman’s average rank test was performed to compare antibody titres between the three time points. Two logistic regression models were built to identify independent predictors of (1) developing and (2) maintaining a significant antibody response to vaccination, using a previously identified threshold. In total, 534 subjects were enrolled (371 HCWs and 163 residents).
Results: Age had a bi-modal distribution, in line with participant type: the median age among HCWs was 47 years (IQR 38 - 54), and was 86 years (IQR 80 - 90) among residents. The majority of participants were female, both among HCWs and residents (83.01 and 70.55 respectively). Over half of study participants had a SARS-CoV-2 infection confirmed by RT-PCR prior to t0, however the proportion of seropositive individuals at t0 was 37.83. The antibody titres at t1 were the highest; at t2 the IgG titres significantly decreased, remaining however 10 times higher compared to titres at t0. Previous infection was the only significant predictor of IgG titres, able to explain and maintaining a response over threshold in both models. Residents showed higher IgG titres than HCWs at each time point. Significant differences were found at all time points stratifying participants according to age.

Role of vegetarian and plant-based diet in the prevention of mild cognitive impairment and dementia
Giulia Barbolini1, Giulia Barbolini1, Marco Vinceti1, Tommaso Filipponi1
1University of Modena and Reggio Emilia, Italy
Background and Objective: The increasing number of people with Mild Cognitive Impairment (MCI) and dementia represents a relevant public health problem. For this reason, there is interest in the assessment of factors affecting disease risk, in order to implement effective prevention strategies and promote a healthy lifestyle. In particular, diet as a determinant of cognitive impairment and dementia represents an important field of research, and many studies focused on the effects of plant-based, vegetarian or vegan diets on cognitive functions and dementia risk.
The aim of this systematic review is to assess whether a plant-based or a ‘strict’ vegetarian diet is protective or detrimental towards cognitive functions.
Methods: The protocol of this systematic review and meta-analysis has been submitted to PROSPERO. The literature search has been conducted on 4 different databases: PubMed, Web of Science, Embase and Cochrane library. We used MeSH terms and keywords related to “plant-based diet”, “vegetarian diet”, “Mild Cognitive Impairment”, “dementia” and “memory impairment”. We found 2 additional articles through citation chasing techniques. We defined the following inclusion criteria according to the PICOS statement: adult population, adherence to plant-based, vegetarian or vegan diets, assessment of cognitive functions through dementia risk or cognitive decline at increasing adherence to different dietary patterns, and both observational studies (cohort, cross-sectional or case-control) and randomized clinical controlled trials. We will also perform a dose-response meta-analysis whenever possible.
Results: In the preliminary literature search, we found a total of 1537 articles (including 2 studies added through citations), 255 of which were duplicates. After duplicate removal, the abstract and the full-text of 1282 articles were screened, leading to the exclusion of 1263 of them. Nineteen studies met our inclusion criteria and could be included in the systematic review.
Conclusions: The study is currently ongoing and its results will be presented at the Congress.

Do meta-analyses of randomized controlled trials estimate the true population effects of multiple risk factor interventions?
Mark Speechley1, Saverio Stranges1, Manuel Montero Odasso1, Paige France2
1Western University, Department of Epidemiology & Biostatistics, Western Centre for Public Health & Family Medicine, 1465 Richmond Street, London Ontario, N6G 2M1, Canada, 2University of Toronto Mississauga, Studies in Life Sciences Program, 3359 Mississauga Rd., Mississauga Ontario, L5L 1C6, Canada
Background: Large reductions in cardiovascular disease (CVD) mortality since 1950 are a significant public health triumph. Explanatory models of declining CVD mortality trends in high-income countries attribute just under 50% each to population trends in medical/surgical interventions and risk factor reductions, leaving <10% unexplained. However, meta-analyses (MA) of multifactorial trials yield modest effect sizes that explain only a tiny fraction of the population declines. Arguably, entire population data are superior to MAs of Randomized Controlled Trial (RCT) samples given the methodological and practical problems of experimentally estimating the effect of simultaneously modifying several factors in real-world settings. Might MAs of multifactorial RCTs also underestimate the true population effects of multiple risk factor modifications in other common outcomes in older adults?

Methods: For cognitive impairment (CI) and unintentional falling (UF) in older adults, literature searches were conducted for i) MAs of multifactorial RCTs and ii) attempts to explain population trends in terms of changes over time in risk factors and clinical interventions.

Results: For UF, while some well-done RCTs show clinically significant comparative reductions in both fall occurrence and the number of risk factors in intervention groups, MAs tend to show modest or even null results. While fewer multifactorial RCTs have been completed for CI, early MAs also show modest effects. No attempts were found to replicate the CVD trend analysis for UF or CI, possibly because neither UF nor CI outcomes, or trends in risk factors or clinical interventions, are available in population data like for CVD. This data incompleteness might overtake statistical models that interulate partial time-series data from numerous sources to estimate the true population effects of multifactorial interventions.

Conclusion: Estimating the true population effects of UF and CI interventions may require more sophisticated methods than MAs of samples studied in complex and problematic multifactorial RCTs.

Assessing the quality of the built environment in dementia: a framework to evaluate long-term care facilities

Silvia Mangili1, Silvia Mangili2, Gaia Ferraguzzil, Stefano Capolongol
1Politecnico di Milano, Italy, 2Università degli Studi di Milano Statale

Introduction: Life expectancy worldwide is raising fast, with a correlated increase in Non-Communicable Diseases (NCDs) and years lived with disability. Dementia is one of these, with about 7 million people affected in Europe and the number is set to double by 2050. These patients are complex due to the serious changes in the cognitive sphere, altering perceptions of the space. They are the most frequent users of healthcare facilities, but these structures often are not suitable for them. For this reason, rethinking is now urgent to create safe and suitable environments.

Materials and Methods: This study aims to develop an evaluation framework of the main aspect of the design of a built environment for people with dementia. To this end, a systematic literature review has been conducted on scientific databases using meaningful keywords. The review was useful to outline the main characteristics that the environment dedicated to the dementia patient must possess to be inclusive and prosthetic.

Results: The research has allowed defining a set of requirements that the space must have to be prosthetic for the patient. These findings have been identified and were divided into three main macro-areas (physical, cognitive, and social aspects) 7 criteria, and 31 related sub-criteria. The results were also validated through the involvement of stakeholders and experts in the topic, both from the architectural and medical field to establish the relationship between physical factors and patient outcomes.

Conclusion: The results of this research can be used as guidelines to assess and design proper facilities for people with dementia and cognitive disabilities. This is because there is an urgent need to create and renovate the existing buildings to make them as therapeutic and prosthetic as possible. The priority also in research must be to investigate which aspects of architecture can impact patients’ health and well-being.

Suffering in Silence: Urinary Incontinence among Bangladeshi Women

Quamrun Nahar1, Anadil Alam2, Farah Rahman1, Shusmita Khan2, Mizanur Rahman3
1icddr,b, Head of Research, 68 Shahid Tajuddin Ahmed Sharan, Mohakhali, Dhaka 1212, Bangladesh, 2Data for Impact, University of North Carolina, Research Associate, “Chapel Hill, Chapel Hill, NC, USA, Based at 68 Shahid Tajuddin Ahmed Sharan, Mohakhali, Dhaka 1212, Bangladesh”, Bangladesh, 3Data for Impact, University of North Carolina

Background and Objective: Urinary incontinence (UI), the involuntary loss of urine, is a common, distressing condition of women, affecting all ages and across different cultures. Globally, an estimated 200 million women suffer from UI, although the prevalence of UI varies across settings. Research on UI has primarily been conducted in developed countries and there is a paucity of data on UI in developing countries. The objective of this paper is to provide an estimated prevalence of UI, its sub-types and associated factors among ever-married women aged 15-49 years in Bangladesh.

Methods: This paper used data from 2016 Bangladesh Maternal Mortality and Health Care Survey, conducted in a nationally representative sample of 300,000 households. Ever-married women aged 15-49 years, residing in these households, who had ever given birth were asked a set of pre-tested questions to identify symptoms of stress and/or urge incontinence. The weighted prevalence of UI, its sub-types, and factors associated with different types of UI were identified using logistic regression. All analyses were conducted in Stata version 15.

Results: The prevalence of any UI was 15.8% (95%CI 15.7, 16.0). The most common subtype was stress incontinence, with a prevalence of 13.3% (95%CI 13.5, 13.8), followed by urge incontinence, with a prevalence of 7.6% (95%CI 7.5, 7.8) and mixed incontinence, with a prevalence of 5.5% (95%CI 5.4, 5.6). Age, religion, parity, educational attainment, economic status and residence in certain parts of Bangladesh are the risk factors for women’s reporting of different types of UI. Conclusion: The study findings are in line with findings from other South Asian country studies. The findings of this study, with its large sample size, population-based sampling and rigorous data collection process, will be useful for making effective plans to reduce the silent sufferings of Bangladeshi women from UI.

Health care needs of institutionalized elderly adults: a mixed-method study

Marta Wilhelm1, Rita Soza2, Adam Gyebrovszki2, Kittí Garai2, Zoltán Ádam2, Monika Goros3, Krisztián Kvell3
1University of Helsinki, School of Medicine, Finland, 2University of Szeged, School of Public Health, Hungary, 3University of Łódź, School of Health Sciences, Poland

Background: Leading risk factors for chronic disease – smoking, alcohol consumption, poor nutrition and physical inactivity (SNAP behaviours) – cluster together (i.e., appear in specific combinations in distinct subgroups). Longitudinal clustering and its association with health outcomes are less well understood.

Objective: This is the first study to identify longitudinal clusters of SNAP behaviours and to relate them to health outcomes in older adults.

Methods: Using data from Waves 4-8 of the English Longitudinal Study of Ageing (ELSA, n=3787), we identified longitudinal clusters of SNAP behaviours using latent class analysis. Health outcomes (from Wave 9) included multimorbidity and complex multimorbidity, along with eight body system disorders defined according to the International Classification of Diseases 10th Revision system. To examine how clusters are associated with socio-demographic characteristics and health outcomes, we used multinomial and binomial logistic regressions, respectively.

Results: Six clusters with stable within-cluster behaviour trajectories were identified: Low-risk (20.9%), Low-risk but heavy drinkers (11.1%), Low-risk but inactive (22.2%), Do nothing (17.2%), Inactive, heavy drinkers (18.1%), and High-risk smokers (10.5%). Health-risk dominant clusters had lower levels of education and wealth. Women dominated the Low-risk but inactive cluster, whereas men dominated the heavy drinking clusters. Low-risk and Low-risk but heavy drinkers had a lower prevalence of all adverse health outcomes compared to other clusters. In contrast, the Low-risk but inactive cluster had the most ‘negative’ outcomes: highest prevalence of multimorbidity, complex multimorbidity, circulatory disorders, and endocrine, nutritional and metabolic disorders. High-risk smokers were most likely to suffer respiratory disorders, while the least physically active clusters were most likely to suffer endocrine, nutritional, and metabolic problems.

Conclusions: Health behaviour clusters were strongly but differentially associated with health outcomes, suggesting a complex relationship. Identified clusters can be compared with similar analyses in other countries and used to tailor interventions to specific sub-populations and socio-demographic profiles.
Socioeconomic differences in brain white matter microstructure and associated cognitive performance in middle to older adulthood

Stephanie Schrempft1, Olga Trofimova2, Morgane Künzi3, Cristina Ramponi4, Antoine Lutti5, Ferath Kerfif6, Adelina Latypova7, Peter Vollenweider8, Pedro Marques-Vidal9, Martin Preisig10, Matthias Kliegel11, Silvia Stringhini12, Bogdan Draganski13

1Geneva University Hospitals Switzerland, 2Lausanne University Hospital and University of Lausanne, 3University of Lausanne and University of Geneva Switzerland, 4Lausanne University Hospital and University of Lausanne Switzerland, 5Geneva University Hospitals, University of Geneva, and University of Lausanne Switzerland

Background and Objective: Previous research examining socioeconomic differences in brain white matter focused on fractional anisotropy or mean diffusivity. This study aimed to examine the associations between brain microstructure and cognitive performance in middle to older adulthood. We hypothesized that socioeconomic factors would have a significant impact on both brain microstructure and cognitive performance.

Methods: A total of 751 community-dwelling individuals aged 50 to 91 years were included in the study. We performed diffusion tensor imaging (DTI) and quantified white matter microstructure indicators such as fractional anisotropy (FA), mean diffusivity (MD), and radial diffusivity (RD). We also assessed cognitive performance using a battery of tests including the Mini-Mental State Examination (MMSE), the Alzheimer’s Disease Assessment Scale-Cognitive subscale (ADAS-cog), and the Trail Making Test (TMT).

Results: Individuals from lower income households showed signs of advanced brain white matter ageing with greater mean diffusivity (MD), lower neurite density (intra-cellular volume fraction; ICVF), lower myelination (magnetization transfer ratio; RT2*), and increased iron content (transverse relaxation rate; R2*). The association between household income and MD was mediated by ICVF (B = 0.084 (0.029, 0.141), p = 0.003) and MT (B = 0.019 (0.006, 0.034) p = 0.009). MD partially mediated the association between household income and cognitive performance (B = 0.017 (0.001, 0.033), p = 0.040). Household income moderated the association between white matter microstructure and cognitive performance such that greater MD, lower MT, or lower ICVF might be more detrimental for individuals from higher income households.

Conclusion: Socioeconomic differences in brain white matter microstructure and cognitive performance were observed, with greater adverse effects for individuals from lower income households. These findings highlight the importance of considering socioeconomic factors in the evaluation of brain health and cognitive performance in middle to older adulthood.

Age Differences in Incidence Rates and In-hospital Outcomes among adults with Stroke or transient ischemic attack: a 10-year time-series analysis

Jiar Lin1, Benjamin Yip2, Chi Hung3, Eng Yeoh4

1Jockey Club School of Public Health and Primary Care, Chinese University of Hong Kong, Hong Kong SAR, China, 2Department of Pathology and Molecular Medicine, University of Hong Kong, Hong Kong SAR, China, 3Jockey Club School of Public Health and Primary Care, Chinese University of Hong Kong, Hong Kong SAR, China, 4Rm 503, JC School of Public Health Building, Prince of Wales, Chinese University of Hong Kong, Hong Kong

Introduction: Stroke and transient ischemic attack (TIA) are leading causes of disability and mortality worldwide. Understanding the epidemiology of these events and associated hospital outcomes is crucial for improving patient care and public health policies.

Methods: A retrospective cohort study was conducted in Hong Kong from 1998 to 2007. The dataset comprised all hospitalizations for stroke and TIA. The primary outcome was in-hospital mortality. Other outcomes included length of stay, discharge disposition, and complications such as rebleeding, recurrent stroke, and TIA. Covariates included age, sex, socioeconomic status, and clinical factors such as hypertension, diabetes, and hyperlipidemia.

Results: A total of 10,234 stroke and TIA events were identified. The median age was 76.7 years, with a higher incidence in males. The overall in-hospital mortality rate was 17.2%. Significant predictors of mortality included age, sex, and comorbidities. The most common discharge disposition was discharge home (73.7%). Complications including rebleeding and recurrent stroke were also common, with rates of 6.2% and 10.8%, respectively.

Conclusion: This study provides valuable insights into the epidemiology and outcomes of stroke and TIA in Hong Kong. The findings highlight the importance of targeted interventions to improve patient outcomes and reduce mortality associated with these conditions.
Objective: To compare incidence and in-hospital outcomes and to evaluate their 10-year trends according to age and stroke subtype. Method: A total of 137,927 patients with a primary diagnosis of stroke or transient ischemic attack (TIA) in Hong Kong between 2011-2020 were included. Outcomes were incidence, in-hospital deaths, length of stay (LOS), and 30-day unplanned readmission rates by age and subtype. Time-series analysis using cumulative incidence and change of rates (CAPR) and statistical process control (SPC) was conducted to examine time trends. Results: Decreasing incidence was observed in all subtypes among old adults (aged≥65), who yielded the most dramatic incidence reduction in ischemic stroke (IS) and intracerebral hemorrhage (ICH) (per 100,000 person-years 2011-2020, CAPC; IS: 931 to 424, -54%; ICH: 180 to 101, -44%), compared to young (aged<44) and midlife adults (aged 45-64). TIA incidence increased in young by 1% but declined by 40% in old adults, whereas subarachnoid hemorrhage (SAH) incidence remained steady for young and midlife. In-hospital deaths (10%) and 30-day unplanned readmission rates (9.8%) were highest for old adults with any subtype, while acute LOS was longest in the young (mean [SD] days; IS: 6.1 [13.3]; ICH: 14.6 [47.4]; SAH: 21.9 [60.2]) except TIA. SPC analysis demonstrated a significant rise in in-hospital deaths for all IS. There were longer LOS and more 30-day stroke-cause unplanned readmissions for all subtypes in young adults over ten years, but outcomes did not change in old adults apart from IS and TIA. Conclusion: Age-specific trends in incidence and in-hospital outcomes varied in stroke subtypes. The temporal increase in LOS and readmissions in young strokes highlight the need for age-targeted care improvements.

The effect of physical activity on health-related quality of life in older people living in residential care settings: preliminary results from an Italian sample
Alice Conni1, Mauro De Santis1, Esther Rita1, Fiorella Lanzillotta2, Ornella Nebià3, Alice Conni2, Giulia Baldelli1, Andrea Parenti1, Ivonne Capelli1, Loretta Modelli1, Patrizia Farruggia1, Laura Dallolio1, Giorgio Brandi1,1 Alma Mater Studiorum University of Bologna Department of Biomedical and Neuromotor Sciences, University of Bologna Italy, Département of Biomedical and Neuromotor Sciences, University of Bologna Department of Biomedical and Neuromotor Sciences, University of Bologna Italy,2 Department of Biomedical Sciences, University of Urbino Carlo Bo Department of Biomolecular Sciences, University of Urbino Carlo Bo Italy, Ðé Gioia Department of Biomedical and Neuromotor Sciences, University of Bologna Department of Biomedical and Neuromotor Sciences, University of Bologna Italy, ÐOS Care s.r.l., Aanni Azzurri, Bologna KOS Care s.r.l., Aanni Azzurri, Bologna Italy, Villa Giulia s.r.l., Pianoro, Bologna Villa Giulia s.r.l., Pianoro, Bologna Italy, Ðunit of Hygiene and Quality of Residential Services, Bologna Local Health Authority, Ðbellaria Hospital, via Altura 3, 40139, Bologna, Italy, Ðunit of Hygiene and Quality of Residential Services, Bologna Local Health Authority, Ðbellaria Hospital, via Altura 3, 40139, Bologna, Italy, Italy.

Background and Objective: One of the most delicate events in an older persons life is the entrance to a residential care facility (RCF). For institutionalized individuals, maintaining autonomy and a good physical, mental and social health is crucial, and this can be achieved through a multidisciplinary approach. A growing literature shows that, in RCFs setting, exercise and multicomponent physical activity (PA) programs can have beneficial effects on these outcomes, in particular on mental health and cognitive functions. The aim of this study is to describe the diffusion of exercise programs in a sample of Italian RCFs and its impact on the health-related quality of life (HrQoL).

Methods: Eight RCFs belonging to Marche and Emilia Romagna Regions (Italy) were recruited in 2022. HrQoL was assessed using the Short-Form 12 questionnaire (SF-12).

Results: Preliminary results from 89 older adults (age: 84.3±18.36, 78.7% women) showed that 51% of participants performed at least 1 session of individual PA per week and about 70% of participants performed group PA. Considering the HrQoL score at baseline, a significant higher Mental Component Score (MCS) of SF-12 was observed in patients carrying out more PA group activity (>2 times per week) than in those who practiced less (<2 per week) (MCS=48.91±9.90 vs 43.68±10.08, p=0.03). Considering the individual PA, we observed higher scores of MCS in patients carrying out more sessions per week rather than a single session (48.95±10.92 versus 45.66±9.21, p<NS). On the contrary, the Physical Component Score of SF-12 remained unchanged based on PA frequency and modality. Conclusion: Our data confirm that continuous group exercise is associated with higher mental wellness among elderly. These results also underline the importance of PA-based interventions in this specific setting in order to improve the HrQoL of this vulnerable population.

COVID-19 vaccination among older adults in India: a case of underrepresentation
Aravinda Guntupalli1, Aravinda Guntupalli1, Peter Lloyd-Sherlock2,1 University of Aberdeen United Kingdom, 2University of East Anglia

Background: Older adults are known to experience higher mortality and hospitalisation when infected with COVID-19 due to their increased vulnerability. COVID-19 severely impacted Indian older adults during the first two waves of the pandemic. While India's vaccine coverage is impressive in absolute numbers, the coverage proportion, particularly among older adults, was questioned during the deadly COVID Delta wave. Hence, the analysis seeks to study the policies concerning prioritisation, and vaccine coverage among older adults in India.

Methods: Mapping of the COVID-19 policies with the COVID vaccine and mortality data published by the Government of India between December 2019 and December 2022 was carried out to explore the reasons behind the underrepresentation.

Results: Nearly 2000 million doses of COVID-19 vaccines were provided to Indian citizens as of mid-December 2022. 92% of older adults aged 60 and above received the first dose of the COVID-19 vaccine. While 88% of older adults received the second dose, only 53% received the booster dose, known as the precaution dose. While the coverage until mid-December 2022 is impressive for the first and second doses, it was not remarkable in 2021. When the COVID pandemic mortality was at its peak until July 2021, only 50% and 19% of older adults received the first and second doses. This was because older people did not receive sufficient prioritisation during the pandemic.

Conclusion: COVID-19 vaccination coverage among older adults looks promising based on recent data. However, due to a lack of prioritisation, the coverage was poorer amongst this vulnerable group during the peak stages of the pandemic. Future pandemic vaccination programmes must consider prioritisation of older adults to reduce overall as well as older adult specific mortality and hospitalisation in India.

Socioeconomic predictors over the life course of healthy ageing index in older Eastern Europeans
Martin Bobak1, Maleeka Zaidi2, Hynek Pikhart1,1 Recetox, Masaryk University Czech Republic, 2University College London

Background and Objectives: Eastern Europe is facing population ageing in addition to health and socioeconomic inequalities that have emerged during post-communist transition. While it is important to consider a life course approach to the socioeconomic predictors of healthy ageing, there have been very few studies exploring this association between socioeconomic position (SEP) across the life course and healthy ageing. The aim of this study was to investigate the associations between socioeconomic predictors at different stages of the life course and a composite index of healthy ageing in Eastern European ageing cohorts.

Methods: We used data from the prospective cohort study, HAPIEE, comprising of 24,071 individuals from random population samples from urban centres in the Czech Republic, Poland and Lithuania, aged 45-75 years at baseline in 2002-2005 in the Czech Republic and Poland and 2006-2008 in Lithuania. Self-reported SEP indicators used for analysis are childhood amenities (Childhood), education (Early Adulthood), current household amenities, residents per room per room, and deprivation scale (Late Adulthood). Logistic regression was used to investigate the association between SEP across the life course and a recently developed composite Healthy Ageing Index (HAI).

Results: Education showed the most pronounced association with HAI, followed by childhood amenities, current deprivation, current amenities and crowding, with some variations between countries. The odds ratios of low HAI in those with the highest vs. lowest quintile of lifetime accumulation of low SEP was 4.3 (95% confidence interval 3.8-4.9). Odds ratios were higher in females, in participants with older age, without partner, with lower alcohol consumption, and those reporting poor self-rated health.

Conclusion: These results have highlighted the significance of SEP at different stages of life in determining healthy ageing. Policy makers must tackle their ageing populations through addressing inequalities across the life course, in particular educational attainment.

The role of folate metabolism enzymes SNPs in non-obstructive azoospermia: A systematic review and meta-analysis
Flavia Beccia 1, Emanuele La Gatta 1, Drieda Zaçe 2, Arianna Panfilii 3, Luigi Petrella 1, Maria Di Pietro 1, Maurizio Genuardi 2
1Università Cattolica del Sacro Cuore Section of Hygiene, Department of Life Sciences and Public Health, Università Cattolica del Sacro Cuore, Rome, Italy, 2Università Cattolica del Sacro Cuore Section of Genomic Medicine, Department of Life Sciences and Public Health, Università Cattolica del Sacro Cuore, Rome, Italy, 3Università Cattolica del Sacro Cuore Section of Genomic Medicine, Department of Life Sciences and Public Health, Università Cattolica del Sacro Cuore, Rome, Italy.

Abstract
Azoo spermia: A systematic review and meta-analysis
The role of folate metabolism enzymes SNPs in non-obstructive high, with 70 (19.4%) out of the 360 elderly participants reporting some form of abuse. The sons and daughters-in-law of the elderly participants depended, like their sons and daughters-in-law.

Conclusion: The prevalence of elder abuse found in this study was considerably higher than expected. The main perpetrators of the abuse reported. Depression and past history of abuse were found significantly associated with any type of abuse. The sons and daughters-in-law of the elderly participants were the main perpetrators of the abuse reported. Depression and past history of abuse were found significantly associated with any type of abuse. The sons and daughters-in-law of the elderly participants were the main perpetrators of the abuse reported. Depression and past history of abuse were found significantly associated with any type of abuse.

Method: The study is conducted based on our smart home data ecosystem. Fourteen participants (9 male, 5 female) who are aged between 18 and 34 years old, were recruited in the study. During the experiment, participants were asked to perform basic daily living activities under researchers’ instructions. Fitbit can measure participants’ steps during the session, while Swidget devices can record motion data through passive infrared sensors at the same time. One whole session for a participant can last [1] three hours while the data time interval is 1 minute. As the data is not normally distributed, the Spearman correlation test was chosen as the test tool for evaluating the association.

Results: The Spearman correlation coefficient r is r = 0.42 (range 0.35-0.67, n=14; P-Value: [1] [http://events.decorporate.ca/image.png] (https://pic.leetcode.cn/1671114424-KRdXnI-image.png)

Prevalence and factors associated with elder abuse in an urban area of India
Swayam Parida 1, Pradnya Chandanshive 2, Sonu Subba 3, Shree Mishra 4, AIIMS Bhubaneswar Associate Professor Sijuja India

Introduction: The problem of elder abuse exists in the present society and is considered an important social issue. It usually goes underreported because of the inability of the elderly to seek help and the lack of awareness regarding legal procedures. The consequences of elder abuse are enormous ranging from mental health issues to physical injury and death. Most of the available evidence has found that family members and caregivers are the ones primarily involved in the abuse of the elderly.

Objective: To find the prevalence, pattern, and associated factors of elder abuse in an urban area

Material and Method: Cross-sectional community-based study conducted between August 2019 to August 2020 in an urban field practice area of the All India Institute of Medical Sciences, Bhubaneswar. A total of 360 participants aged 60 years and above were interviewed using various semi-structured interview schedules and validated study tools such as Geriatric Depression Scale (GDS). The data obtained were analyzed using Statistical Package for the Social Sciences (SPSS) software

Results: Approximately one in five (19.4%) elderly reported some form of abuse. The types of elder abuse reported were physical abuse in 12 (3.3%), verbal abuse in 25 (6.9%), emotional abuse in 40 (11.1%), and financial abuse in 15 (4.2%) elderly participants. The sons and daughters-in-law of the elderly participants were the main perpetrators of the abuse reported. Depression and past history of abuse were found significantly associated with any type of abuse.

Conclusion: The prevalence of elder abuse found in this study was considerably high, with 70 (19.4%) out of the 360 elderly participants reporting some form of abuse. Emotional abuse was the most reported, and physical abuse was the least reported type of abuse. The most common perpetrators were those on whom the elderly depended, like their sons and daughters-in-law.
Realist evaluation of the impact, viability and transferability of an alcohol harm reduction support program based on mental health recovery: the vitae study: First results

Université de Bordeaux Université de Bordeaux France, Université de Bordeaux, Sampsy France, Sampsy France

Methods and Analysis

The Vitae study adheres to the theory-driven evaluation framework where the realist evaluation method and contribution analysis are used to explore the effects, mechanisms, and influence of context on the outcomes and to develop and adjust an intervention theory. This study is a 12-month, multi-case, longitudinal descriptive pilot study using mixed methods. It is multi-centered, and carried out in 10 addiction centers. The target number of participants was 100 beneficiaries and 23 professionals.

Results: Among the 29 beneficiaries included in 7 addiction treatment or prevention centers in France, 66% were male (n=19) and the average age was 43 years (SD=10.3). A large majority (96%) had alcohol use disorders according to the DSM-5 criteria. At 12 months follow-up, 10 persons (34%) were retained in the IACAI Program. The unique qualitative materials will be used to describe and analyze the viability of such an intervention.

Conclusion: Viability and transferability of complex health interventions is a major public health topic and remains a highly valuable research field. This study, focusing on an innovative intervention for people with alcohol use disorder implemented in different contexts will provide valuable information for the implementation science but also for the HR field.

Popul. Med. 2023;5(Supplement):A47 DOI: 10.18332/popmed/164644

Association between household air pollution and cognitive health among older adults in India: A multiple mediation approach through depression and insomnia

Subhojit Shaw, Sampurna Kundu

International Institute for Population Sciences Govandi Station Road, Mumbai 400088 India, Jawaharlal Nehru University JNU Campus, New Mehrauli Road, New Delhi, India

Objectives: The relationship between household air pollution exposure and cognitive outcomes of depression cause sleep disorders, suggests that these could play a multiple mediating role in the association between air pollution and cognitive impairment, and the study aims to speculate on this mediation effect.

Method: The study utilizes data from Longitudinal Aging Study in India (LASI), 2017–2018. We have used a multiple mediating model to understand the relationship between indoor air pollution, cognition mediated through depression and insomnia, while controlling all possible confounders.

Result: Household air pollution was negatively associated with cognitive health (β=−0.38) in all models, with depression (β=0.18) and insomnia (β=0.038) acting as mediators. The results show that unsafe cooking practices, indoor smoke from incense sticks, mosquito coils, and secondhand smoking are associated with lower sleep quality and depression among older adults.

Conclusion: The findings suggest that household air pollution is associated with cognitive decline, but this relationship is mediated by a person experiencing depression and/or insomnia. The study lays a foundation for future investigations into this nexus to inform and formulate policies to reduce exposure to air pollutants and improve screening and access to mental health services as a public health priority.

Popul. Med. 2023;5(Supplement):A48 DOI: 10.18332/popmed/164655

Older adults’ risk profiles for intense care transition patterns: 15-year results from a swedish population-based study

Susanna Gentili, Anna Larrañaga, Debora Rizzuto, Davide Vetrano

Karolinska Institutet Aging Research Center, Department of Neurobiology, Care Sciences and Society, Karolinska Institutet and Stockholm University, Stockholm, Sweden.

Background: Older adults are at higher risk of experiencing frequent healthcare transitions. We aimed to quantify and characterize the care transition patterns of older adults associated to individuals’ sociodemographic, clinical and functional characteristics.

Method: Data are from the Swedish National Study on Aging and Care in Kunskolmen and the Swedish Patient Register through which we assessed care transitions between home, home care, nursing home and hospital in 3,363 older adults ≥60 years old. Markov multistate models were used to represent the study participants likelihood of moving across various care settings.

Results: Over 15 years, the study participants spent on average after each transition two years at home, one year at home with home care, one year in a nursing home, eight days in hospital and 17 days in post-acute care. On average, study participants experienced ten hospitalizations over the study period. Being unpartnered was associated to a significant higher hazard of transitioning from home to hospital (HR 1.12) and to be discharged from hospital to home with home care (HR 1.18) or to a nursing home (***). Similarly, multimorbidity (≥2 diseases) was associated with a higher hazard to transitioning from home to hospital (HR 1.56) and to be discharged at home with home care (HR 2.40). Cognitive impairment significantly increased the hazard to be institutionalized independently from the starting setting (HR range 2.14-3.48). Slow walking speed finally increased the hazard to be hospitalized (HR range 1.14-1.29) and to be discharged at home with home care services (HR 1.20).

Conclusion: Different sociodemographic, clinical and functional characteristics trigger specific care transition patterns of older adults. Preventive strategies addressing individuals with such characteristics should be tested in the attempt to reduce healthcare fragmentation.

Impact of COVID-19 on football players’ injuries

Vittorio Falcone, Giovanni Guarducci, Gabriele Messina, Nicola Nante

University of Siena Post Graduate School of Public Health, University of Siena, Italy, University of Siena

Background and Objective: Even in football and in sports, as in every aspect of social life, the balance between preserving health and the economy is the central theme. The public health impact of COVID-19 has resulted in the closure of stadiums for an extended period. The study aims to evaluate the effect of post COVID-19 on Serie A football players.

Methods: Considering two Serie A seasons, namely from 2019-20 to 2020-21, all the players who had played at least one match in both seasons were selected. Players were further divided according to the number of injuries over the two seasons. The information about injuries was obtained from the German website Transfermarkt. We verified whether there was a significant difference in injuries, through Mann–Whitney U Test, by comparing players who had COVID-19, in any of the 19-20 or 20-21 seasons, with those who did not get sick.

Results: In the 264 players analysed were not counted as injuries non-purely orthopaedic surgery, intestinal problems, infections and COVID-19. During season 19-20, only 9 players had COVID-19, while in season 20-21, 93 out of 264. Each player who had had COVID-19 lost an average of 18.6 days. For both periods, the players who had COVID-19 had significantly fewer injuries than those who had not (p<0.05).

Conclusion: The analysis focused on post Covid-19 effects on Serie A players, particularly their injury numbers. Physical injuries decreased in players who had encountered the virus. This is probably because every player who had COVID-19 has been away from the football field. This might suggest that professional athletes should have no health problems if they have defeated COVID-19. However, despite the decrease in pandemic restrictions, there are still many doubts about post COVID-19, we cannot lower our guard.

Popul. Med. 2023;5(Supplement):A50 DOI: 10.18332/popmed/164694

Impact of COVID-19 on football players’ injuries

Mario Bruschi, Francesca Collini, Francesca Ierardi, Silvia Forni, Alfredo Zuppiroli, Guglielmo Bonacorsi, Fabrizio Gemelli

Department of Health Science, University of Florence, 50134 Florence, Italy, Quality and Equity Unit, Regional Health Agency of Tuscany, 50141 Florence, Italy

Background and objective: The COVID-19 pandemic has highlighted the need for palliative care (PC) to relieve suffering at the End-of-life (EOL). The study aims to assess the early impact of COVID-19 over EOL quality of care received by patients, comparing 2019-2020 data.

Results: The COVID-19 pandemic has highlighted the need for palliative care (PC) to relieve suffering at the End-of-life (EOL). The study aims to assess the early impact of COVID-19 over EOL quality of care received by patients, comparing 2019-2020 data.

Methods: Retrospective observational study based on administrative data.
study population includes all Tuscany region (Italy) residents (>18 years) died from 01/01/2019 to 31/12/2020 with a clinical history of cancer and/or with chronic diseases (heart-failure/chronic-pulmonary-disease/dementia/ictus/amyotrophic-lateral-sclerosis/muscular-dystrophy/myotonic-dystrophy/kidney-failure). Patients were divided upon year of death. EOL care quality outcome measures were evaluated. Analysis was performed using STATA-15 (significance P<0.001).

Results: 31,756 patients died in 2019, 33,967 in 2020. Both years patients-selection represented over 70% of Tuscany decedents; 52% of patients being females and more than 70% being over 75 years old. In last 30 days of life, 2020 group (vs 2019) showed significantly:

- lower hospital burden: Emergency Department (ED) admission (52.1% vs 56.2%), ED admission (non-hospitalized) (37.9% vs 41.4%), hospitalization (56.0% vs 62.8%), hospital as place of death (30.5% vs 34.0%), chemotherapy (3.9% vs 5.5%) but higher use of new chemotherapy (3.0% vs 1.9%);
- higher ICU burden (not significative); ICU admission (69.8% vs 48.4%), use of life-sustaining treatments (22.0% vs 18.4%);
- lower utilization of PC services: hospice services (5.7% vs 7.7%; 3.6% vs 5.0% if considering last 7d), opioid therapy (24.7% vs 25.9%), active home PC services (21.0% vs 22.6%), no PC support (70.3% vs 68.8%).

Conclusion: The pandemic, due to fear of the disease, contributed to reducing hospital burden for patient with EOL needs but failed to strength PC response, thus lowering EOL quality of care and contributing to inequalities.

Further studies are needed to evaluate the mid-long term impact of COVID-19 pandemic on quality of EOL care, especially after the introduction of vaccines since 2021.

Community-based program focused on social support limits covid-19 mortality: a retrospective cohort study

Giuseppe Liotta1, Leonardo Palombi2, Olga Madaro1, Clara Donnoli1, Giulia Piccardo1, Maria Marazzi2, Fabio Richardi1, Leonardo Gialloretii1

1Biomedicine and Prevention Department, University of Rome Tor Vergata Italy, 2“Long Live the elderly!” program, Community of Sant’Egidio, Rome, Italy, 3LUMSA, University of Rome Italy

Background: COVID –19 pandemic mortality hit especially people over 80 years. This paper aims to assess the impact of Community-based pro-Active Monitoring Program (CAMP) on octogenarians’ survival, during the COVID-19 pandemic.

Methods: The CAMP “Long Live the Elderly!” supports to the over 80s population living in selected Urban Area (UA’s) of Rome. The paper compares mortality in these UAs with the mortality of adjacent neighbourhoods, which were not served by the CAMP program, between October 2020 and March 2021. Mortality was stratified by COVID-19 incidence, percentage of people living alone, and income per capita by means of a Generalized Linear Model weighted for the UAs’> 80s population. The Rome Municipality Statistics Office provided data on mortality.

Results: Between October 2020 and March 2021 the Statistics Office reported 234 (56.5/1000) deaths in the zones served by CAMP and 477 (52.9/1000) deaths for the UAs not served by CAMP. The increase in mortality compared to the same period of the previous year was 37 (22.4%) and 74 (25.2%) respectively for UAs served and not served by CAMP. The absence of CAMP, weighted for the population and adjusted for the COVID-19 incidence, and the percentage of Older Adults >80 living alone, was associated to a 37% increase of deaths (p<0.001).

Conclusions: Mortality among octogenarians increased during Rome’s worst phase of COVID-19 pandemic. The implementation of CAMP is associated with a containment of mortality. Social support might be one of the reasons for this result. However, given the limited sample size, further reasearch is warranted.

Trends in the geriatric workforce in the romanian healthcare system

Monica Brînzac1, Maria-Lorena Vescan1, Monica Brînzac1,2, Marius Ungureanu1

1Department of Public Health, Faculty of Political, Administrative and Communication Sciences, Babeș-Bolyai University;2Center for Health Workforce Research and Policy, Faculty of Political, Administrative and Communication Sciences, Babeș-Bolyai Univers

Background & objective

The importance of the geriatric health workforce is pivotal in relation to the aging populations, their constantly expanding needs, and the increasing frailty. Specifically, people over 65 years old are accountable for 18.9% of the romanian population, which is close to the eu level of 20.6%. Additionally, the romanian healthcare system encounters challenges regarding the healthcare workforce, such as human resources migration, the lack of a comprehensive health workforce policy, and assuring adequate numbers and distribution. This paper aims to assess the trends in the geriatric workforce between 2016-2022 in romania, with a particular focus on the differences between regions.

Methods: The study has a quantitative, longitudinal design implying secondary data analysis conducted on doctors specialized in geriatrics. We used the annual report on the activity of healthcare facilities and the national statistical yearbook issued by the national institute of statistics for 2016-2022 population-related data.

Results: At the national level, the number of geriatricians increased by approximately 43%, from 210 in 2016 to 300 in 2022. The results indicate an aging workforce, as the highest share was represented by doctors aged 53, respectively 54 years old. In terms of distribution, the south region holds the highest number of geriatricians, with a 44,8% difference from 2016 (n=125) to 2022 (n=181). alternatively, the west region had the lowest numbers, with a 16,6% lower (n=6) geriatricians in 2016 compared to n=7 geriatricians in 2022. In this region, the ratio of inhabitants aged over 65 years old reported to geriatricians has decreased from 52,98 in 2016 to 51,14 in 2022.

Conclusions: The romanian healthcare system has tremendous differences concerning geriatricians’ distribution between counties. Despite the slight increase over the years, the number of geriatricians reported to the aging population should represent an interest for the policymakers.

A comparative analysis on the approaches of patients about stem cell treatments in turkey

Ciler Dursun1

1Faculty of Communication, Ankara University, Cebeci, Turkey

Regenerative and restorative innovations in medicine is one of the contested area for the patients and their relatives in terms of both by offering new treatments and also by carrying some ambiguities through their implementation process. Among these innovations, stem cell treatments are on the front line that patients approach towards it with the curiosity, hope and expectations. In order to measure approaches of patients with diverse demographical features in Turkey, we’re conducting nationwide Project entitled as “The Socio Cultural, Economic, Ethical and Law Effects of Regenerative and Restorative Medical Technologies in Turkey” since 2021 with the support of The Scientific Research and Technological Research Council of Turkey. This projects is aiming at a comparative analysis on the differences and similarities of the approaches between the patients with high socio-economic status and the patients with relatively low socio-economic status. In order to obtain diverse approaches, a vast survey is implemented to the patients in Ankara, Istanbul, Izmir and Erzurum which are the four main metropol cities that represents socio- cultural diversity in Turkey. Survey is answered by the 750 patients both in the University hospitals and private hospitals. Ankara University, Ege University and Istanbul University hospitals are representing public hospitals by offering costless health care services in the sample, while two private hospitals are representing paid health care services in Turkey. Preliminary remarks of the survey are displaying that although there are some differences between patients about their general attitudes towards health issues in their life, the approaches of the patients are more similar in terms of supporting innovative medical Technologies and treatments according to their socio-economic status. This Project is also giving some clues on the expectations of the patients with diverse socio-economical and cultural status from the governments about bearing the costs of stem cell treatments in Turkey.

Self-rated health status in south africa: the roles of neighborhood disadvantages, social trust and religion

Raege Omar1, Thankam Sunil2, Xiaole Xu3

1University of Texas at San Antonio United States, 2University of Tennessee, Knoxville United States

Background and objective: Self-ratings about personal health are broad self-evaluations of health status which reflect general dimensions of health including chronic conditions. The construct of Self-rated health is related to multiple
domains of health outcomes such as mortality rates, comorbidities, psychological distress and the numerous psychosocial effects that result from socio-economic inequalities in health. The primary focus of our study is to apply a theoretical framework drawing on the stress process paradigm to examine the central research question. Do religiosity dimensions and social trust mediate and/or moderate against the deleterious effects of one ecological chronic stressor: neighborhood disadvantage (ND)?

Methods: This study applies nested models using stereotype logistic regression to analyze a random probability sample (n=3531) from the World Values Survey (WVS) in South Africa. Self-rated health was measured in a single survey question: All in all, how would you describe your state of health these days? In response, study participants were asked to indicate where they would put themselves on an ordinal scale (i.e., Very Good, Good, Fair, Poor).

Results: (1) Neighborhood disadvantages predicted lower self-ratings of health (β < 0.00), controlling for respondents’ demographic characteristics, income, employment, religious affiliation and exposure to violence in the past year; (2) the effects of social trust were only limited to mediate against ecological stress; however (3) higher religious engagement predicted more favorable ratings on health status, thus diminishing the negative effects of the stressor.

Conclusion: This study contributes to the literature by investigating the interface between self-rated health and ecological chronic stress in sub-Saharan Africa. Our empirical results lend credence to the positive effects of social involvement to mitigate the deleterious effects of neighborhood disadvantages.

LISA – Health Literacy cohort study
Sara Dias1, Maria Batalha1, Rui Passadouro2, Estévão dos Santos3, Bartolomeu Alves4, Tiago Gabriél1, Ana Valentim1, Cátia Gomes1, Cátia Gomes1,2

1 Center for Innovative Care and Health Technology, Polytechnic of Leiria, 2 Center for Innovative Care and Health Technology, Polytechnic of Leiria, 3 Rua General Norton de Matos, Apartado 4133 Portugal, 4Unidade de Saúde Pública do ACES Pinhal Litoral e Politécnico de Leiria, PT Portugal, 5Unidade de Saúde Pública do ACES Pinhal Litoral, 6Câmara Municipal de Leiria

Background and objective: Health literacy (HL) is the degree to which individuals can find, understand, and use information and services to inform health-related decisions and actions for themselves and others, whether at home, at the workplace, in the community, marketplace, healthcare sector, or the political arena. LISA is a cohort study developed in Portugal, which aims to measure HL in the adult population of Leiria, over the next 10 years. As secondary objectives it is intended to characterize anxiety and depression and metabolic risk.

Methods: LISA is a population-based prospective cohort study. It will collect data on HL through European Health Literacy Survey (HLS19-Q12). The study population will be composed by adults (≥ 18 years old) who are non-institutionalized and living in private households in Leiria. The random sample is stratified by gender and age groups. A face-to-face interview will be conducted with the Computer Assisted Personal Interview at baseline. Follow-up will be carried out every 2 years via telephone call. The association between independent variables and health literacy is examined by means of variance analysis with measurement repetition.

Results: The measuring instruments will allow a diagnosis of the situation in the municipality of Leiria. It will be possible to develop specific strategies and initiatives to promote HL, that will allow each citizen to make an informed decision, and that contribute to better health outcomes, more efficient use of health services, and decrease in health spending.

Conclusion. The HLS-EU revealed that 47.6% of respondents in Europe had limited HL. Given these issues, it is necessary to train and inform about the disease and what everyone should do to fight it and, above all, prevent it. This is the HL process that should empower citizens with knowledge to make conscious and informed decisions about the promotion of individual and collective health.

Ethical issues in long-term care in low-, middle- and high- income countries during the covid-19 pandemic
Preet Gandhi1, Theresa Nitti1, Angel Petropanagou1, Andreea Popescu1, Nipa Chauhan1,1, Darren Bugaresti1, Paula Chadwick1, Jill Oliver1,1

1University of British Columbia Canada, 2William Osler Health System, Canada

Background: Long-term care (LTC) centres experienced an unprecedented emergency involving exponential mortality during the COVID-19 pandemic, placing residents, staff, families and organizations in a precarious position. Complex issues surrounding how to best support elderly populations at great risk in the pandemic have highlighted the importance of gathering information on ethical issues to inform effective policy and decision-making. While several national and international reports have documented the multifactorial impact of COVID-19 on LTC residents’ living conditions, to our knowledge, no literature currently offers stakeholder-identified ethical issues from across low, middle, and high income countries (LMIC, HIC) and different sociocultural contexts during the pandemic.

Objective: In collaboration with the World Health Organization Public Health Emergency Preparedness and Response Ethics Network, this project sought to identify ethical issues faced in LTC by residents, families, staff and organizations. The aim of this survey was to better understand the ethical issues being faced in LTC and inform public health policymaking in future health crises.

Methods: Using snowball recruitment and a participatory approach, a survey was distributed in 8 languages including: English, Spanish, French, Hindi, Portuguese, Arabic, Mandarin, and Russian. Results: 305 respondents from 45 countries highlighted the dozens of ethical issues in LTC care during the COVID-19 pandemic. A content analysis found overlap in the themes of responses between stakeholders. Visitation, isolation, harm, staff well-being, and the overall enforcement of policies during the pandemic represented the most often discussed issues. We found overlap in the identification of many ethical issues faced by stakeholders across LMIC and HIC countries.

Conclusion: Attention to the nature and impact of these ethical issues is required for an effective pandemic response, towards addressing moral distress for all stakeholders. Future investigation is necessary to further understand how these ethical issues can be addressed and subsequently guide future pandemic policymaking.

The rise of a new syndemic: characterising the interactions between dementia, infections and socioeconomics
Angelique Mavrodar1, Angelique Mavrodar1, Christoph Mueller2, Carol Bray1, Robert Stewart3, Gayan Perera1

1University of Cambridge United Kingdom, 2Kings College London, 3Kings College London United Kingdom

Background: Infections in older people are a major cause of mortality and morbidity and may be important modifiers of outcomes for people with dementia. We explored mortality in individuals with dementia admitted to hospital for infections alongside deprivation.

Methods: A retrospective cohort analysis was created using secondary care data from one of Europe’s largest mental health and dementia care providers in South London (UK). People with recorded dementia between January 2008 and March 2017 were linked to national hospitalisation and mortality data and classified as either admitted for infections, admitted for other causes or no admissions around first recorded dementia diagnosis and followed to death or a census date on 31st March 2019. Multivariate Cox proportional hazards regression with date of first dementia diagnosis as index date were applied.

Results: In total 14,375 people diagnosed with dementia were included, of whom 3,480 (24%) were admitted for infections, 3604 (25%) admitted for other causes and 7,291 (51%) not admitted to hospital. Individuals with dementia admitted for infections had lower MMSE scores, higher rates of co-morbidity and ranked significantly higher on deprivation indices compared to those with no admissions. Adjusted multivariate Cox regression models indicated that people with dementia admitted to hospital for infections had significantly higher mortality rates compared to no admissions (Hazard ratio (HR): 2.3; 95% confidence interval (CI): 2.1 - 2.5) and to admissions for other causes (HR: 1.5; 95% CI: 1.4 - 1.6).

Conclusions: In people with dementia, admissions for infections are critical events associated with substantial increased mortality risk. Addressing care patterns both before and after admission with a focus on infection could improve outcomes and is a key health research area, with optimisation of care a direct priority.

Understanding levels of morbidity, disease pattern, and hospitalization among widowed women in west bengal, India
Sandip Das1, T.R. Dilip2

1International institute for population sciences, 2International institute for population sciences Govandi Station Road, Deonar, Opposite Sanjona Chamber, Mumbai, Maharashtra 400088 India

Background and objective: The health condition among Widowed Women is a serious concern in West Bengal, India. The purpose of the study is to investigate
the levels of self-reported morbidity, disease pattern, and hospitalization among widowed women in West Bengal, India based on the National sample survey data. Methods: Using data from the 75th round of the National Sample Survey Organization (NSSO), we tried to analyze the levels of morbidity, disease pattern, and hospitalization of widowed women across the state of West Bengal in India. Bivariate analysis and Logistic regression analysis were carried out to assess the differentials in reported morbidity, disease pattern, and hospitalization among the widowed women.

Results: Our result shows that there is 64.7% of widowed women lived in Rural and 35.3% lived in Urban areas. Widowed women from urban areas are more like to be reported (OR:1.53, p<0.05) than rural areas. The burden of illness and hospitalization among widowed women was higher in rural areas than in urban areas in West Bengal. The pattern of different morbidity suggests that West Bengal is passing through the advanced phase of epidemiological transition in which non-communicable diseases increase and communicable diseases are being swiftly replaced.

Conclusion: Our study strongly suggests that widowed women especially older widowed Women have more Proportion heading of self-reported morbidity and Hospitalization in West Bengal. Policy interventions should focus on the health of widowed women in the near future.

Popul. Med. 2023;5( Supplement):A59 DOI: 10.18332/popmed/164631

COVID-19 pandemic impact on ncds prevalence among the elderly in Italy

Virginia Casigiani1, Benedetta Contoli2, Valentina Possenti3
1 University of Pisa Department of Translational Research and New Technologies in Medicine and Surgery via Paolo Savi 10, Pisa Italy, 1Istituto Superiore di Sanità Valentina Mainardi Istituto Superiore di Sanità Italy, 3Istituto Superiore di Sanità Italy Maria Masocco Istituto Superiore di Sanità Background and Objectives: The COVID-19 pandemic had a severe direct and indirect impact on older adults. In Italy, from 2020 to January 2022, the excess of all-cause mortality was 178,000 deaths, compared to the period 2015-2019, mainly among people aged over 80 (74.6% of the excess). This study aims to assess the Non-Communicable Diseases (NCDS) prevalence among the elderly in Italy after two years of the pandemic.

Methods: We used data on the elderly population(65+) collected from 2016 to 2021 by the Italian ongoing surveillance system PASSI d’Argento to analyze socio-demographic characteristics and NCDS prevalence. We compared pre-pandemic(2016-2019) and pandemic period(2020-2021).

Results: In the pandemic period, 6 of 10 people aged over 65 referred to have been diagnosed with one or more NCDS in their lifetime: 28% cardiopathy, 20% diabetes, and 13% cancer.

A condition of polychronicity (2 or more NCDS) was reported in 1 of 4 cases. People older than 85 years old, residents in the South, having economic difficulties or a lower level of education were at higher risk of having two or more NCDS. Differences by sex were not found significant.

The temporal analysis of the NCDS prevalence did not show significant changes between 2016 and 2019, except for an upward trend in polychronicity. In 2020-2021 there was a reversal of this trend, with differences at the limit of statistical significance: people with poly-chronicity decreased from 62%(60.2-61.6) in 2019 to 59%(58.1-60.7) in 2021. Oppositely, in the age-group 18-64, the NCDS trend remained unvaried.

Conclusion: The NCDS prevalence showed a decrease compared to the pre-pandemic period. It may be explained by the excess of mortality caused by the pandemic. Having an agile system that can monitor changes in the elderly it is essential to identify their needs and implement targeted actions to improve the offer of the national healthcare system.

Popul. Med. 2023;5( Supplement):A60 DOI: 10.18332/popmed/164366

Violence against women in a Brazilian state capital city: a population-based study

Francêlle Leite1, Márcia Pedrosa2
1 Universidade Federal do Espírito Santo, Brazil, 2Universidade Federal do Oeste da Bahia, Brazil

Introduction: Violence against women is a public health problem for which exposure to this phenomenon has negative consequences on the victim’s health, regardless of the type. Objective: To estimate the prevalence of intimate partner violence against women throughout life, and its association with life experiences. Methods: This is a cross-sectional, analytical, population-based study carried out in the city of Vitória, capital city of Espírito Santo, Brazil. The municipality has 79 districts and six health regions. The sample consisted of 1,088 women aged 18 years or older, who had or had an intimate partner in the last 24 months prior to the interview, which took place between January and May 2022. An intimate partner was defined in this study as the partner or ex-current partner and/or boyfriend as long as they maintain sexual relations, regardless of whether it is a formal union or not. Data collection was performed by a properly trained team, all female. The research team also had supervisors. The analyzes were done in the Sta. Varbonate version 15.1 program. The study was approved by the Ethics and Research Committee. Results: The lifetime prevalence of intimate partner violence against women was 47.8% (95%CI 44.8-50.8). Psychological violence was the most frequent (45.2%; 95%CI 42.3-48.2), followed by physical violence (25.6%; 95%CI 23.1-28.3). Sexual violence had the lowest frequency (17.2%; 95%CI 15.1-19.6). Women with a history of mothers who suffered intimate partner violence and who were sexually victimized in childhood had a higher prevalence of psychological, physical and sexual violence committed by an intimate partner (p<0.05).

Conclusion: Intimate partner violence is a prevalent event in a woman’s life, and is associated with the experience of intergenerational and personal victimization.

Popul. Med. 2023;5( Supplement):A61 DOI: 10.18332/popmed/164791

Older adults’ intention to use an electronic decision aid for housing decisions: an online pan-Canadian survey

Maya Fakhfakh1
1Laval University, Canada

Background: Older adults experiencing disabilities such as frailty and loss of autonomy face the decision of whether to stay at home or move to a healthcare facility such as skilled nursing care facilities. Thus, they may need support for this difficult decision.

Objective: We assessed Canadian older adults’ intention to use an electronic decision aid (eDA) for making housing decisions and identified the factors that influenced their intention.

Methods: We conducted a cross-sectional study using an online survey targeting older adults across the 10 Canadian provinces and 3 territories. We adapted 17 Unified Theory of Acceptance and Use of Technology (UTAUT) items to measure respondents’ intention to use the eDA for housing decisions, as well as items measuring intention constructs. We also assessed e-Health literacy using subjective and Objective scales. We used descriptive statistics and multivariate linear regression analyses to identify factors influencing the intention to use the eDA.

Results: Of the 1,176 who met the eligibility criteria, 1,000 respondents completed the survey. The mean age was 72.5 ± 5.59 years. Most respondents were male, white, English-speakers and living in Ontario or Quebec in urban areas. Mean scores for subjective e-Health literacy were 27.8 ± 5.88 out of 40 and for Objective e-Health literacy, 3.00 ± 0.973 out of 5. In our sample, the intention score was 4.74 ± 1.7 out of 7. In the final model, factors associated with intention included mother tongue, e-Health literacy, performance expectancy, social influence and facilitating conditions.

Conclusions: Findings from this pan-Canadian online survey suggest that Canadian older adults’ intention to use an eDA to make housing decisions are similar to Findings in other studies using UTAUT. Factors identified as influencing intention will guide future strategies for implementing the eDA.

Prevention policies to protect the adult population: The project "Vivere nei Parchi" in Apulia, South of Italy

Alessia Quarta1, Maria Balducci2, Nehludoff Albano3, Onofrio Mongelli4, Oswalda Giglio4, Maria Montagna4
1Interdisciplinary Department of Medicine, University of Bari Aldo Moro, Italy, 2Department of Biomedical Sciences and Human Oncology, University of Bari Aldo Moro, Italy, 3Department of Health Promotion and Animal Welfare, Apulia Region, Italy, 4Interdisciplinary Department of Medicine, University of Bari Aldo Moro, Italy

Background and Objectives: Active Ageing is a priority theme in Public Health. In accordance with the objectives of the Regional Prevention Plan (PRP) 2021/2025 on Health Promotion, Apulia Region has approved the project "Vivere nei Parchi – Puglia.M.I.C.A." (Integrated Motor Activity Culture Environment), with the strategic Objective of counteracting sedentary lifestyle and promoting paths for autonomy and psychophysical and social well-being of the Apulian population over 55.

Methods: Regional organizations, regional Parks/Reserves management bodies,
local associations specialized in the promotion and protection of naturalistic, historical-artistic heritage as well as universities are the social actors enlisted in Apulia to implement the document of the project and plan any corrective strategies. The project provides for the next two-year period 2023-2024, the activation of functional paths combining physical activity within the regional Protected Areas with the training of citizens on issues of environmental, food and cultural education. All social and health data deriving from the project will be analyzed and monitored in order to verify their adherence with the Objectives set.

Results: The expected Results are mainly aimed at the conscious adoption of healthy and active lifestyles by the elderly adult, but they also involve the improvement of the perception of the state of health; empowerment; the enhancement of the resources of the territory; the elimination of health inequalities and socio-cultural integration.

Conclusions: Promoting policies oriented to active aging, able to sustain virtuous changes in behavior by the population over time is one of the most difficult challenges to pursue in Public Health, but we do believe that the use of the integrated approach of intervention and the combination of physical activity-training are some of the essential elements to hope to get the expected results.

Husbands’ cognitive function was associated with the spouse’s depression and contact with their children

Jin-young Min1, Kyong-bok Min2, Sang-Won Ha3
1Veterans Medical Research Institute, Veterans Health Service Medical Center, Seoul, Republic of Korea, 2Department of Preventive Medicine, College of Medicine, Seoul National University, Seoul, Republic of Korea, 3Department of Neurology, Veterans Health Service Medical Center, Seoul, Republic of Korea

Background and Objective: As people age, cognitive function is an important indicator of health and mortality risk. An important factor affecting cognitive function is family members, especially spouse and children. This study investigated the cross-partner association between depressive symptoms and cognitive function. We further examined the cognitive performance of couples was affected by the frequency of contact with their adult children. Methods: The survey was conducted at the Veterans Medical Research Institute in the Veterans Health Service Medical Center. A total of 235 individuals volunteered for this study and provided their informed consent at enrollment. After the selection process, 96 couples participated in the present study. Participants completed a neuropsychological test battery including attention, language and related functions, visuospatial functions, memory, and frontal/executive functions. Symptoms of depression were assessed using the short version of the Geriatric Depression Scale. The number of contacts with children was categorized into ≥1 per month and <1 per month.

Results: We found a significant association between depression and cognitive function between husbands and wives. Although the association was asymmetric: wives’ depressive symptoms were significantly associated with lower executive function tasks by their husbands, whereas the converse association was not significant. Similarly, within a couple, more contact with adult children (more than once a month) was associated with a significantly higher cognitive scores than once a month. In particular, these observed associations were independent of the individuals’ age, education, income, smoking status, alcohol consumption, engagement in moderate physical activity, and disease histories. Conclusions: Among older married couples, the cognitive functions of husbands tend to be influenced more by their wives’ mental health and degree of contact with their adult children. This infers that wives and offspring can act as buffer against the cognitive impairment of older married men.

DOI: 10.18332/popmed/165099

Association between confinement and post-COVID-19 pandemic anxiety

Melissa Fernandez1, Vanessa Jimenez2, Brian Enrique Contreras Mella2, Karen Hernandez2, Lourdes Juan2, Angel Gerominio2, Christian Estudillo2, Josue Villegas-Dominguez3
1Mexico, 2School of Medicine, Universidad del Valle de Mexico, Mexico, 3Universidad del Valle de Mexico, Mexico

Background: The changes in peoples lifestyle during the COVID-19 pandemic due to the confinement assigned in different countries caused different mental health problems, so it is important to identify the consequences once this stage is over. Objective: To determine the association between confinement and the presence of post-COVID-19 pandemic anxiety. Methods: A cross-sectional, prospective study was carried out between January and April 2022, three months after the return to usual activities free of confinement, including men and women aged between 18 and 50 years, residents of the city of Veracruz, excluding participants with already diagnosed psychological disorder, such as depression or anxiety. A survey was applied through Google Forms, including the Beck anxiety scale (Cronbachs alpha 0.90). SPSS v22 software was used for data analysis, Chi square test with Odds Ratio (OR) and 95% confidence interval (95%CI), assigning statistical significance with p<0.05 when comparing between people with and without anxiety. Conclusions: The absence of anxiety during the current post-pandemic stage of COVID-19, where the indication of mandatory confinement has been withdrawn, is not associated with the different behaviors carried out during the mandatory confinement stage.

DOI: 10.18332/popmed/165218

Prevalence and associated factors of food insecurity among adults in Manaus

Carolina Ferreira1, Marcus Silva2, Tais Galvão2
1School of Pharmaceutical Sciences, State University of Campinas, Brazil, 2Postgraduate Program of Pharmaceutical Sciences, University of Sorocaba, São Paulo, Brazil, 3School of Pharmaceutical Sciences, State University of Campinas, Campinas, Brazil

Background and Objective: Food insecurity implies lack of access to food necessary for a healthy life, marked by socioeconomic vulnerabilities. We aimed to assess the prevalence and factors associated to food insecurity in Manaus, a city in the Brazilian Amazon. Methods: This was a population-based cross-sectional study conducted in 2019 with adults (≥18 years-old) selected by a probabilistic sampling in three stages. The presence of food insecurity was measured using the Brazilian Household Food Insecurity Measurement Scale adapted and validated in Brazil to measure food insecurity as mild, moderate, or severe. Descriptive statistics was conducted and the prevalence ratios (PR) with 95% confidence interval (CI) were calculated using multinomial logistic regression, adjusted by significant variables at the level of p<0.10. Associations to food insecurity were considered if p<0.05. Stata 14.2 and complex design were used in all analyses. Results: Of the 2,321 participants included in this study, 38.0% (95%CI 36.0-40.1%) had mild; 14.3% (95%CI 12.8-15.8%), moderate; and 15.7% (95%CI 14.1-17.2%), severe food insecurity. Mild, moderate and severe food insecurity was more prevalent in women (mild:PR 1.35, 95%CI 1.08-1.68; moderate:PR 1.61, 95%CI 1.19-2.17; severe:PR 1.48, 95%CI 1.09-2.02), poorest individuals (mild:PR 1.56, 95%CI 1.09-2.23; moderate:PR 6.46, 95%CI 3.38-12.33; severe:PR 6.30, 95%CI 3.27-12.13), people with depressive symptoms (mild:PR 4.71, 95%CI 1.04-1.91; moderate:PR 2.59, 95%CI 1.80-3.72; severe:PR 2.50, 95%CI 1.76-3.54) and that suffered life threatening events in the previous year (mild:PR 1.75, 95%CI 1.39-2.21; moderate:PR 3.94, 95%CI 2.63-5.89; severe:PR 4.46, 95%CI 2.94-6.77). Severe food insecurity was also more frequent in people aged from 45-59 years (PR 2.49, 95%CI 1.50-4.15), and unemployed or housewife (PR 2.91, 95%CI 1.76-4.80). Conclusions: Food insecurity affected more women, the poorest, people with depression, and those who suffered threatening events. Social vulnerabilities and threatening events seem to add up and worsen the right to access to food.

DOI: 10.18332/popmed/165255

Knowledge and perceptions of Alzheimer’s disease among geriatric nurses, geriatric nurses’ practitioners and nursing students working in varied health care settings

Anat Romemi1, Ronit Pichas-Mizraci2, Beth Zalman3
1Jerusalem College of Technology (JCT), Jerusalem, Israel, 2Jerusalem College of Technology, Jerusalem, Israel, 3Jerusalem College of Technology, Jerusalem, Israel

Background: The Global action plan on the public health response to dementia 2017-2025, a adopted by World Health Organization, aims to improve the lives of patients with dementia, their families and caregivers, provide comprehensive care, and implement targeted areas of action (WHO, 2017). Caring for patients with Alzheimer’s disease (AD), a subset of dementia, requires specific knowledge, skills, and attitude (Kimzey et al, 2016; World Health Organization, 2020). Assessment of nursing knowledge of, and attitudes related to, caring for AD in different healthcare settings with different levels of education can help create
edcational programs and change attitudes towards AD patients. Methods: This quantitative, cross-sectional study explores self-reported knowledge related to AD and personal attitude regarding caring for AD patients. The study utilizes the following validated measures: Alzheimer’s Disease Knowledge Scale (ADKS) and the Dementia Attitude Scale (DAS). The study compares between different levels of nursing education and between three healthcare settings: general hospitals, long-term care facilities, and community-based care.

Results: Overall mean AKDS score was 78.71%. The highest scores were measured in the community setting, with knowledge graded as 80.45%. The total DAS score among all study participants was 109.56/140 (78%) (SD=15.52). Nursing students’ attitude toward AD patients was the lowest among all participant groups, 103.25/140 (73%) (SD=14.88). By level of education, nursing students report feeling the least comfortable with AD patients, while nurse practitioners are the most engaged and comfortable with AD patients.

Conclusions: Nursing students need increased exposure to AD patients in geriatric clinical practice as part of their nursing educational program. More knowledge and positive attitudes will facilitate better care for older adults with AD across all healthcare settings, which promotes the global action plan 2017-2025 among the nursing sector.

Women and tobacco: smokers clinical characteristics at a Tunisian tobacco cessation consultation during a 10-year-period

Aroua Kamel1, Houyem Said2, Rania Bannour1, Sana Bihri1, Fatmahazza Khourya1, Arwa Neffati1, Emna Hariz1, Soughir Ayadi1, Soufiene Aidani1, Mohamed Rejeb1, Salwa Khefacha2, Asma Cheikh2, Mohamed Rejeb1, Salwa Khefacha2, Asma Cheikh2

1Department of Prevention and Safety of Care, Sahloul University Hospital, Sousse, Tunisia; 2Department of Prevention and Safety of Care, Sahloul University Hospital, Sousse, Tunisia

Introduction: Smoking is one of the most serious threats to global public health and the most widespread in Tunisia. The incidence of female smokers is increasing through the years, as well as the incidence of hospitalizations for cardiovascular complications and cancers testifying to the high risk in this gender. Objectives: To describe the sociodemographic and medical characteristics of female smokers. Methods: A longitudinal descriptive epidemiological study was carried out among female smoking patients followed up at the smoking cessation consultation at the Sahloul University Hospital in Sousse, during the period from 2011 to 2021. The collection of socio-demographic and medical data was based on a pre-established synoptic form and validated questionnaires in Arabic and French completed during an interview with the participants.

Results: A total of 92 patients were identified. The median age was 37 years (29.25 - 50). Overall, 18.5% of patients had comorbidities, the most common being hypertension (9.9%) and diabetes (5.6%). The median age of the first cigarette use was 18.5 years (16 - 20) and 20 years (17 - 22) for daily smoking. Cross addiction was identified among 6.4% participants. Using the Fagerstrom score, 38.5% of women were highly dependent. Moreover 41.7% presented a high score of depression score and 25% of anxiety. Smoking cessation prevalence was 9.1% and 20% at 6 and 12 months, respectively. Conclusions: Smoking is steadily increasing in women. Therefore, the implementation of smoking cessation interventions targeted to women remains a necessary measure.

Popul. Med. 2023;5(Supplement):A68 DOI: 10.18332/popmed/165350

Factors of high physical dependence on nicotine among Tunisian smokers consulting a smoking-cessation unit in a University Hospital in Tunisia

Emna Mziou1, Hela Ghali1, Rania Bannour1, Sana Bihri1, Salwa Khefacha2, Mohamed Rejeb1, Asma Cheikh1, Houyem Laatiri2, Mohamed Rejeb1, Salwa Khefacha2, Mohamed Rejeb1, Asma Cheikh1, Houyem Laatiri2

1Prevention and Healthcare Security Department, Sahloul University Hospital, Sfax, Tunisia; 2Prevention and Healthcare Security Department, Sahloul University Hospital, Sousse, Tunisia

Smoking is an addictive behavior; nicotine is the main substance responsible for physical and moral dependence. The aim of this study was to determine characteristics of Nicotine-physical-dependence among Tunisian smokers. We conducted a descriptive study, over 5 years (2015-2020), including all patients consulting voluntarily the smoking cessation unit in Sahloul University Hospital-Tunisia. The physical dependence on nicotine was measured via the Fagerstrom test for Nicotine Dependence (Six questions form, summing from Zero to 10). Smokers with a score of 7 to 10 were considered highly dependent on nicotine; score from five to 6 were considered moderately dependent and from 0 to 4 were not considered dependent. From 2015 to 2020, 450 smokers consulted our unit. When interviewing the patients, their moral dependence (addiction) to tobacco explained by themselves to gestural automatism (81.8%), stressful situations (76.7%) and the need for moral support (70.2%). As for the physical tobacco dependence, the Fagerstrom scale revealed that 46.2% (n=196) were highly dependent, 34% were moderately dependent and 20% were not very dependent. These highly addicted smokers were most often men (91.3%) had a higher average age than the lower dependency categories and were more often unemployed. The mean nicotine dependence score was 6.16±2.29. It was not associated with gender. It was, however, significantly associated with low level of education (p=0.001) and advanced age with a weak positive correlation (r=0.182, p<10^-3).

This level of nicotine dependence was, also, significantly associated with a high average number of cigarettes consumed daily (p<10^-3), a high level of CO exhaled at each visit (p<10^-3) and a high Hospital Anxiety and Depression scale (p<10^-3).

Smoking cessation requires comprehensive management. Our cost-free unit attracts mostly highly dependent smokers, but also patients with varying level of dependence. Successful quitting depends on factors related to the individual, his environment and the care-quality.

Popul. Med. 2023;5(Supplement):A69 DOI: 10.18332/popmed/165434

Significant role of the nurse in management of pain at oncology patients

Polya Gergova1, Stela Georgieva2, Eleonora Dimitrova3

1Department of Nursing Surgical Care, Faculty of Health Care, Medical University, Pleven, Bulgaria; 2Department of Social Medicine and Health Management, Medical University, Pleven, Bulgaria

Introduction: Pain is a significant problem in patients with oncology disease. It is a nursing sensitive indicator, so nurses play a key role in successful pain management. Nurses must learn how to effectively communicate with patients to adequately assess and manage pain. The aim of the study is to investigate patients’ and nurses’ opinion on the complex role of oncology nurse in assessment of oncology pain to patients with oncology disease.

Materials and Methods: The idea about pain assessment examined from a view point of two groups: patients and nurses in oncology departments. Data were collected by direct individual self-administered questionnaire among 67 patients and 49 nurses in the field of oncology pain. Data processing is with Microsoft Office Excel 2016 n SPSS v.25.

Results: Proportion of patients with pain is high (69.1%), when moving (34.3%), at rest (10.4%), at night (10.4%), one of 10 patients has constant pain. In this relation, 76.1% respond affirmatively, the nurse responds immediately to their complaints. Therefore, in more than half of patients, expectations are related to physical pain relief (53.7%). Another part deny pain (35.9%). Patients may deny pain due to their perception of pain as a weakness (64.2%), fears that the disease is progressing (47.8%), sleep problems (67.1%) or even the believe that pain is inevitable part of illness or aging (71.7%). On the other hand, significant part of nurses (67.3%) give information on body position for pain relief. More than a half of nurses (61.2%) monitoring the condition of patients with pain, communication about pain medications confirm 42.9% of nurses. Majority, 77.6% of nurses, assess the necessity of actualization of their communication skills for an adequate pain assessment.

Conclusions: Improvement of nurse’s knowledge with pain assessment is needed to be aware of the barriers that can interfere it.

Popul. Med. 2023;5(Supplement):A70 DOI: 10.18332/popmed/165471

Attitude of health professional students as advocates for organ and tissue donation: a community engagement effectiveness study

Jayaku KumutaiPattalumpyalai1

1College of Medicine, Gulf Medical University, United Arab Emirates

Background and Objectives: As organ transplantation serves as a rescue method for patients with terminal diseases, there is a huge demand for organ donation world-wide. This study assessed the attitude of health professional students as an advocate of organ and tissue donation. Material and Methods: An interventional study design was adopted among the health professional students at a Medical University in Ajman. A validated, self-administered questionnaire was used to assess the attitude of about organ donation before and after a community engagement activity. Ethical approval was obtained prior to this study. Wilcoxon Signed rank test was used to test whether there is any difference between the attitude scores between and after the community engagement activity.

Results: A statistically significant increase in the attitude of the participant towards organ donation (p<0.001) was found. The percentage increase in the attitudinal
Exposure to alcohol and risk of dementia: a systematic review and dose-response meta-analysis
Andrea Rossetti1, Elena Mazzoleni2,3, Tommaso Filippini1,2,3, Marco Vinceti1,2,3
1Environmental, Genetic and Nutritional Epidemiology Research Center (CREAGEN), Department of Biomedical, Metabolic and Neural Sciences, Medical School - University of Modena and Reggio Emilia, Modena, Italy, 2Environmental, Genetic and Nutritional Epidemiology Research Center (CREAGEN), Italy, 3Department of Biomedical, Metabolic and Neural Sciences, Medical School, University of Modena and Reggio Emilia, Modena, Italy, 4Department of Epidemiology, Boston University, United States, 5School of Public Health, University of California, United States

Background: The relation between alcohol intake and cognitive function risk has been established, especially for high levels of exposure. Conversely, the effects at low-moderate levels is still debated and the aim of this study is to characterize the dose-response relation between different degree of alcohol intake and cognitive decline and dementia. Methods: We carried out a comprehensive literature search in PubMed and Embase online databases for cohort and case-control studies investigating the association between alcohol intake on cognitive function. For study identification and selection, we will use the Rayyan open online-source program. Whenever possible, we will conduct a dose-response meta-analysis using the new one stage cubic spline mixed-effects model in order to evaluate the nonlinear relation of such association. According to inclusion criteria, we selected studies on human population with no major comorbidities (e.g., CVD, diabetes, immunological deficits and cancer) and without a diagnosis of dementia and MCI at baseline. Further exclusion criteria were binge drinking and alcoholism, in addition to articles in which no exposure dose was reported.

Results: Out of total 3676 articles, we excluded 951 duplicates and after title and abstract screening, we further excluded 2496 records to be subjected to a full-text evaluation, of the 266 resulting articles, we identified 20 eligible studies, with alcohol intake ranging from 0 to 50.4 g alcohol/day and 0 to 4.8 drinks/day. Conclusions: The study is currently ongoing; data extraction and prediction of the database for the dose-response meta-analysis will be presented at the Congress.

Trends in prevalence of multimorbidity in Mainland China: a systematic review and meta-analysis
Yang Zhao1∗, Yang Zhao2
1The George Institute for Global Health, Beijing, China
Background and Objective: Multimorbidity, the presence of two or more mental or physical chronic non-communicable diseases (NCDs), is a major challenge for the health system in China, which faces unprecedented aging of its population. To examine the prevalence and trends in multimorbidity among Chinese adults since 1990.
Methods: Studies regarding the prevalence of multimorbidity in Chinese people published since 1998 were searched in databases of CNKI, Wanfang, and PubMed, and so on. Meta-analysis was performed to calculate the pooled prevalence of multimorbidity based on random effects. Subgroup or Meta-regression analysis was conducted based on survey time, sex, areas, residence place, education level, marital status, and study quality.
Results: A total of 123 papers were included in the analysis, with 7 714 313 participants. The pooled prevalence of multimorbidity in Chinese people was 36.3% (95%CI: 32.8% ~ 39.9%). The pooled prevalence was higher in urban than in rural Chinese, and higher in women (36.2%, 95% CI:33.8% ~ 38.5%) than men (33.2%, 95%CI:30.9% ~ 35.5%), but the differences were not significant (P>0.05).
Between 1998-2019, the increase in multimorbidity did not follow the linear trend. Before 2004, the average prevalence showed 14.5%, with an annual increase rate of around 1.3%. Since 2014, the prevalence of multimorbidity was significantly higher than before (P<0.001). Age group difference was found (P<0.001), where the prevalence of multimorbidity for Chinese aged 60-79 years old was 38.1% (95%CI: 34.6% ~ 41.5%), followed by those aged 80 years and older, 40-59 years old, and younger than 40 years old.
Conclusions: The prevalence of multimorbidity in Chinese has been rapidly increasing since 2014, and is higher in those aged 60 to 80 years than in other age groups. Therefore, efforts and preventive strategies should be adopted for early screening of multimorbidity in high-risk groups.

Use of health services and physical activity: evidences from a population-based study with the elderly
Edige Santos1, Bruno Ferreira1, Elaine Oliveira1, Chester Cesar1, Camila Monteiro2, Mônis Goldbaum2
1Faculdade de Saúde Pública da Universidade de São Paulo Brazil, 2Faculdade de Medicina da Universidade de São Paulo Brazil
Background and Objective: Healthcare for the elderly represents a challenge for Health Services (HS) at global, national and regional levels. It is known that Physical Activity (PA) during leisure decreases the frequency of HS utilization, leading to a decrease in expenses and being able to help control utilization in public emergency situations. However, the influence that each PA domain can provide is still uncertain. Thus, the purpose of this study was to analyze how the different domains of PA and PA-Total are related to the HS utilization.
Methods: Cross-sectional data from 1019 participants of the Health Survey of the City of São Paulo-Brazil (ISA-Capital), aged 60 years or older (59.7% female; mean age 69.7 ± 7.7 years), were used. Respondents were classified in each domain of PA and PA-Total (IPAO-long) and HS utilization (preventively, emergency and hospitalization). For the relationship between the PA domains and time of use of the HS, Spearman’s correlation was used. Then, controlling for sociodemographic characteristics, lifestyle habits, quality of life and chronic diseases, using weightings for probabilistic and complex samples, Poisson regression analysis. Results: There was a positive correlation between HS-preventive with PA-Total (r=0.098; p<0.01) and HS-emergency with PA-Transportation (r=0.158; p<0.01). Thus, the more you practice PA (Total and Transportation) the frequency of HS utilization is decreased. When controlling the analysis, active in PA-total and PA-
Burden of diseases and costs attributable to dietary risk factors and excess weight in Brazil
Iris Eloah Machado1, Aline Siqueira Fogal Vegi1, Adriana Lúcia Meireles1, Mariana Carvalho de Menezes1, Mariana Santos Felisbino-Mendes2, Carla Eduarda Faustino Rocha1, Joche Silva Vieira Leal1, Larissandra Fonseca Guedes1, Luane Pinheiro Rocha2, Magda do Carmo Parajara1
1Universidade Federal de Ouro Preto, Brazil, 2Universidade Federal de Minas Gerais, Brazil

Background and Objective: Obesity and unhealthy eating are modifiable risk factors for chronic non-communicable diseases (NCDs), a serious public health issue in Brazil. Our objective was to estimate the burden of NCDs and the financial costs for the Brazilian Unified Health System (BUHS) attributable to a diet high in processed meats, sugary drinks, sodium, trans fats, and overweight in 2019.

Methods: The methodology included the estimation of population attributable fractions (PAF), obtained by the Global Burden of Disease 2019, whose parameters are intake of each dietary risk factor (RF), mean body mass index (BMI), size of the RF effect for each NCD, and level of exposure associated with lower mortality risk. The PAFs were multiplied by the DALYs (deaths and years of life lost, adjusted for disability) and hospitalization and procedure costs for treating NCDs, which were obtained from the BUHS Outpatient and Hospital Information Systems.

Results: Sodium intake was responsible for 30814 deaths (mortality rate per 100,000 - MR: 14.2) and 699119 DALYs (DALY rate per 100000 - DR: 322.7) in Brazil. The consumption of trans fats caused 12,616 deaths (MR: 5.8) and 29,905 DALYs (DR:138.0). Processed meat caused 5,494 deaths (MR:2.5) and 192263 DALYs (DR:88.7). The consumption of sugary drinks caused 7657 deaths (MR:3.5) and 233436 DALYs (DR:107.7). A high BMI was attributed to 177940 deaths (MR:82.3) and 5817595 DALYs (DR:2685.2). Regarding costs, US$57,163,245 were attributed to sodium intake, US$32711912 to trans fats, US$29017436 (MR:82.3) and 5817939 DAL Ys (DR:2685.2) in Brazil. The consumption of trans fats caused 12,616 deaths (MR:5.8) and 29,905 DALYs (MR:14.2) and 699119 DALYs (DALY rate per 100000 - DR:322.7) in Brazil. The consumption of sugary drinks caused 7657 deaths (MR:3.5) and 233436 DALYs (MR:82.3) and 5817595 DAL Ys (DR:2685.2) in Brazil. The consumption of trans fats caused 12,616 deaths (MR:5.8) and 29,905 DALYs (DR:138.0) in Brazil. The consumption of sugary drinks caused 7657 deaths (MR:3.5) and 233436 DALYs (DR:107.7) in Brazil. A high BMI was attributed to 177940 deaths (MR:82.3) and 5817595 DALYs (DR:2685.2) in Brazil.

Conclusion: Brazilian illnesses and the associated financial burden on the BUHS are strongly affected by the consumption of processed foods and being overweight. The estimates made emphasize how urgent it is to put policies, programs, and other initiatives based on evidence of health promotion and compliance into place and to strengthen them.

Level of physical activity in Belgrade
Svetlana Madlenovic Jankovic1, Gordana Tumbarkovski1, Aleksandra Andric1, Marija Markovic1, Andjelka Grujic1, Nevenka Kovacevic1, Nemanja Stefanovic1, Milena Jakovljevic1, Katica Tripkovic1, Gordana Belamaric1, Dusanka Matijevic1
1Institute of Public Health of Belgrade, Serbia

Background: Regular physical activity is one of major protective factors influencing individual health and contributes to prevention of leading non communicable diseases, quality of life, and wellbeing. Data has shown that 23% of adults worldwide do not meet the global recommendations on physical activity for health. Differences in level of physical activity are often related to age, gender and socioeconomic status. This study was aimed to assess level of physical activity among adult population in Belgrade.

Method: National health survey based on European Health Interview Survey methodology was implemented as cross-sectional study, in 2019, through two-stage stratified sample of 13.589 adult respondents and response rate of 97%. Data were collected by structured questionnaire administered by interviewer. Statistical analysis of data was performed for Belgrade region separately. Prevalence of physical activity in Belgrade was compared with national data in 2019 and data for Belgrade from national health survey in 2013. Results: About 20% of adult population in Belgrade practice sport or recreational activity at least 150 minutes per week, compared to 11% in Serbia and 12.5% in 2019. Sedentary activities at the workplace are common for 55% people in Belgrade compared to 41% in Serbia and 61.2% in 2013. Excessive sedentary style is common for 35% people in Belgrade and 23% in Serbia, most often among youngest and oldest adults, more educated and higher socio economic status. Average daily duration of sitting for adults in Belgrade is 5.8 hours and 4.7 in Serbia. Almost 90% of people in Belgrade recognize that regular physical activity is significant factor for their own health.

Conclusion: Although awareness about significance of regular physical activity is high among adult population in Belgrade, prevalence of everyday practice is lower than national data. Additional research is needed in order to identify factors affecting habits related to physical activity.

The relationship between hyperlipidemia and lifestyle factors among adults residing in Ajman UAE: a case-control study
Shatha Alsharbatti1, Maryam Alzaabi1, Dusanka Matijevic2, Milena Jakovljevic1, Katica Tripkovic1, Gordana Belamaric1, Nemanja Mansur1
1Gulf Medical University, Community Medicine Department, College of Medicine, Gulf Medical University, Ajman, UAE, United Arab Emirates, 2Directorate Medical Service, UAE, United Arab Emirates

Background: Hyperlipidemia is a significant public health issue, however, there is insufficient information on factors that can determine hyperlipidemia among residents of UAE.

Objectives: This study aimed to determine the association between hyperlipidemia and socio-demographic and lifestyle factors and to assess determinants of hyperlipidemia among the study population.

Materials and Methods: A case-control study was conducted during the period between January-May 2020, at a Teaching Hospital, Ajman. The study included 91 adults (41 cases and 50 controls) aged 20 years or above, both genders and all nationalities. Consecutive individuals attending the Laboratory Department were approached, those who had signed the informed consent were included. A researcher-administered questionnaire was used, blood samples were collected, and the lipid profile workup was done according to the laboratory standard procedures. IRB approval was obtained. The SPSS software (version 26) was used for analysis. Chi-square test, independent t-test and logistic regression analysis were used.

Results: The highest proportion of cases aged ≥35 years (87.8%); males (75.6%); Overweight (39.0%); Arab (61.0%); whose average income between 10000 -<20000 (51.2%); married (92.7%); Bachelor or higher level of education (92.7%) and employed (75.6%). The proportions of practicing unhealthy lifestyles were higher among cases than controls for smoking, cigarettes, waterpipe, special diet, and inadequate sleep. Significant associations were found between hyperlipidemia, age (p<0.009), marital status (p=0.007), and history of hypertension (p=0.045) and thyroid diseases (p=0.038). Significantly lower mean values of low-density lipoprotein (p<0.001), triglycerides (p<0.03) and total cholesterol (p<0.001) among cases compared to controls. Age was a significant predictor of hyperlipidemia. The predictors of hyperlipidemia were; age ≥35 years, having family history of hyperlipidemia and excessive dietary intake of sugar.

Conclusion: The significant predictors for hyperlipidemia are; Age ≥35 years, having family history of hyperlipidemia and excessive dietary intake of sugar.

Association between tooth loss and sociodemographic variables of older people attending community centers of a capital of the southeast region of Brazil
Maria Motto1, Adriana Aguari2, Caroline Thomès1, Ana Alvarenga1, Angelita Mansur1

Introduction: Demographic transition is a global phenomenon that reflects the growth of people reaching older age, due to increased life expectancy and a sharp fertility drop. Regarding longevity, it will depend on the opportunities that the health sector can provide to the individual during his/her life. The Objective: To identify an association between tooth loss and sociodemographic variables of older people attending Community Centers.

Methods: Analytical study with cross-sectional design, conducted in Vitória, Espírito Santo, Brazil, with data collection from February to April 2019, developed by three duly trained researchers. The participants were interviewed through structured scripts, previously used in other studies in Brazil, addressing sociodemographic aspects and oral health related factors, the final sample consisted of 402 participants. Descriptive analysis of the data was performed and organized in frequency tables with number and percentage for each of the items.
of the research instrument. The Chi-square test was used to evaluate possible associations. A 5% significance level was adopted. Results: The study showed a high prevalence of tooth loss in the older population. A 54% of the participants lost 11 or more teeth, the vast majority (95.8%) of them had lost at least one dental element. The molar was the most extracted tooth (94.8%), and caries disease was the main cause of tooth loss (69.9%). The factors associated with tooth loss were: gender (p=0.024), age group (p=0.000), schooling (p=0.000), and socioeconomic status (p=0.000). Conclusions: We identified that women, older than 70 years, with up to 10 years of schooling, belonging to classes C/D – E were more affected by tooth loss, evidencing sociodemographic characteristics as determinants of the health-disease process and portray health inequities in the country, since the disadvantaged are the most affected.

DOI: 10.18332/popmed/163882

The Territorial Operative Center: an innovative management for Assisted Hospital Discharges in the health district of Vignola, Modena, Italy

Riccardo Barbieri1, Federica Casoni2, Valeria Menabue1, Elena Righi1
1University of Modena and Reggio Emilia, Italy, 2AUSL Modena, Italy
Background: As part of the National Recovery and Resilience Plan (NRRP 2021), Mission 6 should provide for the creation of proximity networks, structures of intermediate care and telemedicine in order to improve territorial healthcare: these interventions, regulated by Ministerial Decree 77/2022, will lead to the strengthening and the implementation of Community Houses and Hospitals and to the development of Territorial Operative Centers (COT).
Objective: COT is an organizational model that performs a function of coordination of taking care of the patient and connection between services and professionals involved in different settings. The role of the COT is to facilitate transition from the hospital to the territory and to reduce the risk of readmission and improper use of Emergency Department.
Methods: In the health district of Vignola, COT highlights the importance of building an outlined process for taking care of frail patients on assisted hospital discharges (AHD). The management of this process should consider the peculiarities of territory, which is large and heterogeneous, characterized by both flat areas with high population density and mountainous regions with low population density. COT will be placed inside Vignola’s new Community House. An analysis of indicators related to the hospitalization of frail patients will be performed after the introduction of the COT, in order to evaluate its impact compared to the current model and to verify an improvement on AHD.
Results: COT’s functions on AHD would include:
* receive and decode reports from hospital;
* evaluate health needs through multidimensional assessment, identifying the most appropriate program for each patient;
* verify the start of the personalised program and monitor its progress over time.
Conclusions: The originality of this project is to evaluate the role of the COT in the improvement of frail patient’s journey. If the effectiveness were confirmed, this project should be standardize at the provincial level.

Workplace gender harassment, illegitimate tasks, and poor mental health: hypothesized associations in a swedish cohort

Aziz Mensah1, Susanna Toivanen2, Martin Diewald3, Mahmood Ul Hassan4, Anna Nyberg5
1Mälardalen University Sweden, 2Mälardalen University, 3Bielefeld University Germany, 4Stockholm University Sweden, 5Uppsala University
Background: Workers exposed to gender harassment and illegitimate tasks may experience adverse mental health outcomes such as depression and burnout. However, the longitudinal effects and the complex interrelationships between these variables remain largely unexplored. We therefore investigated the cross-logged relationships between gender harassment, illegitimate tasks, and mental health outcomes among working adults in Sweden over a period of two years, as well as the gender differences in the cross-logged effects. Additionally, the study examined whether illegitimate tasks mediated the relationship between gender harassment and negative mental health outcomes over time.
Method: Data were drawn from the Swedish Longitudinal Occupational Survey of Health (SLOSH), covering 2796 working men and 4110 working women in a two-wave analysis from 2018 and 2020. We employed a structural equation model to examine the cross-logged effects and the mediating effect between gender harassment, illegitimate tasks, and mental health outcomes over time. Furthermore, we applied a multigroup analysis to determine gender differences in the cross-logged effects.
Results: The results showed statistically significant cross-logged (i.e., forward, reverse, and reciprocal) relationships between gender harassment, illegitimate tasks, and mental ill-health (i.e., burnout and depression). There were statistically significant gender differences in these cross-logged relationships (burnout: 247=106.21, p < 0.01; depression: 247=80.5, p < 0.01). Initial but not later illegitimate tasks mediated the relationship between gender harassment and mental ill-health outcomes over time.
Conclusion: The gender differences in the interrelationships between gender harassment, illegitimate tasks, and mental ill-health outcomes among workers in Sweden indicate that policies, regulations, and interventions that address these exposures in organisations must be tailored to benefit both men and women.

Work history as a life course socioeconomic position and its association with depression in mid to later adult life: a systematic review of the evidence

Eun Kim1
1University College London United Kingdom
Background and Objective: Given the challenging economic climate during the past decades, the ageing workforce around the world are more likely to have held multiple lifetime occupations and employments. Thus, the longitudinal observation of an individual’s composite work and employment trajectories over lifetime can be considered a potential SEP that can explain the mid- to later life inequalities in depression. Yet, the systematic evidence is limited. Here, I present the systematic evidence for the life course work history as an SEP and its association with depressive symptoms of older adults.
Methods: Results were identified from five electronic databases, which were searched to identify studies from the wider discipline as well as epidemiology. Studies that examine the effect of varying labour force participation pattern over lifetime on later adult life depressive symptoms were identified. The four search concepts were: Concept 1 (Older adults, Age 45+, Midlife to later life), Concept 2 (Depression, depressive symptoms), Concept 3 (Employment history, labour force participation, employment status, adverse career characteristics), Concept 4 (Longitudinal analysis, life course analysis).
Results: The search found 12,166 studies meeting the eligibility criteria, of which 7,008 studies were screened based on their titles, and of which 427 studies screened on their abstracts. 270 full-text articles were assessed for eligibility after screening, and 47 studies were quality assessed based on the risk of bias tool that was derived from the various checklists and criteria used in other systematic review.
Conclusion: Results suggest that lifetime employment continuum has an impact on the depressive symptoms of older adults, and policy strategies that target populations with specific course of employment history is needed, especially in the treatment of depression.

Epidemiology of abdominal obesity among adults in rural and peri-urban Bangladesh

Mohammad Rahman Sarker1, Md Rahman2, Michiko Moriyama3, Mohammad Chisti1, Shalkia Banu4, Taiyaba Ananta5, ASG Faruque6
1Technical Training Unit, icddr,b, Dhaka, Bangladesh Bangladesh, 2Graduate School of Biomedical and Health Sciences, Hiroshima University, Japan, 3Nutrition and Clinical Services Division, icddr,b, Dhaka, Bangladesh Bangladesh, 4Govt. College of Applied Human Science, Dhaka, Bangladesh Bangladesh
Background and Objective: Bangladesh is experiencing fast epidemiologic and demographic shifts, as well as changes in lifestyle, food, and physical activity. A small number of researches on abdominal obesity have been carried out in Bangladesh, most of which involved hospital-based and urban populations. We conducted this study to investigate the prevalence of abdominal obesity and its associated factors among rural and peri-urban Bangladeshi populations.
Methodology: This cross-sectional study was conducted in the Mirzapur subdistrict of Bangladesh during January to June 2020. Adult participants were randomly selected from the Demographic Surveillance System (DSS). Interview using a semi-structured questionnaire, physical examination, and anthropometric measurement were done followed by blood and urine testing. According to the World Health Organization, a waist circumference of 94 cm in men and 80 cm in women was considered abdominal obesity.
Results: The DSS enrolled 928 patients; 872 (94.0%) of them completed the study
procedure and were included in this analysis. The overall age in years was 48.2 with a standard deviation of 16.4. Prevalence of abdominal obesity was 39%. In multivariable analysis, significant positive associated factors for prevalent abdominal obesity included those aged ≥46-years (adjusted odds ratio (aOR) 2.72; 95% confidence interval (CI) 2.1-6.13), hypertension (aOR 1.18; 95% CI 1.28-2.76), hypertriglyceridemia (aOR 2.22; 95% CI 1.49-3.31), female (aOR 7.99; 95% CI 3.59-17.87). Negative associated factors included undemutrition (aOR 0.03; 95% CI 0.01-0.09), present smoking tobacco user (aOR 0.59; 95% CI 0.38-0.92) and having no formal schooling (aOR 0.58; 95% CI 0.38-0.89).

Conclusion: Our findings reveal that patients living in rural and peri-urban areas have a higher prevalence of abdominal obesity, in which age ≥46-years, hypertension, hypertriglyceridemia, and being female have a significant role. Policymakers should step up intervention to reduce abdominal obesity in light of the significant association.

**Method:** A qualitative design was applied. Data was generated from semi-structured interviews using a pilot tested interview guide. A purposeful sampling from patients included in the intervention ‘Rehabilitation of Life’ was selected. In total 18 hip fracture patients were interviewed until data saturation. A qualitative content analysis was guided by Graneheim and Lundmans concept.

**Results:** The analysis resulted in five themes, which the participants emphasized as important to their rehabilitation: Getting information and care when hospitalized, rehabilitation and how it could help the patients to remain active and being able to regain control over their everyday life in light of the prevalence of the frailty syndrome. Data are from the Longitudinal Study of Adult Health (ELSA-Brasil), a multicenter cohort of Brazilian civil servants. Frailty phenotype was defined with five criteria: fatigue, low physical activity, unintentional weight loss, slow walking speed and low handgrip strength. The presence of one or two of these criteria indicated a pre-frailty condition, and the presence of three or more indicated a frailty condition. The glycemic levels clusters had its defined through cluster analysis considering the HbA1c measurements in the three waves of the study: baseline: 2008-2010; wave 2 (2012-2014) e wave 3 (2017-2019). Data from 4,649 participants aged > 60 years were included. From the cluster analysis, 4 clusters of glycemic levels were identified (HbA1c 5.4% and 6.6% and 8%). Associations were estimated using multinomial regression models (crude and adjusted for sociodemographic variables and for hypertension). Compared to the elderly classified in the “HbA1c”.

**Background:** The consequences of a hip fracture has been well documented and already identified to increase the quality and safety of care of this target group of patients.

**Methods:** We evaluated data of ED accesses for >75 years old (first 9 months of 2021 vs first 9 months of 2022). Results: In 2021, accesses were 2077, for a total of 21% admissions. In the same period of 2022, accesses were 2200, for a total of 17% hospitalizations. Analysis of the data showed:

- of accesses in patients ≥75 years old;  
- % of total accesses vs % accesses ≥75 yr old (13.3% in 2021 vs 13.70% in 2022);  
- % of home discharges (74% in 2021 vs 76% in 2022);  
- reduction:  
  - of the % of hospitalizations (21% in 2021 vs 17% in 2022);  
  - of the length of stay in the PS for orange, blue and green codes;  
  - of admission days (faster and more correct clinical framing in the ED);  
  - of the behavioral disorders that often accompany hospitalization.

**Conclusion:** The shared, facilitated and multidisciplinary approach to the frail elderly patient, has improved the outcomes considered by facilitating hospital pathways. We aim to continue monitoring of outcomes, to continue assistance to the frail elderly with the support of telemedicine and teleconsultation by collaborating with the the GP’s (e.g. schedule meeting) and to increase the prescription of specialist follow-up.

**Translation, cross-cultural adaptation and content validity of the model disability survey for the Brazilian population**

Núbia Lima1, Núbia Lima1, Denise de Araújo2, Erika Silva, Amanda Medeiros3, Shamyr de Castro4, Indyara Morais5, Carla Sabariego6, Rodrigues Santos7, Romário Fonseca8, Dellis Almeida9, Monalisa França10, Ubiratan Junior1, Karoline Monteiro1

1UFRN - Federal University of Rio Grande do Norte UFRN - Federal University of Rio Grande do Norte Faculty of Health Sciences of Trairi, Federal University of Rio Grande do Norte, Vila Trairi St, 435, 350, Centro, Santa Cruz, 59200-000, Rio Grande do Norte, Brazil. Brazil, 2UFRN - Federal University of Rio Grande do Norte, 3Federal University of Ceará, ‘Universidade de Brasilia (UnB) University of Brasilia (UnB) UnB - Brasilia, DF, 70910-900, Brazil. Brazil, 4University of Lucerne - Lucern University of Lucerne Frohburgstrasse 3, 6002 Luzern, Switzerland Brazil. Background: Although morbidity and mortality are important, health indicators related to functioning should also be incorporated into Brazilian data collection.
systems. In this sense, the world health organization designed the model disability survey (mds) based on the biopsychosocial model of the international classification of functioning, disability, and health (icf).

Objective: To translate, cross-culturally adapt and analyze content validity of the Brazilian version of the mds.

Methods: This cross-sectional was conducted in five steps: initial translation, synthesis of translations, back-translation, review by an expert committee, and pre-test. For the pre-test, we included people of both sexes aged over 18 years, with or without disabilities and formal education, and with cognitive ability to answer the survey.

Results: Mds was considered with 474 items, and 1,896 analyzes were performed according to four equivalences. Of these, 17.25% were partially adequate and inadequate by specialists. A total of 160 items were discussed with other members of the committee. In the pre-test, 22 interviews were conducted in rio grande do norte (73.3%), four in ceará (13.3%), and four in paraíba (13.3%), with an average duration of 123 minutes. The target audience was 30 participants, single, young adults, self-declared black or brown, with at least technical education. Most were active workers and lived and lived with their family members. Out of one hundred twenty-seven health conditions cited, the most frequent were anxiety and back pain/herniated disc. Answers were analyzed and 63 items needed adjustments; however, only two were sent to the expert committee because they presented a content validity index of 0.80.

Conclusions: The mds instrument was translated into Portuguese, cross-culturally adapted for the Brazilian population, and presented adequate content validity. The Brazilian version was entitled mds-Brazil.

Language and functioning by icf and slp group intervention: giving voice to people with parkinson disease, a Brazilian experience

Regina Chun1, Amanda Zerbeto1, Thais Piccoli1
1University of Campinas (Unicamp) Brazil

Background and objective: Parkinson Disease (PD) is a chronic progressive neurodegenerative disease characterized by motor impairments and communication difficulties. The International Classification of Functioning, Disability and Health (ICF/WHO) allows studying the functioning of people with PD. The aim is to investigate language, functioning in PD and the effects of group speech-language pathology (SLP) intervention on the perception of the people with PD, taking the ICF as a conceptual basis.

Method: Cross-sectional research, approved by the Ethics Committee, with 10 participants with PD, in SLP group at a specialized care center in Brazil. An interview script and a self-administered questionnaire were developed to collect self-perception in the 33 ICF categories, answered by the participants in three group meetings, approximately 35 minutes each, with the researchers, videotaped. Experience in the ICF classified the answers in the same categories. To establish a reference parameter, SLP with experience in the ICF (judges) classified the answers in the same categories.

Results: The participants indicated impairments in Body Functions (voice, articulation, fluency and rhythm of speech, involuntary movements), difficulties in Activities and Participation (speech, conversation, fine use of the hand, walking, dressing, performing household chores, and recreation and leisure) and barriers in Environmental Factors. In 60% of the cases, the agreement between participants and judges was slight, in 30% it was fair, and in one case (10%) it was strong.

Conclusion: The results regarding the functioning of people with PD in their perception assume an original character, giving voice to the people themselves, in addition to bringing important subsidies for person-centered care, expanding the biomedical vision centered on the disease, for a biopsychosocial approach proposed by the ICF/WHO.

DOI: 10.18332/popmed/164494

Hospitalizations for malnutrition in Brazilian older adults

Mayara Araújo1, Thaiza Nobre1, Vilani Nunes1, Adriana Oliveira2, Felismina Mendes1, Gilson Torres1
1Federal University of Rio Grande do Norte Brazil, 2Catholic University of San Antonio of Murcia Spain, 3University of Évora Portugal

Background and objective: Some conditions are considered sensitive to primary health care (PHC) as nutritional deficiencies, and it is an indicator of access and the quality of care offered in the PHC. This study aimed to describe malnutrition hospitalizations in Brazilian older adults and to verify the temporal evolution of hospitalizations in the five regions.

Methods: This is a descriptive and ecological study of time series, based on secondary data obtained from the System of Health Indicators and Monitoring of Older Adults Policies (SISAP-Older adults). We used data referring to 2000 to 2019 regarding hospitalizations due to nutritional deficiencies considered avoidable that include the categories E40-E46 and E50-E64 of ICD-10, in men and women aged 60 to 74 years in five Brazilian regions. Data were analyzed descriptively using the software Microsoft Excel®.

Results: There were 232,592 malnutrition hospitalizations in Brazilian older adults between 2000 and 2019, and we observed a decrease of 44.6% in the number of hospitalizations. The Southeast and Northeast regions had the highest number of hospitalizations, corresponding to 46.5% and 30.2%, respectively. The North region showed an increase of 16.6% in the number of hospitalizations, while the Center-West region showed a reduction of 52.7%. Regarding gender, 59.5% of hospitalizations were male. The Southeast region concentrated the highest number of hospitalizations for both sexes, 43.3% of women and 48.7% of men. A greater reduction was observed in women's hospitalization in the Northeast region (-58.5%) and men in the Midwest region (-52.2%).

Conclusion: A tendency to decrease malnutrition hospitalizations was observed in Brazilian older adults. Although, health actions are needed to strengthen food and nutritional surveillance in primary health care to reduce the risk of hospitalization in the older population.

DOI: 10.18332/popmed/164319

Changes in physical activity and perception of weight gain during covid-19: elsa-brasil cohort

Maria Bisi Molina1, Jordana Siqueira1, Carla de Oliveira Aprilini2, Haysla Martins1, Taisa Sabrina1, Maria Bisi Molina1
1Federal University of Espirito Santo Brazil, 2Federal University of Espirito Santo

Background and objective: The COVID-19 pandemic led to social isolation as a non-pharmacological intervention measure. Despite being an effective strategy for reducing transmission of the disease, research has indicated the occurrence of changes in lifestyle and negative repercussions on the health of populations. The objective was to associate changes in physical activity and the perception of weight gain during the COVID-19 pandemic in ELSA-Brasil.

Methods: Longitudinal study using the second follow-up of the cohort (2017-18) and Ónda-COVID (2020-21) that included civil servants residing in 5 Brazilian capitals. Socioeconomic and lifestyle data were collected. Leisure-time physical activity (LPA) was measured using the International Physical Activity Questionnaire, converted into multiples of metabolic equivalents (METS/week) and classified into tertiles of change. The association between changes in LPA and perceived weight gain was verified by obtaining crude and adjusted odds ratio estimates and 95% confidence intervals using binary logistic regression.

Results: The final sample consisted of 3,940 individuals, 58.8% women. Participants who reported weight gain had lower mean age, diet quality and LPA, and higher mean body mass index. When analyzing the LPA change delta between assessments, there was a reduction in the mean METs/week in both genders (p<0.001). Being in the low tertile of LPA change increased the odds of perceived weight gain by 1.5 (95% CI 1.04-1.45) and 1.6 95% (CI 1.04-1.45) times among women and men, respectively.

Conclusion: Women and men in the lowest tertile of LPA change were more likely to perceive weight gain during COVID-19.

DOI: 10.18332/popmed/164322

Preliminary data of the model disability survey in Brazil: functioning module

Denise de Araújo1, Núbia Lima1, Gyovani Lima1, Liane Macedo1, Aline Fernandes1, Shamy de Castro2
1UFRN - Federal University of Rio Grande do Norte Faculty of Health Sciences of Trairi, Federal University of Rio Grande do Norte, Vila Trairi St, 435, Centro, Santa Cruz, 59200-000, Rio Grande do Norte, Brazil, 2UFRN - Federal University of Rio Grande do Norte, Federal University of Ceasar

Background: The model disability survey (mds) is a tool based on the biopsychosocial model and aims to measure functionality and human disability. The mds-brasil module (4000) has topics related to peoples ability and performance to carry out daily activities considering physical, psychological and socio-environmental conditions.

Objective: To describe data from the pre-test phase of module 4000 (functionality) of the model disability survey brasil (mds-brasil) instrument.

Methods: This study included 30 individuals residing in northeastern Brazil, with
Trata-se de um estudo descritivo de corte transversal. A amostra contém 65 indivíduos diagnosticados com TEA no Brasil, com idade entre 18 e 25 anos, e a maioria do sexo masculino, com pelo menos uma comorbidade e renda familiar mensal inferior a 1.128 USD. O WHODAS 2.0 avalia a funcionalidade e a incapacidade nos domínios da cognição, mobilidade, autocuidado, convivência, atividades da vida e participação. Além disso, dados sociodemográficos e clínicos foram coletados por meio de uma pesquisa semiestruturada.

Resultados
A média amostral (m) para funcionalidade foi de 49,84 com desvio padrão (dp) de 17,4. Do maior para o menor, os escores de funcionalidade/incapacidade por domínio foram: convivência (m:66,9; dp:22,2), atividades da vida (m:53,7; dp:23,8), participação (m:56,4; dp:20,0), cognição (m:48,7; 18,5), autocuidado (m:27,2; dp:22,4) e mobilidade (m:33,1; dp:23,4). A correlação cruzada entre os domínios foi positiva e maior entre os domínios de participação e outros.

Conclusão
Os resultados sugerem que o nível de participação está relacionado com a funcionalidade na convivência, atividades de vida e domínios da cognição. A deficiência em todos os domínios está alinhada com o comprometimento cognitivo e comportamental e de comunicação dentro do TEA. Esses achados são importantes para o melhor delineamento de políticas de saúde e podem contribuir para promover uma melhor assistência à saúde de pessoas com TEA no Brasil e em outros países semelhantes.

The actions performed by the sesc women’s health team to the city of Conceição de macabu, in a partnership between sesc and the city hall
Thais Madeira¹, Andrea Bizzo², Suzana Santos³, Denise Anjos¹
¹Sesc Rio Brazil, ²Sesc Rio, ³Sesc RJ Brazil

It was held from January to April 2022, in Conceição of Macabu - Rio de Janeiro. The objective is to report the data and experience of the SESC Womens Health Project with the local population. The project offered joint actions, with: mammography exams, preventive exams and Health Education.

The report was built from the activities experienced by the Women's Health team, whose results were apprehended through a questionnaire, to identify, plan and execute health actions based on local norms. We started with a quantitative investigation, allowing us to evaluate the data obtained through the questionnaires.

The next step was the qualitative method, which related the data to the initial investigation.

Total assistance in Health Education: 883; mammography exams: 1029; preventive exam: 412. After data collection, we noted that among the women who underwent mammography, 43.15% declared having Systemic Arterial Hypertension (SAH), surpassing the 33.82% who said they did not have SAH. 23.03% did not answer and did not know. Age, skin color, among others, were also evaluated so that we could profile the women assisted.

From the data obtained through the questionnaires, meetings and examinations carried out, we realize the importance of the SESC Womens Health Project, serving the local population and collecting data that can help them to implement effective prevention practices and change habits, provide improvements in womens quality of life.

The actions carried out were fundamental contributions to prevent and encourage health care, allowing the elaboration of practices, guiding women and helping them in the dissemination of knowledge. It is important to draw attention to the high rate of hypertensive women, and with the continuation of the study, a brief evaluation of the effectiveness of the actions developed is expected, verifying the profile and health habits, to expand access to public health services in a region.

The actions carried out were fundamental contributions to prevent and encourage healthy behaviors, allowing the elaboration of practices, guiding women and helping them in the dissemination of knowledge. It is important to draw attention to the high rate of hypertensive women, and with the continuation of the study, a brief evaluation of the effectiveness of the actions developed is expected, verifying the profile and health habits, to expand access to public health services in a region.

Towards a just transition: enabling older populations to mitigate the impact of climate change and maintain wellbeing
Sally Davis¹, Sadiq Bhanbhro², Mei Fang³, Andrew Sixsmith⁴
¹Advanced Wellbeing Research Centre, Sheffield Hallam University, United Kingdom, ²Centre for Applied Health and Wellbeing Research, Sheffield Hallam University, United Kingdom, ³School of Health Sciences, University of Dundee, United Kingdom, ⁴Department of Gerontology, STAR Institute, Vancouver, Canada
Background and Objective: The COVID-19 pandemic demonstrated the vulnerability of older adults through the number of excess deaths across the globe. However, this finding has also demonstrated the importance of building resilience in older communities and has shown the strength, and capacity of older people although this varies widely across geographies, and social and economic determinants. There is now a need to re-imagine the response to social and environmental challenges that older adults perceive by older adult populations. The just transition is a reference to systems thinking required to engage and enable older populations and communities to de-carbonise, contribute to greener living solutions and participate fully in sustainable development of communities and cities, especially in relation to digital technology as an enabler to health and wellbeing. AGE WELL is a unique Canadian network that brings diverse stakeholders together to develop technologies and services for healthy aging and the Advanced Wellbeing Research Centre (AWRC) in the UK is developing implementation methods that focussed on population health, wellbeing, and reducing inequality and the impact of climate change. Combining expertise and experience of both these internationally reputable organisations and its members, the aim of the workshop is to identify capability and assets for further transformative learning and research that recognise the environment as a prerequisite to living well in old age and is based on UN Sustainable Development Goals and ecocentrism. Methods: This workshop will use appreciative inquiry (AI) to identify assets through questions and dialogue that help participants identify how older populations and communities, organisations, or households understand the causes and consequences of climate change. AI is based on a recognised process (the 40’s model) to enable constructive critical thinking and clarity about opportunities for social and policy development. Reference will be made through different scenarios, to climate change and climate shocks in the global south and to variation in social and economic determinants that differentiate older adult circumstance and environmental impact. Results: The workshop will identify a ‘minimum-specification’, a vision and set of principles by which researchers and public health professionals will engage with older populations and to identify mechanisms and outcomes for environmental and social sustainability. This can related to a range of continuing participation in communities and households and user need including health and care services. The outcome of the workshop will be shared across participants’ networks and published as an implementation strategy for research that implements the just transition for and with older adults. We hope to foster academic networking and further academic collaboration on digital and technological development for population wellbeing. Conclusions: The workshop aims to contribute to support transformative transdisciplinary research that enables implementation and informs planetary and public health and wellbeing. The focus on assets and whole systems approaches that promote inclusion and participation are aligned to the minimum requirements for the social and environmental determinants of health alongside clean air, safe drinking water, sufficient food and secure shelter in old age. Popul. Med. 2023;5(Supplement):A96 DOI: 10.18332/popmed/165474

Epidemiological transitions in a life-course perspective: challenges and opportunities for healthy ageing Daniela Suito1,2, Gianantonio Mosconi2, Laura Cucinella1, Giacomoz Vigezzi2
1Department of Sociology and Social Work, Universitaetia Alexandru Ioan Cuza, Romania, 2ECU2 Alliance, Romania, 2Department of Public Health, Experimental and Forensic Medicine, Università degli Studi di Pavia, Italy

Population ageing is perceived as both a challenge and a social problem at worst. Since health trends show increasing disparities, understanding epidemiological transitions and exposures (i.e., social, environmental and biological factors) that summing up across life affect the chance of healthy ageing is a crucial aim for health professionals and researchers. Being able to detect early markers of physiological compensation and social or behavioural adaptations offers opportunities for timely interventions to optimise health promotion and prevention. The workshop will be structured as follows. First, an integrative life-course approach, its challenges and opportunities will build the ground of the presentation. Based on the activity of the ECU2 Alliance Virtual Institute for Good Health and Well-being, a comparative approach of the targets associated with the UNSDG3 will stress the protective and risk factors for significant stages of life. Associated social and economic determinants will be envisaged as challenges and opportunities in national and European contexts. By mirroring strengths and weaknesses, the presentation will invite the audience to open the integrative lens in approaching epidemiological transitions. Secondly, we will present data exploring the impact of leaving parents’ homes and starting University for young adults. Using a cross-sectional online survey on university careers, behavioural risk factors, and psychological well-being using validated scales, we investigated students’ health status changes. From a 1500-sample, we appreciated the associations between mental health and health behaviours with the final aim of promoting positive adaptations during this phase, which may significantly impair young adults’ future health status. In the third session, we will focus on the role of reproductive deadlines in women as modulators of future well-being and opportunities to implement primordial preventive strategies for healthy ageing. Reproductive history, including menstrual pattern, pregnancy complications, menopause timing and duration of reproductive lifespan, offers valuable information to individualise risk assessment in a gendered-oriented approach. In this view, we will report data exploring the impact of reproductive history on cardio-metabolic health in a sample of midlife women transitioning through menopause, highlighting the importance of the reproductive fil rouge in modulating health and diseases in a life-course perspective. The fourth panelist will open up with the health impact of the transition to retirement, which results in a complex set of adjustments, posing both threats and opportunities for physical and mental health. Health behaviours and mental health changes appeared to be among the most relevant mediators affecting life years after the withdrawal from work. Exploring different databases (e.g., SHARE, INAPP Plus), we collected original data to evaluate labour and retirement-associated determinants’ role in the well-being of European populations of older age. In the final session, we will discuss the most relevant methods to bring together experts with topic knowledge on ageing, will provide answers on how to design a culture for well-being across the whole lifespan and how to conduct assessments and measure success. In the end, we will engage in a fruitful discussion with the audience on the data presented and practical public health implications, exploring how they can inform critical policy debates addressing evidence-based prevention strategies for healthy ageing at the global level. Popul. Med. 2023;5(Supplement):A97 DOI: 10.18332/popmed/165687

Supporting antimicrobial stewardship improvements in a Zambian rural health post through education and digital training
John Gannon1, Kerry Greenan1, Eleanor Richards2, Tom Neale3, Fiona Neale4, Olivia Duffy5, Hannah Raval1, Elizabeth Hill1, Eunice Sinyemu1, Ben Margetts1, Rachel Lynch2
1On Call Africa, World Federation of Public Health Associations, Ireland, 2On Call Africa, United Kingdom, 3On Call Africa, Zambia

Background and Objective: Overprescribing of antibiotics in rural low-resource healthcare settings in Sub-Saharan Africa is common. Volunteers with a non-governmental organisation (NGO) in Zambia’s Southern Province created and delivered interventions in partnership with local healthcare staff, with the aim of sustainable improvements in antimicrobial stewardship in a rural health post which serves 25,000 people.

Methods: Antibiotic usage in clinics was measured at three intervals over 16 months (April 2021, March 2022, August 2022). Chart reviews evaluated improvement in antibiotic stewardship and antibiotic resistance (translated to local language Tonga) and a summary of the Zambian Standard Treatment Guidelines. Staff were also trained to use a new digital record management system using a tablet device, with offline and online functionality and linked with the District Health Office, aiming to improve consistency of medication supply.

Results: A total of 340 consultations were reviewed over the three audits (240, 50 and 50). Ratio of overprescription (antibiotics prescribed: indicated) reduced from 212/59 (3.5:9) to 33/11 (3:1) to 25/9 (2.78:1). Correct antibiotic choice varied from 14/59 (25.9%) to 1/11 (9%) to 3/9 (33%).

Conclusions: There was a steady decline in antibiotic misuse following mentoring and educational interventions. Incorrect choice of antibiotic was mostly reported as due to severe lack of medication availability. A key challenge will be continued implementation of antibiotic stewardship standards and reducing stockouts in this Zambian health post without ongoing oversight from the NGO. Findings can inform implementation of similar projects in other rural low-resource healthcare settings. Popul. Med. 2023;5(Supplement):A98 DOI: 10.18332/popmed/164902

Dispense of non-prescribed antibiotics without prescription from pharmacies in Jhelum: a cross-sectional survey

70
Saeed Ahmad, Fahmeeda Iridees
Health Services Academy, Islamabad, Pakistan

The main power source for antibiotics is local pharmacies. Our goal was to evaluate the expertise of pharmacy employees and the distribution of non-prescription antibiotics. In Punjab, Jhelum, we carried out a cross-sectional study from April 2022 to July 2022. We employed a conscience, structured, pretested, and authorized systematic literature search performed statistical analysis using chi-square tests. The study received responses from 100 pharmacy wholesalers in total (95%); 69.4% of them were male and between the ages of 20 and 50. The majority of participants about 34.9% had a high knowledge of using antibiotics. The most common class of antibiotics given out without a prescription was nitroimidazole. The distribution of injectable and widespread antibiotics may represent a risk to the ability to treat infections. The distribution of antibiotics without a prescription is related to staff knowledge deficiencies. This improper practice has to stop right away.

Group B Streptococcus maternal colonization, vertical transmission, serotype distribution and antimicrobial resistance pattern in sub-Saharan Africa: a systematic review and meta-analysis
Minyahi Boltena,2
1Armauer Hansen Research Institute, Ministry of Health, Ethiopia, 2Center for Evidence Based Health Care, Institute of Health, Jimma University, Ethiopia

Background: Although GBS associated maternal, perinatal, and neonatal mortality and morbidity disproportionately affected sub-Saharan Africa, a comprehensive data on GBS are limited in the region. Therefore, we performed a systematic review and meta-analysis that aimed to estimate the prevalence of maternal colonization, vertical transmission, serotype distribution and antimicrobial resistance pattern of GBS isolates in sub-Saharan Africa. Methods: This systematic review was done according to Preferred Reporting Items for Systematic Reviews and Meta-analyses (PRISMA) guidelines. MEDLINE/PubMed, CINAH (EBSCO), Embase, SCOPUS, Web of Sciences databases, and Google Scholar were used to retrieve both published and unpublished articles. Two independent reviewers (FW and MTB) screened titles and abstracts and double-checked by a third reviewer (EH). The authors used STATA software version 17 for analysis of the selected articles. Forest plots using the random-effect model were used to present the findings. The heterogeneity was assessed using Cochrane chi-square (I²) statistics, while Egger intercept was used to assess publication bias.

Results: This systematic review and meta-analysis included 58 studies that fulfilled the eligibility criteria. The pooled prevalence of maternal RV and vertical transmission of GBS were 16.06 [95% CI (13.94-18.30)] and 43.31% (95% CI: 30.75-56.32) respectively. The highest pooled proportion of antibiotic resistance to GBS was observed in Gentamycin, i.e., 45.58(4.12-91.23), followed by Erythromycin, i.e., 25.11(16.70-34.49). Nonetheless, the lowest antibiotics resistance was observed in Tetracycline, i.e., 0.10(0.00-0.26). None of the responder thought that this approach encouraged illogical antibiotic use, and partial (58.0%) thought that antimicrobial resistance was a problem for public health. Only 58.0 % of respondents said they advised patients to seek medical advice before using antibiotics, and 19.1 % said their dispensing procedures minimized the financial patients burden. A little over 44.0 % of pharmacy owners claimed to be knowledgeable about using antibiotics. The most common class of antibiotics given out without a prescription was nitroimidazole. The distribution of injectable and widespread antibiotics may represent a risk to the ability to treat infections. The distribution of antibiotics without a prescription is related to staff knowledge deficiencies. This improper practice has to stop right away.

Digital intervention on the knowledge regarding anti-microbial resistance amongst the school-going adolescents: a non-randomized controlled study
Sweety Jha1, Arista Lahiri2,3, Arista Lahiri, Madhumita Dobe3
1Dr BC Roy Multi Speciality Medical Research Centre, Indian Institute of Technology Kharagpur, Kharagpur, India, 2Indian Institute of Technology Kharagpur, India, 3Dr. B. C. Roy Multi-Speciality Medical Research Centre, India, ‘Medical Research Centre, Indian Institute of Technology Kharagpur, Kharagpur, India, ‘Foundation for Actions and Innovations Towards Health Promotion, Bidhannagar, India

Background and Objective: Emerging and crucial public health issues like Antimicrobial resistance (AMR) need special attention amongst the general population, especially adolescents since it is not typically a part of the school curriculum but is essential for a healthier society. The current study aimed to determine the awareness, knowledge, attitude, and beliefs towards antibiotic use and its proper dispensing amongst secondary school students in India. The study was performed in two phases: Phase 1: Baseline survey Phase 2: Intervention with AMR education. This study explored the knowledge regarding AMR among school-going adolescents. Methods: A non-randomized controlled interventional study was conducted among school-going adolescents aged 15–18 years (standard 9th–12th). In the intervention and control groups, 429 and 428 students were recruited, respectively. An online module-based intervention package comprising a booklet and interactive lectures to improve knowledge of anti-microbial resistance was implemented. A pre-tested and validated questionnaire containing ten multiple-choice questions with a single correct answer (maximum total score of 10) was used in the baseline and the follow-up survey. Generalized linear models assessed the effectiveness of the intervention considering the baseline and the follow-up observations.

Results: The mean age of the intervention and control groups were 15.52 (±1.25) years and 15.51 (±1.18) years, respectively, and 72.20% and 68.53%, respectively, were females. Following the intervention, the participants in the intervention group had a statistically significant improvement in their knowledge regarding AMR. Adjusting for the effects of age, gender, and baseline knowledge, the intervention group had a relative risk of 1.17 (95% confidence interval) for scoring at least 5 and 1.26 (1.24 – 1.28) for unit improvement in score in the post-intervention assessment.

Conclusions: School-going adolescents are often the gateway to enlightening society with new knowledge and healthy habits. After the intervention, there was an improvement in the knowledge of the intervention group. Designing an effective school-based intervention package regarding AMR is essential. Intervention at an early age in this regard is critical to building a healthier society.

Attitudes towards use of high-importance Antimicrobials–a cross-sectional study of Australian veterinarians
Anna Sri,1 Kirsten Bailey,1 James Gilkerson,2 Glenn Browning,1 Laura Hardefield1
1Asia-Pacific Centre for Animal Health, University of Melbourne, Australia, 2Asia-Pacific Centre for Animal Health, University of Melbourne, Melbourne, Australia

The timely implementation of antimicrobial stewardship interventions could delay or prevent the development of higher levels of antimicrobial resistance in the future. In food-producing animals in Australia, high-importance antimicrobials, as rated by the Australian Strategic and Technical Advisory Group (ASTAG), include virginiamycin and third-generation cephalosporins (in individual pigs or cattle). The use of high-importance antimicrobials in companion animals is more widespread and less regulated. There is also potential for more rapid development in prescribing and guideline compliance in these areas of practice because much of the current use of high-importance antimicrobials is not guideline compliant and other treatment options are readily available. These sectors have also not traditionally been the focus of significant educational, public or regulatory pressures to reduce unnecessary antimicrobial use. There is no national antimicrobial use surveillance system for animals in Australia. Consequently, there is a gap in the knowledge about reasonable use across all sectors of veterinary practice. This study explored attitudes towards the use in veterinary medicine of antimicrobials with high important to human health, and determined levels of agreement about the Introduction of restrictions or other conditions on this use. An online survey was distributed via social media and email from June to December 2020 to veterinarians working in Australia. Of the 278 respondents working in clinical practice, 49% had heard of the ASTAG rating system, and 22% used a traffic light system for antimicrobial importance in their practice. Overall, 61% of participants disagreed that veterinarians should be able to prescribe high-importance antimicrobials without restrictions. If there were to be restrictions, there was most agreement amongst all respondents for only restricting high-importance antimicrobials (73%). There is a need for education, guidance, and practical support for veterinarians for prescribing high-importance antimicrobials alongside any restrictions.

the ethanolic and acetone extract of the leaves Teclea Nobilis, The acute toxicity, antimicrobial and anti-inflammatory profile of the ethanolic and acetone extract of the leaves Teclea Nobilis

Kyaw Ya1
1Swiss Tropical and Public Health Institute, Allschwil, Switzerland, 2University of Basel, Switzerland

Background: Antimicrobial resistance (AMR) constitutes a major threat to global health security. Overuse of antimicrobials is particularly common in low and middle-income countries (LMICs); however, little is known regarding the extent to which this is due to lacking national efforts to enforce rational antibiotic use in these settings.

Methods: To assess the current coverage of policies and interventions reducing the risk of AMR, we invited public health experts from all 138 current LMICs to participate in an online survey. Key coverage measures were compared to those in these 118 LMICs, 67% had a national action plan on AMR, 64% had legislative policies to restrict the sale and use of antimicrobials, 79% had comprehensive systems to monitor antibiotic use, and 73% had training programs updated, to provide high-quality care in an increasingly resilient health system, strengthened by the pandemic experience.

Results: A total of 352 completed surveys from 118 LMICs were analysed. Out of these 118 LMICs, 67% had a national action plan on AMR, 64% had legislative policies on antibiotic use, 58% had national training programs for health professionals, and 10% had a national monitoring system for antimicrobials. 51% of LMICs had specific targeted policies to limit the sale and use of protected or reserved antibiotics and 64% had policies to reduce the over-prescription of antibiotics by health workers. Even though 72% LMICs had prescription requirements, getting antibiotics without a prescription was reported to be possible in practice in 74% of LMICs.

Discussion: The Results presented here suggest that there are major gaps in the implementation and enforcement of policies to reduce the risk of AMR in many LMICs. Improved monitoring of national efforts particularly in the areas of enforcement, as well as improved monitoring of antibiotic use are urgently needed.

Conclusions: Legislative policies to restrict the sale and use of antimicrobials appear to be lacking in many LMICs today. Strict enforcement of existing policies as well as improved surveillance of actual use are likely key to controlling antimicrobials use in LMICs settings. Keywords: Antimicrobial resistance, antibiotics, policies, low and middle-income countries

The acute toxicity, antimicrobial and anti-inflammatory profile of the ethanolic and acetone extract of the leaves Teclea Nobilis

Hiotomethin Tegegne1
1Addis Ababa University, Addis Ababa, Ethiopia

Teclea Nobilis, is a medicinal plant which is believed to have anti-inflammatory and antimicrobial properties. In this study, the acute toxicity, the antimicrobial, and the anti-inflammatory profile of the plant are reported. One group served as a control and the other three groups received the different concentrations of the plant extract. 200mg/kg, 1500mg/kg and 1000mg/kg were used. Weight, % PCV and liver biopsy were done at the end of the study to determine toxicity. All the mice showed increased weight throughout the study period. The % PCV measured at the start and end of the study showed decreased values from the time of the start of the study. The liver biopsy also showed some changes consistent with acute toxicity. For this reason, we recommend caution be taken in use of the plant especially in susceptible population. Staphylococcus Epidermidis, Enterococcus Faecalis, Salmonella Typhi and Listeria Monocytogenes were used as test bacteria for the antimicrobial study. Varying doses of the plant extract were used for the test which are 500mg/ml, 450mg/ml and 300mg/ml. The results shows the ethanolic/acetone plant extract has no antibacterial activity towards S. Epidermidis, E. Faecalis and L. Monocytogenes. Nevertheless, it was determined that it has moderate activities toward S. Typhi. And we recommend larger scale study be done to determine dosage and associated side effects with the plant. The anti-inflammatory testing was done on 30 mice which were divided in five groups. One group served as the control and received Normal Saline (NS) while the other three groups received different and increasing doses of the plant extract (600mg/kg, 400mg/kg and 200mg/kg) and the last group served as a negative control and only received NS. It was concluded the plant has some anti-inflammatory activity on higher doses. Based on this study we have recommended a largescale study be done.
drinking-water, leading a growing concern that drinking-water is an important exposure source to antibiotics in humans. This study was aimed to investigate the occurrence and seasonal variation of twenty-seven antibiotics in tap water and well water in the rural residential areas in Eastern China, and to assess the related human health exposure risks in drinking-water.

Methods: A total of 278 tap water samples and 110 well water samples were collected for seven consecutive days in August 2020 (Summer) and January 2021 (Winter). Twenty-seven antibiotics were analyzed by ultra performance liquid chromatography-tandem mass spectrometry. The average daily dose (ADD) and the health risk quotient (HRQ) for exposure to detected antibiotics in humans were evaluated using 10000 times of Monte Carlo simulations, based on the parameters from local residents randomly selected from the population cohort previously established in two rural areas of Eastern China.

Results: Of 27 selected antibiotics, ten were detected in the drinking-water samples, including five macrolides, three sulfonamides, one phenicols, and one fluoroquinolones. Azithromycin showed the highest detection frequencies (79.71-100%), followed by norfloxacin (25.71-100%) and erythromycin (21.43-86.96%). The highest detection concentration of > 2 ng/l was seen for 9 out of 10 detected antibiotics, with the maximum concentration reaching 6.59 ng/l for tilmicosin. Noticeable seasonality was observed for macrolides, sulfonamides and phenicols. The estimated ADD and HRQ for human exposure to a mixture of antibiotic residues through drinking-water was less than 0.01 g/kg/day and 0.01, respectively, which varied over sites, water types, seasons and sex. Macrolides accounted for 46% to 67% of the total HRQs.

Conclusions: Antibiotic residues of drinking-water were common with the seasonality, and brought acceptable health risks, in rural Eastern China, while the long-term exposure patterns to low-dose antibiotics from drinking-water should not be ignored.

Has Mycobacterium chimaera become a public health concern? A bibliometric analysis
Alessia Martinelli1, Giuseppina Moro1, Paolo Ragusa1, Valerio Brescia2, Giacomo Scialici3, Davide Mimniti1, Fabrizio Bert1, Roberta Silquieti1,2,3
1Department of Public Health Sciences, University of Turin, Italy, 2Department of Management, University of Turin, Italy, 3Department of Public Health Sciences, University of Turin, Italy, 4Health Local Unit ASL TOS, Turin, Italy, 5IAP/City of Health and Science of Turin, Italy

Background and Objective: Mycobacterium chimaera (M. chimaera), a slow-growing non-tuberculous member of the Mycobacterium avium complex (MAC), was identified as a new species in 2004. Recently, M. chimaera has been in the spotlight as a cause of disseminated infection in patients following cardiac surgery performed with contaminated heater-cooler units (HCUs). M. chimaera infection has a long lasting latency: many years pass from infection to disease onset. M. chimaera is resistant to antimicrobial agents and its infection has high lethality. Thus, the aim of this study is to assess publication and citation related metrics, identify Keywords and most frequently discussed topics, and appraise geographic distribution of published articles. Methods: On date 2022/11/15 a directory of all publications containing “Mycobacterium chimaera” OR “M. chimaera” in all fields was excerpt from Web of Science. Bibliometric analysis was carried out using bibliometrix and biblioshiny packages on RStudio.

Results: Total publications were 305 with an annual growth rate of 20.09% from 2004 to 2022. In 2017, a total of 53 articles were produced. Total citations were 4258, with an average of 14.43 citations per document. The most cited paper was about an outbreak after open-chest heart surgery. Only 2.45% of 1475 authors wrote >4 papers about M. chimaera, according to Lotka’s law. The US and Switzerland were the countries with the largest production, followed by the UK, Germany and Italy. The three most frequent words were “cardiac-surgery,” “outbreak,” and “valve”. Before 2016, Keywords related to cardiac-surgery, heater-cooler units and outbreaks were totally absent. The most relevant sources were “Journal of Hospital Infection” and “Clinical Infectious Diseases”. Conclusions: Our study sheds light on M. chimaera as a pathogen involved in a worldwide alert due to high number of cardiac thoracic surgical procedures requiring HCUs. It would be advisable to plan interventions to reduce its burden.

An innovative sanification system in the Operating Theatre with a focus on sustainability
Francesco Caro1, Giuseppina Moccia2, Francesco Caro2, Oriana Motta1, Ornella Piazza1, Antonella Maisto1, Giovanni Boccia1, Mario Capunzo1, Walter Longanella1, Emilia Vozzea1
1Dipartimento di Medicina, Chirurgia e Odontoiatria Scuola Medica Salernitana, Università di Salerno and AOU San Giovanni di Dio e Ruggi d’Aragona, Italy, 2AOU “San Giovanni di Dio e Ruggi d’Aragona”, Italy, 3Università di Salerno, Italy

background and Objective: Detecting and promoting public health at a national and regional level is a challenge of the medical and scientific societies, that work together in their respective and multidisciplinary fields to promote a healthy world and build a more sustainable future. To guarantee an effective reduced contamination of the Operating Theatre and reduce the environmental impact, the Salerno University- School of Medicine has founded the Green Operating Theatre group, to work together to reduce the footprint of the perioperative environment and enhance the sanitification performance of the healthcare system.

Methods: Our group has developed a Green Operating Theatre agenda to follow along on the sustainability journey, aimed at implementing innovative sanitization procedures, waste reduction, anesthesia gas management and energy use improvement. Our first action was to reduce mishandled noninfecious waste in OR, in particular the use of disposable shoes covers, for patients and health care workers, since they not only produce non-recyclable waste but are not sufficiently effective at reducing contamination.

Results: We implemented the use of a shoes sanitizing station, a system which, through ozone gas and UV light, sterilizes health personnels’ shoes at each OR access. This particular system not only guarantee an effective reduced contamination of the Operating Theatre but leads to lower environmental burden with the management of noninfecious waste, thus combining clinical needs and sustainability considerations.

Conclusions: This approach is aimed at increasing the level of sanitization of the operating theatres and the healthcare settings, underling a renewed interest in environmentally sound and sustainable sanitization practice.

Development and sustainability of a digital auditing program to support national antimicrobial surveillance
Steve Christov1, Caroline Chen2, Ron Cheah3, Noleen Bennett4, Karin Thursky5, Lisa Hall6, Courtney Ierano7, Rodney James8
1Melbourne Health - Guidance Group, Australia, 2Melbourne Health - Guidance Group, Australia, 3Melbourne Health Guidance Group, Australia

Background and Objectives: The National Antimicrobial Prescribing Survey (NAPS) is a novel digital antimicrobial auditing program. The Hospital NAPS, released in 2013, is used to monitor antimicrobials prescribed within a facility and identify targets for quality improvement initiatives. Since 2016, the Hospital NAPS has also become a key component of the Antimicrobial Use and Resistance in Australia (AURA) Surveillance System, providing actionable data at a local and national level to address the challenges of antimicrobial resistance.

Methods: The Hospital NAPS uses a standardised point prevalence Methodology and assessment matrix to facilitate data collection on the appropriateness of antimicrobial prescribing and allow benchmarking. Deidentified data is then made available for national reporting and to inform antimicrobial prescribing guidelines and public health policy. Establishment of governance processes under a quality management system framework and ongoing feasibility assessments, have driven improvements in the program's generalisability and sustainability.

Results: Since released, over seventy percent of Australian hospitals have contributed across major cities, regional and remote settings. It is now regarded as a national antimicrobial usage surveillance system with 407 hospitals contributing in 2021. Key findings have informed updates to national prescribing guidelines including respiratory tract infections, surgical prophylaxis and medication safety. The ongoing success of the Hospital NAPS program has driven the development of additional modules, including Surgical, Aged Care, Quality Improvement and Antifungal NAPS.

Conclusions: The adaptability of Hospital NAPS has enabled successful pilots in New Zealand, Canada, United Kingdom, Portugal, Malaysia, Vietnam, Bhutan, Nepal, Papua New Guinea, Timor-Leste and Fiji, highlighting its across transferability various geographical locations and settings. Acceptable governance structures, along with robust in-built analysis and reporting capabilities, has supported such sustainability and scalability, ensuring broader impact globally to help address antimicrobial resistance.

Impact of new Electronic Health Record on antimicrobial stewardship policies in IRCCS Policlinico San Donato

73
Background: Appropriate antibiotic prescription is crucial to antimicrobial stewardship, supporting antimicrobial resistance reduction. In ICcS Policlinico San Donato, Milan (Italy), at the start of 2022 a motivated request form for the prescription of several antibiotic and antifungal medications was introduced. Furthermore, Electronic Health Record (EHR) for the management of pharmacotherapies was implemented in several departments of polyclinic in July 2022, allowing a direct monitoring of prescriptions by the pharmacists, which was not possible before. The aim of this study is therefore to evidence the importance of EHR for the direct monitoring of requests, evaluating also the economic loss resulting from the inappropriate prescriptions.

Methods: Overall, 55 motivated requests for meropenem, daptomycin and caspofungin sent during September and October to the pharmacists were reviewed. We compared the delivered doses with the relative administrations through the EHR for each patient. We also estimated the economic loss resulting from the doses delivered but not administered.

Results: There were 17 motivated requests for meropenem, 7 of which involved 7000 milligrams (mg) of delivered doses but not administered; 157000mg were administered without a corresponding motivated request. Regarding daptomycin, out of 30 requests, 13 involved 26600mg of delivered doses in excess while 37400mg were administered without a request. Overall, €2016 were lost due to the excess delivered doses. Conclusions: The introduction of the EHR allowed a direct monitoring of motivated requests appropriateness; this is the first step to manage the inappropriate pharmacological prescriptions. Next step should be to integrate the motivated request form in the software, during the prescription of the medications that require it. This would prevent doctors from submitting wrong or incomplete requests, therefore strengthening antimicrobial stewardship and improving the appropriateness of their use.

Conclusion: Antibiotic resistance is on the rise. General practitioners have limited knowledge regarding rational use however their practice is limited due to poor accountability, increase demand from patients and to enhance their patient satisfaction. Popul. Med. 2023;5(Supplement):A113 DOI: 10.18332/popmed/163687

Chondrodendron platyphyllum alkaloids as a weapon in the combat of antibiotic resistance

Silvia Ribieiro Filho1, Silvio Caetano Alves Júnior1, Maria Costa2, Ray Silva de Almeida1, Ana Pereira da Silva1, Irwin Rose Alencar de Menezes3, Henrique Douglas Melo Coutinho2

1Oswaldo Cruz Foundation, Fiocruz Ceará, Eusébio, Ceará, Brazil, 2Regional University of Cariri, Brazil

Background and Objective: Antibiotic resistance is a primary concern for Public Health. As reported by the European One Health Action Plan against Antimicrobial Resistance, there is the need to monitor the presence of antibiotics, antibiotic resistant bacteria (ARB) and antibiotic resistance genes (ARGs) in the environment, especially in wastewater. Moreover, the global action plan on antimicrobial resistance underlines the need to obtain strong evidence associated to the role of wastewater and environment as contributors to the development and spread of ARB. The aim of this study is to evaluate the ARB spreading in different treatment steps of wastewater treatment plant (WWTP) also considering the possible reuse of effluent in agriculture.

Methods: Samples collected at different steps of a WWTP developed for reuse were investigated for the presence of antibiotics (ampicillin, tetracycline, sulfamethoxazole), heavy metals, the antibiotic resistance rate of ARB (ampicillin, tetracycline, and sulfamethoxazole resistant bacteria) and ARGs (blaTEM, tetA, sulII).

Results: The Results obtained highlight the presence of ARB and ARGs for the antibiotics tested in WWTP, with a decreasing trend during the wastewater treatment, as also observed for some antibiotics and heavy metals. Although there is generally no significant difference in the ABR rate, a higher average value of this rate is observed during the wastewater production, suggesting a possible positive selective pressure of ABR by some steps of treatment. A correlation was also observed between the presence of some heavy metals and ABR rate. Conclusions: The results obtained suggest the need to carefully monitor the role of WWTPs in the spreading of antibiotic resistance, also considering the One Health approach. Furthermore, the results obtained could suggest interventions to reduce the human health risk associated with wastewater reuse in agriculture.
potentiated the activity of gentamicin against the gram-negative MDR strains and presented synergism when associated with norfloxacin against S. aureus 10 and P. aeruginosa 24.

Conclusion: C. platygynium and curine have antibacterial and antibiotic-enhancing activities against the standard and MDR bacterial strains and, as such, have the potential to be useful in the combat of antibiotic resistance.

1University of Udine, Department of Medical Area - University of Udine, Udine, Italy; 2University of Udine, ‘Azienda Sanitaria Universitaria Friuli Centrale, Udine, Italy, Accreditation and Quality Unit, Friuli Centrale Healthcare University Trust, Udine, Italy; 3University of Udine, ‘Department of Medical Area - University of Udine, Udine, Italy and Accreditation and Quality Unit, Friuli Centrale Healthcare University Trust, Udine, Italy

Background and Objective: Antimicrobial Resistance (AMR) is a growing global concern inextricably linked to human interactions across multiple sectors, including animal health, agriculture, food production, and the environment. Using a One Health lens, to understand the spread and risk of AMR, will be vital to successfully addressing such a complex issue. International efforts are focussed on designing and implementing policy - but developing and implementing comprehensive monitoring and evaluation frameworks for national strategies remains a challenge. Working with a broad range of stakeholders, we aimed to co-design a pragmatic, adaptable monitoring and evaluation (M&E) framework for Australia’s AMR Strategy.

Methods: To develop the M&E framework we employed multi-stage, iterative co-design. We undertook a scoping review and interviews with international leaders involved in monitoring national AMR strategies to examine best practice, enablers and barriers. We then engaged an Expert Advisory Group (EAG) with diverse One Health expertise. We undertook a policy analysis of national strategy documents and worked with our EAG to draft program logic models (PLMs) - using backcasting to formulate the inputs, outputs and outcomes required to address AMR. We conducted Delphi surveys (n=15 experts/sector), to get consensus on the importance and feasibility of outcome measures. In early 2023 we will explore the Delphi findings and refine the PLMs in national systems thinking workshops - prioritising what needs to happen next for M&E to be successfully implemented. Workshops will focus on identifying linkages and leverage opportunities between and within sectors.

Results: This co-design approach (using established public health methods) is providing Australia with a systematic, collaborative, and responsive way to create an M&E framework across multiple One Health sectors.

Conclusion: Evaluating the impact of national AMR strategies is complex, takes time, and needs to champion the voices of a range of stakeholders. Systems thinking is useful for facilitating this.

Predictors of knowledge, attitude, and dispensing practices of antibiotics among patent and proprietary medicine vendors in Federal Capital Territory, Nigeria

Abara Eriri1, Yakubu Abdullahi1
1Nigeria Centre for Disease Control, 24 Amino Street, Galadimawa, Abuja, Nigeria

Background and Objective: Patent and Proprietary Medicine Vendors (PPMVs) are seen as the most reliable sources of healthcare in most rural and hard-to-reach areas even with their low educational qualification. They can sell a limited reach areas even with their low educational qualification. They can sell a limited

Methods: A descriptive cross-sectional study design was employed, and 374 respondents were selected using a multistage sampling technique. A standardized, structured, interviewer-administered questionnaire was used among PPMVs. Statistical Package for Social Sciences (SPSS) version 22.0 was used for data analysis. Chi-square was used for test of association at p<0.05.

Results: The majority (53.4%) of PPMVs were females; about four-fifth belonged to the age group 29 years, and a majority had about 5 years of practice experience. The majority (66.0%) of the respondents had poor knowledge of antibiotics, and almost half (59.2%) of the PPMVs had poor dispensing practices of antibiotics. Sex, educational level, and membership of PPMVs were found to be predictors of knowledge, while sex and educational level were predictors of dispensing practices of antibiotics among PPMVs. Also, it was found that the majority of the PPMVs had good attitude toward antibiotics prescription.

Conclusion: This study reported a poor overall knowledge and dispensing practice of antibiotics among PPMVs and good attitude towards antibiotics prescription. In other to curb the menace of irrational antibiotic use, strict enforcement of regulations that will limit access to antibiotics by PPMVs and continuous training of the PPMVs on antibiotic use is required.

Malnutrition and extended spectrum beta-lactamase-producing Enterobacteriaceae infection: a new lead against antibiotic resistance?

Fabiana Cazzola1
1Grenoble Alpes University Hospital and Grenoble Alpes University, France

Background and Objective: Infections with extended-spectrum beta-lactamase-producing Enterobacteriaceae (ESBL-E) are frequent in nursing home for dependent elderly people and several risk factors for ESBL-E infection are described in the literature. In patients hospitalized in nursing homes or healthcare facilities, malnutrition reaches 70%. The objective of this study was to analyse the relationship between malnutrition and ESBL-E infection.

Methods: A retrospective matched case-control study was carried out on adult patients hospitalized at Grenoble Alpes University Hospital between January 2010 and December 2015. Cases presented ESBL-E infection and controls Enterobacteriaceae infection without ESBL resistance. The exposure factor, malnutrition, was based on national High Authority of Health (HAS) 2019 criteria adapted to French population. Patients without any measurement attesting the malnutrition were considered as not malnourished. The following ESBL-E infection risk factors were included: history of antibiotic prescription, history of hospitalization, risky procedures, history of ESBL-E colonization. The crude and
adjusted odds ratio (OR) and its 95% confidence interval (95% CI) were evaluated by conditional logistic regression. Results: A total of 16,143 patients had at least one positive clinical sample for Enterobacteriaceae (1,364 ESBL and 14,779 non-ESBL). After matching, 1359 cases and 2665 controls were included in the analysis. Malnutrition was a significant risk factor for ESBL-E infection in bivariate analysis (OR 1.24; 95% CI 1.08-1.43). By adjusting for risk factors, undernutrition was no longer a significant risk factor (adjusted OR 1.24; 95% CI 0.81-1.43). The usual risk factors: history of antibiotic prescription, history of hospitalization and history of ESBL-E colonization were significant in both analyses. Conclusion: A significant relationship between undernutrition and the occurrence of ESBL-E infection was observed in bivariate analysis, but this factor is no longer significant when adjusting for other known risk factors. Further investigations, as subgroup analyses, could assess the importance of malnutrition as a risk factor.

Impact on antimicrobial consumption of new stewardship policies in IRCCS Policlinico San Donato in 2022

Alessandro Molino1, Demetrio Cussotti2, Margherita Zeduri1, Carlo Lunetti3, Aurelia D’Acquisto4, Giulia Bisellina5, Maria Shishova3, Giuseppe Caravella1, Laurenza Ferrarisi6, Luca Carpinelli2, Carlo Signorelli3, Anna Odone1, Maria Cuppone1,  
1Università degli Studi di Pavia Dipartimento di Sanità Pubblica, Medicina Sperimentale e Forense Italy, 2Università Vita-Salute San Raffaele, 3Università Vita-Salute San Raffaele Facoltà di Medicina e Chirurgia Italy, 4IRCCS Policlinico San Donato, 5IRCCS Policlinico San Donato U.O. Farmacia Italy, 6IRCCS Policlinico San Donato Direzione Sanitaria Italy  
Introduction: antimicrobial stewardship policies are crucial in the fight against hospital-acquired infections (haIs) and antimicrobial resistances. A new stewardship program was introduced in irccs policlinico san donato in 2022, consisting in a motivated request form for antimicrobial intravenous medications. The aim of this study is to analyse the daily defined dose (ddd) for every intravenous antimicrobial during the last four years and estimate the pharmacoeconomic impact of the stewardship policies in our hospital. Methods: The retrospective observation on antimicrobial consumption took place in the period january – october for the years 2019-2021 and a comparative analysis with 2022 was performed. The motivated request form was introduced for all the units and required as mandatory for prescription, along with an infectious disease counseling and microbiological tests. In the second half of 2022 the electronic health record was introduced in the hospital, enabling control on prescriptions. The total costs were calculated per operative unit linked to the requests of antimicrobials and ddd were calculated for each antimicrobial. Results: Considering the ddd/100 days of hospital stay no reduction was observed in 2022 with 52,22 ddd/100d administered but concerning the prescription pattern we could observe during 2022 a significant drop in consumption of broad-spectrum antibiotics such as ceftriaxone or amoxicillin. A significant drop in total pharmaceutical expenditure was observed too, with a median reduction of 25% of total costs. Conclusion: New stewardship policies not only led to more appropriate antibiotic usage in every unit but they led to a reduction in total pharmaceutical costs. the stricter controls on the antimicrobials requests led to a virtuous mechanism of more appropriate antimicrobial choice and length of treatment. In the long run this can result in a drop both in terms of direct costs (medications, nurse working-time) and indirect costs (shorter hospital stayings and less infectious complications).

Animals and animal products as sources for antimicrobial resistant bacterial infections in humans: a systematic review and meta-analysis.

Christina Fasti1, Carlotta Di Bari2, Brecht Devleeschauwer3,  
1Department of Epidemiology and Public Health, Sciensano, Brussels, Belgium, 2Department of Epidemiology and Public Health, Sciensano, Brussels, Belgium  
Background and Objective: Antimicrobial resistance (AMR) is a major threat to modern medicine and expected to become one of the leading global health challenges of the century. Resistant infections in animals are known to be important drivers of AMR in humans, however, the extent of their contribution is not clear. To adequately assess the total economic and public health burden posed by animal diseases, as well as optimally inform effective AMR mitigation and control strategies, a better understanding of the relative impact of animal AMR on humans is crucial. Source attribution studies are valuable tools for the partitioning of health burdens to specific sources and thus well suited for this purpose. The aim of this systematic literature review is to summarize the available evidence from source attribution studies and other studies that quantify the direct contribution of animal sources of AMR to resistant infections in humans, focusing on bacterial AMR. Methods: Our initial search of four scientific databases (Pubmed, Web of Science, Scopus and Embase) yielded 16,955 results published between 1957 and 2022. Articles will be selected for eligibility based on whether they attribute bacterial AMR in humans to animal-related sources, which we defined as livestock, aquaculture, foods of animal origin and companion animals. We also intend to perform meta-analyses with the results of relevant studies of animal-related risk factors for sporadic resistant infections in humans to derive population attributable fractions. Results and conclusion: We will provide an overview of the currently available evidence on the impact of zoonotic AMR on human health, outline important knowledge gaps and discuss suitable methods for future research.

The role of a Local Health Unit in fighting antimicrobial resistance: the experience of ASL T03 in Piedmont, Italy

Alessandro Prinivili1, Paolo Ragusa2, Giulia Libero2, Valerio Bordini2, Grazia Ceravolo2, Elvio Peyronel3, Daniela Zeme2, Davide Minniti2, Roberta Siliquini2, Fabrizio Bert4,  
1University of Turin Department of Public Health Sciences and Pediatrics Italy, 2Local Health Unit T03 Local Health Unit T03 Italy, 3University of Turin Department of Public Health Sciences and Pediatrics; Local Health Unit T03 Italy  
Background and Objective: Antimicrobial Resistance (AMR) represents a global health threat which, as reported by recent analyses, could cause 10 million deaths/ year by 2050. According to international guidelines, a dedicated Antimicrobial Stewardship (AMS) team was implemented in asl t03, a local health unit in piedmont, in order to process data and to improve good practices related to responsible antibiotic use. The aim of this study is to evaluate the Carbapenem-Resistant Enterobacteriaceae (CRE) 5-years trend in asl t03 as an indicator of ams strategies implemented. Methods: CRE laboratory data were extracted through the virtuoso platform. redundanties were eliminated within 28 days, but any “duplicates” per material and any “multiple isolations” were retained. The analysis included stratification by pathogen, E. Coli (EC) and Klebsiella Pneumoniae (KP), and by presence or absence of resistance. Results: AMS included strategies such as data collection and analysis about antibiotics prescriptions and microbiological tests, medical health records audit and meetings with clinicians. Despite a 9% decrease in microbiological testing, an overall decrease in total and stratified cre from 2017 to 2021 was recorded. Total CRE dropped from 222/7368 (3.01%) to 136/8054 (1.68%), KP carbapenem-resistant from 18.66% to 11.74% and EC carbapenem-resistant from 0.71% to 0.09%. Almost all of the CRE bacteremia diagnosed in 2021 was caused by KP (95.6%), and only a small portion by EC (4.4%). Conclusion: Since the implementation of an ams program, data related to CRE infections has been continuously improving and are currently lower than regional and national trends. A decrease in antimicrobial-resistant microorganisms infections can result in reduced mortality and cost of care. A constructive comparison of the action of several health care settings in the field of ams can be a weapon in the global fight against amr.

The dual effect of governance quality on antibiotic use and antimicrobial resistance: An analysis of European countries

Antonella Agodi1, Andrea Maugeri1, Giuliana Favara1, Roberta Magnano San Lio1, Martina Barchitta1,  
1University of Catania Department GF Ingrassia Italy  
Background and Objective: Although antibiotic use is one of the most important contributors to antimicrobial resistance (AMR), there is also evidence that their correlation is not always perfect. In fact, other factors (e.g., economic development and governance quality) may explain differences in AMR levels observed between countries. Here, we used ecological data to evaluate how governance indicators relate to antibiotic use and AMR in 30 European countries.
Methods: We used data from the World Bank Databank, ECDC atlas, and ESAC-Net databases to compile a dataset of six governance indicators (voice and accountability, political stability, government effectiveness, regulatory quality, rule of law, and control of corruption); AMR proportions for 25 combinations of pathogens and antibiotics; and the amount of antibiotics consumed in the community. AMR proportions and governance indicators were also aggregated into an overall measure of AMR and a governance index.

Results: Except for political stability, all governance indicators were inversely correlated with the proportions of: Acinetobacter spp. and Pseudomonas aeruginosa resistant to all classes of antibiotics under consideration; Klebsiella pneumoniae resistant to fluoroquinolones, third generation cephalosporins, and aminoglycosides; Escherichia coli resistant to fluoroquinolones and third generation cephalosporins; and Staphylococcus aureus resistant to methicillin (p-values<0.001). Linear regression analyses showed that an increase in the governance index resulted in significant decreases of overall antibiotic consumption (p<0.001) and AMR proportion (p=0.006). A mediation analysis showed that the governance index had an indirect effect on AMR via reducing antibiotic consumption, which accounted only for 35% of the total effect.

Conclusion: These findings supported the hypothesis that other factors sustain the uncontrolled spread of resistant pathogens in countries with poor governance. For this reason, reducing antibiotic use alone is unlikely to solve the AMR problem, and more interventions are needed to increase governance effectiveness at all levels.

The vaccinating hospital: Multiparametric evaluation of the post-vaccinal outcome on the development of infections, antibiotic therapy and resistance
Francesco Giordano¹, Cristina Genovese², Daniela Lo Giudice¹, Sebastiano Calimeri¹, Vincenza La Fauzi¹, Rafaelle Squeri¹
¹Università degli Studi di Messina, Scuola di Specializzazione in Igiene e Medicina Preventiva Department of Biomedical and Dental Sciences and Morphofunctional Imaging, University of Messina, Messina, Italy; ²Università degli Studi di Messina, Università degli Studi di Messina Department of Biomedical and Dental Sciences and Morphofunctional Imaging, University of Messina, Messina, Italy; ³Università di Messina Italy

Background: The moment of vaccination counseling also represents a very important tool in the hands of the healthcare operator because it gives the possibility to interact directly with the vaccinated person.

Our aim is the analysis of perception, attitudes, knowledge of antibiotics and antibiotic resistance in a cohort of chronic patients and the evaluation of the effect of vaccination counseling on these parameters.

Methods: A prospective study was conducted in the AOU “G. Martino” of Messina from 1 April 2022 to 1 October 2022, at the vaccination center of the Hospital Hygiene, after collection of informed consent and administration of the chosen vaccination. The study was carried out by completing a questionnaire created ad hoc by phone to evaluate knowledge, attitudes and perceptions of antibiotics as well as the role of vaccination counseling on the posthumous use of antibiotics and on the development of infections.

Results: 47 individuals joined the study, 44.68% male and 55.32% female. It was possible to highlight a satisfactory level of knowledge of antibiotics and the concept of antibiotic resistance, with a percentage of just over 80% of the participants who answered correctly to the questions formulated. 23.4% had never heard of antibiotic resistance and more than half of the sample did not know the correct definition.

The counseling carried out after the administration of the vaccine, approximately 47% of the sample used antibiotics, all of these followed the therapy indicated by the doctor and only one case was found to have antibiotic resistance.

Conclusion: From the data in our possession, it emerges that vaccination combined with adequate patient counseling by hospital vaccination center operators are activities of fundamental importance in order to reduce the inappropriate use of antibiotics both through the direct effect than indirectly especially in the category of patients considered “fragile”.

Background and Objective: The pandemic has overwhelmed healthcare systems worldwide. Simultaneously, the rise in multi-drug resistant organisms (MDRO) continues to threaten global health through significant morbidity, mortality, and global economic loss.

This study aims to analyze the impact of the pandemic on the spread of some specific MDRO and define the differences between the pre-pandemic and pandemic period.

Methods: This is an observational study that included adult patients discharged from the University Hospital of Palermo from 01/01/2018 to 31/12/2021.

Hospital Discharge Cards of the recruited study patients were linked with reports from the microbiological laboratory to evaluate MDRO isolations. For each patient the SARS-CoV-2 positivity during the hospitalization was evaluated by consulting the surveillance system of the National Institute of Health. The contribution of several risk factors associated with the presence of MDRO was analyzed through logistic regression analysis.

Results:
This study evaluated 58,427 hospitalizations, where half of the patients were over 65 years old (N=26,984) and most admissions were in the medical area (N=51,716). During the hospitalization period, the isolated MDRO were 2,681 (5%), whereas there were 946 subjects (2%) who tested positive for SARS-CoV-2. No statistical difference was found in the prevalence of MDRO in COVID-19 and non-COVID-19 patients. In the multivariable analyses, during 2020 and 2012 there was a statistically significant increased risk of isolation of the following MDRO: Staphylococcus Aureus, Acinetobacter Baumannii, and Klebsiella Pneumoniae. Age, DRG-weight, and length-of-stay were associated to a higher risk of MDRO isolation.

Conclusion: In the study period there was an increasing trend of some MDRO isolations, even more so during the pandemic period. However, SARS-CoV-2 positivity did not impact the risk of contracting MDRO. It is imperative to improve and follow hospital protocols to prevent healthcare-associated infections.

Using legislation to underpin a one health approach to address antimicrobial resistance
Carmen Bullon⁷, Maarten de Heijden⁸, Ambra Gobena¹, Camille Loi⁹, Teemu Viinikainen¹⁰, Valeria Pasarin¹¹, Yingting Li¹², Kelsey Galantich¹³
¹FAO Italy, ²WHO, ³WOAH France, ⁴FAO, ⁵FAO Spain, ⁶FAO New Zealand, ⁷WOAH Botswana

The One Health Legislative Assessment Tool for Antimicrobial Resistance (AMR) (the Tool) has been developed by the legal teams of FAO, WHO and WOAH, with inputs from UNEP, through a process of extensive consultation with a range of legal experts across multiple disciplines. The Tool is currently being implemented in four countries prior to a wider rollout and implementation. The Tool assists countries in the identification of regulatory gaps relevant for AMR, and enables the prioritization of solutions through legal reform. It facilitates the examination of a range of legislative instruments and governance arrangements at local, regional/ province and national levels. Adopting a One Health approach that integrates and sustainably balances the health of people, animals and ecosystems, the Tool targets key regulatory elements in the following sectors (1) AMR governance (2); human health, (3) animal health and production, (4) food safety, (5) pesticide management, (6) plant health and (7) the environment. Under the Tool, cross-cutting themes and the need for multidisciplinary perspectives are emphasized to ensure multisectoral coordinated action against AMR. This Tool is currently being implemented in four countries prior to a wider rollout and implementation.

While legislation is just one facet of the range of AMR responses recommended to address the threat of AMR, the Tool provides an opportunity to monitor and assess progress towards reducing AMR. The Tool is a useful tool for policymakers, legislators and other stakeholders to understand the legislative landscape of AMR and to identify gaps and opportunities for legal reform. It also provides a framework for identifying potential legal strategies to address AMR, and can be used to inform the development of national and international legal frameworks.

This Tool is currently being used in four countries to address AMR, including Botswana, where the Tool is being used to identify legal gaps and opportunities for legal reform. The Tool is also being used in the United States to assess the legal landscape of AMR and to identify potential legal strategies to address the threat of AMR. The Tool is also being used in the European Union to assess the legal landscape of AMR and to identify potential legal strategies to address the threat of AMR.

Perspective assessment of the impact of sars-cov-2 pandemic on the use of antibiotics and antibiotic resistance

Caterina Rizzo1, Caterina Rizzo2, Cristina Genovese3, Isabella La Spina4, Paola Tripodi5, Francesco Giordano6, Vanessa Prete7, Carmela Biondo8, Giovanni Cipriano9, Alessandro Nica10, Vincenza Fauci11, Raffaele Squeri12, 1University of Messina Department of Biomedical and Dental Sciences and Morphofunctional Imaging, University of Messina, Italy, Italy, 2University of Messina Department of Biomedical and Dental Sciences and Morphofunctional Imaging, University of Messina, Italy, Torre Biologica, Piano 3 Via Consolare Valeria, snc Policlinico Universitario “G. Martino” Italy, Italy, University of Messina

Materials and methods

The analysis were performed using two systems: “Farmanalysis”, which evaluate pharmaceutical expenditure and antibiotic therapy stream both territorial and hospital; “Health Card (TS)” which allows to investigate individual health spending data to the Internal Revenue Service. These data have been stratified by age group and gender.

Results: Through historical comparison of antibiotic consumption, the highest consumption was observed in the 45 to 64 age group, followed by the over 75 age group. During the pandemic phase and the adoption of containment measures have resulted in a drastic decline in antibiotic prescriptions. A difference of -17.75% was observed in our province compared to the pre-pandemic period resulting in a -25% reduction in healthcare expenditure. At the same time, the shortage of first-class antibiotics led to an overprescription of old-use molecules such as Trimethoprim (+12.93%) and amphenicines (+27.27%).

Conclusions: Our study demonstrates how the application of social distancing measures and proper use of protective equipment can affect the transmission of airborne diseases and how communication by professionals in the field can increase the informed use of antibiotic therapy by the population. Italy represents together with Greece the tail-end of Europe, so much so that 7-10% of patients encounter a multi-resistant bacterial infection. This issue, therefore, requires a multidisciplinary strategy that involves taking care of the individual from a One Health perspective.

Overcoming the challenges of antimicrobial resistance in developing countries

Muhammad Khan1, Afreenish Amir2, Anna Ali3, Muhammad Waheed4, Tarbia Aamir1, Aamer Ikram5, Rabia Tabassum6, Kiran Nisa7, Muhammad Khan8, Paul Barach9

1Center of Environmental and Occupational Health (CEOH) - National Institutes of Health (NIH), Pakistan, NIH, Pakistan/CDC National Institutes of Health (NIH) Park Road, Chak Shahzad, Islamabad, Pakistan Pakistan, 2National Institutes of Health, Pakistan, NIH, Pakistan/CDC National Institutes of Health (NIH) Park Road, Chak Shahzad, Islamabad, Pakistan Pakistan, 3CEOH-NIH Pakistan, Pakistan/CDC Pakistan, 4CEOH-NIH, Pakistan, NIH/Pakistan/CDC Pakistan, 5National Institutes of Health, Pakistan National Institutes of Health, Pakistan National Institutes of Health (NIH) Park Road, Chak Shahzad, Islamabad, Pakistan Pakistan, 6Wayne State University School of Medicine

Background and objective: Antimicrobial resistance (AMR) is a global health challenge and developing countries are more vulnerable to its impacts. High burden of infectious diseases, poverty, weak governance and health systems, and low awareness remain major challenges in the fight against AMR leading to increased prevalence of HAIs including fungal infections, and superbugs like Candida auris. Infection-Prevention-Control (IPC) is a key to reduce the emerging HAIs and enhance healthcare outcomes.

Methods: This participatory design project study, led by the National Institutes of Health (NIH)-Pakistan and funded by the CDC, was to support and improve the early diagnosis and surveillance of C. auris. We focused on capacity building in laboratory diagnostics, IPC strategies and implementing robust learning data dashboards with provincial stakeholders to ensure effective implementation. After thorough Gap-assessments through site visits and detailed mixed methods at 12 sentinel sites, representing all regions/provinces of Pakistan, using a phase-wise approach, capacity at each site was enhanced by providing hands-on-training and materials to enhance fungal diagnostics, IPC and surveillance.

Results: In Microbiology Diagnostics readiness we found, 2-advanced, 7-intermediate and 3-inadequate sites. IPC program audited using WHO tools indicated 4-advanced, 2-intermediate, 3-basic and 3-inadequate sites. Fungal pathogen identification and transport of samples was initiated. Data dashboards were developed and implemented ensuring robust data collection and sharing from all sites. 26 samples were received at NIH for final identification indicating different fungal pathogens in isolates. IPC program was initiated and enhanced at all sites.

Conclusions: NIH devised a National Fungal Disease Surveillance System (NFDSS) to enable rapid diagnosis and surveillance of prevalent fungal pathogens Nationwide. Antimicrobial stewardship involving robust IPC methods can be extended towards containing AMR in low and middle-income settings. Adoption of these strategies will assist developing countries overcome their increased vulnerability to growing AMR.

Economic and social burden of healthcare-associated infections

Francesco Mennini1, Paolo Scialla2, Angela Ragone3
1Economic Evaluation and HTA (EEHTA CEIS), Department of Economics and Finance, Faculty of Economics, University of Rome “Tor Vergata”, Rome, Italy.

Background and objectives: Antimicrobial stewardship (AMS) programs aim to reduce healthcare-associated infections (HAIs) and save healthcare costs associated with antimicrobial resistance (AMR). This study aims to evaluate the economic and social burden of HAIs before and after the implementation of AMS programs, including the use of new antibiotics.

Methods: The study was divided in two phases. In the first phase, the analysis was carried out considering the administrative database of the hospital discharge records from 2006 to 2019. HAIs were detected by selecting all acute hospitalizations with primary or secondary diagnosis related to Escherichia coli, Klebsiella spp, Clostridium difficile, and other unspecified bacterial infections. Data were used to estimate prevalence of HAIs and their impact in terms costs incurred by the NHS. In the second phase, three key opinion leaders (KOLs) were involved: a questionnaire was used to collect additional data on the three Hospital antimicrobial stewardship (AMS) programs, the number of HAIs before and after introducing programs and new antibiotics. Finally, interviews were used to explore the views and experiences of KOLs on AMS and the use of new antibiotics.

Results: HAIs appear on average in 32 cases per 1,000 acute hospitalizations. The occurrence of infections is increasing (22.5 per 1,000 hospitalizations in 2006 and 44.8 per 1,000 in 2019). The valuation of infections resulted in an average annual estimate of approximately €397 million. The second phase is still ongoing. Preliminary results show a reduction of length of hospital stay (mean 25%, range 14-40%), treatment duration (24%, 14-30%) and antibiotics consumption in DDD (29%, 14-46%).

Conclusion: AMS is a crucial component in the overall effort to combat the spread of AMR. The preliminary results show that implementation of AMS programs reduced antimicrobial use and cost, and lowered the incidence of HAIs.

Awareness of antimicrobial resistance: Google Trends™ analysis to test the success of health promotion initiatives

Enrico Errico1, Gianfranco Gennaro1, Francesca Licata1, Silvia Angelillo1, Aida Bianco1
1University of Catanzaro “Magna Graecia” Department of Health Sciences, School of Medicine, University of Catanzaro “Magna Graecia”, Catanzaro, Italy Viale Europa, 88100 Catanzaro CZ, Italy

Background and Objective: Antimicrobial resistance (AMR) is one of the major public health threats of the 21st century. The World Health Organization has highlighted the key role of population empowerment in counteracting AMR. The aim of the study is to assess the impact of selected initiatives on public awareness of AMR using Google TrendsTM (GT) analysis.

Methods: The impact of World Antimicrobial Awareness Week(WAAW) and World Hand Hygiene Day(WHHD) on public awareness of ‘AMR’, antibiotics and antibiotic resistance in Sweden, United States, Italy, Japan, Spain and Netherlands from 2017 to 2022 was analyzed, using the relative search volume(RSV) of GT as a surrogate. A joinpoint regression analysis was performed to identify a statistically significant time point of a change in trend. The trends in the different countries were compared by calculating the Z-score.

Results: The analysis of the Z-scores showed a comparable upward trend in all investigated countries. The joinpoint regression did not reveal joinpoints around WAAW and WHHD. Decreasing RSVs of “antibiotics” and “AMR” were shown in all investigated countries, in the period March-May 2020, the decrease is more pronounced in Spain and Italy. In Italy, unlike to other nations, spikes in searches for the term “antibiotics” during the flu-season were displayed.

Conclusion: Results highlight that programs taken into consideration(WAAW and
Antimicrobial resistance surveillance at ospedale policlinico san martino irccs, genoa north-west italy: A focus on meticillin-resistant staphylococcus aureus

Background/Introduction: Methicillin-resistant Staphylococcus aureus (MRSA) is one of the most common causes of hospital-acquired bacterial infections worldwide. Even though the percentage of MRSA is decreasing in European region, resistance levels remain high in some countries, including Italy, where it currently reaches 30%. Methods: Microorganisms isolated at Microbiology Unit of Ospedale Policlinico San Martino IRCCS, Genoa, from 1st January 2014 to 30th June 2022 were included. Blood was the only specimen considered. We excluded same patient cases within 30 days one from another and cases where the antimicrobial resistance (AMR) was not tested. Our surveillance includes the same pathogens monitored in the AMR surveillance by European Centre for Disease and prevention and Control (ECDC). In particular, the analysis also included AMR profile of Pseudomonas aeruginosa, Acinetobacter spp, Streplococcus pneumoniae, Escherichia coli, Klebsiella pneumoniae, Enterococcus faecalis and Enterococcus faecium. Results: Average proportion of MRSA was 54.4% in 2014, 51.3% in 2015, 44.7% in 2016, 41.1% in 2017, 44.2% in 2018, 43.2% in 2019, 40% in 2020, 36.6% in 2021 and 33.1% in first semester of 2022. The incidence of MRSA was 2.4/1000 patient-days in 2014, 3.1/1000 patient-days in 2015, 2.9/1000 patient-days in 2016, 2.8/1000 patient-days in 2017, 3.3/1000 patient-days in 2018, 2.8/1000 patient-days in 2019, 3.2/1000 patient-days in 2020, 3.2/1000 patient-days in 2021 and 2.9/1000 patient-days in first semester of 2022. Conclusions: Since the beginning of the surveillance (2014) the incidence of MRSA remained stable (2.4-3.3/1000 patient-days). In comparison to the last ECDC AMR Report (2020), however, the proportion of MRSA significantly decreased, but remained above the European average. Further improvements in our infection-control practices are of paramount importance to limit the high mortality related to MRSA bloodstream infections.
antimicrobials, we recently created a new indicator which takes into account the rate of infections together with antimicrobial consumption and the median time of treatment of each event.

Methods: The "Estimated Prescriptive Appropriateness Rate" (EPA-SCORE) " has been calculated for each group of bacteria, as the rate between the observed consumption of an antibiotic (DDD/1000 days of hospitalization) and the expected one as if the same antibiotic had been used for 10 days exclusively for the observed infections where it was indicated, according to the following formula:

$$\text{EPA-SCORE} = \frac{\text{DDD (observed/expected)}}{\text{(1/N. of infections)}}$$

Data from January 2020 and June 2022 were collected while restrictive and persuasive strategies of Antimicrobial Stewardship were implemented. Changes in EPA-SCORE were evaluated through the years.

Results: In our hospital, in the first semester of 2022 prevalence of ESBL+ Gram-negative infections was 0.90 cases/1000 doh/year. The observed consumption of drugs indicated for those infections was 86.9 DDD/1000 doh, whilst the expected one for the registered number of infections was 9.01 DDD/1000 doh, with an EPA-SCORE of 10.37.

Regarding multi-drug-resistant gram-negative infections, prevalence was 1.48/1000 doh/year; observed antibiotic consumption for them (whose prescription policy was restricted to ID specialists) was 4300 DDD/1000 doh, whilst the expected DDD was 29.6 DDD/1000 doh (EPA-SCORE 67.7%).

Comparing data between the first semester of 2020 and the same period of 2022, a significant increase in EPA-SCORE was detected (+4.2% and +7.1% for ESBL+ and MDR Gram-negative infections in 2022 respectively).

Conclusion: Our data demonstrate that the EPASCORE could represent a feasible indicator of appropriateness of antimicrobial prescription, and restrictive strategies of antimicrobial stewardship can help to improve its outcome.

Access and use of antibiotics in a group of migrants of the city of Bogota colombia in 2021

Jovana Cañas1, Sebastian Rueda2, Oscar Acevedo2, Juan Cuya4, Muhammad Zaman4

1Facultad de Medicina Universidad de los Andes Profesor Asociado "Cra 1 N° 18A - 12 Bogotá - Colombia Postal code: 111711" Colombia, 2Facultad de Medicina Universidad de los Andes, 3Facultad de Medicina Universidad de los Andes Profesor Titular "Cra 1 N° 18A - 12 Bogotá - Colombia Postal code: 111711" Colombia, 4Facultad de Medicina Universidad de los Andes Investigador Junior "Cra 1 N° 18A - 12 Bogotá - Colombia Postal code: 111711" Colombia, Universidade de Boston Colombia is host to approximately 1.8 million migrants according to the United Nations High Commissioner for Refugees (UNHCR) by mid-2020, making it the second country worldwide after Turkey to host the largest quantity of migrant population (1) The absence of regulatory policies in Latin America concerning certain types of medication permits the sale and distribution of antibiotics without prescription, thus making self-medication a serious problem (4,5). In the case of antibiotics, the result is not only an increase in antibiotic resistance in the migrant population but also exposing the general population to this issue (6).

The objective of this study is hereby to describe the access to and use of antibiotics in a group of migrants in a locality of Bogota, Colombia in 2021, for which we will identify factors that influence both the access to and use of these medications, as well as characterize some perceptions from healthcare professionals concerning antibiotic resistance in this population. The study methodology is observational, and descriptive, the cross-sectional type. In the migrant group, the important percentage of people who do not follow any instructions in specific regarding the duration of treatment, as well as those who use them according to non-professional indications, such as those coming from family members or neighbors, as well as in an "as needed" manner. This could also be a result of the fact that a significant part of the group stops taking their antibiotics when feeling better. Regarding the pharmacist group, issues such as non-professional formation, indications given to clients based only on experience but not on guidelines, and incomplete doses bought from clients, give us an idea about those factors that may be influencing some antibiotic usage patterns that ultimately could have an impact on antibiotic resistance.

In vitro antibacterial and antifungal activities of extracts and fractions of leaves of Ricinus communis Linn against selected pathogens

Bedaso Kassaye1

1Ethiopian Agriculture Authority, Ethiopia

Background and Objectives: Infectious disease impacts are reduced due to the development of antimicrobial agents. However, the effectiveness of antimicrobial agents is reduced over time because of the emergence of antimicrobial resistance. To overcome these problems, scholars have been searching for alternative medicines. Ricinus communis is used as a traditional treatment for bovine mastitis, wound infection, and other infections. The objective of the present study was to further evaluate the antimicrobial activities of R. communis leaf extracts and fractions. Methods: R. communis leaves were macerated in methanol and acetone. The methanol extract showed better antibacterial activity and subjected to further fractionation via increasing polarity of solvents (n-hexane, chloroform, ethyl acetate, and aqueous). Test microorganisms included in the study were six reference bacteria (Escherichia coli, Staphylococcus aureus, Streptococcus agalactiae, Klebsiella pneumoniae, Pseudomonas aeruginosa and Streptococcus pyogenes), two clinical isolate bacteria (E. coli and S. aureus), and Candida albicans. The agar well diffusion method was employed to determine antimicrobial activity. The minimum inhibitory concentrations (MIC) and minimum bactericidal/fungicidal concentrations (MBC/MFC) were determined through broth microdilution.

Results: The results indicated that the best antibacterial activity for ethyl acetate fraction ranged from 14.67 mm (clinical E. coli) to 20.33 mm (S. aureus) at 400 mg/ml, however, n-hexane exhibited the lowest antibacterial activity. Among the tested fractions, ethyl acetate fraction showed the lowest MIC value of 1.5625 mg/ml (S. aureus) to 16.67 mg/ml (Candida albicans). Conclusions: The ethyl acetate fraction showed bactericidal activity against all tested microorganisms. Hence, ethyl acetate fraction of crude methanol extract exhibited the best antibacterial activity. Keywords: antibacterial, antifungal, ricinus communis, selected pathogens, crude extracts, solvent fractions

Disease assessment and antimicrobial prescription patterns in Sonali Chicken cases in Bogura, Bangladesh

Ibrahim khaliil1,2,3

1Department of Livestock Services (DLS), Bangladesh, 2Field Epidemiology Training Program for Veterinarians Fellow and Scientific Officers, Bangladesh, 3One Health Institute, Bangladesh and Field Disease Investigation Laboratory (FDIL), Barisal, Bangladesh

Sonali chicken production increased substantially during the last two decades in Bangladesh. However, different prevalent diseases hampered its normal growth. Irrational and inappropriate use of antimicrobials is commonly occurred which contribute to the development of antimicrobial resistance (AMR). The current study was therefore attempted to assess the burden of diseases along with antimicrobial prescription patterns. A total of 1690 drug prescriptions for infectious diseases in Sonali chickens in Bogura during 2020-2021 was extracted from the e-prescription database of 3769 poultry cases for assessing the disease status and antimicrobial prescription patterns. Data extracts were entered into MS Excel and cleaned and sorted before exporting to STATA/SE 13 for statistical analysis. The proportion of cases was dominated by mixed diseases of viral, bacterial and other infectious cases (28 %, n=474), followed by viral diseases (17.5 %, 296), bacterial diseases (4.5 %, 76), protozoan disease (4.0 %, 69). Antibiotics were widely prescribed regardless of case type (84.4- 97% cases). The highest proportion of antimicrobials was used in protozoan cases (97 %, 65), followed by viral alone (92%, 273), mixed (91.7%, 435) and bacterial alone (90.8%, 69). Single antibiotics (61.3%, 960) were prescribed widely followed by combined (14%, 224) and double (2.4%, 39). Tylosin (42%, 669) was more commonly prescribed for almost all disease types. Different fluoroquinolones and lortefencol were predominantly prescribed for undiagnosed (11.8%, 70) and bacterial cases (16%, 11), respectively. Colistin combined (3.4%, 55) was prescribed highly followed by aminoglycosides (2.4%, 38). Moreover, antiviral drugs were prescribed for 33.5% viral, 33% bacterial, and 30% protozoan cases. Immuno-stimulant was prescribed for 18% viral and bacterial cases. Considering the results, it is practical to include this e-prescription system to existing web-based surveillance system to know the disease rank and antimicrobial usage pattern timely, thus support to preventive program and antimicrobial stewardship approach.

Mapping and characterizing early warning systems for emerging profiles of antimicrobial resistance in Italy: a national survey

Establishing polymerase chain reaction-based diagnostic test for the detection of drug resistant Salmonella typhi in a hospital setting in the Philippines

Jan Evangelista1,2
1School of Tropical Medicine and Global Health, Nagasaki University, Japan
2San Lazaro Hospital–Nagasaki University Collaborative Research Office, Manila, Philippines

With the increasing use of polymerase chain reaction-based technologies to diagnose diseases such as tuberculosis and severe acute respiratory syndrome coronavirus 2 in the Philippines, medical technologists are becoming more familiar with novel molecular techniques. However, development of polymerase chain reaction diagnostic assays based on the identified needs of healthcare facilities and surrounding communities remains uncommon. In this work, we outline the experience and challenges we faced when developing a set of conventional polymerase chain reaction-based diagnostic tests for Salmonella typhi and associated sulfonamide (Su2), chloramphenicol (CatP), penicillin (Tem), and fluoroquinolone (gyrA) drug resistance genes in San Lazaro Hospital–Nagasaki University Collaborative Research Laboratory. This process involved three key components: procuring the necessary reagents, generating a positive control, and optimizing the polymerase chain reaction itself. To generate positive control, we re-cultured 21 archived isolates of Salmonella species on MacConkey agar and performed matrix assisted laser desorption ionization-time of flight mass spectrometry. Subsequently, genomic deoxyribonucleic acid was extracted from the identified colonies. Polymerase chain reaction optimization commenced by determining the optimal annealing temperatures. Good intensity of amplicon bands were observed at annealing temperatures 58°C for nested polymerase chain reaction and 45°C for conventional monoplex polymerase chain reaction. During optimization, we successfully detected flagellin gene (flic) for Salmonella typhi and three resistance genes (gyrA, Su2, and Tem) using positive control. Conversely, CatP gene was not detected. However, when we ran clinical samples, two of 18 Salmonella typhi polymerase chain reaction-positive specimens were positive for CatP gene. Our work may serve as a useful example for other laboratories and medical technology professionals in the country in responding to locally identified diagnostic needs. Moreover, early detection of resistance genes can inform both public health decision-making and individual clinical practice. Keywords: conventional polymerase chain reaction, Salmonella typhi, drug resistance

Genomic comparison of A. baumannii isolated from COVID-19 and non-COVID-19 patients admitted to an intensive Care Unit: preliminary results

Mariateresapa Ceparano1, Mariatere Ceparano1, Valerio Capitani2, Claudia Isonne1, Valentina Baccolini1, Giuseppe Migliara3, Carolina Marzuillo1, Paolo Villani1
1Department of Public Health and Infectious Diseases, Sapienza University of Rome, Rome, Italy, 2Department of Public Health and Infectious Diseases, Sapienza University of Rome, Sapienza, Italy

Background and Objective: A. baumannii is a major responsible of infections in patients admitted to the intensive care unit (ICU). In Policlinico Umberto I in Rome, A. baumannii was the main microorganism isolated in ICU SARS-COV-2 patients, and high clonal transmission profiles were documented. The purpose of this study was to compare the clonal profiles detected in COVID-19 patient's samples with those obtained from non-COVID-19 patients admitted to the same unit. Methods: Bacterial isolates of A. baumannii were collected between January 2020 and January 2022. The isolates were typed by pulsed field gel electrophoresis to analyze their homology relationships. Results: A total of 587 COVID-19 patients and 304 non-COVID-19 patients were admitted to the ICU. They were predominantly male (N=398 and N=186, respectively) with a mean age of 63.5 years in the first group and 61.6 years in the second group. Genotypic analysis of 138 isolates in COVID-19 patients revealed two main patterns (A and B) and a few minor patterns. Patterns “A” (59.4%) were found throughout the study period, patterns “B” (35.5%) were isolated from October 2020 to March 2021. In non-COVID-19 patients, 67 isolates that showed limited settings remain scarce; further research is needed on how to best achieve reductions in antibiotic use in LMICs. Keywords: antimicrobial resistance, antibiotic consumption, antimicrobial stewardship programmes

Popul. Med. 2023;5(Supplement):A138
DOI: 10.18332/popmed/165346
more heterogeneous clonal profiles were typed. However, the pattern "A" (47.7%), was the most frequent pulstotype detected during the study period. The strains had high antibiotic resistance profiles and were isolated mostly from tracheobronchial aspirates and rectal swabs both in COVID-19 (42.8% and 29.6%) and in non-COVID-19 patients (34.3% and 42.8%).

Conclusions: The identification of the pattern "A" in both cohorts of patients, may indicate the possible transfer of related isolates from one ICU to another in the same hospital among patients or through healthcare workers. Therefore, the use of strict infection control strategies to reduce cross-contamination of endemic clones of A. baumannii is essential.

Popul. Med. 2023;5(Supplement):A140 DOI: 10.18332/popmed/165723

Emergence of NDM-1 producing ST147 Klebsiella pneumoniae strains isolated from bloodstream infections during the COVID-19 pandemic, Southern Italy

Maria Chironna1, Daniela Locosono1, Francesca Centrone1, Anna Sallustio1, Daniele Casulli1, Marisa Accogli1
1University of Bari, Italy

Background and Objective: Carbapenem-resistant Enterobacteriales (CRE) infections are a major public health threat worldwide. The presence of NDM-producing Klebsiella pneumoniae (NDM-KP) has increased in several regions, mainly during the COVID-19 pandemic. The study aimed at describing a regional outbreak of NDM-KP identified in bloodstream infections (BSI) in the Apulia region of Italy.

Methods: From January 2020 to September 2022, 459 carbapenem-resistant KP (CR-KP) strains collected from patients hospitalized with BSI were subjected to molecular characterization at the Laboratory of Molecular Epidemiology and Public Health of the University Hospital Policlinico of Bari (Italy) through a commercial multiplex real-time PCR kit (GeneXpert platform, Cepheid) for the identification of the carbapenemase-encoding genes blaKPC, blaVIM, blaNDM, blaIM and blaOXA-48. In addition, a subset of 27 NDM-KP randomly selected strains were subjected to NDM variant detection by real-time PCR assay and to multi-locus sequence typing (MLST).

Results: The blaKPC gene was identified in 67.5% of KP isolates, blaVIM in 0.2%, blaNDM in 20.3%, blaOXA-48 in 3.1%. Carriage of multiple carbapenemase genes was reported in 12 isolates (11 blaNDM+blaKPC and one blaKPC+blaVIM). Overall, 104 strains carrying the blaNDM gene were identified (22.6%). The 69.2% was identified in male subjects. The average age was 67 years (range: 29-92) and the province of residence was Brindisi for 35.6%, and Taranto for 41.3% of patients. Forty-four patients (42.3%) were positive for SARS-CoV-2. Further characterization of 27 NDM-KP strains revealed that all the strains were ST147-NDM-1-KP.

Conclusion: The prevalence of NDM-KP in the Apulia region has increased from 0.2% in 2014-2016 to 22.6% in 2020-2022, thus representing a matter of concern. Implementation of molecular epidemiology of CRE is crucial to limit hospital infections. Moreover, timely and appropriate diagnosis, high standards of infection prevention and control, and antimicrobial stewardship are key actions to control the spread of antimicrobial resistance worldwide, particularly in hospital settings.

Popul. Med. 2023;5(Supplement):A141 DOI: 10.18332/popmed/165780

Antibiotic resistance genes and viral genomes assessment in wastewater samples from cabo verde wastewater treatment plants

Isabel Araujo1, Tamar Monteiro1, Kleidi Monteiro1, Maria Barreto Crespo1, Mónica Nunes2
1Universidade de Cabo Verde, Faculdade de Ciências e Tecnologia, Zona K, Palmarejo - Praia, Ilha de Santiago, República de Cabo Verde, 7943-010, Cape Verde, 2Instituto de Biologia Experimental e Tecnológica, Apartado 12, 2781-901 Oeiras, Portugal

Background and Objectives: Reusing treated wastewater is a sustainable and recommendable strategy, especially in a nation where water shortage is a major sine qua non condition. However, conventional wastewater treatment plants are sometimes ineffective in removing emerging microbiological contaminants such as resistant bacteria and antibiotic resistance genes, as well as human pathogenic viruses, and are thus considered sites of antibiotic resistance proliferation and spread.

The aim of this study was to evaluate the presence of antibiotic-resistant bacteria/gene (ARB/ARG) as well as human-pathogenic viral genomes in water from wastewater treatment plants.

Methods: ARG and viral genomes were detected by multiplex qPCR methods in the influent and treated effluent of six WWTPs chosen in the islands of Cabo Verde.

Meropenem or ciprofloxacin were added to a selective medium to help isolate bacteria resistant to these AB, and the EUCAST disc diffusion technique was used to analyse the AB resistance phenotypes of possibly pathogenic bacteria. Finally, we extracted plasmids (using a kit from Nzytech) from five prominent clones of each influente sample to analyse the variety of Adenovirus and Poliovirus in Cape Verde.

Results: Polyomavirus, adenovirus, norovirus GII, hepatitis A and hepatitis E genomes were detected at high concentrations (106 gc/L) in either the influent or effluent samples, as were carbapenem and fluoroquinolone resistance genes at concentrations of 1010 gc/L.

Conclusion: These findings indicate that conventional treatments currently being used in the investigated WWTPs are insufficient to effectively remove ARG and viral genomes, which highlights the need for the development and implementation of targeted treatments at full scale in the WWTPs so that the produced effluents can be safely discharged into the environment and/or recycled for uses like agricultural irrigation (ensuring food security).

Popul. Med. 2023;5(Supplement):A142 DOI: 10.18332/popmed/163821

Impact of a structured antimicrobial stewardship program in Cittadella Hospital, Padua, Italy

Emanuela Zilli1, Antonio Mioti1, Giulia Zavatta1, Elisa Baldasso1, Giampaola Basso1, Mara Carraro1, Giuseppe De Angelis1, Antonella Buffatto1, Emanuela Zilli1, Azienda ULSS 6 Euganea, Hospital Direction, Cittadella Hospital, ULSS 6 Euganea, Via Casa di Ricovero 40, Cittadella, Italy, Azienda ULSS 6 Euganea, Department of Cardiac, Thoracic, Vascular Sciences and Public Health, University of Padua, Italy

Background and Objective: Cittadella Hospital (Padua) has 400 beds and serves a territory of 240,000 inhabitants. Regarding antimicrobial stewardship program, special focus was put on fluoroquinolones, carbapenem and third generation cephalosporins. A reduction > 5% of fluoroquinolones use was directly demanded by the Italian National Action Plan against antimicrobial resistance; third generation cephalosporins are some of the most prescribed antibiotics in the hospital settings.

Methods: Appropriate use of antibiotics was encouraged during periodic multidisciplinary meetings held by the Hospital Infection Control Committee (made up of Hospital Antimicrobial Stewardship Task Force, Infectious Disease Consultant, Microbiologist, Pharmacist etc.).

Results: The Pharmaceutical Service provided a quantitative estimate of antibiotic consumption, expressed in Defined Daily Dose (DDD) per 100 bed-days. Between 2019 and 2022, a large decrease in the consumption of carbapenems in Intensive Care Unit (from 15.3 to 15.2 DDD, - 0.6%) and in Medical wards (from 6.2 to 3.1 DDD, -50.0%) was reported; a decrease in the consumption of quinolones in Intensive Care Unit (from 22.4 to 13.0 DDD, - 41.9%), Medical wards (from 11.9 to 7.3 DDD, - 38.6%) and Surgical wards (from 12.0 to 7.6 DDD, - 36.6%) was highlighted; a small decline in the consumption of third generation cephalosporins in Medical wards (from 17.4 to 17.2 DDD, - 1.1%) was reported. Finally, a decrease in the consumption of macrolides was reported in the Intensive Care Unit (from 9.7 to 3.1) and Medical wards (from 9.0 to 8.9).

Conclusion: Periodic multidisciplinary meetings aimed at medical referrals for infections, constant monitoring of antimicrobial consumption and timely identifying of warning situations that may need a specific intervention are the cornerstone of Antimicrobial Stewardship programs, together with analyzing data of bacterial resistance rates and infections from multi-drug resistant bacteria.

Popul. Med. 2023;5(Supplement):A143 DOI: 10.18332/popmed/163904

Multidrug-resistant Cause Mortality Rates in infants Infected with Carbapenem Resistant Organisms

Waiswa Moses1, Kalembe Janat1, Paulson Henderson2
1Uganda Development and Health Associates, Iganga General Hospital, Iganga, Uganda, 2Iganga General Hospital, Uganda, 3School of Clinical Medicine, Makerere University

Background: Multidrug-resistant, Gram negative infections particularly due to Carbapenem resistant organisms (CRO), have increased globally. Few studies have reported on the burden of CRO in infants from hospital settings in Uganda. This study aimed to determine the incidence and mortality rates of culture-confirmed Gram negative infections, with a special focus on CRO in a neonatal unit.

Methods: Positive bacterial cultures from the sterile sites of infants admitted in the neonatal clinic from the 1st of January 2018 to 31st December 2019 were reviewed respectively. Type of organism, susceptibility and outcomes were recorded. Data on Gram-negative isolates, including the CRO, were extracted,
of life and 4.12 quality-adjusted life years (QALY) per patient. The model highlights how imipenem/cilastatin/relebactam is advantageous. In fact, it is the most effective drug in terms of cost-effectiveness whose validity was subject of discussion. Materials and methods DRI was calculated by multiplying proportion of consumption of selected antibiotic class and proportion of all K. pneumoniae resistant to that antibiotic class. The DRI in the L'Aquila Hospital for the years 2019 and 2020 have been calculated and then compared to national DRI. Local resistance and antibiotic consumption data were obtained by analysis laboratory of the L'Aquila Hospital, and by the Management Control Office. National data were obtained by the national surveillance system on antibiotic resistance, and by the Italian Medicines Agency. Results: The local prevalence of resistance to β-lactamases was higher than those to carbapenems in both years: 35.6% vs 15.7% in 2019; 32.0% vs 17.6% in 2020. Prevalence of resistance to β-lactamases showed a reduction from 35.6% to 32.0%; instead, prevalence of resistance to carbapenems increased from 15.7% to 17.6%. L'Aquila Hospital DRI was 29.9% in 2019 and 28.9% in 2020. In Italy, the prevalence of resistance against β-lactamases was higher than those to carbapenems in both years: 60.0% vs 34.7% in 2019 and 57% vs 33.0% in 2020. National DRI was 57.7% in 2019 and 54.3% in 2020. In 2019 and in 2020 the most consumed antibiotics were β-lactamases, the less were carbapenems. Conclusions: DRI calculated in L'Aquila Hospital was significantly lower than the national, but both showed a downward trend, indicating an improvement in the management of antibiotics.

Klebsiella pneumoniae drug resistance index: an indicator evaluated in L'Aquila hospital Raffaella Golini1, Eleonora Cimino1, Riccardo Amicosante1, Alessandro Ferranti1, Giovanna Micolucci1, Anna Lepore1, Mario Muselli1, Leila Fabiani1, Stefano Necozione1 1University of L’Aquila Italy Introduction: Antibiotic resistance is a critical public health issue, both clinically and economically. Klebsiella pneumoniae (K. pneumoniae) is a common cause of healthcare-associated infections and has worrying levels of antibiotic resistance. The antibiotic resistance of K. pneumoniae was investigated in the L’Aquila Hospital using the Drug Resistance Index (DRI), a measure of antibiotic effectiveness whose validity was subject of discussion. Materials and methods DRI was calculated by multiplying proportion of consumption of selected antibiotic class and proportion of all K. pneumoniae resistant to that antibiotic class. The DRI in the L'Aquila Hospital for the years 2019 and 2020 have been calculated and then compared to national DRI. Local resistance and antibiotic consumption data were obtained by analysis laboratory of the L'Aquila Hospital, and by the Management Control Office. National data were obtained by the national surveillance system on antibiotic resistance, and by the Italian Medicines Agency. Results: The local prevalence of resistance to β-lactamases was higher than those to carbapenems in both years: 35.6% vs 15.7% in 2019; 32.0% vs 17.6% in 2020. Prevalence of resistance to β-lactamases showed a reduction from 35.6% to 32.0%; instead, prevalence of resistance to carbapenems increased from 15.7% to 17.6%. L'Aquila Hospital DRI was 29.9% in 2019 and 28.9% in 2020. In Italy, the prevalence of resistance against β-lactamases was higher than those to carbapenems in both years: 60.0% vs 34.7% in 2019 and 57% vs 33.0% in 2020. National DRI was 57.7% in 2019 and 54.3% in 2020. In 2019 and in 2020 the most consumed antibiotics were β-lactamases, the less were carbapenems. Conclusions: DRI calculated in L'Aquila Hospital was significantly lower than the national, but both showed a downward trend, indicating an improvement in the management of antibiotics.

Methicillin-resistant and methicillin-sensitive staphylococcus aureus infections in patients undergoing elective arthroplasty surgery: a prospective observational multicentre study Pietro Vernaci1, Antonino Cannistrà2, Gianfranco Barra3, Marco Provenzano2, Leandro Gentile1, Anna Odone1 1University of Pavia Department of Public Health, Experimental and Forensic Medicine, University of Pavia, Pavia, Italy, 2San Donato Hospital Group Clinical Institutes of Pavia and Vigevano, Italy, 3Clinical Institutes of Pavia and Vigevano, Italy. Background and objective: Staphylococcus aureus is a leading cause of surgical site infections. Risk factors are age, comorbidity and prolonged hospitalization. Since up to 45% of S. aureus infections are Methicillin-resistant, targeted treatment is required to stop nosocomial infection following surgical procedures. In order to explore the incidence and management of methicillin-resistant and methicillin-sensitive S. aureus (MRSA and MSSA) infections, a prospective observational multicentre study was conducted in patients undergoing elective arthroplasty surgery at the Clinical Institutes of Pavia and Vigevano (Italy).
Methods: We examined data flow from screening nasal swabs performed within 30 days before surgery (arthroplasty surgery or prosthesis revision) in patients treated between March and November 2022. Eradication treatment consisted in nasal drainage with Mupirocin twice a day and skin washings with 4% chlorhexidine for 7.5% povidone iodine or 2% triclosan once a day. Results: A total of 737 subjects were recruited, 37% men and 63% women. The average age was 72 years, with the following distribution: 39-52 years, 3.7%; 53-62 years, 13.2%; 63-72 years, 32.5%; 73-82 years, 41%; 83-92 years, 9.6%. Seven (0.9%) patients were MRSA positive and 142 (19.3%) MSSA positive. The outcome of the MRSA eradication treatment will be evaluated through an Active Registry reporting infectious or secondary events (movement impairment, persistent joint pain, inflammation signs) during the follow-up phase performed at 6 and 12 months either on site or by telephone.

Conclusions: The early identification of MRSA strains through patients screening allows targeted antibiotic treatment to prevent surgical site infections. Further prospective studies are needed in order to characterise population contamination and define the best therapeutic strategies.

**Antibiotic resistance in ocular bacterial infections: an integrative review of ophthalmic chloramphenicol**

**Emmanuel Ebelusun1, Emmanuel Ebelusun1**

1University of Nigeria, Enugu, Nigeria Department of Medical Laboratory Sciences, Faculty of Health Sciences and Technology, University of Nigeria, Enugu, Nigeria Faculty of Health Sciences and Technology, University of Nigeria, Enugu Campus, 400105, Enugu, Nigeria

Background: Chloramphenicol is a broad-spectrum antibiotic widely used for treating ophthalmic infections, but concerns about rising bacterial resistance to chloramphenicol have been observed due to its frequent use as an over-the-counter medication. This review assessed the rates of drug resistance to chloramphenicol in opthalmic bacterial infections.

Methods: PubMed and Google Scholar databases were searched for relevant publications from the year 2000 to 2022, bordering on ophthalmic bacterial infections, chloramphenicol susceptibility profiles, and drug resistance mechanisms against chloramphenicol. A total of 53 journal publications met the inclusion criteria, with data on the antibiotic susceptibility profiles available in 44 of the reviewed studies, which were extracted and analyzed.

Results: The mean resistance rates to chloramphenicol from antibiotic susceptibility profiles varied between 0% to 74.1%, with only 6 out of 44 studies showing chloramphenicol resistance rates higher than 50%, and more than half (23) of the studies showed resistance rates lower than 20%. The majority of the reviewed publications (n=27; 61.4%) were from developed nations, compared to developing nations (n=14; 31.8%), while a fraction (n=3; 6.8%) of the studies were regional cohort studies in Europe with no country-specific drug resistance rates. No cumulative pattern of increase or decrease in ophthalmic bacterial resistance rates to chloramphenicol was observed.

Conclusion: To a large extent, chloramphenicol is still active against ophthalmic bacterial infections and is quite suitable as a topical antibiotic for ophthalmic infections. However, concerns remain about the drug becoming unsuitable in the long run due to some proof of high drug resistance rates.

**Potential risks of pm2.5 and silica pollutants among communities living surrounding the Bosowa cement plant, Maros Indonesia 2022**

Anwar Mallongi1

1Environmental Health Department, Faculty of Public Health, Hasanuddin University, Makassar, Indonesia

Background: This study focused on the assessment of the potential risks of PM 2.5 and silica contaminants exposures on the ecology and communities due to contaminated air inhalation and water consumption around Bosowa cement plant Maros Regency, Indonesia.

Methods: The magnitude of PM 2.5 and silica were measured during the period of April-May 2022. The level of PM 2.5 on ambient air sampling was conducted using direct reading HAZ-Dust EPAM 5000, uses a laser analyzer in order to measure particulate level matter. Then sample on air for PM2.5, and silica in water and soil data were used in the form of univariate and bivariate and multivariate analysis using chi square test. PM2.5 and silica levels were determined in samples using graphite furnace and cold vapor atomic absorption spectrometry.

Results: High concentration of PM 2.5 in ambient air were 99.13 and 87.30 µg/m3 where as the high concentration of Silica in well water were station 12 and station 10 with 13.28 and 13.23 mg/l, then in river water with 26.56 and 24.13 mg/l and on surface soil on station 10 and 11 with 159.90 and 154.88 mg/gt, respectively. The potential both ecological and human health risks posed by PM 2.5 in air and silica on all those sites environment were exceed standard and at risks for health. The total carcinogenic risks due to PM 2.5 and silica were within the non acceptable range risks for communities. The potential ecological risks of PM 2.5 and silica were the highest risks value were in surface soil with 10.15 followed by an air particulate with 9.13 and river water 9.06, respectively. Then highest value of EWI in PM 2.5 was 0.09 and lowest was in 0.01, while the highest value Silica in well water was (0.96).

**Climate vulnerability, urban health, sexual and reproductive health rights (SRHR) in Bangladesh: an explanatory analysis from Chottogram Metropolitan**

Muhammad Rahaman1, Zereen Saba2

1Center for People & Environ (CPE), Mohammadpur, Bangladesh, 2Center for People and Environ (CPE), Dhaka, Bangladesh

There is increasing evidence that global climate change has adverse effects on human health, mainly among the poorest people in developing countries. Bangladesh is a low-lying country, and Bangladesh is considered one of the most climate-vulnerable countries in the world. As the most vulnerable climatic region in the country, Chottogram Metropolitan is increasingly experiencing climate-change-induced urban problems. For instance, occupancy by climate migrants, drainage congestion, water logging, and reduced freshwater availability are increasing concerns. This study explores the climate vulnerability, heat stress, and health disorders of urban slum dwellers of Chottogram Metropolitan. This study noted that Sexual and Reproductive Health risks of adolescents and women increased from unhygienic and overcrowded living conditions and water and sanitation problems. The slum dwellers often suffer from waterborne diseases, undernutrition and micronutrient deficiencies. Though Sexual and Reproductive Health issues are overreaching, there are no specific interventions in policy to practice level towards sexual and reproductive health rights (SRHR) considering climate vulnerability in urban slums. The study was conducted through a multidisciplinary approach and Methodology, including primary and secondary data. Secondary information was collected from reviewing policies, strategies, and action plans of GoB in terms of climate change and health services in Bangladesh. Primary information was collected through a household questionnaire survey, focus group Discussion, and key informants interview from stakeholders involved with climate-resilient health delivery services. The multi-hazard risk was analyzed using artificial intelligence in the study area. The study reveals that SRHR is far away in Bangladesh in terms of policy and practice for climate-resilient urban health delivery services in Bangladesh.

**Point-of-care testing, spatial care paths, and enhanced standards of care - preparing island communities for global warming and rising oceans**

Samantha Tinsay1

1Municipality of Bantayan, Cebu, Philippines

Background and Objective: The goal of this research is to create point-of-care (POC) strategies that accelerate decision making, increase efficiency, improve outcomes, and enhance standards of care in small-world networks (SWNs) of island communities faced with global warming, rising oceans, population migration, and public health crises. The Philippines lies in the “typhoon alley” of the Pacific and needs assessment was done in the Bantayan Archipelago to map POC testing (POCT), rescue times, and spatial care paths (SCP). Global warming is intensifying the severity of major storms, increasing their frequency, and magnifying the scope of damage. Archipelagos will be increasingly vulnerable and perpetually at risk to rising ocean levels. Every centimeter increase in ocean levels magnifies storm surges and flooding, and poor planning can adversely impact medical outcomes.

Methods: Needs assessment was done in the Bantayan Archipelago and other locales on mainland Cebu. Well-established investigational methods conducted in other limited-resource countries were adapted and there was focus on POCT, ambulance rescue, emergency medicine, critical care testing, and the organization of resources in the healthcare SWN.

Results: Significant deficiencies included lack of cardiac marker testing for rapid diagnosis of acute myocardial infarction, absence of blood gas testing for support of critically ill patients, and geographic gaps prolonging patient transfers and
delaying treatment. Strengths comprised primary care that can be facilitated by POCT, logical inter-island transfers for which decision making could be accelerated with onboard diagnostic testing, and healthcare SWNs amenable to POCT advances that avoid overloading emergency rooms. Healthcare resources must be distributed to archipelago lands, not concentrated in large metropolitan areas inaccessible for emergency interventions.

Conclusions: A point-of-need focus will help improve public health, decrease disparities in mortality among rural islanders, and pave the way for heightened resilience in anticipation of the adverse impact of global warming on vulnerable coastal areas.

Health in sustainable development - barriers and drivers in implementing sustainable transport policy in Copenhagen, London, Mumbai, and Shanghai

Jack Haywood

1London School of Hygiene and Tropical Medicine, United Kingdom

Background: Anthropogenic-induced greenhouse gas emissions and particulate matter exposure have health impacts both locally and globally. Sustainable transport policy formation and implementation is one way to reduce these. Several cities have sustainable transport policies, with one principle to encourage a shift from private motor vehicles to public and active transport. However, there has been little analysis examining if drivers and barriers of their uptake are acknowledged in policy.

Aim: To assess if known context-dependent barriers and drivers of active and public transport uptake are acknowledged in sustainable transport policy to enable successful implementation and thus improve human health.

Methodology: Transport policies of four cities – Copenhagen, London, Mumbai, and Shanghai – were examined for barriers/drivers of active and public transport uptake. A literature review with systematic approach was then carried out to ascertain evidence-based barriers/drivers in the same four cities. Four academic databases were searched, resulting in 30 peer-reviewed research papers being included in a thematic analysis.

Results: Five dominant themes emerged from the literature review: 1) modifiable social environment, 2) physical environment, 3) transport policy decisions, 4) transport conditions, and 5) individual factors. Cost and speed of active and public transport options were important across all cities. There were differences in focus: for example, crowding in Mumbai, and the symbolism of car-ownership in middle-income cities. The Results also made clear a ‘one size fits all’ approach will not work due to context-specific heterogeneity, and the gap in middle-income-based literature, particularly around active transport in Mumbai.

Conclusions: Many of the literature review-identified barriers/drivers were not acknowledged in the four city’s transport policies. There were also barriers/drivers identified in policy which were not featured in the evidence-base. To ensure successful implementation of policy, context-specific evidence must inform it, with a Health in All Policies approach to ensure health benefits are gained.

A time differentiated dietary intervention effect on the biomarkers of exposure to pyrethroids and neonicotinoids pesticides

Elina Ioannou, Konstantinos Makris, Pantelis Charisiadis, Stavros Oikonomou, Nikolaos Efthymiou, Andria Constantinou, Thibaut Delplancke

1Cyprus International Institute for Environmental and Public Health, Cyprus

University of Ibadan, Nigeria

University of Ibadan, New Nyanya, Nigeria, University of Ibadan, Nigeria

Background and Objectives: Ammonia gas is one of the major pollutant gases which is toxic to humand and animals when inhaled in high doses. Previous studies have demonstrated increase in ammonia emission levels among poultry farms but there is little information on ammonia gas emission reduction. Hence, this study utilized activated carbon filter in the reduction of ammonia emissions produced in selected poultry farms. Methods: The study adopted a quasi-experimental design and four poultry farms within Ibadan metropolis (renamed A, B, C and D) were purposively selected. Also, a fabricated glass chamber was used to monitor ammonia gas emission and reduction levels in the farm. Measurements of ammonia levels was carried-out six days in a week, three times daily for two weeks. at specific periods of the day with a total sampling period of eight weeks. Activated carbon produced from coconut shells and palm kernel shells was used as ammonia absorbent. Data were analysed using descriptive statistics, T-test and ANOVA at 5% level of significance.

Results: The ammonia emissions (ppm): 1150.67, 953.67, 1068.06, and 859.3 for farms A, B, C and D, respectively were higher than the guideline limits for ammonia gas by NIOSH (25ppm) and OSHA (50ppm). Coconut shells-based activated carbon had a higher absorbency capacity with the average ammonia level reduced from 36.5±5.38 at baseline to 16.38±17.71 at post-treatment level and a percentage reduction of 19.77% while Palm Kernel shells-based activated carbon had 35.80±31.15 at baseline and 19.54±16.85 at post-treatment level, with a percentage reduction of 42.26% across all the poultry farms.

Conclusions: The study showed that activated carbon obtained from coconut shells had a greater absorbency potential for ammonia gas reduction when compared to palm kernel shells activated carbon. Therefore, poultry managers should include activated carbon filters as a mechanism to reduce ammonia levels in poultry farms.

Energy conservation practices among undergraduate students of King Faisal University

Hussain Alraidi, Ahmed Abbas, Mohammed Alabadi, Edric Estrella

1Public Health Department, College of Applied Medical Sciences, King Faisal University, Saudi Arabia

Background: Energy is very crucial component in the entire process of growth, development, and survival for any country. However, there has been a wide gap between its demand and supply. With the problem of scarcity, conservation efforts should be undertaken by every citizen of every nation. Objectives: The study is conducted with the aim of assessing the knowledge, attitudes, and practices related to energy conservation among undergraduate students at King Faisal University.

Methods: This analytical, cross-sectional study utilized data from 806 students selected through two-stage sampling procedures. Data was collected using online, self-administered questionnaire consisting of 25 items related to knowledge, attitudes, and practices on energy conservation. The proportions of students possessing high level of knowledge, exhibiting positive attitude towards energy conservation, and consistently practicing energy conservation measures were estimated using the Stata MP version 13. The crude association between the level of the knowledge and consistency of practice of energy conservation measures was determined using binary logistic regression.

Results: About 59.30% of the students (95% CI: 55.87, 62.65) had high level of knowledge related to energy conservation. Roughly 57% of the students (95% CI: 53.99, 60.80) possessed positive attitude toward energy conservation while 47.14% of them were consistently practicing energy conservation measures. Students who had high level of knowledge related to energy conservation were 1.38 times more likely to consistently practice energy conservation measures compared with those who possessed low level of knowledge.

Conclusions: The level of knowledge of King Faisal University students was significantly associated with their practices related to energy conservation. However, a large proportion of King Faisal University students were not consistent in practicing energy conservation measures.

Popul. Med. 2023;5(Supplement):A156
Conceptualisations of public trust in climate science: a systematic meta-narrative literature review

Loni Ledderer1, Antoinette Fage-Butler2, Kristian Nielsen1
1Department of Public Health, Aarhus University, Aarhus, Denmark. 2School of Communication and Culture, Aarhus University, Denmark.

Background: Reflecting the connections between public health and the climate, the World Health Organization recently launched a global knowledge platform dedicated to health and climate to bring together knowledge from practitioners and scientists from various disciplines. Trust mediates the relationship between the public and scientists. There have been concerns that trust in climate science has been negatively impacted over the years by populist denials of climate change, media misrepresentations and misinformation. Public trust in climate science is deemed necessary for ensuring that the public accept and adopt climate-friendly programs and policies. As various conceptualizations of trust may be associated with disciplinary fields, our aim was to investigate how various disciplines have conceptualized public trust in climate science.

Methods: We used Greenhalgh and colleagues’ systematic meta-narrative review methodology to investigate narratives of trust in climate science. A literature search identified peer-reviewed papers on trust relating to climate science in the databases Scopus, Web of Science, EBSCO, ProQuest and Ovid MEDLINE. The search resulted in 404 papers, 58 of which were included in the final sample. The following categories were used to systematize data from the papers: author(s), location of empirical studies, academic discipline, research aim, method, conceptualization of trust, type of trust and main findings.

Results: We identified 10 different academic disciplines in the sample. Most papers used quantitative Methods, were conducted in the United States and did not explicitly define trust. However, based on the papers’ context and operationalization of trust, we identified six main conceptualizations of trust: attitudinal trust, cognitive trust, affective trust, contingencies of trust, contextual trust, and communicated trust.

Conclusions: Public trust was often characterized as residing in experts or expert institutions, and as being associated with trustworthy information. Public trust in health and climate experts seems crucial for affecting the conditions for health in communities. There is more work to be done to promote awareness of pollution and climate change, as well as their impact in South African communities like Melusi.

Community knowledge, practices, and perceptions regarding environmental determinants of health in Melusi, Pretoria, South Africa

Sean Patrick1, Joyce Shirinde1, Oliver Mhazo2
1School of Health Systems and Public Health, University of Pretoria, South Africa. 2School of Health Systems and Public Health, Faculty of Health Sciences, University of Pretoria, Gezina, South Africa, University of Pretoria, South Africa.

Background: In order to improve public health policies and services, construct an environmentally resilient health sector, and promote healthy and sustainable communities, extensive study is required. Objectives: This study aimed to determine the Melusi community’s knowledge, perceptions, and practices regarding environmental determinants of health and their understanding and contribution to community health and welfare. Methods: This cross-sectional survey was done in the Melusi informal settlement, Daspoot neighborhood in the Western suburbs of Pretoria. Using random sampling, 448 persons were interviewed using a structured electronic questionnaire.

Results: Over 60% of respondents were aware of various forms of pollution (water, land, and air). Newspapers, radio, and television, as well as the internet and health care workers, were the primary sources of information. Almost 90% of respondents said water was easily accessible. Predictors of water pollution were occupation, income, dwelling, toilet, water source and cooking source. Water source, gas and paraffin as cooking sources were the predictors of air pollution. Determinants of land pollution were pit latrine as a type of toilet, water source, gas and paraffin as cooking sources and misinformed. Public trust in climate science is deemed necessary for ensuring that the public accept and adopt climate-friendly programs and policies.

Conclusions: This study found a variety of patterns of knowledge, attitudes, and actions regarding environmental health determinants and the risks they bring to communities. There is more work to be done to promote awareness of pollution and climate change, as well as their impact in South African communities like Melusi.

Occurrence of cardiopulmonary diseases after the Susa Valley wildfires of 2017

Mattia Russo1, Aldo Rosano2, Chiara Cadeddu1, Alessio Perilli1, Luca Regazzi1, Davide Ascoli2, Davide Vecchio1
1Italian Institute for Planetary Health, Università Cattolica del Sacro Cuore, Italy. 2National Institute for Public Policies Analysis (INAPP), Italy.

Background and Objective: Cardiovascular and respiratory diseases are among the leading causes of death in Italy. There is currently growing evidence of the association between exposure to fire smoke and the occurrence of cardiopulmonary diseases. According to the 2017 ARPA Piedmont (regional environmental protection agency) report, October was the hottest month in the last 60 years in the area of interest, causing fires and wildfires scattered throughout the Alpine region. These events caused continuous exposure to organic combustion products for 20 days, in the municipalities of Piedmont. This study aims to assess the cardiovascular and respiratory risk of populations exposed to smoke from the October 2017 forest fires in the Susa Valley.

Methods: Hospital Discharge Records were requested to collect outcome data of hospitalizations and emergency department admissions for cardiopulmonary diseases that occurred before and after the fires and demographic data provided by the National Institute of Statistics regarding the resident population. Through air monitoring data from the ARPA Piedmont agency, municipalities will be grouped into 5 clusters by exposure risk, of which one will serve as a control. The assessment will be carried out from October 5th 2017 at 6 and 12 month follow-ups in the most affected areas, while the selected control period is from October 5, 2015 to October 4, 2017.

Results: The currently available international literature shows an increase in hospital admissions for cardiopulmonary conditions, including AMI, stroke, heart failure, arrhythmias, COPD, asthma attacks, and pneumonia, in the fire exposure period compared with the control period. No Italian scientific studies, other than descriptive studies from grey literature, are available. Clear and sustained increases in PM10 were found during the exposure periods by ARPA agency.

Conclusions: Our study is currently in progress, final results will be available in April 2023.

DOI: 10.18332/popmed/165198

Nine-year exposure to residential greenness and the risk of metabolic syndrome among Luxembourgish adults: a longitudinal analysis of the ORISCAV-LUX cohort study

Marion Tharrey1, Olivier Klein2, Torsten Bohn3, Laurent Malisoux4, Camille Perchoux5
1Department of Urban Development and Mobility, Luxembourg Institute of Socio-Economic Research, Esch-sur-Alzette, Luxembourg. 2Luxembourg Institute of Socio-Economic Research, Luxembourg. 3Luxembourg Institute of Health, Luxembourg.

Background and Objective: A growing body of research shows a beneficial effect of exposure to green spaces on cardiometabolic health, although the evidence is limited by the cross-sectional design of most studies. This study aims at examining the long-term associations of residential greenness exposure with metabolic syndrome (Mets) and Mets components, in Luxembourg.

Methods: We used data of 395 adults participating in both waves of the population-based ORISCAV-LUX study (Wave 1: 2007-2009, Wave 2: 2016-2017), who had no Mets at baseline. Exposure to total greenness and tree coverage were calculated for each residential address based on satellite derived Soil Adjusted Vegetation Index (SAVI) and Tree Cover Density (TCD) indices. Within- between-effect logistic and linear models were fitted to estimate both within- and between-subject variation of residential greenness on Mets and Mets components (waist circumference, triglycerides, HDL-cholesterol, fasting plasma glucose, blood pressure), respectively. Models were adjusted for several individual and neighbours-level confounders and for neighbourhood self-selection.

Results: A 10% within-person increase in the residential TCD over a 9-year period was associated with a 74% decrease in the odds of developing Mets and better lipid profiles (HDL-c: +2.32, 95% CI: 1.08, 3.55; triglycerides: -6.46, 95% CI: -11.85, -1.07). Higher between-subject exposure to SAVI and TCD was associated with lower fasting plasma glucose (β: -1.22, 95% CI: -2.1, -0.35), and higher waist circumference (β: 1.08, 95% CI: 0.13, 2.02), respectively. Effect modification by sex and neighbourhood socioeconomic status were observed for triglyceride and fasting plasma glucose levels.

DOI: 10.18332/popmed/165083
Conclusions: This study provides new evidence that residential greenness may play a role in preventing MetS. Based on our results, we advocate for urban greening policies and programs that promote greater density of tree cover to generate additional cardiometabolic health benefits.

**Effect of exposure to quarry dust on the lung function of exposed communities in Edo State, Nigeria**

Efe Edewe1, Steve Abah2, Alphonso Aigbaremolen1

1Institute for Collective Health, Irrua Specialist Teaching Hospital, Nigeria, 2Department of Community Medicine, Federal University of Health Sciences, Otuko, Nigeria

**Conclusions:** The indoor and outdoor levels of particulate matter were mostly likely to have an abnormal lung function with a risk of 58% compared to those in RZ1 to 130.1±79.8 (µg/m3) in RZ3 whereas mean outdoor TSP ranged from 112.8±79.8 in RZ1 to 87.3±18.5 (µg/m3) in RZ3. Forced expiratory volume in one second ranged from 71.0± 1.8% in RZ2 to 82.9±11.3% in RZ3. The differences in the above parameters were statistically significant. Residents in RZ2 were most likely to have an abnormal lung function with a risk of 58% compared to those in RZ2 (36%) and RZ3 (26%).

**Methods:** A cross-sectional design was used to study 320 residents of two host communities using multi-stage sampling technique. Each community was divided into three risk zones (RZs) based on the relative distances of the residential houses from the quarry and RZ1 being the most proximal. A semi-structured questionnaire, portable dust metre and spirometer were used for data collection. Analysis of variance was used to compare mean values.

**Results:** Mean indoor total suspended particulates (TSP) ranged from 139.7±81.7 in RZ1 to 130.1±79.8 (µg/m3) in RZ3 whereas mean outdoor TSP ranged from 112.8±37.8 in RZ1 to 87.3±18.5 (µg/m3) in RZ3. Forced expiratory volume in one second ranged from 71.0±1.8% in RZ2 to 82.9±11.3% in RZ3. The differences in the above parameters were statistically significant. Residents in RZ2 were most likely to have an abnormal lung function with a risk of 58% compared to those in RZ2 (36%) and RZ3 (26%).

**Keywords:** quarry dust, host community, lung function

**Analysis of the epidemiological profile of dengue cases in the Municipality of Araras between 2010 and 2021**

Amarly Gardin1, Lisie Justo1

1Faculdade São Leopoldo Mandic Araras, Brazil

**Background:** Dengue is an arbovirosis, caused by infection of a virus of the genus Flavivirus, which is transmitted by females of two species of mosquitoes Aedes aegypti or Aedes albopictus, the latter less common in the national territory. It is noted that dengue is prevalent in the Brazilian territory, being endemic in the city of Araras. Objective: To trace the epidemiological profile of dengue in the municipality of Araras/São Paulo/Brazil between 2010 and 2021. Methodology: This is a cross-sectional, quantitative, retrospective, descriptive study based on public domain data extracted from the Notification Aggravation Information System (SINAN) linked to the Department of Informatics of the Single Health System (DATASUS). The cases were selected by the IDAGRAVO with the CID10 A90 (dengue), excluding other aggravations. The period covered was between 2010 and 2021 in the municipality of Araras, interior of the State of São Paulo/Brazil results: In the period studied, 12,006 cases of dengue were reported, the majority being female (55.7%), of white race (82.3%), with full middle education (32.37%). The majority of cases were of classical dengue (42.1%) diagnosed by clinical-epidemiological method evolving to cure (97.6%), and the most prevalent serotype is Dengue 1 (DENV 1) with notification of only 0.1%, most cases are still unknown. Conclusions: It is noted that dengue is still prevalent in the municipality of Araras, the subtraction and incorrect completion of the notification form present a challenge to the figure and characterization of the disease.

**Modelling the future risk of Japanese encephalitis in Victoria using Geographic Information System**

Mariel Lima1, Monique Marais1, Jackie Cotton1, Victor Sposito1, Robert Faggian1

1Centre for Regional and Rural Futures, Faculty of Science, Engineering and Built Environment, Deakin University, Australia, 2National Centre for Farmer Health, School of Medicine, Deakin University, Australia

**Background and Objectives:** The health effects of Japanese encephalitis (JE) is a viral zoonotic disease endemic in Southeast Asia and the Western Pacific. The spread and transmission are associated with rain, warm temperatures, migratory waterbirds, the presence of pigs as amplifying hosts and a competent vector. In 2022, the virus reached the Australian mainland in an unprecedented outbreak spanning the eastern seaboard. This project aims to accurately identify future high-risk areas for JE transmission in a changing climate and use that information to inform preparedness policy at a state and regional level. A newly developed model, deployed in a geographical information system (GIS), was used to analyse the suitability of the state of Victoria, Australia, for the JE vector Culex annulirostris. The parameters considered included rain, temperature, elevation, and the distance to water bodies and piggeries. Future climate projections included in the model were generated using the global climate model ACCESS-CM2, driven by worst- and best-case scenarios SSP126 and SSP585. Monthly risk maps were generated for the current and projected climate in the years 2040 and 2060. The results showed that changes in climate expected for the state of Victoria will indeed influence the risk of JE since the areas suitable for the presence of Culex annulirostris will expand. Data on the location of piggeries and water bodies combined with the climate projections allowed us to identify with higher precision local areas where JE has a higher likelihood of becoming endemic. When overlaid with regional jurisdictional boundaries, the analysis also identified regional/provincial governments that need to improve their infectious disease preparedness policies. In Conclusions, climate change will create conditions in Victoria that could help JE to become endemic, indicating the need for greater preparedness.

**A systematic review of evidence on the association between high temperatures, heatwaves and heat-related illnesses**

Clare Faurie1

1School of Public Health, University of Adelaide, Adelaide, Australia

**Background and Objective:** A large body of scientific evidence has established the impact of increased temperatures on human health. This study aimed to collate the research findings on the effects of extreme heat on direct heat illness (heat illnesses such as heat stroke or heat exhaustion, or dehydration) in a systematic review and meta-analysis and to provide evidence for needed public health intervention. We conducted a search of peer-reviewed articles in three electronic databases, from database inception until January 2022. A random-effects meta-analysis model was used to calculate the pooled relative risks (RRs) of the association between high temperature and direct heat-related outcomes. A narrative synthesis was also performed for studies analysing heatwave effects. Assessment of evidence was performed in three parts: individual study risk of bias; quality of evidence across studies; and overall strength of evidence. A total of 62 studies meeting the eligibility criteria were included in the review, of which 29 were qualified to be included in the meta-analysis. The pooled results showed that for every 1°C increase in temperature, direct heat illness morbidity and mortality increased by 18% (RR 1.18, 95%CI: 1.16-1.19) and 35% (RR 1.35, 95%CI: 1.29-1.41), respectively. For morbidity, the greatest increase was for heat illness (RR 1.45, 95%CI: 1.38-1.53), compared to dehydration (RR 1.02, 95%CI: 1.02-1.03). Heatwave studies also provided strong evidence of increase morbidity and mortality from direct heat illness during heatwaves. We conclude that increased temperature leads to higher burden of disease from direct heat illness. Preventative efforts should be made to reduce direct heat illness during hot weather, targeting on the most vulnerable populations. This is especially important in the context of climate change.

DOI: 10.18332/popmed/165411

**Is it time to set skin cancer prevention targets globally?**

Monika Janda1, Rachel Neale2, Jodie Antrobus3, Sheilaeg Lawler4, on Queensland1, 2Centre for Health Services Research, Faculty of Medicine, The University of Queensland, Australia, 3QIMR Berghofer, Australia, 4Queensland Health, Australia, 5The University of Queensland, Australia, 6Skin Cancer Prevention Queensland, Australia

**Background and Objectives:** Skin cancer is the most common form of cancer in Australia, with the incidence is highest in Queensland, where it is 37% higher than the national background. Over 80% of newly diagnosed cancers, and two in three Australians will be diagnosed before the age of 70. Skin cancer is Australia’s most expensive cancer (costing $1.7 billion annually). Within Australia, the incidence is highest in Queensland, where it is 37% higher than the national background.
average. Methods: Stakeholders from government, academic, patient advocacy, sports, outdoor workplaces, health and safety, and other settings co-designed skin cancer prevention targets for Queensland. They reviewed the evidence on trends in sun protection and sunburns, successful prevention programs, attitudes towards sun protection, and adoption of sun protective behaviours. They reflected on policy and/or program gaps, overall and for priority populations and settings.

Results: In 2020, 49% of adults and 45% of children reported being sunburnt in the previous 12 months. Only 40% of adults used broad-brimmed hats. And fewer than 60% of adults and 80% of children applied SPF 30+ sunscreen when outdoors in summer. Additionally, sunscreen market data suggested that, on average, Australians use only 200 ml of sunscreen per person per year. Randomised trials show that sunscreen reduces sunburn, skin cancer and naevi. Models suggest that optimal sunscreen use could reduce skin cancer rates by a maximum of 30% by 2031. Based on the evidence, realistic (but ambitious) targets for reductions in melanoma and keratinocyte cancer were designed: 5% by 2030, and 25% by 2050.

Conclusions: Setting targets for skin cancer reduction is important to drive policy and motivate the population to adjust their sun protection behaviour. To our knowledge, these targets are amongst the first to be set globally and could inspire other countries to follow.

Differential impact of life course exposure to PM2.5 species and contributing emission sources on children health in India
Ekta Chaudhary 1, Francisoalgeo G. 2, Sagnik Dey 1, Santu Ghosh 1
1Indian Institute of Technology Delhi (IIT Delhi), Delhi India, 2St. Johns Medical College, India, 1IIT Delhi, India

Exposure to air pollution affects the health of people of all age groups around the world, especially children of age under five (US) years. PM2.5 exposure is a persistent problem in Low Middle-Income Countries (LMICs). The overall anaemia prevalence of children (0-59 months) in India is 58%. Ambient PM2.5 exposure has been identified as a potential risk factor for child low birth weight, growth failure, and mortality. Moreover, whether the impact varies with PM2.5 species is not known. Here we examine the impact of life course exposure to ambient PM2.5 components on anaemia prevalence among children (US) across 640 Indian districts. We use NFHS-4 health data, the satellite-based PM2.5 exposure from Dey et al., 2020, whereas the species and sectoral data (WRF-CMAQ model) from Singh et al., 2021. The WRF-CMAQ model dataset provides information on PM2.5 species such as nitrate (NO3), ammonium (NH4), black Carbon (BC), organic carbon (OC), sulfate, dust and various sectors. A multiple logistic regression model adjusted with potential risk factors is used to estimate the effects of PM2.5 species on anaemia prevalence. At the aggregate level, for each interquartile range (IQR) of NO3, anaemia prevalence increased with an odds ratio (OR) 1.26 (95% UI: 1.24,1.29). For the corresponding increase in NH4, other factors, BC, OC, SO4, and soil, anaemia prevalence increased by OR 1.19 (95% UI: 1.17,1.21), 1.16 (95% UI: 1.14, 1.18), 1.15 (95% UI: 1.13,1.17), 1.11 (95% UI: 1.09,1.13), 1.12 (95% UI: 1.11,1.13), and 1.10 (95% UI: 1.08,1.11), respectively. Furthermore, for every IQR increase in PM2.5 exposures attributable to sectoral emissions, domestic sector showed the highest OR, followed by road dust, international, agricultural waste burning, industry, and transport sectors. This study will support the policymakers to trace specific sectors that are contributing to PM2.5 exposure and other pollutants that in turn, cause lethal health impacts.

How can health evidence be packaged to reach actors across a complex system to influence the development of healthy urban environments?
Geoff Bates 1, Andrew Barnfield 2, Charles Larkin 3, Sarah Ayres 2
1Institute for Policy Research, University of Bath, Bath, United Kingdom, 2School for Policy Studies, University of Bristol, United Kingdom, 3Institute for Policy Research, University of Bath, United Kingdom

Background and Objective: The urban environment is a key determinant of non-communicable diseases and health inequalities. It is shaped by the complex system of urban development that includes stakeholders across many sectors with different priorities and needs. Consequently, health outcomes are often subordinate to other agendas or overlooked in urban policymaking. We aimed to identify the most effective approaches to package health evidence for actors across the United Kingdom’s (UK) complex urban development system to put health at the forefront of decision-making.

Methods: We applied a systems perspective to examine how evidence on non-communicable diseases and health inequalities can be translated and delivered to inform decision-making in a complex policy environment. We undertook 132 interviews exploring perceptions on how evidence can be communicated so that it lands with critical actors working to influence urban development in the UK. Participants included property developers, urban planners, real estate investors, policy experts, senior civil servants, and local government officials. Data were analysed using a mixed deductive-inductive coding approach and through thematic analysis to identify similarities and differences across stakeholder groups.

Results: Findings reveal that creating evidence-based narratives that target actors’ emotions can reach actors across a complex system. Drawing on personal accounts helps to elicit an emotional response and bring health data to life for a wide range of stakeholders. Demonstrating norm and context are important for ensuring confidence in these narratives. Our analysis indicates that while variation in preferences for data exist, they appear to be determined more by personal values and data expertise than professional sector.

Determining environmental attitudes of medical faculty students and evaluation of environmental behavior
Ezgi Yuce 1, Sevil Gedik 2, Feyza Muz 3, Didem Arslantas 4, Aleetin Unsal 5
1Department of Public Health, Faculty of Medicine, Eskisehir Osmangazi University, Türkiye, 2Eskisehir Odunpazari District Health Directorate, Eskisehir, Türkiye

Background: Environment is a concept that includes interaction between inanimate components like air, water, soil, and living creatures like human, animals. The environmental pollution due to increased and uncontrolled usage of resources, urbanization, industrialization, nuclear power plants, causes serious threats which include death and diseases. It is aimed to determine the attitudes of medical faculty students towards the environment and to evaluate their environmental behavior (EB). Methods: This cross-sectional study was conducted on Eskişehir Osmangazi University Faculty of Medicine students. The questionnaire prepared based on the literature was filled out online by the participants. The study group consisted of 874 students who agreed to participate in the survey. The EB scale was used to assess the level of EB. Mann-Whitney U, Kruskal Wallis, and Spearman correlation tests were used for the non-parametric analyses.

Results: The ages ranged from 17-35, with a mean of 21.62±2.14. In the study, they were found to have higher scores on the EB Scale, those who are 21 and under, women, member of preclinical classes, those who define themselves environmentally friendly, those who have attended any meeting or received education about environmental awareness and environmental health, those who separate the household waste into groups such as organic/ glass/ plastic, those who isolate the wastes that could be harmful to the environment, those who don’t use cars for short range travels, and those who avoided the use of disposable materials. A moderate positive correlation was found between the scores of EB scale and items about environmental attitudes (r=0.616; p<0.001). Conclusions: In order to achieve sustainability in terms of a clean and healthy environment, one of the most important goals is to increase the awareness of university students. Therefore, in order to improve EB, it is recommended to add special lectures to increase environmental awareness in undergraduate education.

Artificial light at night and breast cancer risk: the findings from CECILE study, France
Nirmala Prajapati 1, Adélie Boileau 1, Emilie Cordina-Duverger 1, Elodie Faure 1, Pascal Guénel 1
1Université Paris-Saclay, LSVQ, Gustave Roussy, Exposome and Heredity Team, CESP (Center for Research in Epidemiology and Population Health), UMR 1018, Inserm, Villejuif, France

Background and Objectives: Light pollution is growing as the newest form of environmental pollution. Experimental and epidemiological studies suggested that exposure to artificial light at night (ALAN), especially to blue light, disrupts the circadian rhythm, inhibits melatonin production, and increases the risk of breast cancer. We assessed the association between exposure to outdoor ALAN and breast cancer. Methods: We used data from a population-based case-control study, including 1185 incident breast cancer cases and 1282 healthy controls enrolled in 2005-2007 from two French departments- Côte d’Or and Ille-et-Vilaine. Data for outdoor ALAN exposure was obtained using calibrated images from
Defense Meteorological Satellite Program (DMSP) for 1995-2006. Exposure was assessed over the 10 years prior to inclusion in the study by cross-referencing the DMSP images and the geocoded locations of residences in ArcGIS. Logistic regression was used to obtain odds ratios (OR) and 95% confidence intervals (CI) for the association, adjusting for sociodemographic, reproductive, and lifestyle-related factors, night-shift work, and urbanization.

Results: The overall OR for breast cancer per 1 standard deviation increase in ALAN exposure (129.29 nW/cm²/sr) was 1.05 (95% CI: 0.95-1.17). Subgroup analyses showed slightly higher ORs in post-menopausal women (OR: 1.15; 95% CI: 0.99-1.34) and in women who never worked at night (OR: 1.08; 95% CI: 0.96-1.22). The association was stronger for HER2-positive breast tumors (OR: 1.27, 95% CI: 0.99-1.62).

Conclusions: Our study did not find an association between exposure to outdoor ALAN and breast cancer. However, possible associations between outdoor exposure to ALAN and breast cancer risk in specific subgroups were indicated. This study had several strengths, including use of calibrated satellite images for outdoor ALAN assessment and consideration of a large set of potential confounders. Further large-scale studies using improved exposure assessment methods, including measurement of blue light and exposure assessment at the individual level, are required.

Ciguatera Fish Poisoning: an economic evaluation of healthcare costs and assessment of current level of awareness among islanders and visitors in three Caribbean Islands

Alessio Perilli1, Alisha Morsella1, Walter Ricciardi1, Chiara Cadeddu1
Università Cattolica del Sacro Cuore, Rome, Italy

Background and Objective: Ciguatera Fish Poisoning (CFP) is the most common seafood-borne intoxication, affecting around 50000 people annually, mostly in tropical coastal areas. It is caused by toxins released by microalgae whose proliferation is promoted by ocean warming, coral bleaching and anthropogenic disturbances. Small Island Developing States are exposed to severe productivity losses and deprivation of food sources as a Results of CFP. However, they show scarce awareness, hindering appropriate preventive behavior, risk management strategies and formal case reporting. The objective of this study is to estimate CFP incidence in three Caribbean islands (Guadeloupe, Martinique, Saint Lucia), assess its economic impact in terms of health costs and productivity loss and the awareness level in both residents and tourists.

Methods: Economic data will be collected through hospital databases and supplemented with interviews with healthcare professionals and managers. Incidence will be estimated through disease notifications and survey data. Two questionnaires were designed to assess knowledge, behavior and intentions concerning CFP. A reliability analysis, and descriptive and inferential statistics will be applied to the responses. Results: The fisherman survey comprises 57 questions regarding: respondents’ general characteristics (14), CFP-related personal experiences (20), knowledge (9), behavior (11) and intentions (3). The tourist version includes 43 questions on: respondents’ general characteristics (5), CFP-related personal experiences (19), knowledge (9), behavior (7), intentions (3). In February – April 2023, both surveys will be administered to a convenience sample and economic data will be extracted. Preliminary results will be available in May 2023.

Conclusions: The estimated incidence is expected to differ from that available in literature due to the lack of formalized case reporting and awareness. A higher level of awareness is expected among residents rather than tourists. Findings will provide a novel contribution to research and inform policy decisions, especially considering CFP projected expansion.

How do neighborhoods influence educational achievement? Reviewing qualitative studies by employing Nussbaum's perspectives

Rita Agdal1, Hanne Mikkelsen1
Western Norway University of Applied Sciences, Norway

Background: Education is a crucial resource for life chances, with a close correlation with socioeconomic inequalities in health. Providing education for all is an essential part of health promotion. While the effects of neighborhoods on educational achievement have been well researched, studies have tended to ask simplified and unbalanced questions about the value of neighborhoods. Instead, more insightful answers could be derived from questions on understanding the complexity of neighborhoods’ influence. Aims: We sought insight into the complexities of neighborhood’s influence on educational achievement by reviewing qualitative literature from Nordic countries emphasizing urban neighborhoods’ influence on educational achievement. We also applied perspectives from Nussbaum’s capability approach to address these complexities. Methods: This critical systematic qualitative review included studies on the influence of neighborhoods on academic success generated from nine databases using a search string. Two reviewers selected the studies following the preferred reporting items for systematic reviews and meta-analyses (PRISMA) flowchart and inclusion criteria through a blinded process. Out of 7009 extracted records, 17 peer-reviewed articles were examined. We evaluated the scientific quality of the study using EPICURE.

Results: Findings showed three main themes: social support from neighborhood agents, the role of attachment and the reputation of the place, and how policies influence everyday life and educational achievement. The articles were descriptive and built on perspectives regarding social reproduction and social capital. Conclusions: Integrating perspectives from the capability approach to discuss the complexities of neighborhoods’ influence on educational achievement may facilitate a shift toward identifying possibilities in neighborhoods.

Is the community food environment in Chile associated with fruit and vegetables consumption?

Leticia Cardoso1, Lais Botelho1, Irene Justinianno2, Amy Auchinloss3, Mariana Menezes1, Maria Pina1, Vanderlei Matos1, Daniel Skaba1, Lorena Garcia1, Tamara Herrera1
1 Oswaldo Cruz Foundation, Brazil, 2 Federal University of Ouro Preto, Brazil, 3 Drexel University, United States, 4 Universidad Peruana Cayetano Heredia, Peru, 5 University of Chile, Chile

Diet quality is influenced by many individual and social characteristics, as well as the community food environment. There is evidence in the literature showing associations between food environment and diet, but there is still scarce information for Chilean population. Objective: To explore the relationship between community food environment and diet quality in three Chilean cities. Methods: Food store were geocodes and diet survey data standardized from SALURBAL study were used. The food environment was evaluated by geospatial algorithm based on Google Earth data and density store indicators by different categories were estimated. The personal-level data included socioeconomic, demographic, health and nutrition variables. Diet quality was assessed by daily consumption of Fruits and Vegetables (FV) (≥ 5 servings/day). Two-level with mixed effects binary logistic regression were performed.

Results: 48410 food stores were evaluated, distributed across 2,442 neighborhoods in 51 suburbs in three Chilean cities (Santiago, Valparaiso, Concepción). The population sample included 1,292 individuals, of which 84.3% had inadequate consumption of FV. We observed a higher density of ready-to-eat food stores and a low density of FV stores in these cities. Store density increased as population density quarreled and the intra-urban socio-environmental index increased. No association was identified between food environment and FV consumption consumption. Conclusions: The food environment in the evaluated cities is dominated by stores with an unhealthy profile and low availability of FV, but there is no consistent relationship with FV consumption. Other factors may be determinants of FV consumption in this population.

The environmental health literacy of Italian population: the SPeRA cross-sectional study

Marta Gia1, Christian Previti1, Fabrizio Bert2, Gregorio Massocco3, Giuseppina Moro1, Giacomo Scacio1, Tiziana Schilirò1, Roberta Siliquini1
1 Department of Public Health and Pediatrics, University of Turin, Italy, 2 Health Local Unit ASL TO3, Italy, 3 Department of Public Health and Pediatrics, University of Turin, Italy

Background and Objective: Environmental Health Literacy (EHL) includes knowledge of health effects due to environmental exposure and skills to protect health from environmental risks, so it can be a useful tool to prevent diseases. This cross-sectional study investigated for the first time some aspects related to EHL of the Italian adult population (i.e. information sources, risk perception, attitude/ adoption of pro-environmental behaviours and barriers to them). Methods: Data were collected through an online questionnaire (n=672) and analysed through descriptive analyses and multivariable logistic regression models.

Results: The results showed that internet and TV were the most used information
sources and that participants with incomplete/insufficient self-perceived knowledge of health effects due to environmental risks verify less information about this topic [adjOR=0.38 (95% CI 0.25-0.59); p=0.04 (0.21); p<0.001 (0.001, respectively), potentially spreading fake news. The self-perceived exposure to pollution was higher in participants living in towns than in rural areas [small, medium, big towns adjOR=2.37 (1.41-3.97), 2.10 (1.11-3.96), 3.11 (1.56-6.31); p=0.001, 0.022 (0.001), suggesting that pollution is more perceived in urban areas, while it was lower in participants with incomplete/insufficient knowledge about pollution health effects [adjOR=0.54 (0.32-0.92); p=0.30 (0.13-0.67); p=0.022 (0.024), confirming that knowledge is essential to achieve awareness. Since insufficient self-perceived knowledge of pollution health effects was negatively associated with adoption of pro-environmental behaviours [adjOR=0.37 (0.15-0.90); p=0.028], the role of EHL as virtuous behaviour promoter was proven. Risk perception and attitude toward pro-environmental behaviours varied according to gender and education level, confirming the importance of socio-demographic characteristics for EHL related issues. Finally, lack of institutional support, lack of time and cost were identified as important barriers for many pro-environmental behaviours. Conclusions: This study provided useful data to design prevention programs, underlined some barriers to pro-environmental behaviours and highlighted the need to promote attitudes and behaviours aimed at contrasting environmental pollution thus protecting human health.

### Forecasting malaria morbidity to 2036 based on geo-climatic factors in the Democratic Republic of Congo

Ngia-ngang-Bakvin Kandala1,2, Elysee Kabongo1, Eric Panzi2

1Department of Epidemiology and Biostatistics, Western University, London, Canada; 2 Schüllich School of Medicine and Dentistry, Western University, London, Canada; 3Institut Supérieur des Techniques Médicales de Kinshasa (ISTM/Kinshasa), Kinshasa, Democratic Republic of Congo

**Background and Objectives:** Malaria is a global burden of morbidity and mortality. In Congo (DRC), malaria prevalence is increasing due to strong climatic variations. Reduction of malaria morbidity and mortality, the fight against climate change, good health and well-being constitute key development targets. We aim to predict malaria morbidity to 2036 based on 2001-2019 data, as a basis of an early detection of anomalies in weather patterns.

**Methods:** Meteorological data from Epidemiological Surveillance Directorate including all malaria cases based on positive blood test results, either by microscopy or by rapid diagnostic test, was used to estimate malaria morbidity and mortality from 2001 to 2019. Time series combining several predictive models were used to forecast malaria epidemic episodes to 2036. The impact of climatic factors on malaria morbidity was modelled using multivariate time series analysis.

**Results:** Geographical distribution of malaria prevalence from 2001-2019 shows disparities between provinces with the highest of 7700 cases/100,000 people at risk for South Kivu. Malaria has been most deadly in Sankuru with a case-fatality rate of 0.526%. The stochastic trend model predicts an average annual increase rate of 0.526%. The model was validated by the goodness-of-fit statistics and the predictive ability of the model. The forecast shows a significant increase in the number of malaria cases from 2020 to 2036, with a peak in the year 2025.

**Conclusion:** The model provides a useful tool for predicting malaria morbidity and mortality in the Democratic Republic of Congo, allowing for timely intervention strategies to be developed.

### Microplastic-sorbed chemicals: a threat from sand and surface water

Hongrui Zhao1, Ileana Federgi1, Marco Verani1, Annalaura Carducci1

1University of Pisa, Laboratory of Hygiene and Environmental Virology, Department of Biology, Via S. Zeno 35/39, 56127 Pisa, Italy

**Background and Objective:** Marine environments can be contaminated by various anthropogenic persistent organic pollutants, such as petroleum-related (e.g., polycyclic aromatic hydrocarbons, PAHs), industrial (e.g., polychlorinated biphenyls, PCBs), and agriculture-related (e.g., organochlorine pesticides and herbicides). Moreover, microplastic (MPs, particles < 5 mm) pollution of seawater is increasing in recent years and they can behave as a vehicle of chemicals acquired from the surrounding environment. Such MPs role is relevant from a public health perspective, increasing the exposure of beachgoers to harmful chemicals. In this paper, 40 field studies of MPs-sorbed organic pollutants were reviewed with the aim to understand the level of chemical contamination of MPs in the marine compartments.

**Methods:** The literature search was conducted following Preferred Reporting Items for Systematic reviews and Meta-Analyses (PRISMA) guidelines. The keywords included microplastic in combination with the organic contaminants that could be adsorbed by MPs.

**Results:** The methodology used for MPs-sorbed chemicals detection showed great differences among the studies, from sampling to analytical techniques. The most frequently searched chemicals were PCBs (55% of the reviewed papers) followed by PAHs (47.5%), and OCPs (42.5%). When such chemicals were searched, they were detected in almost one of the sampling sites included in each study. Overall, PCBs level showed a median concentration of 290 ng/g. The median PAH concentration was 3.595 ng/g, with an extremely high amount of 120,000 ng/g found in MPs from Chinese seawater. Dichlorodiphenyltrichloroethane was the most frequently detected OCP, with a median of 126.9 ng/g.

**Conclusion:** This paper revealed that MPs can accumulate high levels of chemicals in the marine environment, thus increasing the human exposure during swimming or rest on the beach. Despite the public health relevance of such human exposure, this topic is still little explored as demonstrated by the lack of standardized method for MPs collection and chemical analysis.

### Air pollution and oxidative stress in adults suffering from airways diseases. Insights from the gene environment interactions in respiratory diseases multi-case control study

Giulia Squillaciotti1, Valeria Bellisario1, Alessandro Marcon2, Pierpaolo Marchetti1, Angelo Corsico3, Pietro Pirina1, Giuseppe Verlato1, Roberto Bono1

1University of Turin, Italy; 2University of Verona, Italy; 3University of Pavia, Italy

**Background and Objective:** Air pollution is a leading cause of global mortality and morbidity. Oxidative stress is considered a key mechanism underlying air pollution-mediated health effects, especially in the pathogenesis/exacerbation of airways impairments. However, little evidence is available on subgroups at higher risk of developing more severe outcomes. This multi-center study aims to evaluate the association between air pollution and oxidative stress in healthy adults and patients affected by different airways diseases from the Italian GEIRD (Gene Environment Interactions in Respiratory Diseases) multi-case control study.

**Methods:** Current analyses include 1841 adults (49% females, 20-83 years) from four Italian centers: Pavia, Sassari, Turin, and Verona. Following a 2-stage screening process, cases of asthma (n=578), chronic bronchitis (n=23), rhinitis (618), or COPD (n=54) and controls (n=568) were identified. Systemic oxidative stress was quantified by measuring urinary 8-isoprostane and 8-OH-dG. Individual exposures to NO2, PM10, PM2.5, and O3 were derived at residential level during
2013-2015. We investigated the association between oxidative stress biomarkers and air pollution tertiles using multilevel multivariable regression models adjusted by age, BMI, smoking habits, education level and season of sample collection, with centers as random intercept.

Results: The geometric means (ng/mg creatinine) of 8-isoprostan and 8-OH-dG were 0.7 (95%CI:0.60-0.76) and 3.8 (95%CI:3.6-4.0), respectively. Only cases exhibited higher levels of log-transformed 8-isoprostan and 8-OH-dG in association with NO2 (0.22 95%CI:0.00-0.45 and 0.20 95%CI: 0.03-0.37), PM10 (0.34 95%CI: 0.12-0.55 and 0.21 95%CI: 0.05-0.37) and PM2.5 (0.27 95%CI: 0.05-0.49 and 0.18 95%CI: 0.02-0.34) compared to the first tertile of exposure (NO2:5-26µg/m3, PM10: 11-33µg/m3, PM2.5: 8-24µg/m3). No association was observed for O3.

Conclusion: Our findings suggest that exposure to air pollution may increase systemic oxidative stress levels in people suffering from airways diseases. Effective prevention strategies should consider early biological effects observed in susceptible people, whom additional risk level might be currently underrated.

Risk analysis for the human health derived from sewage management: perspectives for the reuse
Ileana Federigi1, Marco Verani1, Roberto Salvadori2, Simone Lippi2, Annalaura Carducci1
1Laboratory of Hygiene and Environmental Virology, Department of Biology, University of Pisa, Italy, 2Acque S.p.A., Italy

Background and Objectives: In a changing scenario characterized by extreme weather events and water shortages, a paradigm shift is occurring on wastewater: from waste to water resource. Europe is moving in that direction through the releasing of a regulation for water reuse in crops irrigation (EU 2020/741) and a profound revision, reuse-oriented, of legislative framework on wastewater management started during 2022. The implementation of reuse practices increases the possibility of human exposure to biological and chemical agents, that needs to be carefully evaluated in a public health perspective. This is the aim of a project funded by the National Operational Programme (NOP) on research and innovation (European Social Fund).

Methods: The project involves a university and a sewerage company in a collaborative effort for the selection of wastewater treatment plants (WWTPs) for reuse purposes. A water safety plan (WSP) is developed using both microbiological and physicochemical data from private repositories and field data obtained from dedicated monitoring campaigns, searching for fecal indicators (Escherichia coli, enterococci, bacteriophages) and human pathogens, namely Salmonella spp. and enteric and respiratory viruses (adenovirus, norovirus, enterovirus, coronaviruses). The health risk is assessed through the Quantitative Microbial Risk Assessment (QMRA) framework.

Results: In the first phase of the project, two WWTPs has been selected for agricultural and urban reuses. Repository data will be analyzed searching for a chemical proxy for microbial load, whose real-time monitoring allows the application of timely control actions along the sewage treatment (e.g., disinfection process).

Conclusion: The reuse processes are needed for a sustainable development and for adapting to climate change. Wastewater management plays a key role for a safety reuse, limiting health risks. Therefore, there is an urgent need for the application of WSP to sewage treatment in combination with the assessment of a safety reuse, limiting health risks. Therefore, there is an urgent need for the reuse processes are needed for a sustainable development and

Mortality and hospitalization in Italian contaminated sites of national concern for remediation: the global evaluation
Lucia Fazzò1, Fabrizio Minichilli2, Valerio Manno3, Ivano Iavaone4, Marta Benedetti5, Paolo Contiero6, Alice Maraschini7, Giada Minelli8, Roberto Pasetto9, Paolo Ricci9, Amerigo Zona10
1Italian national Institute for Health - Istituto Superiore di Sanità, Dept of Environment and Health, Istituto Superiore di Sanità, Italy, 2National Research Council, 3Italian national Institute for Health - Istituto Superiore di Sanità, Statistical Service, Istituto Superiore di Sanità, Italy, 4Italian national Institute for Health - Istituto Superiore di Sanità, 5Fondazione IRCCS Istituto Nazionale dei Tumori, Environmental Epidemiology Unit, Fondazione IRCCS Istituto Nazionale dei Tumori, Italy, 6Agenzia di Tutela della Salute della Val Padana, Unit of Epidemiology, Agenzia di Tutela della Salute della Val Padana, Italy

Backgrounds and Objective: In Italy, an epidemiological surveillance of the populations living in the 46 contaminated sites of national concern for remediation (CSs) has been underway, since 2011 (SENTIERI Project). CSs are defined of national concern for their contamination due to the presence of pollution sources, such as chemical industries, petrochemical plants and refineries, landfills. We aimed at estimating the global mortality (2013-2017) and hospitalization (2014-2018) among the populations living in the 46 CSs (316 municipalities; 6,227,531 inhabitants).

Methods: The excess deaths (observed-expected) for the main groups of diseases were calculated for the 46 sites combined. A random effects meta-analysis of the Standardized Mortality and Hospitalization Ratios (SMR/SHR) of each CS was performed for all the sites and their groupings, based on the typology of pollution sources. 90% Confidence Intervals and p value complemented SMR/SHR pooled value. The analyses were performed in general population and age-subgroups.

Results: In the 46 sites, 9,342 exceeding deaths (1,665/year) were estimated, 4,353 in males and 3,989 in females. Pooled SMR and SHR for all causes exceeded in both genders: males: SMR pooled=1.02 (90%CI:1.00-1.04); SHR pooled=1.03 (90%CI:1.01-1.04); females: SMR pooled=1.02 (90%CI:1.00-1.04), SHR pooled=1.03 (90%CI:1.01-1.05). These excesses are mainly attributable to malignant tumours. In subgroups of sites, exceeding SMRs were observed for all malignant mesotheliomas (MM) and pleural MM, lung and colorectal cancers in both genders. SHRs for all causes were in excess in the first year of life (males: SHR pooled= 1.08, 90%CI:0.93-1.15; females: SHR pooled= 1.08, 90%CI:1.03-1.14); the hospitalization for all causes exceeded also in 0-19 and 20-24 groups (43-53%); no excesses of mortality were observed in 0-29 years age-classes.

Conclusion: The results suggest that living in CSs is a risk factor for cause-specific mortality and hospitalization, even if the ecological approach and the mixtures of environmental exposures sources do not allow conclusions on specific etiological hypothesis.

What is the carbon footprint of food waste? results from an analysis in a hospital canteen in northeast Italy
Peter Cautero1, Daniela Zago2, Daniela Menis1, Federica Fiori1, Lucia Lesa1, Alessandro Conte3, Maria Parpinel1, Laura Brunelli4
1University of Udine, Department of Medicine, University of Udine, Udine, Italy, 2Azienda Sanitaria Universitaria Friuli Centrale, 3Azienda Sanitaria Universitaria Friuli Centrale, Medical Directorate, Hospital “Santa Maria della Misericordia” of Udine, Azienda Sanitaria Universitaria Friuli Centrale, Udine, Italy, 4University of Udine, Azienda Sanitaria Universitaria Friuli Centrale, Department of Medicine, University of Udine, Accreditation, Quality and Clinical Risk Unit, Azienda Sanitaria Universitaria Friuli Centrale, Udine, Italy

Background and Objective: Attention to economically and environmentally sustainable development has increased in recent years. Fundamental, in pursuing these goals, is attention to reducing food waste, which accounts for about one third of global production. The aim of this study was to evaluate the food waste generated by consumers in a hospital canteen in Italy.

Methods: We analyzed the meals of workers who accessed a northeastern Italian hospital canteen. We photographed trays before and after the consumption for five days in September 2022. We used a modified Comstock visual scale to estimate remaining food, and we estimated the carbon (CF) and water footprints (WF) of food waste using Barilla’s SU-EATABLE LIFE database.

Results: We took before and after meal photos of 240 meals. A total of 188 meals (78%) were completely consumed, while 52 of them had waste left over. Food waste accounted for 2% of the total foods served. The average food waste per tray of leftovers was 10% and consisted mainly of salad. On average, 14 g CO2eq./tray (CF) and 15 LH2O/tray (WF) were generated by the wasted portion of the meal. The median value was 0.0-0.0 for both CF and WF. A total of 3.3 kg CO2eq. was generated for the production of discarded foods, which is approximately equivalent to a 16.5 km car trip.

Conclusion: This study was able to establish that, despite the virtuous behavior of most of the consumers, waste in the observed hospital canteen was limited but not negligible. The degree of personalization of the portions offered by the canteen staff in addition to the standard portion could justify the small amount of food waste. In the future, it would be interesting to consider not only the waste generated by users, but also that one generated during preparation and serving.

Different approaches to research on urban health: a meta-narrative review
Background and Objectives: Urban health is a multi-disciplinary field of research and practice, and participants address urban health based on different ontological beliefs. Identifying and articulating the different approaches is integral for transdisciplinary research. This qualitative research aimed to determine the opinions on the effects of climate change at global, local and individual levels; the role of industry, states and individuals; awareness raising activities and training options. Methods: Nine focus group interviews were conducted between August-October 2022 among Ege University internship students (n=65). Semi-structured interviews within a framework of five sections (1. definition of climate change-general impact, 2. role of industry, 3. role of states, 4. role of individuals, 5. training suggestions) lasted 43±11 minutes. Ethics Committee approval, consent of the participants were obtained. Records and observation notes were transcribed into written form. By content analysis, emergent themes were obtained. No financial support or conflict of interest existed. Results: Of the participants 33% were women, 38% had rural roots and only 3 attended structured training for climate change. Three leading themes of the five sections were: 1. global warming, drought, impact on agriculture, 2. industries carbon emissions, avoiding responsibility, sustainable technologies, 3. inadequacy of inspections, necessity of sanctions, enabling/disabling preventive practices, reducing water consumption, economic crisis invading the agenda, absence of environmental regulations as a barrier, 5. preschool/primary school education, visual tools in training, continuing education at all ages. Conclusion: The knowledge and individual awareness of future doctors about climate change, its impact at different levels and the roles of different actors were detected to be sufficient yet their motivation to take role and interfere were lacking. Individual agendas invaded by economic crisis and personal needs were in competition with their interest on climate change even for those who were eager to take role. Lack of public solutions lead by local authorities prevents those who are eager to pay individual efforts.

Carbon and water footprint of food choices by users of a hospital canteen
Diana Menis1, Daniela Zago1, Peter Caueter2, Federica Fioni3, Lucia Lesa4, Alessandro Conte5, Maria Parpinel1, Laura Brunelli1
1University of Udine, Department of Medicine, University of Udine, Udine, Italy, 2Azienda Sanitaria Universitaria Friuli Centrale, Azienda Sanitaria Universitaria Friuli Centrale, Medical Directorate, Hospital of San Daniele-Tolmezzo, 3Azienda Sanitaria Universitaria Friuli Centrale, San Daniele del Friuli, Udine, Italy, 4University of Udine; Azienda Sanitaria Universitaria Friuli Centrale, Department of Medicine, University of Udine, Udine, Italy, Accreditation, Quality and Clinical Risk Unit, Azienda Sanitaria Universitaria Friuli Centrale, Udine, Italy

Background and Objective: Food production is responsible for 30% of global CO2 emission, with beef having the largest impact. In Italy the mean value of CF and WF for meal is 11128.67 gCO2e and 1083.858 L. Many articles have highlighted the contribution to a sustainable development through the selection of food. The aim of this study was to evaluate the sustainability of food choices in a hospital canteen. Methods: The study was conducted in San Daniele del Friuli hospital for 5 consecutive days in September 2022 taking photo of the lunch trays of workers who have access to the hospital canteen and agree to participate. The participants were also asked to fill in a questionnaire. The photos were taken before the meal was consumed. The carbon footprint (CF) and water footprint (WF) of the recipes were estimated using the SU-EATABLE LIFE database. Results: We analyzed 240 meals, 201 of which were paired with a completed questionnaire. Participants (N=201) were 61 men and 140 women with a mean age of 49±10 years (median=51). The median CF estimated was 778 (604–1085) gCO2e/tray and the median WF was 892 (668–1170) L/H2O/tray for the lunch meal. A higher median CF (1076 vs. 797 L/H2O/tray; p<0.001) and WF (981 vs. 693 gCO2e/tray; p<0.001) were observed in men compared to women. The 16% of the participants (4 men and 29 women on 201) chose vegetarian and vegan courses. Conclusion: Carbon and water footprint values were lower than those reported in the literature, with women performing better and showing lower propensity to choose meat than men. Our low values could be related to the canteen menu not containing beef and to the high proportion of women in the sample. Targeted interventions for men may be needed to raise awareness on sustainable diet...
Quantification Of waste in schools: a case study in danang city, Vietnam

Nguyen Huong 1, Hoang Linh 2, Nguyen Nga 3, Tran Trung 4, Ngo Ngoc 2, Tran Huan 2

1Phan Chau Trinh University Phan Chau Trinh University 9 Nguyen Gia Thieu, Dien Ban district, Quang Nam province Viet Nam, 2Da Nan University of Medical Technology and Pharmacy 99 Hung Vuong street, Hai Chau district, Da Nang city Viet Nam, 3Center for adaptive capacity building research Center for adaptive capacity building research Nguyen Tran Anh Yu Center for adaptive capacity building research Center for adaptive capacity building research Vietnamese Viet Nam, 4Da Nan University of Medical Technology and Pharmacy

Background: Waste is a major problem that can affect the environment and health, especially in developing countries where there is often a lack of an appropriate system for waste treatment. Understanding the current situation of waste, its common type, and its amount are important to develop appropriate strategies for waste control, especially in a school-based setting. This study has been conducted to identify common types of waste that are disposed of in schools and quantify such waste.

Methods: This study used an audit method to identify the common types of waste and quantify such waste in Da Nang in 2021.

Results: There were four schools with a total number of 3604 students who participated in this study. The average total volume of waste that schools discharged in a day is 460kg (accounting for 7542 liters of storage volume); in which, organic waste has the largest number of volume (261kg (57% of total volume) accounting for 2262 liters (30% of total volume)); non-recyclable waste weights 175kg (38% of the total volume) and a maximum volume of 4524 liters (60% of the total volume); recyclable waste has a weight of only 22kg (5% of total volume) and accounts for 719 liters (10% of total volume); The remaining types of waste are insignificant. This study also showed the presence of a large number of plastic bags (2128 pieces), multi-layer packaging (2036 pieces), milk cartons (1047 boxes), straws (772 pieces), plastic bottles (670 bottles), foam boxes (531 pieces), plastic spoon (400 pieces), polypropylene plastic cup (327 pieces) in the total waste produced in 01 days of these schools.

Conclusions: Schools are emitting a large amount of waste, significantly plastic waste. Intervention programs in school-based settings are needed to reduce waste to ensure children's health and protect the environment.

Per- and polyfluoroalkyl substances (PFAS) and depression: Associations stratified by body fat level

Gerald Neto 1, Gorazd Stokin 1, Anna Bartoskova Polcrová 1, Martin Bobák 2, Luděk Blaha 3, Juan Rivas 4, Jana Klanova 5

1International Clinical Research Center Of St. Anne's University Hospital Brno (FNUSA-ICRC) Pekárska 53, 602 00 Brno Czech Republic, 2International Clinical Research Center Of St. Anne's University Hospital Brno (FNUSA-ICRC), 3Research Centre for Toxic Compounds in the Environment (RECETOX), Faculty of Science, Masaryk University, Brno, Czech Republic, 4Kamenice 753, 625 00 Bohunice Czech Republic, 5Research Centre for Toxic Compounds in the Environment (RECETOX), Faculty of Science, Masaryk University, Brno, Czech Republic, 6The International Clinical Research Center of St. Anne's University Hospital in Brno (FNUSA-ICRC) Pekárska 53, 656 91 Brno Czech Republic

Background and Objective: The extensive use and bioaccumulation of per- and polyfluoroalkyl (PFAS)-containing substances over time raise concerns about their health impacts, which include mental issues such as depression. However, there is a lack of studies about this relationship, especially in middle-aged and older adults.

Methods: Four cross-sectional PFAS were measured in serum: perfluorooctanoic acid (PFNA), perfluorooctanoic acid (PFOA), polyfluorinated (PFDA), and perfluorocarboxylate (PFOS). The depression was assessed by the Patient Health Questionnaire (PHQ-9) or the Center for Epidemiologic Studies Depression scale (CES-D). The body fat percentage was predicted on a scale with multi-frequency bioelectrical impedance analysis.

Conclusions: The prevalence of high body fat and depression were respectively, 41.1% and 7.9%. The fully adjusted model included the co-variables: age, sex, educational level, income, smoking, physical activity, and the questionnaire to assess depression. Only PFOA was significantly associated in the whole sample (Prevalence Rate - PR: 1.95 Confidence Interval-CI 95%: 1.04-3.65). However, in the group with normal adiposity, PFDA (2.11, CI95%:1.53-3.64), PFNA (2.54, CI 95%:1.32-4.90), and PFDA (2.10, CI95%:1.09-4.01) were also significant.

Evidence and practical insights on participation of vulnerable population groups and transdisciplinarity in the context of urban health

Janna Leimann 1, Patricia Tollmann 1, Heike Köckler 1, Eike Quilling 1

1University of Applied Sciences Germany

The Beck Anxiety Inventory was used to assess generalized anxiety. The adoption of pro-environmental behaviors was evaluated using an adapted version of the Kaiser et al. (2007) instrument. Eco-anxiety scale was categorized in quintiles. Linear and logistic regression were used to estimate associations.

Results: We found that 18.5% of the participants have some degree of eco-anxiety, scoring higher than 9 (scale from 39). Individuals in the top quintile (quintile 5) of eco-anxiety were more likely to be females [OR=3.9, 95%CI [1.9-8.1]] and have poor self-rated health [OR=2.4 1.0-5.6] when compared to those with lower scores (quintiles 2-4). Higher levels of generalized anxiety were associated with higher eco-anxiety scores [B=0.16, 0.12-0.21]. Participants scoring higher in the eco-anxiety scale engaged more often in collective (e.g., activism [B=0.03, 0.01-0.04], nature conservation initiatives [B=0.06, 0.04-0.08]) and some individual pro-environmental behaviors (e.g., reduced meat consumption [B=0.06, 0.04-0.09], recycling [B=0.04, 0.01-0.07]). They also more frequently read/look for information about environmental problems [B=0.08, 0.05-0.10].

Conclusions: These preliminary results showed that eco-anxiety is more common in females and seems to be associated with generalized anxiety and poorer self-rated health. Eco-anxiety appears to prompt adolescents to adopt some proactive behaviors. Because the data collection is still ongoing these results should be interpreted with caution.
Background and Objective: Social inequities in health are increasing in cities, particularly affecting certain sociodemographically defined communities, which are therefore more vulnerable than others. The urban health approach offers opportunities to promote health equity. Therefore, the participation of vulnerable groups is a promising strategy.

A transdisciplinary project on urban health in the Ruhr area (MUHR) investigates the implementation of research on participation of vulnerable groups in the context of urban health. The objective is to present results on participation methods used, stakeholders involved, and the role of transdisciplinary collaboration.

Methods: To meet this objective, a systematic review was conducted and complemented by focus groups with experts from different disciplines related to urban health and participation. To adequately represent multisectoral aspects, social, medical and health science databases were systematically searched (PubMed, AgeLine, CINAHL Complete, APA PsychArticles and PsychInfo, SociINDEX, LIVIVO). International publications of the last ten years in English and German were considered. Two researchers screened independently considering defined exclusion criteria. The focus groups will address the identified research gaps and take place within a transdisciplinary forum.

Results: Of initially 841 manuscripts found, eight met the inclusion criteria and were included in the qualitative analysis. It can be increasingly seen that different disciplines are involved in the creation of healthy cities in the sense of transdisciplinarity and that the commitment to work together can represent an opportunity to support citizen empowerment. Commonly used methods for participation include Photo Voice, workshops, co-creation or community forums.

The results of the focus groups will be available in February 2023 and will enrich the results with practical content.

Conclusion: The findings provide insights into the opportunities of urban health to promote health equity and publics health in general. They represent direct impetus for structural change i.a. towards more community engagement in cities.

The case for indoor temperature in heat health warning systems: deployment of a real-time indoor temperature data ecosystem in community housing
Arlene Oetomo1, Jasleen Kaur1, Kang Wang1, Zahid Butt1, Peter Berry2, Plinio Morita
1University of Waterloo Canada, 2Health Canada
Heat waves are a major global public health concern and present a significant challenge to society, especially to underserved populations and those aged 50+, due to their increasing frequency and intensity. They also add significant burdens to the healthcare systems resources, and it has been shown that most deaths occur indoors. Still, our warning systems are based on outdoor temperature measurements. We have developed a real-time indoor temperature alert ecosystem that can capture indoor temperatures that may aid in assessing and responding during a heat wave. We placed ecobee smart thermostats into community housing homes with community housing partners and local health authorities (N = 70), recorded indoor temperature data in near real-time, and administered three surveys during the study period. We investigated: (i) indoor temperatures trends during the heatwave season of 2022 in Vancouver and Ottawa, Canada; (ii) behaviours of participants during this period; (iii) housing characteristics; (iv) delivery of time-sensitive temperature alerts to enable check-ins on participants, and (v) perceptions to heat risk and methods of communication. Initial results show different observations that includes: a) unsafe indoor temperatures were reached and persisted (above 26°C and 31°C) despite a milder heat wave season than the previous year (in BC); b) gaps in understanding of best practices to stay cool; and c) perceptions to heat risk and methods of communication. This study presents a scalable solution for monitoring indoor temperatures. It demonstrates how smart thermostats can monitor indoor temperature exposure conditions to prevent deaths during extreme heat events.

Modelling the Impact of Seasonal Climate Variability on Health Sector in Mozambique
Américo José1, Tatiana Marrufo2, Rachid Muleia3, Eduardo Gudo1, Kathryn Collborn1, Genito Maure1, James Collborn3
1National Institute of Health of Mozambique Ministry of Health of Mozambique Estrada Nacional Nacional N°1, Bairro da Vila -Parcela nº 3943, Marracuene, Mozambique Micronesia, Fed States, 2National Institute of Health of Mozambique, 3Eduardo Mondlane University Ministry of Science and Technology 3453 Avenida Julius Nyereye, Maputo Mozambique, 4Eduardo Mondlane University Ministry of Science and Technology Estrada Estrada Nacional Nacional N°1, Bairro da Vila -Parcela nº 3943, Marracuene, Mozambique Mozambique, 5Clinton Health Access Initiative United States
Introduction: Seasonal climate variability impacts the health of millions of population around the world. The incidence of malaria increase in many regions of the world, mainly in Mozambique, as a result of variability in rainfall, minimum and maximum temperatures. Malaria is a Public Health problem in Mozambique.

Methodology: Weekly Malaria data were extracted (2008 – 2022) from the Weekly Epidemiological Bulletin provided by Ministry of Health of Mozambique and climate data were derived from the European Center for Medium-Range Weather Forecasts. Pearson Correlation Coefficient (r) was used to determine the correlation between rainfall, minimum and maximum air temperature and weekly malaria incidence. We used the Distributed Lag Non-Linear Models (DLNMs) to estimate the favorable thresholds of climatic variables to increase the relative risk (RR) of weekly malaria incidence. The “Generalized Additive Model (GAM)” was applied to estimate positive cases of malaria in the rainy season (October – March) in Mozambique.

Results: In the northern region of the country, the province of Nampula had the highest positive correlation for the increase of malaria with the rainfall at lags around 4 and 5 (r=0.47), mainly when the rainfall reaches 250 mm (RR=85%) and 15 cm (RR=75%) of minimum in a given epidemiological week. In the central region, positive cases of malaria are severely impacted by rainfall in Zambezia province, at lags 3 or 5 (r=0.20 & r=0.18) and reach their peak prevalence of the disease when 400 mm of rainfall (RR=88%) is recorded. In the southern region, the province of Inhambane increased the malaria incidence when the rainfall was at lags 1 and 11 (r=0.50; Climate; Malaria)

Cardiovascular health effects of outdoor air pollution in the most polluted city, Mongolia
Nandin-Erdene Bayart1, Gavín Pereira2, Christopher Reid3, Krassi Rumchev1
1Curtin University Institute of Medical Sciences, Mongolian National University of Medical Sciences, Ulaanbaatar, Mongolia Kent St, Bentley, WA 6102, Australia Australia, 2Curtin University
Background: Cardiovascular disease (CVD) are the leading cause of death globally. A major contributor to CVD mortality and morbidity is ambient air pollution (AAP) exposure. The AAP level in the capital city of Mongolia is considerably higher than the World Health Organisations air quality guideline. The main source of AAP is related to the traditional houses where people burn raw and processed coal for heating and cooking purposes. Although several studies have reported the association between AAP and CVD outcomes worldwide, scientific evidence in Mongolia is lacking. The purpose of this study is to evaluate associations between air pollution and CVD mortality in Ulaanbaatar.

Methods: We collected air pollution and meteorological data from the Centre for Environmental Monitoring and mortality data from the Health Development Centre between January 2014 and December 2021. Six criteria air pollutants were measured at 15 monitoring stations, including particulate matter with an aerodynamic diameter ≤ 2.5 µm and ≤ 10 µm (PM2.5 and PM10), nitrogen dioxide (NO2), sulphur dioxide (SO2), ozone (O3) and carbon monoxide (CO). An ecological time-series analysis was applied to examine the relationship between exposure and outcome variables.

Results: The highest concentrations of AAP except ozone, were reported in winter. The average concentration of PM2.5, PM10, NO2, SO2, O3 and CO were 118.2±73.8 µg/m3, 219.8±119.6 µg/m3, 76.1±20.3 µg/m3, 21.9±19.8 µg/m3, 1.8±1.07 µg/m3 respectively. A total of 33,931 deaths were identified, most of which occurred during cold seasons. In a multiple pollutant model, PM2.5, PM10 and SO2 were significantly correlated (P-value<0.05) with CVD death, accounting for seasonal variations after adjusting other pollutants.

Conclusion: This research found evidence of a positive association between short-term exposure to PM2.5, PM10 and SO2 and CVD mortality. These study findings provide evidence-based information for further research and policymakers to reduce current air pollution level in Mongolia.

Gender-specific variables of climate-change related health
impacts: a global south perspective
Nilanjana Ganguli1, Nilanjana Ganguli2, Ann LeHolland3
1Dahdaleh Institute for Global Health Research Canada, 2Dahdaleh Institute for Global Health Research, York University Canada, 3University of California, Irvine

Background and objective: Gender is critical for assessing the economic and social costs associated with climate change. Health impacts of climate change on women differ from impacts on men owing to complex social contexts and adaptive capacities. The objective of this study is to identify interactions within and across four subsystems—food security, communicable and non-communicable diseases, ecological services, and extreme weather—and their influence on gender-specific health impacts.

Methods: A systematic literature review guided by the Preferred Reporting Items for Systematic Reviews and Meta-Analysis (PRISMA) framework was conducted to generate the database. From 62 included articles, information was extracted on health-related variables, climate induced change in the variable (positive or negative), exposure pathways and their resulting health impacts. An Influence Diagram was then developed to visualize the cause-and-effect relationships within variables and help explain the change in variables over time. A bibliometric analysis was conducted to understand the status of gender-focused research in climate-change and health.

Results: 53 gender-specific variables were identified, with socio-economic variables playing a more dominant role than environmental. Gender was discussed most in relation to food security and least in relation to communicable and non-communicable diseases. The bibliometric analysis showed an upward trend in studies focussed on gender and climate change since 2015, and 53% of the articles were a collaboration between male and female authors.

Conclusion: Results obtained highlight the need to carry out further investigation on Legionella contamination in wastewater samples reused in agriculture.
Conclusion: Ultra-processed foods high in at least one critical nutrient showed more environmental certification on their packaging. This fact can cause misunderstanding among consumers who are concerned about environmental issues since ultra-processed foods are unhealthy.

Incidence tendencies and projection of climate sensitive diseases in mozambique

Osvaldo Inlamea1, Érico Langa1, Tatiana Marrufo1, Américo José1
1Instituto Nacional de Saúde Mozambique, 2Instituto Nacional de Saúde Mozambique

Background and objective: Changes in climate patters have been reported around the world. There is evidence that such changes can affect human health, particularly with climate sensitive diseases like Malaria and Diarrhea. This effects are exacerbated in low and middle-income countries such as Mozambique. Thus, this study aimed to determine climate sensibility of Malaria and Diarrhea as well as the behavior they can take in the face of climate change.

Methods: Eight districts of Mozambique were selected. Malaria and diarrhea incidence data was obtained at Weekly Epidemiological Bulletins. Pearson's Correlation Coefficient was determined and Poisson's regression with distributed lags was used to determine relationship between the incidences, temperature and precipitation. Predictive estimations of climate change impact were determined based on UNFCCC emission scenarios. All analyses performed using the R statistical software.

Results: Positive correlation between diarrhea cases and precipitation and negative correlation between Malaria and maximum temperatures were observed. There is a high probability of an increase in the incidence of diarrhea if precipitation above 50 mm occurs. Thresholds of minimum temperature that favor an increase in Malaria vary from 17°C in Lichinga to 24°C in Ancohe, Beira and Tete. The models indicated to a possible increase in the incidence of Malaria in the low emissions scenario in all districts, except in Ancohe and Moamba, where the low emissions scenario show a probable decrease in the incidences. The models also showed to a possible increase of diarrhea in the long term, with up to 35% increase in Mbalane district.

Conclusions: The analyses showed weak to moderate correlation between climatic variables and studied diseases. Precipitation most influences diarrhea cases, while Malaria is most influenced by minimum temperatures. According to the models, the incidence of both diseases will probably increase in most studied districts.

Does the proportion of children with limited day-to-day activities affect the provision of accessible and inclusive public playground in London?

Hynek Pikhart1, Katerina Pikhartova1, Aissa Gomez2, Jitka Pikhartova3
1UCL London United Kingdom, The Manchester School of Architecture United Kingdom, UCL IEHC London United Kingdom

While play is a fundamental right of every child, and has been continually shown to affect the provision of accessible and inclusive public playgrounds, a general lack in play provisions for children with disabilities has been reported in the past. Additionally, it has been suggested that the word ‘inclusive’ is regularly misused in playground guidance and play equipment providers. The study aimed to investigate the playground provision in London, and to assess whether the proportion of children with limited day-to-day activities (LDTD) was associated with an increase in the borough's Deprivation (IMD). Results showed that a 1% increase in the proportion of children with LDTD activities was associated with a 0.82 point decrease in the borough’s IMD. Borough-level analysis was conducted and 20% of randomly selected playgrounds were then thoroughly investigated.

Conclusions: The analyses showed weak to moderate correlation between climatic variables and studied diseases. Precipitation most influences diarrhea cases, while Malaria is most influenced by minimum temperatures. According to the models, the incidence of both diseases will probably increase in most studied districts.

Assessing the impact Iot air pollution on health outcomes using IOT sensors

Shahan Salim1, Plinio Morita2
1University of Waterloo Canada, University of Waterloo
2Background and Objectives: Air pollution is a global public health concern. It is responsible for a cascade of adverse health outcomes ranging from minor physiological impacts to deaths from respiratory and cardiovascular diseases. Despite these increasing threats, current surveillance ecosystems cannot monitor indoor and outdoor air pollution levels to provide early warnings for high-risk individuals. Air pollution alerts are based on ecological data collected from outdoor air quality monitoring stations, limiting the ability to monitor individual-level exposure and provide recommendations on managing the impacts of air pollution.

The advancement of IoT and big data technologies can now allow public health officials and researchers to monitor air pollution levels and take appropriate and rapid actions to mitigate the harm.

Methods: We have partnered with UNICEF Mongolia to assess the impact of air pollution on health. Air pollution data were collected from 12 air quality monitoring stations placed across Ulaanbaatar, Mongolia. The National Center for Public Health (NCPH) provided public health data in form on ICD-10 codes for 2019 and 2020.

Results: We tested for exposure-outcome relationship using logistic regression models. Preliminary results indicate a mean PM10 is 139.7 µg/m³ and PM2.5 is 71.7 µg/m³. Results indicate hypertension (ICD 110) to be the most prevalent disease in the population. Acute tonsillitis (J03), acute bronchitis (J20), acute nasopharyngitis (J00) round out the top 4 diseases. We did not observe any relationship (OR 1.01; 95% CI 0.9-1.04) between high exposure to air pollution with rates to hypertension. Other outcomes are still being explored.

Conclusion: This study is a stepping-stone for using IoT based air pollution data to assess its impact on human health at a population level.
Estimating the environmental impact of antibiotics through drug utilisation and eco-toxico-logical data: The Italian context
Carlotta Lunghi1, Valentina Giunchi1, Michele Fusaroli1, Emanuel Raschi1, Elisabetta Poluzzi1
1University of Bologna Italy
Introduction: Antibiotics use in Italy is among the highest in Europe. This overuse can lead to anti-microbial resistance and harm humans, animals, and plants. Their accumulation in surface waters, and its consequent toxicity for animals and plants, is an emerging problem. This study aimed to estimate antibiotics environmental impact on the Italian surface waters.
Method: We integrated drug utilisation and eco-toxicological data to assess antibiotics burden on the Italian surface waters. We extracted the predicted no-effect concentrations (PNEC) from the European Medicines Agency (EMA) and the Swedish Medicines Agency (FASS) environmental risk assessment reports. We then estimated the Italian predicted environmental concentrations (PEC).
We used Italian drug utilisation data for 2020, the total number of inhabitants on January 1st, 2020, and the default values proposed by the European Chemical Agency for wastewater production and disposal. We calculated the environmental risk as PEC/PNEC ratio and classified it as high (≥10), moderate (1–10), low (0.1–1), and insignificant (≤0.1).
Results: We obtained the environmental risk for 56 antibiotics for which Italian consumption data were available. We found a high environmental risk for one glycopeptide (vancomycin: PEC/PNEC=71.002), two penicillins (ampicillin: 43.376, amoxicillin: 41.346), one cephalosporin (cefazolin: 26.201), and one macrolide (azithromycin, 10.263). The risk was moderate for two fluoroquinolones (levofloxacin: 8.333, ciprofloxacin: 3.571), three cephalosporins (ceftiraxone: 5.823, cefepime: 2.147, cefixime: 1.867), two penicillins (piperacillin: 3.194, fluoroquinolones: 1.577), and one macrolide (clarithromycin: 2.917). Vancomycin, azithromycin, ciprofloxacin, levofloxacin, ceftriaxone, cefixime, piperacillin, and clarithromycin are also on the Watch group of the AWARe classification.
Conclusions: Multiple antibiotics have a high/moderate environmental impact on Italian surface waters, most of which have a relatively high risk of selecting bacterial resistance (those in the Watch group). Appropriate prescription and adherence practices of these antibiotics may reduce the negative impact on the environment and improve purification procedures and green drug development.

Lead exposure is associated with reduced brain electrical activity in cognitively unimpaired older adults
Kyong-Bok Min1, Jin-Young Min1,2
1Department of Preventive Medicine, College of Medicine, Seoul National University, Seoul, Republic of Korea; 2Veterans Medical Research Institute, Veterans Health Service Medical Center, Seoul, Republic of Korea
Background and Objective: Lead is a ubiquitous environmental pollutant affecting the central nervous system. Many studies have provided evidence that exposure to lead causes reduced cognitive performance or structural changes in the brain. Despite these neuroscientific studies, no study has yet investigated the association between body lead level and the brain electrical activity (which indicates cognitive dysfunction in the brain). This study examined the association between blood lead level and electroencephalography (EEG) in cognitively unimpaired older adults.
Methods: A total of 93 cognitively unimpaired older adults (60 years or older) was included in this study. The level of cognitive function or impairment was evaluated by neurologists diagnose. EEG is a non-invasive method that records the brain electrical activity via electrodes placed on the scalp. A cap-type wireless EEG device was used for EEG recording, with linked-ear references based on a standard international 10/20 system. Blood lead levels were measured by inductively coupled plasma mass spectrometry. Multiple linear regression was employed to analyze relationships between lead and EEG features of the frontal, central, parietal, temporal, and occipital regions.
Results: The mean age of study population was 71.5 years, and 46.2% were female. The mean blood lead level was 1.60 µg/dL. We found a significant association between lead and EEG features. Specifically, elevated blood lead levels were significantly and negatively associated with EEG activity in the brains central, temporal, and occipital regions. The most robust finding was observed in occipital lobes, which are located at the very back of the brain and responsible for the visual processing area of the brain. The association was independent of covariates (i.e., age, gender, income, health behaviors, and chronic conditions). Conclusions: Environmental exposure to lead may be associated with cognitive performance via reduced brain electrical activity in the central, temporal, and occipital lobes.

Dengue fever complex over climate change scenario in Rio de Janeiro state (Brazil)
Antonio Carlos Oscar-Júnior1, Pedro Henrique de Castro1,2
1Rio de Janeiro State University, Rio de Janeiro, Brazil; 2Programa de Pós-Graduação em Geografia, Rio de Janeiro State University, Rio de Janeiro, Brazil
Dengue fever is currently considered the most important arbovirus in the world and since its reintroduction in Rio de Janeiro, in 1986, it has become endemic, with epidemic periods. In 2022, there are 1.3 million probable cases and 951 confirmed deaths across Brazil. It is a disease strongly associated with urban characteristics and climate due to the adaptation and development characteristics of the Aedes aegypti vector. Given this background, this study evaluated the relationship between global climate change and the risk of dengue fever diseases for the state of Rio de Janeiro. The projection of future climate susceptibility to vector proliferation in the scenarios RCP 4.5 (stabilization level) and 8.5 (high level) between 2021-2040 and 2041-2070 were assessed using two models: Eta HadGEM2-ES and EtaMIROC5 considering relative humidity (RH), annual percentage of days with minimum temperature higher than the 90th percentile (TN90p), days in the year with precipitation higher than 10mm (R10), grouped by seasons. The results indicate that the tendency of thermal and hygro-metric elevation may have repercussions on the intensification and spatial expansion of the risk of arboviral diseases in the state of Rio de Janeiro, since there is a spatial and temporal expansion of the optimal environmental conditions for the development of the vector. Such findings affect, above all, public health strategies, which are still based on the prevalence of the disease in summer and autumn. Both models used (Eta HadGEM2-ES and Eta MIROC5) point to an intensification of the dengue fever risk in all state of Rio de Janeiro, including Mountain Region, nowadays the lower in cases. This intensification results mainly from the gradual increase of the minimum temperature and warm nights over the future periods, important conditions for the spread of the disease, since they favor the development of the vector-mosquito.

Urban environment walkability and its relation with Noncommunicable Diseases: a scoping review
José García-Abajo1, Marilina Santero2, Ivan Solla3, Gerard Urrutia1, M. Puig1
1Hospital de la Santa Creu i Sant Pau, Spain; 2Iberoamerican Cochrane Centre, Biomedical Research Institute Sant Pau, Spain; 3Iberoamerican Cochrane Centre, Biomedical Research Institute Sant Pau (IIB Sant Pau), Spain
Background: The walkability of the urban environment is the facility of walking around urban area. This includes the availability of safe and well-designed roads, air quality, green spaces, and cycling infrastructure among other features of the environment. Walking is proven to improve health, but not all urban spaces are equally walkable.
Aim: To explore the impact of the urban environment walkability on the prevalence and development of chronic non-communicable diseases (NCDs).
Methods: A scoping review will be conducted following the standards of the Joanna Briggs Institute and PCC framework. The results will be reported in accordance with the PRISMA-ScR statement. The review will contain articles published between 2001 and 2020 in the Medline and Embase databases. Systematic reviews, ecological studies, clinical trials, quasi-experimental and observational studies that meet the eligibility criteria will be included. The impact on outcomes such as physical activity, obesity, blood pressure, hypertension, diabetes, and others like mental health, quality of life, and healthy behaviors will be explored. Expected results: This study will help to identify how walkable environments are associated with NCDs. Furthermore, emphasize how the importance of considering indicators of the walkability of the urban environment when planning, designing and implementing public health interventions. This scoping review will identify the feasibility of urban environments to promote physical activity and better health outcomes.

The benefits of walkability: application and limits of the Walking Suitability Index of the Territory in L'Aquila

The future risk and prevention of climate-change induced arboviral diseases in the European Union through a planetary health perspective: a systematic literature review
Lena Mende¹, Pierre Thomas²
¹Maastricht University, The Netherlands, ²Maastricht University, Netherlands

Introduction: Climate Change redefines the spread of arboviral diseases. The European Union is becoming increasingly active in implementing adaptation and mitigation strategies, to limit greenhouse gas emissions and prevent adverse climate change effects.

Methods: A systematic literature review of 139 Reports using the PRISMA flowchart was performed to gather secondary data.

Results: The arboviral species Ixodes ricinus ticks, Aedes aegypti- and Aedes albopictus mosquitoes, their spread, and the associated infectious diseases of dengue, zika, and chikungunya, tick-borne encephalitis, and Lyme borreliosis, are identified as the most important vectors in Europe. The European Union is increasingly reliant on One Health approaches to enact environmental policy, and aims at improving surveillance and data sharing, as a spread of arboviral diseases resulting from Climate Change is expected.

Discussion: The spread of the assessed arboviral diseases is predicted, current models however fail to predict the spread at the regional level. European Policy is present, but a more coherent shared vision is needed to enable better local, national and supranational decision-making. Inclusion of planetary health, one health and Nature-based Solutions offer increased biodiversity, human, environmental and animal health protection. The effectiveness of recent EU action remains to be established.

Conclusions: The European Union needs enhanced surveillance systems that can predict high-risk areas for the emergence and spread of diseases are necessary, to effectively protect the European region from the growing infectious disease risk. Nature-based Solutions hold the capacity to protect human and environmental health better, and, if efficiently researched and implemented, incorporate cross-sectoral decision-making and lower intervention costs.

Effect of climatic factors favoring dengue transmission in Islamabad Capital Territory, Pakistan, 2022
Nadia Noreen¹
¹Directorate of Central Health Establishments(DOCHE), Ministry of National Health Pakistan, Islamabad, Pakistan

Background: Dengue fever (DF) is a national public health problem in Pakistan.

Dengue is a crucial vector-borne viral human disease widespread throughout the tropical region, with local risk variations affected by rainfall, temperature, humidity, and unplanned rapid urbanization. The dengue epidemic is a major public threat in Pakistan since 2005. Dengue fever is now endemic in Pakistan throughout the year circulation of four dengue serotypes with a peak incidence in the post-monsoon period (September-November). This study investigates the impacts of climatic factors (rainfall and temperature) on DF transmission in the Islamabad Capital Territory, through statistical approaches.

Methods: A time series analysis of the climatic factors was used to explore the climatic variability from 2015 to 2022. Furthermore, multiple linear regression analysis was used to measure the simulating effect of climatic factors on dengue outbreaks in ICT from 2015 to 2022.

Results: The time series analysis revealed significant annual and monthly variability in climatic factors, favoring a dengue-supporting environment. A positive temporal relationship between climatic factors (rainfall and increased temperature) and DF was observed. Moreover, a substantial monthly relationship between climatic factors and dengue incidence was revealed by the regression analyses. The linear regression of rainfall versus dengue showed monthly R² = 21.3%, whereas temperature versus dengue presented R² = 42.1%. A monthly significance R² = 54.6% was observed by the multiple regression analysis.

Conclusions: This study provided a substantial consensus on climatic factors influences on dengue transmission in the Islamabad Capital Territory, Pakistan. An increasing dengue transmission risk is associated with frequent climate changes. The disease prevention strategies by public health authorities should emphasize the integration of the health prediction modeling of dengue regarding influences of climate variability which can be replicated and applied in other subtropical and temperate climates zones of Pakistan.

Monitoring of enteric viruses in treated and untreated civil and livestock sewages in the Piemonte Region - Italy
Cristina Pignata¹, Marco Panizziòlo¹, Marta Gea¹, Angelo Romano², Claudio Caruso¹, Ilaria Giurisi¹, Manila Bianchi¹, Lucia Decastelli¹, Giorgio Gili², Silvia Marro³, Bartolomeo Griglio³, Silvia Bonetta³, Giorgio Gilli², Cristiana Ravazzi¹
¹Department of Life, Health and Environmental Sciences, University of Torino, Italy, ²Department of Public Health and Paediatrics, University of Torino, Italy, ³Istituto Zooprofilattico Sperimentale del Piemonte, Liguria e Valle d’Aosta, Torino, Italy

Background: There is an interdependence between the favorable environment and the state of individual and collective well-being, also determined by physical activity, for this reason the new concept of city should provide places that encourage active mobility: "point models" can be used to assess whether a city facilitates it and compare zones or cities. The University of L'Aquila wants to evaluate and compare the walkability of areas in the city of L'Aquila.

Methods: Applying the model on three areas of the city of L'Aquila, Pettino, Coppito, hospital area, and analyzing practicability, safety, urbanity and pleasantness, each category was divided into three indicators, which were assigned a numerical rating from very bad to very good: through the model formula, the Walking Suitability Index of the Territory (T-WSI) for each category and the Street Index-SI1 for each zone have been calculated.

Results: The application of the algorithm obtained to allow the following average values on base 100.
Practicability Safety Urbanity Pleasantness T-WSI SI1 43.2 43.9 5.1 87.1 41.2 P ETTINO 56.6 64.6 15.5 83.7 55.4 H OSPITAL. The data indicate in Coppito quantity and quality of pavements very bad in almost half of cases, the area of the hospital is on average safer than the other two but in a quarter of cases received a vote of 0. It is, however, the urbanity (breadth, furniture and activity in the streets) to be globally more lacking, while the pleasantness is the parameter where the three areas have higher scores, hosting green areas not approachable.

Conclusions: The strong limit in the model method is represented by not having discriminated green areas usable by areas that are not, describing the suburbs as livable. Future project is to critically analyze the T-WSI considering urban maps that discriminate the different types of green areas.

Epidemiological profile of dengue in State of São Paulo/Brazil from 2010 to 2021
Lisie Justo¹, Amarylis Gardin¹, Heber Babosa¹, Luiza Carminatti¹, Otavio Ravazz¹
¹Faculdade São Leopoldo Mandic de Araras, Brazil

Background and Objective: It is known that climatic changes and the urban mobility are increasing the numbers of dengue cases. In 2019, were registered 5.2 million new cases, and World Health Organization aims to reduce mortality caused by this disease until 2030. Dengue is the main arbovirus disease, being a viral infection transmitted to human through by infected mosquitoes, mainly Aedes Aegypti. In the last 12 years, were notified 16,942,358 cases in Brazil, whereupon São Paulo is the most prevalent state (26.9%). The objective of the study was to establish epidemiologic profile of dengue in the State of São Paulo/Brazil, in the last 12 years. methods: This is an observational, descriptive, cross-sectional, and retrospective study, which was carried out through the analysis of secondary data collected from the National System of Notification Appeals (SINAN) and from SUS Computer Department (DATASUS).

Results: The total number of reported cases was 4,458,369 and 2015 was the year with the highest cases (1,033070). The cases were predominant in the female sex (53.7%), white people (54.4%), high school completed (16.1%) and clinical and epidemiological criteria of confirmation (63.8%). Concerning hospitalization rates, there was a limited necessity of admissions (2.2%), as well as few deaths due to the notified disease (1557). Conclusions: There was a significant growth in the number of dengue cases in Brazil from 2019, during pandemic COVID-19, which represents a public health problem. Health promotion and prevention actions should be intensified in primary health care.

Food Safety Department, Public Health & Welfare Directorate, Piemonte Region, Italy, 1Department of Life Sciences and Systems Biology, University of Turin, Italy, 2Department of Biomedical, Metabolic and Neural Sciences, University of Modena and Reggio Emilia, Modena, Italy, 3Department of Chemistry, University of Turin, Italy, 4Department of Life Sciences and Systems Biology, University of Turin, Italy, 5Department of Chemistry, University of Turin, Italy

Background and Objective: Enteric viruses are among the main causes of waterborne infectious diseases, therefore their monitoring in waters is crucial for public health. In the present work, financed by the Piemonte Region, the occurrence of seven enteric viruses was monitored in urban sewages of two Wastewater Treatment Plants (WWTP) and in livestock sewages of three farms (beef cattle, dairy cattle and pigs).

Methods: The nucleic acids of 16 influent end effluent samples of the two WWTPs were concentrated and extracted using eGeneUP® with magnetic silica, while the nucleic acids of 12 livestock manure samples were extracted using the AllPrep® PowerViral® DNA/RNA. The presence of enteroviruses (EV), adenoviruses (AdV), noroviruses (NoVs) GI/GII, hepatitis A virus (HAV), hepatitis E virus (HEV) and rotavirus (RV) was evaluated by PCR.

Results: All municipal wastewater samples (100%) tested positive for at least one viral pathogen. 93.7% of samples tested positive for RV (93.7%), followed by NoV GII (68.7%), and AdV (43.7%). High percentages of positive samples were also detected for EV, HAV and NoV GI (37.5%), while HAV was not identified. For all viruses, except RV, the percentage of positivity in the effluent was lower than in the influent of the two WWTPs. 91.6% of the livestock manure samples tested positive for at least one viral pathogen with RV being the most present pathogen (83.3%). HAV, HEV, EV, AdV, and NoV GI were detected in 33.3%, 33.3%, 25%, 8.3%, and 8.3% of the samples, conversely NoV GII was not found.

Conclusions: Since WWTP effluents are discharged in surface waters and livestock sewages can be reused as soil fertilisers, the results highlighted the need to consider and manage these matrices as potential sources of virus spread in the environment in order to protect humans in a one-health approach.

Public health impact of new sustainable agronomic practices: the TOMRES project
Elisabetta Carraro1, Silvia Bonetta2, Veronica Porro1, Elisa Gasparro1, Lisa Richardi2, Cristina Pignata1
1Department of Public Health and Pediatrics, University of Turin, Italy, 2Department of Life Sciences and Systems Biology, University of Turin, Italy

Background and Objective: Agricultural crops require high volumes of water and fertilizers. Nowadays, water resources are scarce, also for climate changes, and fertiliser production requires large amounts of non-renewable resources such as phosphorus. The TOMRES project (Horizon 2020, n. 727929) involved 25 partners from 10 European countries with the aim of increasing tomato tolerance to the combination of water and nutritional stress. Sustainable management strategies suitable for water and nutrients absorption from soil were tested and optimised, including fertilisation, irrigation techniques, symbiotic microorganisms and biostimulants use. With the purpose of assessing the effects on Public Health, the evaluation of the hygiene and sanitary impact of the new cultivation method was investigated.

Methods: Microbiological indicators and pathogens, ecotoxicological indicators, pesticides and heavy metals contamination were analysed on soil samples in relation to the agronomic techniques applied in the project trials. To evaluate the hygiene and sanitary impact a statistical comparison of the Results obtained in soil samples between pre- and post-cultivation (t-test) and among the different cultivation strategies applied in each trial (ANOVA) was carried out.

Results: The overall Results showed that the reduction of water and fertiliser use leads to a reduction of bioavailable heavy metals, microbiological contamination and ecotoxicity. However, the results underlined that the use of these sustainable agronomic practices should be managed with particular attention in areas where there may be over-fertilization due to previous agricultural activities because of the risk of toxic substances mobilization in the soil.

Conclusions: The agricultural practices evaluated in the TOMRES project are promising as they limit heavy metals mobility, microbiological contamination and ecotoxicity. So, resilient tomato cultivars could grow using new crop management techniques with a reduction of water and nutrient consumption that is a fundamental goal for linking the growth of the world population with climate changes.

Climate change and wastewater treatment: human pathogens and microbiological indicators in Alpine aquatic environments
Silvia Bonetta1, Silvia Bonetta1, Manuela Maciri1, Marta Catozzo1, Silvia Bertolotti2, Anna Marino1, Elisa Falasco1, Marco Minella2, Francesca Bona1, Stefano Fenoglio1
1Department of Life Sciences and Systems Biology, University of Turin, Italy, 2Department of Chemistry, University of Turin, Italy

Background and Objective: Recent research highlighted the negative impact that climate change has on social and environmental factors that determine human health, such as availability and quality of water resources. In particular Alpine rivers, frequently utilized for different human activities (e.g. drinking and irrigation), are more altered by climatic change showing a general flow rate reduction that can affect water quality. In fact, during the more frequent periods of drought, emissions from anthropogenic sources such as wastewater treatment plant (WWTP) discharges are less diluted determining an increase in the concentrations of pathogenic microorganisms. The aim of this study is to evaluate the wastewater discharge effect on spreading of human pathogens in Alpine rivers in relationship to flow rate reduction.

Methods: Samples upstream (U), downstream (D) and at discharge (W) of WWTPs in three Alpine streams were collected monthly for one year. Parameters investigated are: coliforms, enterococci and Escherichia coli quantification using Quanti-TrayTM 2000 (IDEXX Laboratories), Clostridium perfringens spores enumeration using membrane filtration method, presence/absence of Salmonella spp. and verocytotoxin-producing E. coli (VTEC) by PCR. Moreover, also ecological, chemical and hydrological aspects are investigated.

Results: Discharge samples (W) showed high contamination by the different indicators, but the effect of WWTP is mainly evidenced in one of the investigated rivers which shows an increase respect to U samples. Salmonella spp. was present in all rivers investigated, but similarly among U and D samples except for one river, indicating other contamination sources. VTEC presence seems to be not related to WWTP discharge.

Conclusions: The results obtained so far indicate that WWTP effect is detectable but strongly related to the sampling site underlining the need to monitor the microbiological contamination in river impacted by climatic change reducing human pathogen circulation and the possible indirect effect on human health.

Epidemiological update of human cases of Toscana Virus infections in the Emilia-Romagna region in the period 2010-2022
Daniela Azzalini1, Elena Righi1, Giuseppe Diegoli1, Giulio Matteo1, Andrea Mattivi1, Gian Belloli1, Giovanna Mattei2
1Department of Biomedical, Metabolic and Neural Sciences, University of Modena and Reggio Emilia, Modena, Italy, 2Regional Health Authority, Emilia-Romagna Region, Bologna, Italy

Background and Objective: Toscana virus (TOSV) infection often occurs asymptomatically or with mild symptoms (asthenia, fever, headache) but it can also generate neurological clinical pictures (meningitis, encephalitis). This epidemiological update describes the trend of human confirmed cases of TOSV in the period 2010-2022 in Emilia-Romagna region and the main characteristics of the population involved.

Methods: The elaborations refer to the notifications of infectious diseases, on the regional web-based system “Surveillance of Infectious Diseases” (SMI), provided by ministerial decree 15/12/90, based on the Arboviroses surveillance system (dgr 531/2022) of the 2022 Emilia-Romagna regional plan for the surveillance and control of Arboviroses (PSCA).

Results: In the period 2010-2022, 568 confirmed cases of TOSV were notified. The trend of reports of TOSV infections was variable: a minimum number of cases in 2011 (15 cases) and two peaks in 2013 and 2022 (88 cases and 109 cases, respectively). During the period 2010-2021 we observed a peak of cases in August, in 2022 the peak was observed one month later. In all years, TOSV infection was prevalent in males. In terms of incidence the most affected age group was 25-44 years followed by 45-64 years and over 65. Referring to 2022, we observed a wide overlap between the areas where more human TOSV infections were notified and the areas where more sandflies were caught. During the period 2013-2022 TOSV infections manifested mainly with meningitis, except in 2018 when we recorded more cases of encephalitis.

Conclusions: TOSV infections represent an emerging public health concern. The aim of the PSCA and the Emilia-Romagna region surveillance system is to rapidly identify TOSV infections’ cases and to stimulate behaviors aimed at individual protection and prevention of the vector’s spread in order to correctly invest future resources.

Exposure to neighbourhood greeness and hypertension in adults: a cohort study in Taiwan

Yi Zeng1, Marc Chong2, Xiang Lao3
1Jockey Club School of Public Health and Primary Care, The Chinese University of Hong Kong, Hong Kong, China

Background and Objective: There is limited information on the health effects of long-term exposure to neighborhood greeness in a longitudinal setting, especially in the Asian area with high population densities. This study aims to investigate the association between long-term exposure to neighborhood greeness and hypertension among adults from Taiwan.

Methods: We selected 125537 participants (±18 years of age) without hypertension from Taiwan who joined the standard medical examination program between 2001 and 2016. Neighborhood greeness was estimated by normalized difference vegetation index (NDVI) derived from satellite images at a resolution of 250 m2. The two-year average of NDVI within a 500m buffer around participants residences was calculated. A time-varying Cox regression model was used to investigate the association between greenness and incident hypertension. Mediation analyses were performed to investigate whether the association was explained by air pollution, physical exercise, and body mass index (BMI).

Results: Compared to participants living in the areas with the first quartile of neighborhood greeness, participants living in the areas with the second, third, and fourth quartiles of neighborhood greeness were associated with a lower risk of hypertension, with a hazard ratio (HR) (95% confidence intervals) of 0.95 (0.91, 1.00), 0.95 (0.90, 0.99), and 0.93 (0.88, 0.97), respectively. Each 0.1-unit increase in NDVI was associated with a 24% lower risk of developing hypertension (HR:0.76, 95%CI: 0.66, 0.87). The associations were stronger among males and individuals with higher education levels. BMI slightly mediated the association, but there was no evidence of mediating effects of air pollution and physical exercise.

Conclusions: Our findings suggest the protective effects of neighborhood greeness on hypertension development, especially in males and well-educated persons. Our findings reinforced the importance of greeness for the neighborhood environment.

Biomonitoring the estrogenic effect of wastewaters: role of extraction phase and assay type

Marta Gea1, Tiziana Schilirò2, Federica Spina3, Roberta Revello2, Giovanna Vareske2
1Department of Public Health and Pediatrics, University of Turin, Turin, Italy, 2Department of Public Health and Pediatrics, University of Turin, Italy, 3Department of Life Science and Systems Biology, University of Turin, Italy

Background and Objective: Endocrine disruptors, emerging contaminants of concern, are mainly spread in the environment through effluents of wastewater treatment plants (WWTPs), so an efficient monitoring of effluents is needed. Biological monitoring through estrogenic activity assays has been suggested to improve water quality assessment. This monitoring can evaluate the overall estrogenic activity, considering all chemicals with the same mode of action. However, it could be influenced by many factors. This study compared the estrogenic activity of wastewaters extracted with different extraction phases and analyzed with different assays to establish whether phase and/or assay may affect monitoring results.

Methods: The effluents of six Italian WWTPs were collected in four seasonal samplings and extracted using two phases (HLB, C18). The extracts were tested using gene reporter assay on mammalian cells and yeast estrogen screen assay (YES). To assess whether the estrogenic activity posed an acceptable risk, Results of the cumulative effluent (discharged in surface waters) were compared with safe estrogenic levels reported in literature.

Results: The estrogenic activity of effluents extracted with HLB was significantly different from the estrogenic activity of effluents extracted with C18, showing that phase type can affect monitoring results. Moreover, the Results were also affected by the assay type. Using the gene reporter assay the estrogenic activity was generally higher than using YES, confirming that mammalian cell-based assays are more sensitive than yeast-based assays. Finally, gene reporter data suggested that estrogenic activity of the cumulative effluent might pose a risk to the receiving waters, while YES data suggested that it does not represent an environmental threat.

Conclusions: This study highlighted the need to define a standardized approach to assess the endocrine disrupting potential of waters and provided data that could be useful to choose the most appropriate extraction phase and assay to safeguard environment, thus protecting human health.

DOI: 10.18332/popmed/165699

Evaluation of healthy housing: a strategy to improve environmental health

Laurent Gerbaud1,2, Aurélien Alfaré3, Anna Shujiinimaeva4, Aline Bonnet5
1Institut Pasteur, CHU Clermont-Ferrand, SIGMA Clermont, Université Clermont Auvergne, France, 2CNRS F-63000 Clermont-Ferrand, France, 3Service Santé Universitaire - UCA, France, 4xxUniversité Clermont Auvergne, CHU de Clermont-Ferrand, Inserm, Clermont-Ferrand, France, 5REVELEO, Paris, France, 6Communauté de communes de Brioude, Brioude, France

Background and Objective: Environmental quality of housing is a part of health protection. It combines reduced exposures to pollutants and access to available resources for protection and care services. In France, many local authorities lack of financing capacities or political will to improve housing, except for tourism (hotels, etc.) a key for local economy development. We developed a tool (Reveleo) able to check the environmental quality of the housing and applied it to tourism facilities (hotels, guest houses...) to check the feasibility and acceptability of both tourism holders and local authorities.

Methods: Reveleo combines open sources data (ie exposure to air polluting, noise...) from French Governmental agencies and a questionnaire dedicated to the quality of buildings and close environment. We have tailored the questionnaire so that to clarify health issues and make it fillable by any tourism holder. We tested it, in an urban and rural area of 17000 inhabitants and also checked how it could match the question of tourism development policies.

Results: Among the 18 tourism holders, 10 answered. Hotel holders did not answer mainly due to the lack of employees they had to face. All the questionnaires were fulfilled, with 78% of the items answered. The scoring for quality of environmental housing goes from 18,6 to 100 (the best possible score). We presented the results to the technical and political staffs of the area which decided to continue the experiment and were able to see the kind of actions they can take. Conclusions: We need to make some improvement to our tool, for answers difficult to get. But, for now, its feasibility and acceptability are good, and there are good hopes that it will help improve or build better healthy environment policies.

DOI: 10.18332/popmed/165760

The association between lead exposure and crime: a systematic review

Maria Talayero Schettino1, C. Robbins1, Maria Talayero Schettino1, C. Robbins1, Carlos Santos Burgos1, Emily Smith1
1The George Washington University Milken Institute School of Public Health, United States

Background and Objective: Prior research has demonstrated an association between lead exposure and criminal behavior at the population-level, however studies exploring the effect of lead exposure on criminal behavior at the individual-level have not been reviewed systematically. The intent of this study is to complete a systematic review of all studies assessing individual-level exposures to lead and the outcomes of crime and antisocial behaviors.

Methods: We included peer reviewed studies that were published prior to August 2022 and were classified as cohort, cross-sectional, or case-control. Studies assessing the outcomes of crime, delinquency, violence, or aggression were included. The following databases were searched using a standardized search strategy: ProQuest Environmental Science Database, PubMed, ToxNet and the Public Affairs Information Service (PAIS).

Results: Seventeen manuscripts met our inclusion criteria. Seventeen manuscripts met our inclusion criteria. Blood lead was measured in 14 studies, bone lead in 3 studies, and dentine lead levels in 1 study. This systematic review identified a consistent and statistically significant association between exposure to lead in the prenatal and 5 - 6 y period and later delinquent and criminal behavior, with increasing blood lead concentrations in childhood prospectively associated with later arrests and convictions in six studies.

Conclusion: There is limited data at the individual level on the effects of prenatal or childhood lead exposure and later criminal behavior and more evidence is necessary to evaluate the magnitude of the associations seen in this review. Our review, in conjunction with the available biological evidence, suggests that an excess risk for criminal behavior in adulthood exists when an individual is exposed to lead in utero or in the early years of childhood.

The global diet quality score's correlation with the EAT-Lancet

100
Background and objective: The world faces a global syndemic, in which diet is an important risk factor. The Global Diet Quality Score (GDQS) is a simple, timely and to highlight concordances between them and shed light into the GDQS' potential as a sustainable diet metric. Methods: The study was conducted in a nationally representative sample of 44,744 individuals aging ≥10 from the Household Budget Survey of Brazil, in which dietary data collection took place between 2017-2018, by trained interviewers using two 24-hour recall per participant. The GDQS and PHDI were scored from the two 24-hour recall means of intake. Spearman's correlation coefficient between the GDQS and PHDI was estimated for the whole sample and across sex, age, and income strata. Results: The correlation coefficient between the GDQS and PHDI was 0.21 (p<0.001), varying from 0.17 to 0.29 by strata. Women, elderly individuals, and the highest income strata had the strongest correlation between metrics (0.23, 0.26, and 0.29, respectively). Classification of food components into healthy, unhealthy in excessive amounts or unhealthy was discordant between metrics for vegetable oils, fish and seafood, low fat dairy, eggs, poultry and substitutes, red meat, and deep orange tubers. Conclusion: The GDQS is positively correlated with the PHDI in Brazil. Sources of discordances between metrics notably rely on the definitions of optimum intake of animal products, which should be subject to further evaluation. Acknowledgements: To the Sao Paulo Research Foundation (FAPESP) for funding our work (grant 2013/07607-8; 2022/08172-4), and Prof. Walter Willett (Harvard University) for the contribution.

Situation analysis of drinking water quality and sanitary conditions in small scale water supply systems in rural areas in Serbia

Dragana Jovanovic1, Vesna Karadzic2, Milena Vasic3
1Institute of Public Health of Serbia “Dr Milan Jovanovic Batut”, Dr Subotica 5, Serbia, 2Faculty of Dentistry Pancevo, Serbia, “Zarka Zrenjanina 179, 26000 Pancevo”, Serbia

Background and objective: Small scale water supply systems (SSWS) in rural areas in Serbia are facing with many challenges in providing safe drinking water to rural population, likewise in in entire pan-European region. This was the first comprehensive situation analysis aimed at assessing the drinking water quality and the sanitary condition conducted in Serbia. Drinking-water quality monitoring in rural areas is less enforced in the Monitoring programme on drinking water quality in Serbia, hindering a comprehensive understanding and systematic assessment of the situation of SSWS, as well as the effective planning and implementation of adequate improvement measures at national and local levels. Methods: This national survey was undertaken in rural areas of the Republic of Serbia in 2016 and on the basis of the WHO rapid assessment methodology. The total number 1,136 of small piped systems were inspected, using sanitary inspection forms for each water technologies and in total 1,168 of water samples were taken and analyzed for E. coli and selected physico-chemical parameters against national standards for drinking water quality. Results: Only 66.9% of water samples taken from SSWS were in compliance with the National standard regarding E.coli, 55.6% were in compliance regarding physico-chemical characteristics, while overall compliance was 36.9%. The most prevalent identified sanitary risks were: absence of fence in 73%, managing by unqualified personnel in 70%, close vicinity to the source of contamination in 64%, and unsatisfactory technical conditions in 55%. Conclusion: This study pointed to the high health risk for rural population in Serbia as a consequence of microbiological contamination of drinking water from rural SSWS and revealed poor sanitary conditions. It is crucial to develop an action plan at national and local level for the improvement of the situation on small-scale water supply systems in rural areas.

Sustainable and green hospital project in the province of Padua, Italy

Emanuela Zilli1, Suada Tikvina2, Guido Di Gregorio3, Davide Bonaldo3, Antonella Ruffatto1, Marzia Serafini1, Luisa Fontana4, Tommaso Caputo4, 1Azienda ULSS 6 Euganea, Hospital Direction, Hospital of Cittadella, ULSS 6 Euganea, Padua, Italy, Via Casa di Ricovero 40, Cittadella (Padua), Italy, 2Department of Cardiac, Thoracic, Vascular Sciences and Public Health, University of Padua, Italy, 3Azienda ULSS 6 Euganea, Department of Reanimation and Intensive therapy, Hospital of Cittadella, ULSS 6 Euganea, Padua, Italy, Via Casa di Ricovero 40, Cittadella (Padua), Italy, 4Azienda ULSS 6 Euganea, Quality manager, ULSS 6 Euganea, Padua, Italy

Background and Objective: Cittadella’s Hospital in the province of Padua, currently under construction, offers 400 beds. Given the changes in the population and environmental demand, more functional and secure areas of healthcare were needed. The new structure is set to be completed in 2026 introducing interesting features in order to project a safe, modern and green hospital concept. Methods: An innovative approach was used in the design of this new structure, dedicating the utmost attention to environmental sustainability, green materials, insertion in the urban and social context, enhancement of existing buildings, functional organization of the treatment areas and circulation zones, accessibility for all people, and humanization of the hospital experience. Results: The interior design was inspired by the external environment (sun movement, climate, landscape). Areas of care and diagnostic-treatment paths were reorganized according to guidelines set during the pandemic. There is an extensive use of renewable energy (solar panels, geothermal heat pumps, photovoltaic-battery hybrid system), a 4th-generation heating system and practical and easy to sanitize surfaces were designed. There is particular focus on the quality of the staff areas, which include spaces dedicated to psycho-physical well-being (relax points, yoga gym), and areas to encourage collaborative work (study rooms, centralized conference room). Outdoor recreational spaces and gardens for music and watercolor therapy were included and a Tai-chi gym is dedicated to oncology patients. Integration in the urban and social context is emphasized through window placement towards the gardens (maternal-infant, mental health and rehabilitation wards) and the city medieval walls. Conclusion: Greener healthcare provides benefits to patients, healthcare professionals and the environment. The use of renewable energy, a fourth-generation heating system, safety in air quality and ventilation, easily sanitized and maintainable surfaces and green materials contribute to the reduction of emissions into the atmosphere for a more sustainable future on the planet.

Spatial injustice: the imbalance between supply and demand for Ecosystem Services

Nausicaa Berselli1, Maria Gatti2, Claudia de Luca3
1University of Modena and Reggio Emilia, Department of Biomedical, Metabolichic and Neural Sciences, Via Campi 287, 41125, Modena, Italy, 2Aziul Medica, Epidemiology and Risk Communication Unit, Department of Public Health, Strada Martiniana 21, 41126, Modena, Italy, 3Aima Mater Studiorum University of Bologna, Department of Architecture, Viale del Risorgimento 2, 40136, Bologna, Italy

Background and Objective: Ecosystem Services (ES) are benefits that natural systems generate and contribute to human well-being. The study intends to map the supply and demand of an important ES for climate regulation, the cooling given by green infrastructures, in the province of Modena (northern Italy), in order to identify situations of spatial injustice. Methods: The cooling capacity given by green infrastructures (supply of ES) was calculated using the InVEST (Integrated Valuation of Ecosystem Services and Tradeoff) software, which calculates the heat mitigation index based on shading, evapotranspiration at albedo and distance from the green infrastructure. The characteristics of vulnerability to heat (demand of ES) considered were age over 80 or under 14, condition of fragility in old age, status of foreigner and low per capita income, obtained through demographic registers or surveillance systems. The cooling capacity given by green infrastructures and the heat vulnerability characteristics were achieved for each municipality in the province of Modena, thus building maps of the supply and demand of the ES.
Results: The study shows the presence of a lower cooling capacity and, at the same time, a greater concentration of subjects more vulnerable to high temperatures, in the city center and in the flat municipalities, especially the most industrialized. The comparison between the supply and demand maps of ES highlights a situation of social injustice, in which the greatest demand is present in places where the climatic mitigation given by greenery is minimal and where summer heat waves occur.

Conclusion: This study is a guide for policy makers for a correct urban redistribution and the implementation of nature-based solutions in areas where the demand is higher, using small-scale solutions (e.g. vertical greeneries, green roofs) where there is no possibility to increase public green spaces.

**Evaluation of indoor air quality and its architectural, environmental, and occupational determinants in a primary health care center - a research protocol**
Francisca Pulido Valente, Diogo Cortes Lopes, Dinis Loyens, Ana Baptista, Francisco Barcelos, Maria Borges

1Public Health Unit of Amadora Portugal

Background and Objectives: Indoor air quality (IAQ) is a significant determinant of health and well-being. Most people spend 90% of their time inside, so maintaining a high level of IAQ is essential. As primary healthcare facilities serve large populations and have many employees, it is especially critical to characterise their IAQ. However, scant research has been done on this topic, and there is no specific legislation regarding IAQ in these locals. In this study protocol, it is proposed to determine what factors contribute to poor IAQ at Amadora Primary Health Care Center (PHCC).

Methods: Using the environmental monitor EVM-7, PM2.5, PM10, CO2, total volatile organic compounds, temperature, and relative humidity will be measured in the treatment rooms, waiting rooms, and consultation rooms of the functional units of the PHCC of Amadora. Buildings and rooms will be characterised according to their architectural features, surroundings, and occupation, utilising the form explicitly developed for this purpose. IAQ will be described by referring to Portuguese IAQ legislation. Using the statistical analysis software Statat 17, multilevel regression models will identify statistically significant associations between the variables.

Results: Results are expected to provide insight into how buildings, facilities, and occupational behaviour affect IAQ at PHCC of Amadora. Additionally, they will enable the development of recommendations designed to protect patients and workers health, quality of life, and well-being.

Conclusion: IAQ in PHCC has not been sufficiently studied, and research has been primarily focused on the hospital context and microbiological parameters. This protocol will identify architectural infrastructure and human occupation as determinants of poor IAQ in PHCCs and stimulate discussion on the need to revise Portugals air quality legislation. A collaborative approach is emphasised between the public health sector and engineering, architectural, and occupational health.

**An ecological study on climate vulnerability and health in India - case for an improved risk index**
Jaya Khatri, Kavitha Ak, Sanghamitra Patti

1Indian Council of Medical Research (ICMR) 2ICMR RMRC NaCo Square Chandrasekarpat, Bhubaneswar 3India

Background and Objective: Climate change has the most direct and immediate effect on a population’s health, highlighting the need for assessing vulnerability of communities towards this effect. This study examines the relationship between common health outcomes and a ‘climate vulnerability index (VI)’ used in India to assess its predictive capability.

Methods: This was an ecological study using districts of India the unit of analysis. Secondary data of four nationally representative datasets obtained from the National Data Analytics Platform was used in this study: fifth round of the National Family Health Survey (NFHS-5), National Health Missions Health Management Information System (HMIS), estimates of district vulnerability, and the latest Census of India. We used some common health outcomes available with these datasets to estimate their correlation with the districts Vulnerability Index (VI), which was the exposure of interest.

Results: The VI of the districts was between 0.34 and 0.75. Among them 222 districts were classified as Very highly and highly vulnerable (VI: 0.50-0.75), 258 as moderately vulnerable (VI: 0.51-0.59) and 132 districts as low or very low vulnerable (VI: 0.34 – 0.51). There was a statistically significant correlation between VI and prevalence of obstetric complications including gestational diabetes mellitus, still births, spontaneous abortions as well as the incidence of childhood pneumonia, asthma, and sepsis. However, the VI had few health parameters in its construction and is not suitable for predicting health related outcomes.

Conclusions: The vulnerability index used in India to classify districts did not significantly or consistently correlate with measures of population health, making it unsuitable for use in health impact assessments.

**Effects of mud-therapy on pain, function and quality of life in patients with rheumatic and dermatologic diseases: A systematic review and meta-analysis**
María Facchini, Stefania Paduano, Francesco Venturelli, Michele Antonelli, Valentina Mingrone, Isabella Marchesi, Federica Valeriani, Maria Bassi, Annalisa Bargellini

1Department of Biomedical, Metabolic and Neural Sciences, Section of Public Health, University of Modena and Reggio Emilia, Italy 2Epidemiology Unit, Azienda USL-IRCCS di Reggio Emilia, Italy 3Department of Public Health, Azienda USL-IRCCS Reggio Emilia, Italy 4Department of Movement, Human and Health Sciences, Public Health Unit, University of Rome ‘Foro Italico’, Italy 5Medical library, Azienda USL-IRCCS di Reggio Emilia, Italy

Background and Objective: Various studies examined mud-therapy in the last twenty years, but mechanisms of action of these non-pharmaceutical treatments (mudpack or mud-bath) are still almost unknown and it is difficult to establish the efficacy of mud-therapy approach.

The aim of this meta-analysis is to offer an update of the existing literature on the efficacy of mud-therapy in rheumatic and dermatologic diseases.

Methods: Electronic bibliographic databases (PubMed, Embase, Medline, Central, Scopus, Pedro) were screened for articles published in English or Italian from January 2000. Studies that compared mud-therapy (alone or combined with drug or thermal or physical therapies) to any other intervention or to no intervention in adults (≥18 years) with rheumatic and dermatologic diseases were selected. The main outcomes were pain, function, quality of life, adverse events. Randomized clinical trials, non-randomized trials, and comparative cohort (prospective and retrospective) were eligible if they assessed at least one main outcome. Non comparative case series and case reports were included for safety outcome only. For categorical outcomes, the effect measure is synthesized calculating Risk Ratio and Risk Difference and for continuous outcomes calculating Mean Difference or standardized Mean Difference. A meta-analysis is performed based on heterogeneity between included studies, assessed statistically.

Results: Of the 3332 articles screened after duplicates removing, 76 studies satisfied the eligibility criteria and were included. Preliminary analysis showed an improvement in 29/35 (82.9%) articles evaluating quality of life in adults treated with mud-therapy; this improvement was reported as significant in 54.3% (19/35). Similar evidence was found in studies evaluating function (36/48, 75.0% of improvement, 28/48, 58.3% of significant improvement) and pain (37/46, 80.4%, 31/46, 67.4%, respectively). Meta-analysis is ongoing.

Conclusions: These preliminary results suggest a therapeutic effect of mud-therapy for rheumatic and dermatologic diseases. Meta-analysis is necessary in order to reach definitive conclusions on the current evidence.

**Gender differences in the Effects of Urban Greenness on Cardiovascular Disease Outcomes**
Alessandro Bianconi, Angela Coa, Giulia Longo, Matteo Fiore, Davide Gori

1University of Bologna Department of Biomedical and Neuromotor Sciences Italy

Background and objectives: Cities are expected to host more than two third of the world population by the half of XXI century. Some aspects of the built environment in the urban context, such as residential greenness, may impact citizens’ health. Many studies highlighted how urban greenness (UG) is correlated to better health. Many studies highlighted how urban greenness (UG) is correlated to better health. Many studies highlighted how urban greenness (UG) is correlated to better health. Many studies highlighted how urban greenness (UG) is correlated to better health. Many studies highlighted how urban greenness (UG) is correlated to better health. Many studies highlighted how urban greenness (UG) is correlated to better

Methods: The PRISMA Statement guidelines were followed while conducting this systematic review. A systematic search of the current literature was performed
through Scopus and PubMed databases. Primary research studies analyzing associations between residential UG exposure measures and CVD outcomes were searched. Only study presenting stratified analyses by gender were finally included.

Results: Eight studies that performed stratified analyses by gender were found. Five studies found a protective effect of UG on exposure to CVD outcomes that was statistically significant after adjustments. Two studies found no statistically significant effect of UG on cardiovascular outcomes in both male and female. One study highlighted an inverse correlation between residential UG and CVD morbidity in both men and women.

Conclusion: This study suggests the presence of underlying gender-specific mediators on UG impacts on CVD outcomes. Since the small number of literature examples of gender-stratified impacts assessment of UG on cardiovascular health, further studies are needed to understand the explanatory mechanisms involved.

DOI: 10.18332/popmed/164411

Heatwaves perceived impacts and adaptive behaviours - results of a cross-sectional study in Pakistan

Farman Ullah\1, Francisco Barone-Adesi\2, Ives Hubloue\1, Luca Ragazzi\2, Martina Valente\2
\1Universität der Piemonte Orientale CRIMEDIM - Center for Research and Training in Disaster Medicine, Humanitarian Aid, and Global Health - Università del Piemonte Orientale (UPO), 28100 Novara, Italy | \2Vrije Universiteit Brussel (VUB), Brussels, Belgium

Data was collected using a standardized questionnaire using Likert Scale technique. Heatwaves perceived impacts were measured using a total of five items using a scale i.e., Not at all "1", Less likely "2", Fairly "3", Very Much "4", A great deal "5". Whereas individual adaptation was measured using a total of 14 statements using a five-point Likert scale of Never "1", Rarely "2", Sometimes "3", Very Often "4", and Always "5" respectively. Demographic information included age, gender, marital status, education, employment, income, ethnicity, living arrangements and type of residence.

A total of 698 responses were received with the majority belonging to urban areas (60.64%) compared to rural areas (39.36%); with most of the respondents being male (71.14%) compared to female (28.86%). Majority of the respondents were from ethnic background "Pashtun" (34.99%) followed by Punjabis (17.78%), other ethnicities (17.20%), Urdu Speakers (16.47%) and Sindhi and Baluchi (13.56%).

Results for perceived impacts suggest extreme impacts in terms of a higher perceived negative personal health impacts, increased perceived negative health consequences of heatwaves in Pakistan.

Respondents’ individual adaptive behaviours were measured using fourteen statements, for example “Use an umbrella/cloth when walking outside” (Cronbach’s alpha=0.91). The total individual adaptive behaviour score was then dichotomized into low (14-43) and high (44-70) at “midpoint”. The study results can play an important role in targeting certain activities at the grassroots level

Conclusions: Heatwaves and their impacts should be a priority of action in Pakistan with a staged targeted approach based on local needs and capacities. An integrated approach to heatwaves management, should include community participation, education and planning.

Popul. Med. 2023;5(Supplement):A225
DOI: 10.18332/popmed/165451

How can the public health community support litigation to protect public health in the context of climate change and other environmental threats to health?

Farhang Tahzib\1, Stephen Holgate\2, Brigit Toebes\3, David Patterson\4
\1UK Faculty of Public Health, United Kingdom, \2University of Southampton School of Medicine, United Kingdom, \3Aletta Jacob School of Public Health, Netherlands, \4Groningen Centre for Health Law, The Netherlands

Outline: Climate change and environmental health are important cross-cutting issues to address within the public health sector. Encouraged by wins on asbestos and against big tobacco, the public health community and environmental advocates are turning to litigation to sue governments and private sector interests for public health harms from environmental pollution and climate change. Climate litigation can be supported using essential public health functions while simultaneously raising awareness about the health impacts on planetary health. Increasingly, climate cases submitted to courts include a focus on health. Yet there remains a lack of awareness and training among the public health community. In October 2021 the European public health association (EUPHA-law) co-hosted a webinar on public health, climate change and strategic litigation which highlighted how strategic partnerships between public health practitioners, environmental advocates, legal experts and affected communities are needed. In response to this, the UK faculty of public health, EUPHA-law, and the Groningen Centre for health law (in collaboration with lancet countdown, Greenpeace, and other stakeholders) will publish a toolkit for public health practitioners on supporting litigation to protect public health in the context of climate change and other environmental threats to health. The toolkit will answer common questions from public health practitioners: legal systems are as varied as health systems, yet there are principles common to all jurisdictions. In particular, the choice of legal forum is key: which court is best placed to hear a given case? Who can initiate legal proceedings? What is the most suitable legal basis for the claim? It could be under a national constitutional protection of the right to life, a human rights treaty, or environmental or tort law. And, what evidence is required and what evidential standard should be met?

Overcoming the challenges of problem identification in complex systems of urban health

Geoff Bates\1, Daniel Black\2
\1Institute for Policy Research, University of Bath, Bath, United Kingdom, \2Bristol Medical School, University of Bristol, United Kingdom

Brief outline of the overall workshop: Complex public health challenges such as climate change, non-communicable diseases, and health inequalities are driven by innumerable interacting factors. Tackling these challenges is increasingly recognised as requiring new and large teams from a wide range of disciplines and sectors spanning large and complex systems, who must identify and agree the root causes of problems to target. The challenge of problem identification becomes substantially greater in complex systems, and for large teams with heterogeneous backgrounds, expectations, and priorities. This workshop looks at how large research teams can identify and develop shared understandings of problem areas in complex systems, with a view to fostering effective collaboration with critical, targeted stakeholders. Through presentations introducing key concepts followed by structured small group work and whole group debate, participants will hear and contribute to Discussions on problem identification within large research teams and approaches to targeted stakeholder engagement in complex systems. The workshop draws on the presenters’ critical reflections from TRUUD (Tackling the Root Causes Upstream of Unhealthy Urban Development), a five-year collaboration between five universities in the United Kingdom and their partners in industry, government, and the public.

Specific Aims/ Objectives and Component Parts: This workshop aims to develop knowledge and ideas that can support large teams to develop shared conceptualisations of complex public health problems. Key objectives are i) to share knowledge about the challenges of problem identification in large research teams and understand why this is critical for tackling complex public health challenges, ii) to define what constitutes good co-production of problem identification with stakeholders in a complex system, and iii) to improve knowledge of the processes and tools that can support large teams to develop shared understandings on these issues. The workshop will include a mixture of presentations, audience questions, and structured discussions in small groups. Firstly, facilitators will share their learnings from the TRUUD project on problem identification and developing shared understandings in inter- or trans-disciplinary teams, and stakeholder engagement in complex systems. Secondly, workshop attendees will be invited to ask questions to the facilitators and to share their reflections on key concepts. Thirdly, attendees will be divided into small groups to debate issues in engaging the wide range of stakeholders relevant to research on complex public health problems, including how to identify stakeholders and when engagement should occur. The session will conclude with a full plenary session where groups will feed back their ideas and we will identify areas of consensus for approaches to stakeholder engagement in a complex system.

Key questions that the workshop will seek to address: The workshop will explore the overall question ‘How can large research teams conceptualise and develop shared understandings of complex health problems to support intervention development?’. Sub-questions include: 1. How can researchers from multiple disciplines develop shared understandings of complex problem spaces? 2. How can stakeholder engagement be managed to help identify and understand problem spaces in complex systems? 3. What tools, methods, and processes help teams to coalesce around specific problems in complex systems?
Workshop Aim: The workshop will provide an overview of how the public health community can better support climate change litigation. Sound scientific evidence is as critical to successful litigation as to effective public health policies. Increasingly, public health practitioners are asked to testify in court about the known health impacts of environmental threats. Collecting this evidence requires foresight, meticulous record-keeping, peer support, and the courage to withstand questioning of professional capacity. The workshop will provide an overview of work for scientists preparing to enter this context and its proposed uses, building on collaboration with environmental and legal organisations. Opportunities to engage with public health practitioners in the global south will be explored. Participant feedback will be welcomed. The key questions that the workshop will address will be: 1) how can the public health competencies be strengthened to understand and support climate change litigation? 2) what essential public health functions can contribute to litigation in the context of climate change and other environmental threats? 3) how can public health professionals work better with lawyers and communities to protect population health in the context of climate change?

Climate, migration and health: questions of ethics and public health

Gözde Ercan1, Edith Haghnazarian1; Colleen Kraft2; Roger Worthington4
1University Of Health Sciences Sancaktepe Training And Research Hospital, Dept. of Child Health and Diseases, Turkey; 2Emergency Department, Los Angeles Children's Hospital, United States; 3University Of Southern California, Keck School of Medicine, United States; 4Higher Education Sustainability Initiative, SDG Fellows Groups, 6 St Georges Court, Tunbridge Wells, TN 4 9GX, United Kingdom

Background and Objective: Migration is being increasingly driven by climate change, and the aim of the workshop is to consider the ethical implications of migration caused by climate change to help prevent unnecessary harm and suffering. Consider learning needs for healthcare professionals treating migrantsconsider leadership issues to help ensure sustainable global and public health policy as these trends become more marked.

Methods: The workshop will begin with a short introduction, followed by small group discussion, ending with a plenary. Delegates in small groups will consider: Moral obligations on populations to accommodate migrants forced to relocate because of climate change making it impossible for them to continue living in areas affected by persistent drought, extreme heat and/or frequent/widespread flooding. Continuing professional development needs for healthcare professionals treating migrants from different countries, cultures, and climates. Policy implications for healthcare leaders facing with increasing demand for public health services, for example, in relation to SDGs 3, 4, 5, 6 and 13.

Results: Each group will summarise their findings and feedback to the plenary.

Conclusion: During the plenary discussion, facilitators will seek to identify key findings that can be shared and used to prepare for anticipated changes in public health policy and provision in response to climate-related migration.

COP 27: African Perspective

Osahon Enabulele1, Harsha Somaroo1, Armand Nkwescheu3, Lwando Maki4, Lwando Maki4

Background and Rationale

Globally, climate-related disasters killed thousands of lives, affected nearly 10 million people, and a financial cost of US$10 billion in 2019 alone[1]. South Africa has been witnessing catastrophic manifestations of climate change, including seasonal snows, veld fires, droughts, and floods.

The United Nations Framework Convention on Climate Change (UNFCCC) is an international treaty that compels its signatories to develop national programs to reduce their emissions of greenhouse gases. The Congress of the Parties (COP) is the supreme decision-making body of the UNFCCC. African countries are signatories to the UNFCCC, the Kyoto Protocol, and the Paris Agreement. The COP held its 27th Conference in Africa at Sharm el-Sheikh Climate Change Conference, held from 6 November until 20 November 2022. Health-related civil society from around the world attended with PHASA being one from Africa.

The World Health Organisation (WHO); World Federation of Public Health Association (WFPHA) and the Public Health Association South Africa (PHASA) recognise climate change as a threat to individual and population health; acknowledge the environmental footprint of the global healthcare sector; and are acting to reduce waste and prevent pollution to ensure healthcare sustainability. PHASA, therefore, holds membership in the Global Climate Health Alliance Board and has a special interest. PHASA, as one of the leading Public Health organisations in South Africa, sees the professional and moral need to leverage WFPHC to engage its African and Global stakeholders on the African perspectives of addressing the climate crisis to ensure sustainable health systems. PHASA seeks to achieve this by hosting a workshop event at the World Congress of Public Health 2023, in collaboration with current and developing strategic partners. Objectives: Create a platform to advocate for climate and health related mitigation and adaptation in Africa and globally; Create a platform to advocate for climate and health related capacity building in Africa and globally; Create a platform to interrogate the latest data and literature on climate change impacts on health and wellbeing in Africa; Propose strategies to educate/ raise awareness among health professionals on impact of climate change on health; To raise the relevance of addressing social determinants of health (SDH), including environmental determinants, to address the climate and health risks, in communities in Africa.

Methodology: A Panel discussion, with moderation.

Popul. Med. 2023;5(Supplement):A228
DOI: 10.18332/popmed/164462

What does the future of public health need to know about climate-health?

Laurent Chambaud1, Karl Conyard1, Mary Codd2, John Middleton3, Tara Chen3
1Association of Schools of Public Health in the European Region, France; 2Association of Schools of Public Health in the European Region (ASPHER), Ireland; 3UCD School of Public Health Physiotherapy and Sports Science, Ireland; 4ASPHER United Kingdom

Synopsis

The climate crisis is a public health emergency. Evidence has highlighted climate change impacts to the social and environmental determinants of health—from clean air, safe drinking water, food security, and even, the built environment. The public health systems have an important role in preventing and reducing these health impacts, requiring further understanding of the intersection of climate change and public health. Climate change brings complex and multi-faceted challenges for public health. Trainees and new graduates are not equipped with the tools to develop effective climate change responses. Academic institutions and public health authorities in the European region have received the call for action to support climate-health training through the EU Health Policy Platform, ASPHER Joint Statement. The joint statement has accelerated leadership buy-in, but the challenge to move forward is exacerbated by the implementation process. ASPHER is currently partnered with various agendas and roadmaps at European and planetary level to move forward with driving climate health conversations which vary from moving forward with deskilling/upskilling the workforce, and reviewing the job market to match workforce needs. This workshop looks to provide the latest research, agendas and policies in the European region from ASPHER and partners, and to share and advocate for climate-health education for the future public health, health workforces and policy makers.

Format

The workshop will be held in a roundtable discussion with three invited panellists who will provide a brief overview of activities from the perspectives of ASPHER (organization), Competencies (education), and Workforce (young professional). Throughout the presentation, there will be intentional opportunities to engage and explore with the audience to understand their background, and their sense of what they see in action and believe is missing in the role of public health in the climate crisis.

Specific Aims/Objectives: • To increase the knowledge of delegates around the latest developments by ASPHER and its partners • To share and reflect the climate-health competencies results with delegates and identify reactions across different roles and countries • To link individuals in the space with the wider network of climate-health advocates in public health • To propose some common actions at European and worldwide level to propel moving forward with climate-health needs

Key Questions

• What is the role of public health systems in climate change? • What is the role of public health professionals across different career trajectories in the climate
Incidence and determinants of loss to follow-up of human immune virus pre-exposure prophylaxis among key and priority population groups in Addis Ababa health centers, Ethiopia
Addisu Aragaw1
1’GAMBY medical and buisness collage, Addis Ababa, Ethiopia
Background: ‘Loss of follow-up’ is a significant public health concern globally. Retention in preventive care among at-risk key and priority population groups is critical for the successful prevention of Human immune virus acquisition. Loss to follow-up of individuals has countless negative impacts on Human immune virus prevention outcomes. There is, however, limited information about the incidence and predictors of loss to follow-up in the study area. Thus, this study aimed to determine the incidence rate and predictors of loss to follow-up among pre-exposure prophylaxis users.
Methods: A retrospective cohort study was undertaken using 240 pre-exposure prophylaxis users between May 2020, and May 26, 2022, at Addis Ababa selected health centers. All eligible clients who fulfilled the inclusion criteria were included in the study.
Results and Discussion: A total of 240 participants with a median age of 32.0 years (interquartile range [IQR]: 27.0 to 40.0) had a median time since initiation of pre-exposure prophylaxis 21.2 months (IQR: 6.5 to 21.1). Almost half (52.0%) were married. Being male is associated with 1.77 times in risk of getting lost to follow-up (ARR=1.77, 95% CI =1.12-2.79), those who had no adherence counseling were associated with 1.86 times in the 15% of LTFU as compared to those who had have adherence counseling (ARR=1.863, 95% CI=1.184, 2.930, P-value=0.003). 86 (35.8%) experienced loss to follow-up and the overall incidence rate of loss to follow-up was 7.3 (95% CI: 4.3-12.6) per 100 person-years of observation (PYs). P= value for adherence strategies should developed and designed as a holistic approach, acknowledging the contextual factors of key population groups.
Conclusions: About 35.8% of clients became lost follow-up of pre-exposure prophylaxis users. the overall incidence of 7.3 (4.3-12.6) per year of observation. Research preparedness involving key and priority population groups should be strengthened for Human immune virus prevention intervention evaluations in Ethiopia.

DOI: 10.18332/popmed/164820

Tsetse flies infected with trypanosomes in three active Human african trypanosomiasis foci of the Republic of Congo
Irina Bembé1, Arsene Lenga2, Herman Awono-Ambene3, Christophe Antonio-Nkondjio2
1'Marien Ngouabi University, Democratic Republic of Congo, 2'Marien Ngouabi University, Congo, 'Organization for the Coordination of the Fight Against Endemic Diseases in Central Africa (OCEAC), Cameroon
Human African Trypanosomiasis (HAT) is a neglected tropical disease still endemic in the Republic of Congo. Despite the continuous detection of HAT cases in the country, there is still not enough data on trypanosome infections in tsetse flies, trypanosome species and tsetse flies’ species distribution in endemic foci. The present study is intended to fill this gap and improve understanding of trypanosome circulation in three active foci in the centre and south of Congo.
Methods: Pyramid traps were set in various places in villages to collect tsetse flies both during the rainy and dry seasons. Once collected, tsetse flies were identified using morphological keys. DNA extracted from flies was processed by PCR for species identification and for detection of trypanosome presence. A second PCR was ran for different trypanosome species identification.
Results: A total of 1,291 tsetse flies were collected. The average apparent density of flies per day was 0.043 in Mpouya, 0.73 in Ngabé and 2.79 in Loudima. Glossina fuscipes quazensis was the predominant tsetse fly collected in Ngabé and Mpouya, while Glossina palpalis palpalis was the only tsetse fly found in Loudima. A total of 224 (17.7%) flies were detected infected by trypanosomes; 100 (7.9%) by Trypanosoma congolense savannah, 22 (1.74%) by Trypanosoma congolense forest, 15 (1.19%) by Trypanosoma vivax, 83 (6.58%) by Trypanosoma brucei (s.1) and 2 (0.16%) undetermined species. Loudima recorded the highest number of infected tsetse flies. Conclusions: The study provided updated information on the dynamics of tsetse fly populations as well as on the transmission of trypanosome species in the different active HAT foci in Congo. Thus data suggest a high risk of potential transmission of animal trypanosomes in these foci stressing the need for active surveillance in this endemic area.

Cholera outbreak investigation among children in Nishter Town District Lahore, Pakistan - May- June 2022: a retrospective cohort study
Shamalia Usman1
1’CDC, Rawalpindi Cantt., Pakistan
In April 2022, National IHR Focal Point of Pakistan reported laboratory confirmed outbreak of cholera. District Lahore reported highest number of Cholera cases from May – August 2022 in Province Punjab thus been epicenter of Cholera. WHO Global Task Force on Cholera Control focuses on containing Cholera outbreaks. In this regard joint field investigation team was formed of FELTP fellows, Communicable Disease & Epidemic Control Department and WHO to assess magnitude of outbreak, evaluate associated risk factors and recommend Prevention control measures. Retrospective Cohort study was designed on AWD/Cholera cases in the study area. Thus, this study aimed to determine the incidence rate and predictors of loss to follow-up among priority population groups such as children and pregnant women in the study area.
Results and Discussion: A total of 240 participants with a median age of 32.0 years (interquartile range [IQR]: 27.0 to 40.0) had a median time since initiation of pre-exposure prophylaxis 21.2 months (IQR: 6.5 to 21.1). Almost half (52.0%) were married. Being male is associated with 1.77 times in risk of getting lost to follow-up (ARR=1.77, 95% CI =1.12-2.79), those who had no adherence counseling were associated with 1.86 times in the 15% of LTFU as compared to those who had have adherence counseling (ARR=1.863, 95% CI=1.184, 2.930, P-value=0.003). 86 (35.8%) experienced loss to follow-up and the overall incidence rate of loss to follow-up was 7.3 (95% CI: 4.3-12.6) per 100 person-years of observation (PYs). P= value for adherence strategies should developed and designed as a holistic approach, acknowledging the contextual factors of key population groups.
Conclusions: About 35.8% of clients became lost follow-up of pre-exposure prophylaxis users. the overall incidence of 7.3 (4.3-12.6) per year of observation. Research preparedness involving key and priority population groups should be strengthened for Human immune virus prevention intervention evaluations in Ethiopia.

following the COVID19 playbook and battling another infodemic: Conspiracy beliefs around human Monkeypox among the Lebanese population
Dalal Youssef1
1Ministry of Public Health, Beirut, Lebanon
Introduction: The non-endemic multicountry outbreak of monkeypox (MPX) has emphasized the issue of conspiracy theories that go viral in times of societal crisis. Given the adverse consequences of conspiracy beliefs, this study aimed to assess the extent of endorsement of MPX conspiracy beliefs among the Lebanese population and to identify its associated factors. Methods: Using a convenience sampling technique, a web-based cross-sectional was conducted among Lebanese adults. Data was collected using an Arabic self-reported questionnaire. Multivariable logistic regression was performed to identify the factors associated with the MPX conspiracy beliefs scale.
Results: Conspiracy beliefs regarding emerging viruses including MPX were detected among 59.1% of Lebanese adults. Participants endorsed particularly the conspiracy theories linking the virus to a deliberate attempt to reduce the size of the global population (59.6%), gain political control (56.6%) or pharmaceutical companies financial gain (39.3%), and the mannmade origin of MPX (47.5%). Remarkably, the majority of surveyed adults exhibited a negative attitude toward the governments preparedness for a potential MPX outbreak. However, a positive attitude was revealed toward the effectiveness of precautionary measures (69.6%). Female participants and those having a good health status were less likely to exhibit a higher level of conspiracy beliefs. Divorced or widowed adults, those having a low economic situation, poor knowledge level, and negative attitude toward the government and precautionary measures were more prone to disclose a higher level of conspiracy beliefs. Notably, participants relying on social media to get information about MPX were also more likely to have a higher level of conspiracy beliefs compared to their counterparts. Conclusions: The widespread extent of conspiracy beliefs endorsement regarding MPX among the Lebanese population urged the policymakers to find ways to reduce people’s reliance on these theories. Future studies exploring the harmful impacts of conspiracy beliefs on health behaviors are recommended.

Malaria remains a public health problem in Cameroon. The prevention of this disease is slowing down by insecticide resistance, mosquito changing behaviour and the fast demographic growth of urban population. To manage those challenges, larval control could be effective. In the frame of a larviciding trial in the city of Yaoundé, a study was conducted in 26 districts from March 2017 to November 2020 to assess its impact on adult anopheline densities, malaria transmission dynamic and prevalence. A baseline survey was performed during one year then the larviciding was applied in 13 districts while the 13 others served as control. Entomological surveys were carried out once every two months to collect adult mosquitoes using CDC light traps and Human Landing Catches. Mosquitoes were identified up to the species level via PCR then analysed for plasmodium falciparum infectivity via ELISA. Two parasitological surveys were also conducted through malaria testing using blood smears and RDTs while dried blood spots were collected on filter papers to identify Plasmodium species. Slides were stained with Giensa and examined by microscopy for malaria parasites detection. Indoor and outdoor anopheline densities recorded with CDC declined by 69.13% and 61.55 % respectively during the larvicide treatment. The same trend was observed with HLC densities regarding the reduction rate of 79.99% and 63.47% recorded. Results also show that the spatio-temporal distribution of anopheline species in the city was affected by the treatment. In the same way, larviciding reduced indoor and outdoor transmission by 68.97% and 61.77% respectively. The intervention was also associated with a reduction in malaria prevalence. The study highlights the efficacy of larviciding in reducing anopheline density, malaria transmission and malaria prevalence in the city of Yaoundé Cameroon. This approach could be undertaken to sustain the efficacy of existing tools.

The most efficient malaria vectors bite and rest inside houses, hence houses play a determinant role in malaria transmission. During the implementation of additional vector control tools such as larviciding, individual disease risk perception could be affected. We carried out this study to evaluate the influence of house structures, community knowledge and practices on anophelines diversity and malaria prevalence, before and during a larviciding program. The study was conducted before and during larviciding intervention in 26 districts. Indoor CDC light traps were used to collect mosquitoes. Questionnaires were administered to collect data on house characteristics and to evaluate the impact of larviciding on population knowledge and behaviour. After morphological identification, anophelines were tested by ELISA to detect infection to Plasmodium parasites. RDT was used to test the blood samples of participants. Binary analyses were used to assess the correlation between different variables. The majority of houses were made with cement walls. The most abundant anophelines was An. coluzzii, followed by An. gambiae s.s, with the highest densities in traditional houses before the treatment in control sites, whereas, they were most abundant in modern houses in treated sites. Opened eaves and absence of ceiling exposed people to anophelines bites. Possession of LLINs before the treatment in control sites exposed people to anopheline bites while they were protected in treated sites. Infection to Plasmodium and malaria prevalence were highest in modern houses found in control sites; while in treated sites, infection to Plasmodium was highest in modern houses, but malaria prevalence was the same in both house types. People who lived in treated sites knew more about malaria prevalence and mosquito breeding sites, and the latter used fewer LLINs. Well-built houses protect people against anophelines species. The implementation of larvicide control improved the knowledge of people and decrease their personal protection against mosquito bites.

Assessing dengue and chikungunya infections among febrile patients visiting four healthcare centres in Yaoundé and Dizangué, Cameroon

Stella Nana-Ndjango1, Borel Djappi-Tschamen2,3, Ruth Mony4, Maurice Demanou1, Joyce Keumezeu-Tsafack4,5, Roland Bamou6, Parfait Awono-Ambene7, Charles Bilong8, Christophe Antonio-Nkondjo4,8,1
1University of Yaoundé I, Yaoundé, Cameroon, 2University of Yaoundé I, Yaoundé, Cameroon, 3Organisation de Coordination pour la lutte contre les Endémies en Afrique Centrale (OCEAC), Yaoundé, Cameroon, 4University of Yaoundé I, Yaoundé, Cameroon, 5World Health Organization, IST West Africa, Ouagadougou, Burkina Faso, 6University of Douala, Cameroon, 7OCEAC (Organisation de Coordination pour la lutte contre les Endémies en Afrique Centrale), University of Dschang, Dschang, Cameroon, 8OCEAC (Organisation de Coordination pour la lutte contre les Endémies en Afrique Centrale), Yaoundé, Cameroon

Dengue and chikungunya are widely distributed in Cameroon but there is still not enough information on their prevalence in different epidemiological settings. This study was undertaken to assess dengue and chikungunya prevalence in both urban and rural settings in Cameroon using 3 diagnostic tools. From December 2019 to September 2021, willing febrile (temperature >38°C) outpatients visiting 4 healthcare facilities in the cities of Yaoundé and Dizangué were screened for dengue and chikungunya. Clinical symptoms were recorded and blood samples collected in EDTA tubes were centrifuged to obtain plasma, then analysed using rtRT-PCR, RDTs, and ELISA. Odds ratios were used to determine the level of association between socio-demographic factors, clinical features and the infection status. Kappa statistic permitted to assess the level of agreement between RDTs and ELISA. Overall, 301 patients were recruited: 198 in Yaoundé and 103 in Dizangué. The prevalence varied according diagnostic tool. For dengue, 110 patients were positive to rtRT-PCR: 90 (45.45%) in Yaoundé and 20 (19.42%) in Dizangué. The prevalence of dengue IgM using ELISA varied from 22.3% in Dizangué to 30.8% in Yaoundé. Dengue positivity rate using RDTs was 7.6% in Yaoundé and 3.9% in Dizangué. For chikungunya, one (0.5 %) patient (Yaoundé) was tested positive to rtRT-PCR. The prevalence of chikungunya IgM with ELISA varied from 18.4% in Dizangué to 21.7% in Yaoundé, while using RDTs, it was 4.5% in Yaoundé and 12.6% in Dizangué. RDTs for either chikungunya or dengue displayed very poor sensitivity. Abdominal and retro-orbital pains were significantly associated to acute dengue infection. All the four dengue serotypes were recorded with a predominance of DEN-V-3 (35.45%) and DEN-V-4 (25.45%). This study further confirms endemicity of both dengue and chikungunya in Yaoundé and Dizangué. These data stress the need for active surveillance of cases to prevent outbreaks occurrence across the country.

Tuberculosis-related knowledge, practices, perceived stigma and discrimination, and adherence to anti-tuberculosis medication among patients with tuberculosis

Rana Hamawi1

117th WORLD CONGRESS ON PUBLIC HEALTH
Adherence to cotrimoxazole preventive therapy has been found to reduce the incidence of opportunistic infections and other AIDS-related illnesses. Cotrimoxazole preventive therapy is self-administered, and therefore, adherence cannot be insured, and the adherence has been low and opportunistic infections continue to be the major cause of mortality and morbidity in HIV, accounting for 47% of AIDS-related deaths. This study aimed to assess adherence and factors associated with cotrimoxazole preventive therapy (CPT) among adult human immunodeficiency virus (HIV) patients attending antiretroviral clinics in Jigiga hospitals.

Methods: Institutional-based-cross-sectional study was conducted from November to December, 2021 among 422 randomly selected adult HIV-positive patients attending Jigiga hospital. The collected data was entered into Epi-data version 3.1 and exported to SPSS version 24 for analysis. Binary and multivariable logistic regressions were used to identify factors associated with CPT adherence.

Results: 417 patients with HIV participated in the study with an overall adherence of CPT of 76.3% with 95% confidence interval (CI): 72.4%-81.3%. level of education can read and write (AOR = 1.50, 95% CI: 1.39-2.73), taking substance (AOR = 1.88, 95% CI: 1.22-2.93), distance of the health facility greater than 5km (AOR = 1.79, 95% CI: 1.07-2.98), residence being rural (AOR = 1.90, 95% CI: 1.14-3.17) not receiving counseling at refill (AOR = 1.33, 95% CI: 1.13-2.80), duration of ART less than 6 years and not disclosing HIV status to other family members (AOR = 5.40, 95% CI: 3.42-8.14, and 3.30, 95% CI: 2.12-5.41 respectively) were significantly associated with magnitude of CPT adherence.

Conclusions: To improve the adherence, continuous education and counselling, giving group service support for clients and patients having trends to disclose HIV status to other members of the family are some of the possible solutions.

Measles seroprevalence national survey among a sample of the Tunisian population: is there an explanation for the 2019 measles epidemic in a mostly vaccinated population?

Emna Mzou1, Mouna Sauer2, Aicha Hchasbi2, Fatma Youess2, Hejer Letaief2, Sonia Dhahoudi3, Leila Bouabid2, Sondes Derouiche3, Rym Mhadhbi3, Souha Bougafet2, Olfa Bahri3, NIssaf Alaia3

4Department of Microbiology and Biochemistry, Hospital Aziza Othmana, Tunis, Tunisia, Observatoire National des Maladies Nouvelles et Emergentes, Tunis, Tunisia

In Tunisia, the measles vaccine is included in the national-immunization-programme. An outbreak of measles occurred with 3896 notified cases and 39 deaths in 2019. We conducted this study to estimate measles IgG-antibodies seroprevalence before the occurrence of 2019-outbreak. We conducted a national seroprevalence survey of measles immunity using blood samples serotheque collected during the 2014-2015 National Viral Hepatitis cross-sectional survey. Written informed consent for using the sera for further analysis was obtained from participants (parents for minors). A subsample of 3500 individuals was included based on expected seroprevalence of 85%, a precision of 0.2% and 95%CI. ELISA was used to detect IgG antibodies against measles. Participants with serum positive for measles antibody were considered protected or immune to measles disease. From 3454 serum samples tested, 3279 were positive for measles IgG antibodies, representing a seroprevalence of 94.9% (95%CI: 94.3%-95.6%). Seroprevalence was significantly lower in rural area(<p=0.001). The prevalence of measles IgG antibodies was different by age(p=0.001). The seroprevalence among children aged 0-5 years was 94.7%. It was 96% for both 5-10- and 10-15-year-old populations. However, it declined significantly among 20-30 years population, 1982-1997 birth cohort, with a seroprevalence of 83.2% (95%CI: 79.7%-86.1%). Among 40-50, 50-60 and >60-year-old populations, seroprevalence were 98.1%, 99.2%, and 98.6% respectively. In this context, during 2021, the Tunisian government, provided and recommended getting a booster dose targeting adults born between 1982-1997(20-30 years), and advancing the first dose for children from 12 to 9 months, in order to ensure a sufficient immunization rate. This study, a pre-epidemic measles seroprevalence survey, showed that seroprevalence among vaccinated population aged 20-30 years in Tunisia was low. To prevent future outbreaks, a nationwide-vaccination-campaign was implemented in 2021, aiming to boost immunity against measles. It was delayed for 2022, as a consequence of the COVID-19 pandemic.

1Young Leaders Organization, Johns Hopkins University, United States, 2Young Professional Development Society Nepal, Nepal

**Introduction:** The prevalence of monkeypox is increasing globally, with the first case reported in the United States in 2022. In the Eastern Mediterranean Region, knowledge among medical students about monkeypox is crucial for effective case management.

**Aim:** This study aimed to assess the knowledge of monkeypox among medical students in Egypt.

**Methods:** A mixed-method approach was used, including a questionnaire to assess students' knowledge and a case study to evaluate case management. The questionnaire was distributed to 230 medical students in Alexandria University.

**Results:** The study found that 36% of students had high knowledge, 44% moderate knowledge, and 20% low knowledge of monkeypox. The majority of students were aware of the symptoms and diagnosis of monkeypox, with 80% correctly identifying the symptoms. However, only 50% had knowledge of the prevention methods, with 30% not knowing how to prevent monkeypox.

**Conclusions:** The study emphasizes the need for improved education and awareness among medical students regarding monkeypox. Further research is needed to evaluate the effectiveness of current education programs.

**The effectiveness of the prevention and control methods applied towards the elimination of malaria in Botswana**
Collen Saudu

**Background:** Malaria elimination is a global health priority. Botswana, a country in southern Africa, has made significant strides in reducing malaria incidence and prevalence.

**Methods:** A retrospective study was conducted using data from the Botswana Ministry of Health and Wellness. The study assessed the effectiveness of control measures implemented between 2000 and 2018.

**Results:** There was a significant reduction in malaria incidence and prevalence, with a decline of 92% and 85%, respectively, from 2000 to 2018. The use of insecticide-treated nets (ITNs) and indoor residual spraying significantly contributed to this reduction.

**Conclusions:** The implementation of evidence-based prevention and control strategies has been effective in reducing malaria in Botswana. Continued commitment and investment are required to sustain these gains.

**Case of yellow fever in the Manankoro area, Bougouni health district, Sikasso region, December 2019**
Soungalo Diakite

**Young Leaders Organization, Johns Hopkins University, United States**

**Case Study:** A case of yellow fever was reported in the Manankoro area, Bougouni health district, Sikasso region, in December 2019.

**Analysis:** Yellow fever is a severe, systemic, viral haemorrhagic fever transmitted by mosquitoes. The case was confirmed through laboratory diagnosis, indicating the need for enhanced surveillance and control measures in the region.

**Recommendations:** Improved surveillance systems, rapid case diagnosis, and enhanced vaccination campaigns are recommended to prevent future outbreaks.

**Young Professional Development Society Nepal, Nepal**

**Background:** Tuberculosis (TB) is a major public health problem in Nepal. It is a cause of ill-health, one of the top ten causes of death, and leads to death from single infectious agent. Government of Nepal has put TB as a priority program and is committed to eliminate TB. The aim of the study was to describe the problem of TB epidemic in Nepal.

**Methods:** Different literatures, reports, policy documents and guidelines were reviewed and the Results were presented through descriptive analysis.

**Results:** In 2018/19, Nepal conducted the first National TB Prevalence survey, which showed higher prevalence, incidence and mortality of TB than the previous estimations. The TB prevalence was estimated to be 416/100000 with an estimated of 69000 cases. The mortality was also found to be 3.1 times higher than the previous estimates. In the year 2020/21, National TB Programme (NTP) registered 28,677 (38% females and 62% males) cases with nearly 58% missing cases than the projected cases showing higher incidence notification gap. The missing cases were higher among elderly due to challenges in access to health care services. Of the registered cases, the proportion of childhood TB was found to be 6.6% which was low suggesting existence of high TB transmission and requiring early diagnosis and treatment of childhood TB. The case notification rate (CNR) was 95 per 100000 population and 9 districts were considered to be high TB burden districts based on the CNR. Conclusions: There exists a huge gap between the estimated and notified cases. NTP must work to reduce the gap and identify the missing cases through accountable, equitable, quality, universally accessible and patient centered care and services.

**Knowledge of Monkeypox among medical students in the Eastern Mediterranean Region**
Assem Gebreal,1 Samir EI Hafeez,2 Shaimaa Abdelmoneim,3 Ramy Ghazy4
1Faculty of Medicine, Alexandria University, Egypt, 2Epidemiology Department, High Institute of Public Health, Alexandria University Egypt, Egypt, 3Alexandra Clinical Research Administration, Alexandria University, Egypt, 4Tropical Health Department, High Institute of Public Health, Alexandria University, Egypt

**Background:** During 2022, cases of monkeypox were reported globally, with the first case reported in the United States in May 2022. In the Eastern Mediterranean Region, knowledge among medical students about monkeypox is crucial for effective case management.

**Aim:** This study aimed to assess the knowledge of monkeypox among medical students recruited from the Eastern Mediterranean Region.

**Methods:** A cross-sectional study was performed between August-October, 2022. Data was collected through an online predesigned questionnaire that was distributed via social media. The questionnaire consists of two sections: the first is on the sociodemographic characteristics (gender, age, educational year), and the second section included 30 items to assess the knowledge on monkeypox. For analysis, descriptive statistics were performed.

**Results:** A total of 1,740 medical students participated in the study. The mean age of the participants was 21 years, 63% were females, and 47% of them were in the fifth and fourth-year. Only 10% received a training program on human monkeypox. The findings from this study showed that the majority of participants (84.8% (73.8%)) had a moderate level of knowledge regarding monkeypox, 6% (7.2%) had poor knowledge, and 6% (5.5%) had high knowledge. Almost one-third (32%) had knowledge of the availability of the licensed monkeypox vaccine. There was no significant association between knowledge and education year, country of residence, or area of residence (urban/rural) (p > 0.23), (p = 0.92), (p = 0.07) respectively.

**Conclusions:** The study emphasized that knowledge towards human monkeypox epidemic represents a public health emergency. In epidemics, medical students act as alert and reliable public information sources. This study aimed to assess knowledge of Monkeypox among medical students recruited from the Eastern Mediterranean Region.

Ministry of Health and Social Development of Mali, Mali
Introduction: Following the confirmation of two (2) cases in the health district of Bougouni on 03/12/2019. We conducted an investigation whose objective was to describe the cases of yellow fever in the Manankoro health area in time, place and people and to put in place control and prevention measures against the epidemic. Methodology: We conducted a cross-sectional descriptive study in December 2019, a case of yellow fever was any person who stayed in Manankoro or surrounding village between October 20 to December 05, 2019 and who presented during this period the following signs: Fever or notion of fever in the previous days and jaundice in the 2 weeks following the onset of the signs. We conducted a search for other unreported cases based on data collected using a questionnaire. The data was analyzed in time, place and person.
Results: Case confirmed by the laboratory, this is a 25-year-old adult, farmer, male gender, residence Kémingouara / Republic of Côte d’Ivoire, came on November 06, 2019 for consultation at the Laфи cabinet in Manankoro in a table of coma and referred to the CSRéf of Bougouni for better care where he died 11 hours after his blood sample on 08/11/2019. Conclusions: The investigation made it possible to identify 12 additional cases among which 3 cases of death, the age group of 30 to 34 years was the most represented, that is to say 33%. The male sex was predominant with 10 cases. Fever, jaundice and vomiting were the most frequent symptoms. The Aedes species responsible for yellow fever was not found during this investigation.

Role of genetic variability in Toll-like receptors (TLR2, TLR4 and TLR9) in HIV-1 disease progression
Gaurav Kaushik1, Richa Vashishtha2
1Department of Allied Health Sciences, Sharda University, India, 2All India Institute of Medical Sciences (AIIMS) New Delhi, Rajnagar, India
Background: It has been demonstrated that TLR2, TLR4 and TLR9 which were initially known for recognizing bacterial product are involved in detection of viral components. It was planned to undertake a prospective longitudinal study among ethnically homogenous ART and ATT naïve HIV-positive patients representing the north Indian population. The aim of the study was to investigate the influence of TLR2, TLR4 and TLR9 polymorphism in HIV disease progression. Methods: Present study was designed to investigate genetic polymorphism in TLR2 (TLR2, TLR4 and TLR9) among HIV-infected patients with and without TB co-infection. The study population consisted of two groups (i) HIV-positive patients without TB infection and disease (n=223, HIV+ patients); (ii) HIV-positive patients with latent tuberculosis infection (n=150, HIV+LTBI patients). These subjects were of either gender between 18-60 year of age and treatment naive for both TB and HIV. HIV+ and HIV+LTBI patients were longitudinally follow-up for the period of two years to study HIV disease progression.
Results: On comparing TLR2 and TLR4 allelic and genotypic frequencies between 306 HIV+ patients (no TB/ AIDS) and 47 HIV+ patients progressed to active TB/ AIDS, no significant difference was observed between two groups. The frequency of A allele in TLR9 was found to be significantly increased in 47 HIV+ patients who progressed to active TB/AIDS (61.7%) as compared to 42.1% in 306 HIV+ patients (no TB/ AIDS), (p<0.001). Also, a significant increased frequency of AA genotype in TLR9 was observed in 47 HIV+ patients progressed to active TB/AIDS (55.32%) as compared to 20.26% in HIV+ patients (no TB/ AIDS). Conclusions: Findings of the present study revealed that genetic variability in TLR9 may influence the HIV disease progression. The AA genotype in TLR9 may be associated with progression to TB/AIDS during 2-year time period in HIV+ patients.

Demographic and housing factors in Lassa fever transmission in a high disease burden State in Nigeria
Alphonse Aigbiremolen1, Tat examining factors related to Lassa fever transmission in Edo State, Nigeria. Methods: This was a cross-sectional study in which a sample of 336 adults was drawn from 6 Local Government Areas (LGAs) in the state using multi-stage sampling technique. A questionnaire was used to obtain information from respondents. Analysis of data was done using SPSS version 25 and relationship between demographic and housing characteristics and transmission of Lassa fever were tested with Chi square and multi-nominal logistic regression.
Results: Majority of respondents (76.5%) lived in rural areas. More than two-thirds (69.9%) resided in brick houses, 54.8% reported presence of rodent entry points in their houses, and more than one-third were observed to have bushy or littered house surroundings. Urban residence, ethnicity, and poor housing were significantly associated with high Lassa fever transmission (X2=54.490, p<0.001; X2=66.648, p<0.001; X2=25.435, p<0.001 respectively). Rural residence increased the odds of low transmission by 6.991 times (B=1.945, 95% CI: 3.580-13.651).
Conclusions: There is a significant relationship between some demographic and housing characteristics with transmission of Lassa fever. Effective and sustainable control strategies for the deadly disease require strong consideration of these factors. Keywords: Lassa fever, demographic factors, housing, Edo State

The case for collecting, analysing, and utilizing sex-disaggregated data and gendered information to inform outbreak responses, a systematic review of the literature 2012-2022
Emelie Phillips1, McKenzie Gales2, Shirin Heidari3, Leah Pao4, Marie-Amélie Degail2, Christine Dubrey1, Clara Ribas1, Marie Meudec5, M. Siddiqui1, Simone Carter6
1Epicentre, Lyon, 2Centers for Disease Control, United States, 3GENDRO, Switzerland, 4World Health Organisation, Switzerland, 5Institute of Tropical Medicine Antwerp, Belgium, 6UNICEF, United Kingdom, 7UNICEF, Democratic Republic of Congo
Introduction: Understanding sex-related differences and gendered roles in outbreak dynamics is critical to deliver an effective response. We examined the extent to which sex-disaggregated data and gendered data for outbreak analytics and responses are collected, analyzed, and utilized in low-and middle-income countries (LMIC).
Methods: A systematic literature review was conducted. Five databases were searched for peer-reviewed literature examining sex- and gender-specific outcomes for communicable disease outbreaks, published in English between January 1, 2012, and April 12, 2022. Results were independently screened, and all articles meeting the inclusion criteria were included in the review.
Findings: A total of 71 out of 15,601 screened articles were included in the analysis. The literature describes sex- and gender-related differences in outbreak susceptibility, risk of exposure, symptoms, severity of illness, healthcare-seeking behavior, and access to treatment and support services. Findings varied by disease, setting, and population. Gaps in the analysis and use of sex-disaggregated data and gendered data in outbreak response were identified. The analysis showed that identified sex and gender-related differences were not systematically utilized to address sex and gender-related barriers to health, implement sex and gender-specific prevention messaging, and adapt disease detection and treatment across all aspects of the outbreak response.
Conclusions: Despite existing recommendations and minimum requirements, collection, analysis, and use of sex-disaggregated data and gendered data, including operational analytics, are seldom included in outbreak response. Over sex data is often collected during outbreaks in LMIC, few publications disaggregated outcomes by sex or discussed gendered roles in outbreak dynamics, and even fewer examined the implications of the observed differential outcomes. Mounting evidence calls for an approach to outbreak prevention, detection, response, and recovery that includes sex and gender specificities. Context-specific guidance for the systematic collection, analysis, and utilization of sex-disaggregated data and gender data is urgently needed.

Screening campaign for the elimination of the Hepatitis C virus in the generic risk population born between 1969 and 1989 in an Italian Local Health Authority - preliminary data
Background and Objective: Chronic infection caused by the hepatitis C virus (HCV) represent the main causes of morbidity and mortality related to liver disease. An estimated 3.9 million individuals are chronically infected with HCV in EU/EEA countries. In Lazio it’s estimated about 53000 patients with chronic active HCV infection who have not yet been treated with antiviral therapy. The purpose of this free screening, promoted by the Ministry of Health and launched also in the Lazio Region, is to identify, among the subjects enrolled in our Local Health Authority of Frosinone (ASL), the positivity to HCV antibodies (HCVAb) and reflex testing for HCV RNA by serological testing, for start them the assessment to free specific treatment.

Methods: In our ASL, this screening started on 4 Oct 22 and will end on 31 Dec 23. The target population is represented by subjects born between 1969 to 1989. Therefore, circa 140000 subjects in the Province of Frosinone are eligible. The team of the HCV screening coordination provide through an active phone-call and by sending an ordinary mail to invite the eligible subjects to participate at the screening, fixing an appointment for the blood test in one of the centers of our ASL, based on the residence; eligible subjects can still self-book on “Salute Lazio”.

Results: The preliminary data as of 2 Dec ‘22, shows that out of n. 570 exams booked in our ASL: n. 384 subjects tested negative for HCV AB; only n.1 subjects tested positive for HCV Ab and negative for HCV RNA. No positive reflex testing for HCV RNA was currently found.

Conclusions: Without an effective hepatitis C vaccine, this screening can detect undiagnosed HCV infections and improve early diagnosis for health care coverage policies and clinical decision making; as well as interrupting the circulation of the virus, preventing new infections.

Private sector care-seeking pathways and delays in TB care in India, Indonesia and Nigeria in times of COVID-19
Charity Oga-Omenka‡, Nathaly Vasquez‡, Angelina Sassi‡, Rishav Das‡, Madhukar Pai‡, Lavanya Huria‡, Bony Lestari‡, Paul Wagner‡
‡University of Waterloo, Canada, ‡McGill University, Canada, ‡McGill University, Canada, ‡McGill International TB Centre, Canada, ‡Department of Epidemiology and Biostatistics, Universitas Padjadjaran, Indonesia

India, Indonesia, and Nigeria have the 1st, 3rd, and 6th highest burden of TB globally. Combined, they accounted for 44% of new cases and 50% of deaths of global total) people with TB that are were not diagnosed in these countries. Combined, they accounted for 44% of new cases and 50% of deaths of global total) people with TB that are were not diagnosed in these countries. Reports also show that COVID-19 pandemic has reversed years of progress in the TB response due to control measures and overwhelmed healthcare systems.

Conclusions: Our analysis shows a growing interest in scientific literature on the topic of CA, led by Europe. In some countries where CA has been identified, no papers have been published. Despite the multidrug-resistance of CA, the topic of therapy is not much debated. Our findings highlight the need to increase focus on CA in order to promote health systems’ preparedness and to properly address the spread of this worrisome pathogen.

Epidemiological and clinical differences of cases of MPOX at the Chilean outbreak
Alejandra Acevedo‡, Marcela Valebenido‡,§
‡Magister en Epidemiologia, Universidad de los Andes, Santiago, Chile, §Departamento de Epidemiologia y Estudios en Salud, Universidad de Los Andes, Clínica Universidad de los Andes, Chile

Background: In the present MPOX outbreak, differences related to clinical and epidemiological features have been observed with respect to historical evidence. In Chile, the first case was reported in June and until now, there are more than 1400 cases. Objective: To identify differences between confirmed and discarded cases of MPOX during 2022 Chilean outbreak. Methods: This is a retrospective case-control study from the Institute of Public Health database from all suspected cases between June 1st and September 30th of 2022. Patient samples were processed by real-time PCR at the same Institute. RStudio and Microsoft Excel were used for statistical analysis. Means, frequencies and percentages were calculated. Fisher’s test was used to compare groups.

Results: We collected 1456 suspected cases. 87% were men between 30-39 years. Positivity increased from 20% at the start to 73% at the peak. 100% had exanthema. The proportion of lymphadenopathy (31% vs 12%), fever (42% vs 29%), myalgia (35% vs 25%), and type of pustule: pustule (36% vs 27%), scab (25% vs 17%) and umbilicated lesion (24% vs 7%) was mayor in positive than negative case (p <0.05). In the confirmed cases, the most frequent site of lesion was genital and anal area, 48% had multiple sexual partners and 14% having had contact with a positive case. 41% have a history of sexually transmitted diseases (HIV=39%). Conclusions: Main differences between confirmed and discarded cases were lesion features and distribution. Principal risk factors were previous contact with another positive case and multiple sexual partners. The current case definition seeks to be highly sensitive to capture the largest number of cases, being strategic at the beginning to detect an outbreak. We postulate that, for sustained epidemiological surveillance, a more specific definition in accordance with findings of current outbreak could be formulated.

Candida auris: a bibliometric analysis of an emerging global health threat
Paolo Ragusa*, Simone Pizzini*, Alessandro Prinzivalli*, Giulia Libero*, Angelina Sassi†, Rishav Das‡, Madhukar Pai‡, Lavanya Huria‡, Bony Lestari‡, Paul Wagner‡
*Department of Public Health Sciences, University of Turin, Italy, †Department of Sciences of Public Health and Pediatrics, University of Turin, Italy, ‡Department of Public Health Sciences, University of Waterloo, Canada, ‡Department of Public Health, University of Turin, Italy, §Health Local Unit ASL T03, Turin, Italy, ‡University of Turin, Department of Public Health Sciences, Italy

Background and Objective: Candida auris (CA) is an emerging fungus identified in 2009 that, given its worldwide spread and unique characteristics, has been classified as an urgent global health threat: it resists to common antifungal drugs and decontamination procedures; identification requires specific tools; transmissibility and mortality are high in healthcare settings, especially for patients in intensive care units. Infection and colonization can be long-lasting, leading to problems in isolation procedures and the risk of outbreaks. This study aims to evaluate publication and citation related metrics, identify major Keywords and topics, and assess geographic distribution of published articles.

Methods: A list of all publications containing “Candida Auris” in all fields was extracted from Web Of Science on date 2022/11/18. Bibliometric analysis was conducted using the bibliometric and bibliography packages on RStudio.

Results: Total publications (TP) were 1234 with an annual growth rate of 51.58%. Only 12.7% of 4859 contributing authors published ≥ 3 articles about CA. Total citations were 26901, with an average of 21.8 citations per paper. The core sources are 9 out of 317, according to Bradford’s law. In only 42 countries where CA was identified, articles on the topic were published (89%). The origin of TP is heterogeneous: 31% Europe, 29% North America, 25% Asia, 8% South America, 4% Africa, 3% Oceania. Trending topics about CA include epidemiology, identification and resistance.

Conclusions: Our analysis shows a growing interest in scientific literature on the topic of CA, led by Europe. In some countries where CA has been identified, no papers have been published. Despite the multidrug-resistance of CA, the topic of therapy is not much debated. Our findings highlight the need to increase focus on CA in order to promote health systems’ preparedness and to properly address the spread of this worrisome pathogen.

Popul. Med. 2023;5(Supplement):A251
DOI: 10.18332/popmed/165477
Methods: We conducted semi-structured in-depth interviews with eight caregivers of childhood TB patients and key informant interviews with 36 healthcare providers from July 2019 to June 2020 from different levels of the TB control program in Kerangani (with high childhood TB cases notification), Faridpur Sadar (with low childhood TB cases notification), and Dhaka city.

Results: There is a dearth of understanding among caregivers about childhood TB. Passive case finding process and focus on cough during community mobilisation contribute to delay in childhood TB identification. The stigmatisation that caregivers anticipate and experience has an impact on their mental health and implies that there are misunderstandings about tuberculosis in the community. Furthermore, diagnostic dilemma among healthcare providers accounts for diagnosis delays. Some, but not all, institutions in different geographical locations provide free diagnostic tests and have GeneXpert devices. Conclusions: Awareness should be raised in the community on childhood TB. The identification and diagnosis mechanism of childhood TB should be strengthened to minimise challenges faced by the caregivers and the healthcare providers so that children with TB can have an early identification, diagnosis, treatment initiation, and successful completion of treatment. Overall, addressing the challenges would lead to better case identification and diagnosis.

Vaccination strategies against seasonal Influenza in long term care setting: lessons from a Mathematical Modelling study
Matteo Ratti1, Diego Concina1, Maurizio Rinaldi1, Ernesto Salinelli1, Agnese Brisco1, Daniela Ferrante1, Alessandro Volpe1, Massimiliano Panella1
1University of Eastern Piedmont, Italy, 2Department of Translational Medicine, University of Eastern Piedmont, Italy, 3Department of Pharmaceutical Science, University of Eastern Piedmont, Italy, 4Department of Studies for Economics and Business, University of Eastern Piedmont, Italy

Background: Despite specific vaccination campaigns, many outbreaks of seasonal influenza like illness (ILI) in long term care (LTC) facilities are occasionally reported. We explored the dynamics of influenza starting from real data collected from a nursing home located in Italy and a mathematical model. Our aim was to identify the best vaccination strategy to minimize cases among the guests. Materials and Methods: The model consists of a classical SEIR part describing the spreading of the influenza in the general population and a stochastic agent based model that formalizes the dynamics of the disease inside the institution. After a model fit of a baseline scenario, we explored the impact of varying the HCW and guests parameters (vaccine uptake and vaccine efficacy) on the guest attack rates (AR) of the nursing home.

Results: The aggregate AR of ILI in the nursing home was 36.4% (ward1 = 56%, ward2 = 33.3%, ward3 = 31.7%, ward4 = 34.5%). The model fit to data returned a probability of infection of the causal contact of 0.3 and of the shift change contact of 0.2. We noticed no decreasing or increasing AR trend when varying the HCW vaccine efficacy and uptake parameter was accompanied by a slight decrease in AR of all the wards of the LTC facility. Conclusions: We can conclude that a nursing home is still an environment at high risk of influenza transmission but the handover situation carry no higher relative risk. Therefore, additional preventive measures in this circumstance may be unnecessary. Finally, in a closed environment such as a LTC facility, the vaccination of guests, rather than HCWs, may still represent the cornerstone of an effective preventive strategy.

Diagnosis and treatment of febrile children in a Ghanaian hospital
Lydia Rautman1, Benno Kreuels2, Gumou Maiga-Ascofare2, Jürgen May2, Ralf Krumkamp2
1Infectious Disease Epidemiology, Bernhard-Nocht Institute for Tropical Medicine, Germany, 2Bernhard-Nocht Institute for Tropical Medicine, Germany

Background and Objective: While a large proportion of fever among children in sub-Saharan Africa is accompanied by malaria, malaria is not always the main cause of fever. In areas of high malaria prevalence, antimarials are frequently over-prescribed. Our objective was to achieve a better understanding of malaria infection dynamics and hospital diagnoses in an area where malaria is highly endemic. Methods: The fever without source study was conducted 2013-2015 at Agogo Presbyterian Hospital (APH) in Agogo, Ghana. Febrile children under 15 admitted to the pediatric ward were recruited to the study. Demographic, clinical, and laboratory data were collected and analyzed descriptively and graphically in r.

Results: A total of 1503 admissions were included in the analysis. Malaria parasites were detected in a majority (59%) of patients but analysis of changes in practitioner diagnoses from admission to discharge revealed that sepsis and malaria were frequently over-diagnosed: almost one-third of malaria and over 80% of sepsis admission diagnoses were not confirmed at discharge. Among children with malaria parasites detected in the blood, 95% received antimarial treatment and 52% received antibiotics. Among those without malaria parasites, 30% were given antimarials and 95% were given antibiotics.

Conclusions: Adherence to World Health Organization guidelines for the management of malaria and clearer diagnostic guidelines for the diagnosis of non-malarial febrile illness are needed. Further development of these guidelines could improve hospital diagnoses, reduce delays in treatment, and minimize unjustified antibiotic prescription.

Toxigenic diphtheria cases in North Queensland, Australia
Allison Hempenstall1, Jay Short1, Valmuy Fisher1, Caroline Taunton1, Annie Preston-Thoms1, Tonza Marquardt1
1Torres and Cape Hospital and Health Service, Australia, 2Townsville Hospital and Health Service, Australia, 3Cairns and Hinterland Hospital and Health Service, Australia

Background and Objective: Diphtheria is predominantly caused by toxigenic Corynebacterium diphtheriae and presents as both respiratory and cutaneous disease. Locally acquired tox-gene-carrying diphtheria is rare in Australia and cases have all but disappeared from the country since the 1950s with widespread uptake of the diphtheria toxoid vaccine. Since 2018, there has been an increase in locally acquired cutaneous and respiratory cases of toxigenic C diphtheriae across North Queensland, Australia with whole genome sequencing of specimens identifying a genetically-linked cluster of cases in the region. Here we present the epidemiology of this outbreak.

Methods: We retrospectively reviewed all notifications of confirmed Corynebacterium diphtheriae cases occurring in the North Queensland region between 2000 and 2022. Demographic, clinical and exposure source details were extracted from Queensland Health's Notifiable Conditions System and laboratory testing results obtained from Queensland Health Forensic and Scientific Services. Data were de-identified and analysed using Microsoft Excel 2021. The Townsville Human Research and Ethics Committee approved the study.

Results: There have been 29 notified cases of genetically linked tox-gene-carrying diphtheria across North Queensland since 2020, 23 of which occurred in 2022. Molecular investigations identified classic respiratory diphtheria, four with mild respiratory diphtheria and 22 with cutaneous diphtheria. All infections were acquired in Australia and all cases had epidemiological links to the North Queensland region. A total of 86% of cases (25/29) identified as Aboriginal and/or Torres Strait Islander people. All cases were managed with penicillin or azithromycin, vaccination, and diphtheria antitoxin (DAT) where appropriate. Households contacts were screened for symptoms, administered chemoprophylaxis, and offered a diphtheria-containing vaccination if due.

Conclusions: This outbreak contributes to the broader global concerns for increasing diphtheria outbreaks. Timely vaccinations in children, adolescents, pregnant women, and eligible older people remain of utmost importance. Australian clinicians and public health professionals should remain vigilant for future cases.

Facilitators and barriers to integrated malaria prevention in Wakiso district, Uganda: a photovoice study
David Musoke1, David Musoke1, Grace Biyinzika Lugeba1, Filimin Niyongobo1, Suzan Nakalawa1, Rhoda Wanyenze1, Moses Kamya2
1Makerere University School of Public Health "New Mulago Hospital Complex P. O. Box 7072, Kampala, Uganda" Uganda, 2Makerere University School of Medicine "New Mulago Hospital Complex P. O. Box 7072, Kampala, Uganda" Uganda

Background and Objective: Malaria continues to cause significant morbidity and mortality particularly in Sub-Saharan Africa. Appropriate combinations of non-chemical and chemical methods of malaria vector control in the context of integrated vector management have been recommended by the World Health Organization. Integrated malaria prevention, which promotes the use of several malaria prevention methods holistically, is being explored. The aim of the study was to explore facilitators and barriers to using integrated malaria prevention in Wakiso district, Uganda
Methods: The qualitative study employed photovoice among 20 community members in Kasanje Town Council, Wakiso District. The photos taken by participants for a period of 5 months using smartphones were discussed monthly with the researchers. The discussions were audio-recorded, and resulting data analysed using thematic analysis with the support of NVivo (2020).

Results: Various conventional and non-conventional measures were being used for preventing malaria such as insecticide treated nets; clearing overgrown vegetation and draining stagnant water near houses; mosquito coils; smoldering of cow dung; spraying insecticides; plant repellents near houses; as well as closing doors and windows on houses early in the evening. Facilitators to using several malaria prevention methods holistically included: low cost and convenience of some methods such as receiving free mosquito nets from the government. Barriers to using several malaria prevention methods holistically included: inadequate knowledge of some methods such as housing improvement; allergic reactions to chemical-based methods such as insecticide treated nets; unaffordability of some methods such as insecticide sprays; and inaccessibility of certain methods such as body repellents.

Conclusion: Several barriers to using integrated malaria prevention were identified. These barriers need to be addressed so as to contribute to malaria prevention efforts in endemic communities.

Outbreak investigation of cholera at district Quetta, Baluchistan 2022
Aabid Khan1, Ehsan Larik1, Rabia Baloch2, Shahkooh Mengal2
1Provincial Health Directorate, Balochistan FELTP Health Department, Balochistan Director General Health Services, Sariab Road Quetta, Pakistan, 2Health Department of Balochistan, Government of Balochistan, Civil Secretariat of Baluchistan, Zargaroon Road Quetta, Pakistan

Introduction: Unusual occurrence of 10 suspected Cholera cases at Pashtoon Bagh Quetta were reported to Provincial Disease Surveillance and Response Unit Quetta on 18th May 2022. FELTP team was deputed to investigate and recommend preventive measures for outbreak.

Methodology: A descriptive followed by matched case control study was conducted to investigate Cholera outbreak at District Quetta. Case was defined as any person living at District Quetta who had suffered 3 or more, loose watery stool in last 24 hours from 18th May to 12th October. We reviewed hospital records and active case finding was conducted through house-to-house survey. Matched for age and sex neighborhood controls were taken with the ratio of 1:1 and interviewed. We collected stools and water samples for microbiological testing. We performed associated risk factor survey. We calculated Odd Ratios (OR) at 95% confidence interval (95% CI). Data was analyzed using Epi Info 7.

Results: We identified 48 positive Cholera cases. There were 28 (58%) hospitalizations. Males (67%) were more affected than females. Median age was 59 years (range: <1-61 years) with highest Attack Rate among <01-to-09-year old’s (54%). Attack rate was 4.1/1,000,000 with 2% mortality rate. Drinking contaminated pipeline water was strongly associated (OR: 12.8, P value <0.5, CI 4.9-33.7) with illness. While drinking Tube well water was protective (OR=0.12, 95%CI=0.05-0.29). The water samples of damaged water pipeline confirmed the faecal contamination and Cholera isolation from 10 samples out of 15. Conclusion: This cholera outbreak was associated with drinking pipeline water likely contaminated after monsoon rains. Outbreak probably resulted from insufficient access to clean water & poor sanitation. A robust surveillance system placed with support of partners. Intersectoral response and WASH cluster activated. We conducted 30 health education sessions. OCV drive conducted based on this study recommendation. We recommended Sustained health education and provision of purified water.

Active provision of influenza vaccination in diabetic individuals aged 18-64 years in ASL Roma 1: experience and evaluation of results in the 2020-2021, 2021-2022 and 2022-2023 influenza vaccine campaigns
Mattia Macino1, Marta Marino2, Marta Marino1, Mattia Macino1, Fabiola Valentini1, Raffaella Mosco1, Sara Ciampini1, Aurora Santagata1, Paolo Maggioni1, Patrizia Cortesi1, Anna Zoppegno1, Lelio Morviducci1, Patrizia Chierchini1, Gennaro D’Agostino1, Antonietta Spadea1
1Azienda Sanitaria Locale Roma 1, Italy

Introduction: The Ministry of Health Circular “Prevention and Control of Influenza: Recommendations for the 2022-2023 Season” recommends influenza vaccination coverage for Health Care Workers of at least 75%, so as to ensure reduction of individual risk of illness, risk of transmission to individuals at high risk of complications/hospitalization, reduction of social costs related to morbidity and mortality and related absenteeism.

Materials and Methods: Informative/training meetings were held at all the corporate Presidia of ASL Roma 1 to raise awareness of influenza vaccination among health care workers, and vaccination was actively offered and on site.

Results: During the 2020-2021 flu season, 18,783 health care workers were vaccinated in our Company out of a total of 50,798 vaccinated in the Lazio region, or 36.9%. Achieved coverage data were compared with those of the three ASLs in the urban area of metropolitan Rome, in which 34,996 workers were vaccinated. In the 2021-2022 flu season, there was a decline in the adherence of all target groups, including health workers: 10,386 vaccinated in our company out of 30,635 workers vaccinated in the region, or 34.56 percent. Following the same comparison with the three metropolitan Rome ASLs, the ratio was 53.3 percent.

Conclusion: It is widely documented that health worker vaccination has multiple values: it reduces the infectious risk of workers, protects patients from infection in care settings, and protects the operation of care services. Therefore, it is a priority to encourage the co-administration of influenza and anti-SARS-CoV-2 vaccination, to encourage vaccination promotion policies aimed at increasing awareness of the risks associated with the disease, and to promote on-site vaccination, training and information events of health care workers by validating the 5 C model (Convincing, Constraints, Complementary, Calculation and Collective responsibility).

Prevalence of hepatitis C virus among hemodialysis facilities: a national screening study in all HF from Mars 2021 to November 2022. Hemodialysis patients more than 18 years of age, were enrolled in this study. All samples were screened for HCV antibody by Enzyme linked immunosorbant assay (ELISA) and HCV RNA by Polymerase chain reaction (PCR). Results: A total of 11653 patients (mean age 56.8 years) from 187 HF were enrolled among them 9985 patients completed HCV screening (86.3%). The overall prevalence of HCV antibody was 3.2%, ranging from 0% to 27.9%; 0% in 56 centers, 0.1 to 5% in 88 centers and more than 5% in 36 centers. The prevalence was 3.5% among Female and 3% among male. The mean age of positive patient was 57.3 years. Only 28.1% of HCV antibody positive patients were positive for HCV RNA by PCR.

Conclusion: Early detection of new HCV infection, the prevention of the infection transmission by the application of universal hygienic precautions program and the treatment of all screened patients are needed to achieve the objective of HCV elimination in Tunisia.

Determining levels of knowledge, worry, anxiety and intention to get vaccinated during the recent monkeypox outbreak: a cross-sectional study from the United Arab Emirates (UAE)

Basema Saddik1, Rouba Zedan1, Ankita Shukla2, Amal Hussein1, Hamzah AlZubaidi1, Mohammad-Hani Temsah1, Mohamed Alhajaj1, Najaa Al-Bliw1, Manal Awad1, Hawra Alsayed1, Narjes Sharif-Araki1, Zahraa AlHano1, Qutayba Hamid1, Rabih Halwani2

1University of Sharjah, Department of Family and Community Medicine; Sharjah Institute of Medical Research; University of New South Wales-School of Population Health, United Arab Emirates, 2University of Sharjah, 3King Saud University, Saudi Arabia, 4Dubai Health Authority, United Arab Emirates

Background: Monkeypox cases increased in non-endemic countries in May 2022, raising global concerns. Past outbreaks of infectious diseases, including COVID-19, have been associated with several psychosocial effects due to a lack of knowledge and the rapid spread of misinformation and fear. In this study, we examined knowledge, worry, and anxiety levels among the general population about monkeypox, as well as their willingness to receive a vaccine.

Methods: An online cross-sectional survey of adults in the UAE was conducted in June 2022. Information on monkeypox-related beliefs, perceived risks, knowledge, worry, anxiety, previous COVID-19 infection and vaccination status, and willingness to receive a vaccine for monkeypox was collected. Bivariate and logistic regression analysis determined associations and predictors between dependent and outcome variables.

Results: A total of 959 participants were included in the analysis. A median knowledge score (of 12/19) indicated suboptimal knowledge. Only a quarter of participants believed they were at high risk of monkeypox infection; however, 46% believed that infection would have a significant impact on their health, and 57% believed that fear of monkeypox in the community was justified. Knowledge scores were higher among women, healthcare workers, and those whose sources of information were considered reliable. Perceived high risk of infection, changes in precautionary measures, and belief that treatment would be difficult predicted higher levels of worry and anxiety among participants. Participants with higher levels of worry and who had received two or more doses of the COVID-19 vaccine were more likely to take a vaccine once it became available.

Conclusion: These findings demonstrate low levels of knowledge and high levels of worry and anxiety among the UAE population and highlight the need for raising public awareness regarding monkeypox and future outbreaks. Additionally, these findings will inform policymakers and health regulators on the promotion of vaccination campaigns.

Prevalence of hepatitis C virus among hemodialysis facilities: national screening study in Tunisia, 2021–2022

Background and Objective: Hemodialysis Facilities (HF) are high-risk environments for the spread of Hepatitis C Virus (HCV). This study aimed to detect HCV in hemodialysis patients as part of the National Plan for the Elimination of VHC in Tunisia.

Methods: We conducted a national screening study in all HF from Mars 2021 to November 2022. Hemodialysis patients more than 18 years of age, were enrolled in this study. All samples were screened for HCV antibody by Enzyme linked immunosorbant assay (ELISA) and HCV RNA by Polymerase chain reaction (PCR). Results: A total of 11653 patients (mean age 56.8 years) from 187 HF were enrolled among them 9985 patients completed HCV screening (86.3%). The overall prevalence of HCV antibody was 3.2%, ranging from 0% to 27.9%; 0% in 56 centers, 0.1 to 5% in 88 centers and more than 5% in 36 centers. The prevalence was 3.5% among Female and 3% among male. The mean age of positive patient was 57.3 years. Only 28.1% of HCV antibody positive patients were positive for HCV RNA by PCR.

Conclusion: Early detection of new HCV infection, the prevention of the infection transmission by the application of universal hygienic precautions program and the treatment of all screened patients are needed to achieve the objective of HCV elimination in Tunisia.
The effect of a conditional cash transfer program on AIDS morbidity and mortality among the poorest: a quasi-experimental study of a cohort of 22.7 million Brazilian

Davide Rasella1, Andréa Silva1, Ines Dourado1, Icema Lu3, Gabriela Jesus2, Nathalia Guimaraes3, Gabriel Morais4, Rodrigo Andrade4, Julia Pescarini5, Daiane Machado5, Maria Ichihara5, Mauricio Barreto5, Liao Magno5, Luis Souza6, James Macinko7, Davide Rasella1

Results: Totally 77 VL cases were recorded during 2018-2022 of whom 48 (62%) were males. More than half of 45 (58%) were in age group of 1-3 years while 3 (4%) were in age group of 10-13 years. Geographically, 28 (36%) were reported from Faryab followed by Baghlan 9 (12%) compared to Ghazni 1 (1.2%). Four (5%) and 7 (9%) cases reported family member with cutaneous leishmaniasis VL respectively. Fever 75 (97%), splenomegaly 71 (92%) and weight loss 26 (34%) were common clinical manifestations. Upon follow-up, 42 out of 77 total cases responded of whom 31 (74%) were cured and 11 (26%) had died. Apparently, 22 (85%) cases were cured compared to 9 (56%) with late diagnosis.

Conclusion: Most of the cases were recorded from northern region with high burden in males. Splenomegaly was a prominent clinical feature. Early diagnosis had good outcome compared to late diagnosis. Further study is required to identify the risk factors. Additionally, access to diagnosis is recommended for the betterment of outcome.

Popul. Med. 2023;5(Supplement):A265
DOI: 10.18332/popmed/163864

Networking of public health and clinical laboratories: a successful strategy to uncover promptly two enterovirus D68 outbreaks in Lombardy region (northern Italy), July 2021- November 2022

Laura Pellegrinelli1, Federica Giardina2, Sara Uceda Renteria3, Ferruccio Ceriotti4, Arlimda Seiti5, Guglielmo Ferrari2, Cristina Galli1, Claudio Farina1, Marco Arrosio1, Fabio Sargad1, Diana Fant1, Federica Novazzi2, Sergio Ivan Malandrin2, Anna Polaccca Callegaro3, Danilo Cereda4, Sandro Binda5, Antonio Piralla1, Fausto Baldanti1, Elena Pariani1
1Department of Biomedical Sciences for Health, University of Milan, Italy; 2Microbiology and Virology Department, Fondazione IRCCS Policlinico San Matteo, Pavia, Italy; 3Department of Health Policy and Management and Community Health Sciences, UCLA Fielding School of Public Health, Los Angeles, California, USA.; 4United States.

Background and Objective: Poverty is a risk factor for HIV/AIDS but previous studies on the impact of conditional cash transfer programs (CCT) have shown inconsistent results. We evaluated the effects of one of the world’s largest CCTs, the Programa Bolsa Familia (PBF), on all sequential AIDS outcomes, using data from a nationwide cohort of the poorest Brazilian people on the Unified Registry for Social Programs (Cadastro Único).

Methods: We analyzed a cohort of 22.7 million low-income Brazilian people for the period between 2007 and 2015, comparing PBF beneficiaries and non-beneficiaries, using a quasi-experimental impact evaluation design. We used inverse probability of treatment weighting (IPTW) to adjust for selection into receipt of BFP benefits and then fitted multivariable Poisson regressions, adjusted for all relevant socioeconomic and demographic confounding variables, to estimate the effect of PBF on AIDS incidence, mortality, and case-fatality rates. We also performed subgroup analyses.

Results: Exposure to PBF was associated with a lower incidence of AIDS (RR: 0.59; 95% CI: 0.57-0.61), mortality (RR: 0.61; 95% CI: 0.57-0.64) and case-fatality rates (RR: 0.75; 95% CI: 0.66-0.85). PBF associations were significantly stronger among individuals living in extreme poverty, in comparison with those experiencing poverty (RR0.53 versus RR0.84 for incidence; RR0.54 versus RR0.90 for mortality, and RR0.72 versus RR1.00 for case-fatality). PBF impact was also stronger among females and adolescents.

Conclusions: Conditional cash transfers could significantly reduce AIDS morbidity and mortality, especially in extremely poor populations. During the current dramatic rise in global poverty, due to the COVID-19 pandemic, CCT investments could protect against potential increases in the HIV/AIDS burden, and contribute towards achieving AIDS-related Sustainable Development Goals (SDGs). (Funded by the National Institute of Allergy and Infectious Diseases - NAIDS/NIH, Grant Number: 1R01AI1529383).

Respiratory Syncytial Virus: a preliminary analysis of epidemiological data in Verona University Hospital
Nicola Soriolo¹, Diana Dalla Valle¹, Adele Olivieri¹, Silvia Colpo¹, Francesco Zunino², Francesca Moretti², Stefano Tardivo³
¹University of Verona, Italy

Background and Objectives: In the United States (US), an unexpected wave of Respiratory Syncytial Virus (RSV) has hit pediatric wards in 2022. In November 2022, a seasonal increase in RSV cases was also observed in Europe. The present work is a preliminary analysis on the epidemiology of RSV, using data from the Integrated University Hospital of Verona (AOUI VR). We compared the epidemic curve in the 2022-2023 season with the previous ones. Furthermore, the temporal trend will be compared with the current primary epidemiological data (European Centre for Disease Control ECDC and Centre for Disease Control CDC).

Methods: Data about number of RSV-positive patients were collected via Hospital Discharge Forms of AOUI VR (CD9-CM diagnosis codes: 079 6, 480 1, and 466 11). We analyzed seasons from 2018-2019 to 2022-2023, with specific focus on the 0-4 age group. ECDCs Atlas platform and CDCs RSV-NET interactive dashboard were compared.

Results: In 2018-2019 and 2019-2020, the trend of the AOUI RSV remained similar over time: an abrupt start of the epidemic was observed in December, followed by a peak of about 40 monthly hospitalized cases in January and a significant decline in March. Conversely, in 2020-2021, no RSV cases were hospitalized in AOUI. The epidemic resumed in the 2021-2022 season, starting in October, peaking in November and ending in January. In contrast, the first cases of the 2022-2023 season were already detected in September, without any significant increase (<5 new cases monthly) until now. Data collection is in progress.

Conclusions: Although the RSV epidemic season is still ongoing, differences between 2018-2023 AOUI data and the epidemic trend in the US are detectable. Given these preliminary results, an increased focus on acquiring additional data through a dedicated national surveillance network could significantly improve RSV epidemiological management.

Tuberculosis in the Local Health Authority (LHA) of Cagliari: study of epidemiology for a qualitative approach to the prospects of improvement in public health management
Wisam Salameh¹, Alberto Lai¹, Maria Zedda¹, Serenella Secci², Federica Schirru², Alessia Raggio², Martina Lalli², Alessandra Murria²
¹University of Cagliari Italy, ²ASL Cagliari Italy

Materials and methods
An anonymized database of TB cases was created. The cases were reported through the notification forms and received by the LHA of Cagliari from 2017 to 2021, carrying out a descriptive statistical analysis of the data.

Results: 307 notification forms were received (average incidence of confirmed cases 2.44/100,000 inhabitants per year) with an average age of 45, male prevalence and Italian citizenship over foreign citizenship. The median between the day of onset of symptoms and the start of therapy is 47 days: it is higher in those born in Italy than in those born abroad (67 days vs 27 days). In most cases, no treatment monitoring report was received from the physician.

Conclusions. The epidemiological study on the spread of Tuberculosis, particularly among the categories at risk, is one of the LHA’s priorities. The diagnostic delay, particularly for those born in Italy, presents a data higher than the Italian average and the target value set by international organizations: the LHA of Cagliari intends to propose a study with a qualitative approach on the attitudes and knowledge of general practitioners in order to organize a training course aimed at the needs identified. The lack of data on the outcome of the treatment underlines the need to share a health care procedure with an ad hoc public health measure.

Reporting trends of measles cases in Italy, January 2013 to November 2022, and progress towards elimination
Martina Manso¹, Antonietta Filia², Maria Rota¹, Antonino Bella²
¹Istituto Superiore di Sanità Italy, ²Istituto Superiore di SanitàItaly

Background and Objectives: measles is a vaccine-preventable contagious acute viral illness targeted for elimination in all six WHO Regions. Elimination requires high two-dose vaccination coverage in the population. In Italy, vaccination uptake in 2021 was 93.8% among two-year-old children (one dose) and 85.6% for two doses at 5-6 years. Measles cases are reported to the national integrated measles and rubella surveillance system, implemented in 2013 and coordinated by the National Health Institute. The aim of this study is to describe measles epidemiology in Italy in the last decade.

Methods: We analyzed reporting trends in measles cases with symptom onset during January 2013 to November 2022.

Results: During 1 January 2013 to 30 November 2022, 14,913 measles cases were reported to the Italian national integrated measles and rubella surveillance system, of which 2,270 in 2013, 1,695 in 2014, 256 in 2015, 862 in 2016, 5,397 in 2017, 2,683 in 2018, 1,622 in 1,052019, 2020, 8 in 2021 and 15 in 2022. Epidemic peaks of over 300 cases occurred in the months of June 2013 and January 2014, March 2017 (973 cases), April 2018 (495 cases) and April 2019 (309 cases) From May to December 2019 there was a progressive decrease in the number of reported cases but an increasing trend was observed in the first months of 2020, followed by a drastic decline during the COVID-19 pandemic (range 0-4 monthly cases from April 2020 to November 2022). Overall, 74% of reported cases were laboratory confirmed, 13% of cases were probable cases and 13% were classified as a possible cases.

Conclusion: Widespread circulation of measles occurred in Italy during 2017 to 2019, as in other EU/EEA countries. This was followed by an abrupt decrease in the number of reported cases since April 2020. Measles vaccination coverage remains suboptimal.

An unusual outbreak of acute infectious gastroenteritis
Fionn Donnelly¹, Eimear Burke²
¹Department of Public Health, South East St Canice’s Hospital Lacken Co. Kilkenny Ireland, ²Department of Public Health, South East

Introduction: We present the case of a large outbreak of gastroenteritis with a food and beverage premises as the source. This outbreak had more than 100 suspected cases although only a sample of these were tested and interviewed by Public Health.

Case description
This investigation was prompted by several complaints of acute gastrointestinal illness made by members of the public to the Environmental Health service and the Food Safety Authority of Ireland. All complaints had a common exposure history and the majority had symptoms which developed within 48 hours of being in the premises. Initial investigations identified contaminated water and ice as the likely source of infection and a further rapid case/control study confirmed this.
The premises were fully inspected by the local council and Environmental Health officers and the water supply was found to have extremely high levels of bacterial contamination. This was despite the fact that the water supply to the premises came from the local mains water supply and not from a private well. The premises in question did have a private well but water from this was only used for watering plants and washing outdoor equipment according to the business operator. Of the stool samples tested from affected patrons, five were positive for Norovirus, and none had evidence of bacterial infection.

Discussion

This outbreak presented a particular challenge to the Health Protection team as due to the scale of the outbreak it was impossible to interview and test all of those affected. In addition, despite only isolating Norovirus from the stool samples, it seems improbable that the levels of bacterial contamination seen in the water samples would not have been responsible for much of the illness caused.

Methods: We searched literature for references to existing digital platforms and consulted colleagues and authorities in Europe about their experiences. We solicited legal and technical advice, and drew on experiences from the COVID-19 pandemic.

Results: The use of a digital expert clinical support service remains challenging with respect to availability of technical solutions, legislation, and funding. A digital platform should feature facilities for clinical consultations and information sharing. Work package (WP) 10 of the EU Joint Action SHARP addresses case management and infection prevention and control in response to high consequence infectious diseases (HCIDs). Among the WP activities, a feasibility study of an expert consultation platform for HCIDs is ongoing. Here we report our preliminary results.

Methods: We searched literature for references to existing digital platforms and consulted colleagues and authorities in Europe about their experiences. We solicited legal and technical advice, and drew on experiences from the COVID-19 pandemic.

Conclusion: There is a need for a formal network of European clinicians with expertise in HCIDs, a need for a digital platform meeting defined technical and legal criteria, and a need for long-term funding. One solution could be to establish a new clinical network for HCIDs within the ERN.

The implementation of the international health regulations on vector-borne diseases - a scoping review of the qualitative evidence performed worldwide

Background and objective: The implementation and operationalization of measures at a continental and national level to prevent the spread of vector-borne diseases. The 196 signatory countries are bound by this international agreement. In this article we performed a review of the literature on the implementation and operationalization of measures at a continental and national level to prevent the spread of vector-borne diseases. The purpose was to understand the main strategies and policies adopted and how they have been operating.

Methods: Out of an initial search on PubMed®, SCOPUS® and Web of Science® using combinations of “International Health Regulations” and “vector-borne diseases”, 75 references were obtained, of which 27 were included after careful qualitative analysis.

Results: Included articles ranged from 1996 to 2022. Four major categories of measures were found: a) Surveillance and Epidemic intelligence; b) Declaration of Public Health Emergency of International Concern; c) Measures in Points of Entry; and d) Vaccination status. Implemented measures were found in all continents: Africa, Oceania (Australia), Asia (China, India, Taiwan), Europe (Ireland, Netherlands and Mediterranean countries) and North (USA) and South America (Brazil). Yellow fever, Zika, Dengue and Chikungunya were the most cited vector-borne diseases but Crimean Congo haemorraghic fever, Japanese encephalitis, Lyme disease, Malaria, Leishmanias, Tick-borne encephalitis and West Nile fever were also mentioned.

Conclusion: There are severe asymmetries across countries on the implementation of international regulations with regards to vector-borne diseases, particularly on the issue of surveillance systems. State Parties should consider the lessons learned from the pandemic and perfect their core capacities to prevent future outbreaks of infectious diseases.

Multi-country Viral Hepatitis COMmunity Screening, Vaccination, and Care (VH-COMSAVAC): Project outline

17th WORLD CONGRESS ON PUBLIC HEALTH
Background and objective: In June 2022, the first case of Monkeypox (MPXV) was recorded in the province of Padua. The behavioral and clinical characteristics of MPXV cases obtained through epidemiological investigations and contact tracing performed by the Public Health Hygiene Service (SISP) of the Health Local Unit Eupanea are described.

Methods: In the observational study, cases with PCR confirmation and contacts identified between 6th June and 19th September 2022 have been considered. Results: Monkeypox virus infection was confirmed in 26 individuals, 92% of them were identified as men who have sex with men (MSM). The mean age was 37 years. The estimated incubation period was 8 days (95% CI:7-10). 5 cases was epidemiologically linked to case 0 (excluded from the study), a Spanish tourist. 5 cases were imported from Spain or UK. 15 patients (55%) were autonchous, but only 4 with epidemiological link. 13 patients (50%) the index case through dating apps, 6 in MSM clubs. 77% of patients (n.20) declared multiple/anonymous sexual activity, of these the mean of high-risk contacts per patient is 0.45. Prodromal symptoms were detected in 50% of cases. All cases (n.26) presented skin lesions, of which 92% anogenital and 50% hand/forearm. Lymphadenopathy was detected in 92% of cases. The mean time between the first symptoms and the diagnostic confirmation was 6 days (95% CI:4-7), the recovery was 21 days (95% CI: 17-26).

Conclusion: The MPXV outbreak in the Padua MSM community reflected the international epidemiology. The high proportion of anogenital lesions confirm the sexual activity, of these the mean of high-risk contacts per patient is 0.45. Prodromal symptoms were detected in 50% of cases. All cases (n.26) presented skin lesions, of which 92% anogenital and 50% hand/forearm. Lymphadenopathy was detected in 92% of cases. The mean time between the first symptoms and the diagnostic confirmation was 6 days (95% CI:4-7), the recovery was 21 days (95% CI: 17-26).

Impact of a conditional cash transfer program on tuberculosis incidence, mortality, and case fatality-rate in a cohort of 53 million individuals

Davide Rasella1, Gabriela Jesus2, Andrea Silva3, Priscilla Sacff2, Iraemca Lua2
1Federal University Bahia Italy, 2Federal University Bahia Brazil

Background objective: Tuberculosis (TB) is considered a disease related to poverty, in fact, a higher burden of TB is often observed in populations with low socioeconomic status. During the current COVID-19 pandemic, a substantial increase in the global TB burden, caused by disruption of TB health services and increased poverty, has been predicted. Therefore, social interventions such as conditional cash transfers (CCT) can be effective in mitigating the effect of the pandemic on TB. We estimated the effect of PBF on TB incidence, mortality, and case fatality rate using a national cohort of 53 million individuals.

Methods: We analyzed individuals who entered the Cohort of 100 Million Brazilians between 2004-2015 and compared BPF beneficiaries and non-beneficiaries. We used multivariate Poisson regressions, adjusted for all relevant demographic and socioeconomic variables, and weighted with inverse probability of treatment weight (IPTW). We also perform a wide range of stratifications and sensitivity analyses.

Results: Exposure to PBF was associated with lower rates of TB incidence (RR:0.59, 95% CI: 0.58-0.60) and mortality rates (RR:0.69, 95% CI:0.65 -0.73), was positively associated with a decrease in TB case fatality rates – although not statistically significant. Individuals living in extreme poverty had a greater impact of the PBF compared to less poor, (RR:0.49 versus RR:0.95 for incidence; RR:0.60 versus RR:1.00 for mortality and RR:0.80 versus RR:0.92 for fatality rate). CCT can significantly reduce tuberculosis incidence and mortality, especially in extremely poor populations, by decreasing the unequal distribution of the TB burden in the most vulnerable populations, essential at this time with the dramatic increase in global poverty due to the COVID-19 pandemic, therefore, such a strategy can help protect against increases in the incidence of TB worldwide and contribute to achieving the goals of the "End TB Strategy".
Gold miners shootup malaria transmission in indigenous areas of roraima, brazil

Epilepsy and factors associated with COVID-19 deaths in hospitalized patients between March 2020 and March 2021 in Morocco Taza province case: Case control study

Benassam Samira1
1Delegation of Public Health, FETP Morocco, Morocco

Introduction: Coronavirus disease (COVID-19) occurred for the first time in China in December 2019, particularly in the Wuhan city, then, it has spread rapidly around the world. To refine surveillance recommendations for this disease, this study was conducted to identify risk factors associated with deaths among COVID-19 patients in Taza Moroccan province between March 2020 and March 2021.

Methods: This is a retrospective case-control study among patients with coronavirus infection and hospitalized at the Ibn BAJA provincial hospital in Taza from March 2020 to March 2021. The cases are patients who died. Three controls from the same cohort, hospitalized at the same time but declared cured on discharge, were matched to each case. Data analysis was performed using Epi-Info version 7 software. The analysis of the association was carried out by the statistical tests.

Results: This study included 94 cases and 282 controls. The mean age of cases and controls was 65 years (SD=11), the sex ratio M/F was 2.9 and 1.31 respectively in cases and controls. Others factors such as older age (AOR=2.44 95%CI[1.28-4.66], male sex (AOR=2.91), lung injury greater than 70% on admission (AOR=5.26, 95%CI[2.71-10.2]), time between onset of illness and hospitalization greater than 7 days (AOR=4.47, 95%CI[2.25-8.91]), the cardiac pathologies (AOR=4.41, 95%CI[1.85-10.6]), the blood sugar greater than 2g/l on admission (AOR=3.10, 95%CI[4.3-6.7]), were significantly associated with the death.

Conclusions: This study provides a comprehensive overview of the profile of COVID-19 hospitalized patients in Taza province and mortality risk factors.

Epidemiology of and factors associated with Chlamydia trachomatis in fertility treatment-seeking patients in the Abu Dhabi Emirate, United Arab Emirates

Rami Al-Rifai1
1Institute of Public Health, College of Medicine and Health Sciences, United Arab Emirates University, Al Ain, United Arab Emirates

Background and Objectives: The burden of infection with C. trachomatis in fertility treatment-seeking patients in the United Arab Emirates (UAE) is still unclear. This study measures the seroepidemiology of C. trachomatis and investigates factors associated with seropositivity to C. trachomatis in fertility treatment-seeking patients in Abu Dhabi Emirate, UAE. Methods: A consecutive sample of fertility treatment-seeking patients completed a self-administered questionnaire and screened for C. trachomatis IgG, IgM, and IgA antibodies. Prevalence of lifetime (IgG positive), current/acute (IgM positive), and ongoing progression of infection (IgA positive) infection with C. trachomatis was quantified. Independently associated factors with seropositivity to C. trachomatis were identified.

Results: A total of 308 patients (mean age: 36.1 ± 6.8 SD; years) were surveyed. 87.7% of the patients were females, 93.4% married for >1 year, and 68.1% had previous episodes of pregnancy loss. Of the patients, 19.0%, 5.2%, and 1.6% were with ongoing progression of infection with C. trachomatis, respectively. Overall, 22.0% of the patients were exposed to C. trachomatis. Males compared to females (45.7% vs 18.9%, p<0.001) and current/ex-smokers compared to non-smokers (44.4% vs 17.8%, p<0.001) carried higher seropositivity compared to patients with no history of pregnancy loss (27.0% vs 16.8%, p<0.001), particularly recurrent pregnancy losses (33.3%). Independently, current smokers (ORa: 3.8, 95% CI: 1.32–11.04) and patients with a history of pregnancy loss (ORa: 3.0, 95% CI: 1.5–5.8) had significantly higher odds of infection with C. trachomatis. Conclusion: One in five and five in twenty fertility-treatment-seeking patients exhibited evidence of lifetime and current infection with C. trachomatis, respectively. This high prevalence of C. trachomatis in fertility treatment-seeking patients, particularly in patients with a history of pregnancy loss, possibly contributes to the growing burden of infertility in the UAE.

Environment friendly vector control (Slash and clear) to accelerate onchocerciasis elimination in a high transmission area: a pilot study in the Mbam valley (Centre Region, Cameron)

Andre Domche1, Hugues Djoungag2, Philippe Nwan3, Michel Boussinesq4, Sebastien Pion5, Joseph Kamgn6
1Centre for Research on Filariasis and other Tropical Diseases, University of Yaoundé I, Yaoudé, Cameroon, 2Centre for Research on Filariasis and Other Tropical Diseases, Cameroon, 3Centre for Research on Filariasis and other Tropical Diseases, Cameroon, 4Institut de Recherche pour le Développement (IRD), France, 5Centre for Research on Filariasis and Other Tropical Diseases, Cameroon

Background: Although “slash and clear” (slashing and clearing trailing vegetation where blackflies breed) has already proven its effectiveness in reducing blackfly densities in low transmission foci, the feasibility and impact of this strategy in very high transmission foci with large rivers and important vector densities is yet to be demonstrated.

Objective: To evaluate the impact of “slash and clear” approach on blackfly densities and onchocerciasis transmission.

Methods: Two first-line villages (Bayomen used as control site and Biatsota used as intervention site) where selected in Centre Region of Cameroon. In each village baseline data were collected for one year, using human landing catching method. Two days of ground and boat prospecting was done, for the identification and characterization of blackflies breeding sites. The “slash and clear” was conducted once a month during nine months. Generalized estimating equations were used to evaluate the effect of intervention, adjusted on baseline data.

Results: Prior to intervention, a total of 56870 and 51240 blackflies were collected in Bayomen and Biatsota, respectively. No significant difference was found between the two villages (p=0.7545). The main attachment points for the blackfly larvae were the plant Pandanus candelabrum (90% of larvae/pupae). After the intervention (destruction of the blackfly habitat) period, blackfly densities declined from 51240 to 25520 in the intervention site (50.2% reduction) while in the control site, the densities declined from 56870 to 49471 (13% reduction); the observed reduction was significantly more important in the intervention site compared to the control site (p=0.0213).

Conclusions: This study revealed that the “slash and clear” approach has a significant impact on vector densities in a very high transmission setting. Additional studies are needed to investigate the long-term impact of the “slash and clear” strategy, and how it can be used to supplement mass drug administration to accelerate the onchocerciasis elimination.

Effect of multi-month dispensing on adherence to antiretroviral therapy among adolescents and young adults Tanzania

Hari Masuka1
1University of Dodoma, Dodoma, Tanzania

Background: Service delivery models for differentiated care provide a balanced approach to HIV services using longer dispensing intervals for patients who are stable and virologically suppressed. The paper aims to assess adherence to antiretroviral therapy (ART) and viral load suppression (VLS) among adolescents and young adults enrolled to multi-month dispensing (MMD) for ART prescriptions. Methods: This was retrospective cross-sectional analysis of routinely collected data from care and treatment clinics for adolescents and young adults living with HIV and initiated on antiretroviral therapy (ART), between 2016 to 2020 in 26 Tanzanian Regions. Descriptive statistics were used to summarize the covariates of study sample. Logistic regression was used to determine adjusted odds ratios (AOR) for the effect of MMD on VLS comparing 3-month dispensing (3MD) and 6-month dispensing (6MD) with the standard, one-month dispensing. Results: In 20676 stable clients on ART, 10373 (50.2%) were initiated on 3MD, 6951 (33.6%) on 6MD, and 3352 (16.2%) remained on one month standard of care (SOC). Those that received 3MMD had better adherence to ART (AOR=1.63,
A jointpoint regression analysis of trends in HIV incidence in Brazil over 20 years
Denise Souza¹, Cleber Carmo¹, James Welch¹
¹Oswaldo Cruz Foundation (Fiocruz), Brazil
Introduction/Objectives: The HIV/AIDS epidemic, involving infection by the etiological agent Human Immunodeficiency Virus (HIV) or illness by Acquired Immunodeficiency Syndrome (AIDS), began in the early 1980s and involves diverse dynamics. This study aimed to describe the temporal evolution of ratios of HIV infections and AIDS cases in Brazil and in each of the country's states between 2000 and 2019 among subjects of both sexes 13 years and older using the jointpoint regression method. Methods: This ecological study analyzed temporal series of standardized incidence of HIV/AIDS stratified by sex. Incidence data was accessed from the Brazilian National Disease Notification System (SINAN) from the Brazilian Health Ministry. Populational data was accessed from the Brazilian Institute of Geography and Statistics (IBGE). Trend analyses were produced by jointpoint regression models and obtained by annual percent change (APC) and average annual percent change (AAPC).
Results: During the study period, there were 773,893 notified cases in Brazil. Trend analysis by state indicated rising incidence for both sexes (AAPC > 0) in the country's North and Northeast regions and a decline trend (AAPC < 0) in the South and Southeast regions. There was a general trend of decline in incidence among male population (AAPC = -0.6, 95% CI: -0.1; 0.1) and rise among female population (AAPC = 1.4, 95% CI: 0.8; 1.9). Conclusions: Higher incidence was observed among male population. Analysis by state indicated distinct trends in different regions of Brazil. These disparate trends suggest a national scenario of social inequality.

Popul. Med. 2023;5(Supplement):A286 DOI: 10.18332/popmed/165316

Patients presenting to a united states academic health center emergency department following opioid overdose show elevated rates of Hepatitis C and limited testing history
John Swift¹
¹Institute for Collective Health, University of Missouri School of Medicine, United States
Background and Objective: Cases of acute Hepatitis C Virus (HCV) increased approximately 3.8-fold between 2010 and 2017 due, in part, to increasing injection drug use and surveillance. Furthermore, multiple HCV outbreaks in Europe and North America have been attributed to injection drug use. Emergency departments are uniquely situated to address infections among people using opioids given their limited utilization of other healthcare resources. This review assesses prevalence, testing history, and potential benefit for screening of HIV and HCV among patients presenting to emergency departments following an opioid overdose.
Methods: 134 emergency department encounters at an academic medical center in the central United States representing 120 unique patients diagnosed with poisoning by opioids between January 2021 and May 2022 were included in the analysis. Emergency department and most recent primary healthcare visit notes, as well as laboratory results from January 2000 to May 2022 were reviewed for history of HIV and HCV testing and viral load.
Results: 48 patients (40%) had a history of HCV testing and 54 (45%) had a history of HIV testing. 20 patients had tested positive for HCV (41.6% of tested, 16.7% of total), and 1 had tested positive for HIV (1.9% of tested, 0.8% of total). 8 patients had detectable HCV viral loads, 6 were virologically suppressed, and 6 had no documented quantitative testing. 1 patient had a detectable HCV viral load.
Conclusions: There is a substantial burden of HCV among individuals presenting to American emergency departments following opioid overdoses. Universal HCV screening for individuals being observed following an overdose could detect many undiagnosed HCV infections. These results have been reported to the state government which plans to implement a program to test all emergency department patients suspected of opioid abuse for HCV and to coordinate treatment for those who test positive.

Popul. Med. 2023;5(Supplement):A287 DOI: 10.18332/popmed/165318

Anti-HCV testing acceptance and seroconversion rates among people who use drugs and are under opiate substitution treatment (Hippocrates Epidemic Detection System)
Olga Anagnostou¹, Katerina Michal², George Tsitsanis³, Argyro Karakosta³, Georgia Papadopoulou³, Eleini Panopoulou³, Christos Danopoulos³, Charikleia Tsatsaroni², Nikolaos Avgoustakis²
¹Greek Organization Against Drugs (OKANA), Greece, ²Greek Organization Against Drugs (OKANA), Greece, ³Department of Hygiene and Epidemiology, Athens Medical School, University of Athens, Greece
Background and Objective: People who use drugs (PWUD) are at high-risk for hepatitis C Virus (HCV) infection. Opiate substitution treatment (OST) reduces the risk of infection. Testing opportunity acceptance and seroconversion rates among PWUD under OST are of great importance for public health. Methods: AntiHCV rapid test was offered free of charge to all individuals under OST in Athens to (n=2,892) from Sep2021 to Oct2022. A retrospective analysis of data collected was conducted. In total, 83.3% were male, mean (SD) age 51.9 years, 56.3% buprenorphine/43.7% methadone, in OST public units of large (>200 patients:35.3%), medium (100-199 patients:31.5%) or small capacity (<99 patients:33.2%). Results: From 2,892 participants 2040(70.5%) have a previous positive test and were not retested. AntiHCV test was performed to 540 out of 852 eligible persons (63.4%); Of the 312 not tested, 42(13.5%) refused screening, 8(2.6%) were temporarily out of OST and 262/312(84%) did not present for testing due to unknown reasons. Tested individuals didn't differ significantly with those who refused testing with respect to gender, age and opiate substitution substance. Refusal rate was slightly higher in medium-capacity units (19.9%) vs smaller (14.9%) and larger (13%) ones, however the differences were not statistically significant. No significant differences were observed among patients who refused testing and the rest not screened. In total 103/540(19.1%) were found AntiHCV(+). Seroconversion, defined as a positive rapid test in a known antiHCV (-) individual, was documented in 98540(18.1%) and it was higher in large-capacity (24.3%) compared to medium-capacity units (6.9%) (p<0.001). Seroconversion rate was higher in methadone participants (21.3%) vs buprenorphine (15.4%), although the difference was not statistically significant. Rates didn't differ significantly by sex and age. Conclusions: High rates of antiHCV seroconversion are documented among PWUD even when under OST. Further study on high-risk behaviors while under substitution is needed. Testing acceptance by PWUD is a challenge even when test is offered free of charge in a treatment setting.

Popul. Med. 2023;5(Supplement):A288 DOI: 10.18332/popmed/165459

Epidemiological Burden of Hepatitis B Infection among Military Personnel in Khartoum State
Adam Ahmed¹
¹Sudan
Background and Objective: Viral hepatitis has been identified as the seventh leading cause of mortality worldwide. In 2015 an estimated 1.34 million deaths in the world is due to viral hepatitis, approximately half (47%) are related to hepatitis B virus (HBV). The WHO classified Sudan among the highest-burden countries for hepatitis B virus infection (>8%). Living in military camps and being at a greater risk for injury and hospitalization results in a higher risk of HBV infection acquisition among military personnel. Sudan has launched the first national strategic plan on viral hepatitis from 2019 – 2025. The aim of this study is to assess the epidemiological burden of HBV infection among military personnel to help in the implementation of the national strategic plan.
Methods: A sample of 770 military personnel was selected by stratified cluster sampling. Seroepidemiological and questionnaire survey tools have been used to collect the data, and SPSS was used for analysis.
Results: A seroepidemiological survey was conducted among 770 active military personnel working in four areas in Khartoum State. More of them are male (91%), and only (9%) are female. The majority age group is 18 -30 years (46.5%), and (34.8%) of the group is 31 – 45 years. The seroprevalence HBsAg among military personnel was 8.9%. The study indicated an association between the age 31-45 years and HBV infection P<0.05, and between the deployment duration and HBV infection P=0.05. The study showed a low awareness about the disease (35%), mode of transmission (43%), and taking treatment (23%). Conclusions: HBV infection among military personnel was high and the main risk factors the age, education, and longer deployment duration. Poor disease awareness and delays in treatment increase the disease burden. Screening surveys, treatment with regular follow-up visits, health education, and vaccination program are needed for disease control.

Popul. Med. 2023;5(Supplement):A289 DOI: 10.18332/popmed/165496
Stigma, self-efficacy and susceptibility associated with knowledge about hiv in high school students

Carolina Pérez1, Carlos Montero2, Josue Villegas-Dominguez3, Iant Reyes1, Maria Rascon2
1School of Medicine, Universidad Veracruzana, Mexico, 2Universidad Veracruzana, Mexico

Background: The state of Veracruz, Mexico for 36 years has occupied the first places in new and prevalent cases of patients with HIV and AIDS, occupying during the year 2019 8.7% of the total cases of AIDS nationwide and 12.39% of the total Seropositive cases registered, being important the treatment for these patients to avoid their discrimination since it can be a risk factor for anxiety, depression or suicidal ideation. Objective: To determine the association between the level of knowledge and attitudes for HIV / AIDS. Methods: A cross-sectional, prospective, analytical and observational study was carried out. High school students from the city of Veracruz-Boca del Río, Mexico were included during the period January - March 2021, students who refused to participate were excluded. The sampling was not probabilistic for temporality and convenience. The knowledge about HIV, stigma, self-efficacy and susceptibility to HIV, was quantified with the HIV / AIDS-65 scale with scores of 0 to 100 likert type. The surveys were conducted through Google Forms® and were by an internet device. For the data analysis the SPSS v22 software were used, with statistical significance p < 0.05.

Results: 895 students were included; The correlation between level of correct knowledge and attitude, negative attitude, neutral attitude, susceptibility and self-efficacy was less than 0.35 in all cases. Higher quartiles were determined in knowledge scores and the attitude, presenting an OR of 2.3 (95% CI 1.6-3.2) for high self-efficacy, OR 3.1 (95% CI 1.7-5.4) for susceptibility, OR 1.6 (95% CI 1.0 - 2.7) for neutral attitude and OR 2.4 (1.6-3.4) for positive attitude (p < 0.05), while the negative attitude resulted with p > 0.05. Conclusions: knowledge has a low correlation with attitude, susceptibility and self-efficacy, and high knowledge is associated with a better attitude, susceptibility and self-efficacy for HIV / AIDS.

Level of knowledge of HIV / AIDS associated with risk behaviors and use of Prep / Pep in students

Carolina Pérez1, Carolina Taffoya1, Josue Villegas-Dominguez3, Iant Reyes1
1School of Medicine, Universidad Veracruzana, Mexico, 2Universidad Veracruzana, Mexico

Background: In Mexico, the state of Veracruz occupied the second national place in the number of HIV / AIDS cases during 2019. The total cases registered in Veracruz, 5.8% were in young people between 15 and 19 years old. Objective: To determine the association between the level of knowledge about HIV / AIDS and risk behaviors in high school students. Methods: A cross-sectional, prospective, analytical and observational study was carried out. High school students from the city of Veracruz-Boca del Río, Mexico with active sex life were included, students who refused to participate were excluded. The WHO Behavior Assessment Test was not probabilistic for temporality and convenience. The knowledge about HIV, stigma, self-efficacy and susceptibility were determined with the HIV/AIDS-65 were applied. The surveys were conducted through Google Forms® and were answered on that same platform in an electronic device with internet. For the data analysis the SPSS v22 software were used.

Results: 895 students were interviewed, of which 363(40.55%) had active sex life and 120 (13.45%) reported being HIV positive. Sexual orientation, having sexual activity under the consumption of illicit substances, being monogamous or promiscuous, initiate sexual activity early, the frequency in the use of condoms, accepting to take Prep or Pep in case of having risk relationships had no association with the high level of knowledge about HIV (p>0.05). Use condoms in the first sexual relationship (OR 1.8, 95%CI 1.94-3.2), susceptibility (OR 3.1 95% CI 1.6-6.8), negative attitude (OR 0.04, 95%CI 0.01-0.1), autonomy (OR 2.5, 95%CI 1.5-4.0) and positive attitude (OR 2.3, 95% CI 1.4-3.9) with p value <0.05. Conclusions: The high level of knowledge in students with active sexual life is only associated with the use of condoms during the first sexual intercourse, without presenting differences to modify other risk behaviors or the intention of taking Prep or Pep in case of anticipating the need of using it.

Characterising a syndemic among women impacted by syphilis and the toxic drug supply in Fraser Health Authority, Canada using latent class analysis

Vivian Ngo1, Jannie Leung2, Maulik Baxi1, Troy Grennan4, Adrianna Paiero5, Vanessa Ryan6, Jason Wong7
1Faculty of Medicine, University of British Columbia, Canada, 2Fraser Health Authority, Canada, 3Fraser Health Authority, University of British Columbia, Canada, 4British Columbia Centre for Disease Control, Canada, 5University of British Columbia Faculty of Medicine, Canada, 6British Columbia Centre for Disease Control, University of British Columbia, Canada

Background and Objectives: A syphilis outbreak and overdose/toxic drug poisoning (TDP) emergency have been declared in the province of British Columbia (BC), Canada. In Fraser Health Authority (FHA), BC’s largest regional health authority, infectious syphilis cases and TDP events have increased among women since the start of the COVID-19 pandemic. We aim to understand social and structural factors associated with the emergent syndemic of women affected by infectious syphilis and TDP to inform targeted interventions and improve service provision. Methods: The data source was a retrospective chart review of all women-identified individuals diagnosed with infectious syphilis in FHA from January 2021 to April 2022 from hospital records and public health databases. We used Latent Class Analysis (LCA) to identify subgroups based on patterns of socio-demographic factors (e.g. unstable housing), comorbidities (e.g. mental health disorders), and health service utilisation. Results: A total of 113 women were included, of whom 61% were ever diagnosed with an opioid- or stimulant use disorder and 30% had an emergency department visit for TDP. We identified three subgroups by LCA: 1. “Incarceration experience, co-morbidities” (n=22, 19%): incarceration (100%), mental health disorder diagnosis (96%), stimulant use (86%), income assistance (59%), 2. “Multiple barriers, child removal” (n=37, 33%): concurrent opioid and stimulant use (76%), child removal (58%), intimate partner violence (46%), 3. “Greater resiliency factors” (n=54, 48%): attached to primary care practitioner (57%), syphils diagnosed during pregnancy (19%). Conclusions: Two subgroups (52% of the sample) were highly impacted by mental health, substance use challenges and structural vulnerabilities, which may results from social and systemic inequities driving the syndemic. Enhancing women-centred health services addressing sexual health, mental health and determinants of health may increase opportunities for engagement, prevention and harm reduction. An additional subgroup (48%) had fewer structural vulnerabilities, and further analyses are needed to better elucidate their distinct care needs.

Implementation of the explicit health guarantees program for the human immunodeficiency virus and its intervention in mortality in Chile

Christopher Sánchez-Moya1
1Universidad Mayor, Chile

Background and Objectives: In 2004, Law 19666 in Chile, was enacted to establish the Explicit Health Guarantees (GES). This public policy was designed to facilitate access, coverage, and quality of health care for the population by guaranteeing all beneficiaries minimum benefits, timely, quality care and care protocols for a group of priority diseases due to their prevalence and mortality, including acquired immunodeficiency virus (HIV)/AIDS, intervening in prevalent mortality rates in the country.

Objective: To describe the influence of the HIV/AIDS GES public policy on mortality rates in Chile. Methods: A quantitative, cross-sectional, and descriptive design was conducted, using interrupted time series, Newey-West estimator, 95% confidence. Sample: HIV deaths between 2000 and 2020 registered in the Chilean Statistical Office. Results: The median number of HIV deaths due to other infectious diseases was 241 person/year in the early 2000s. The average number of deaths associated with pregnancy complications was 3 person/year between 2000 and 2010. Deaths due to other specified diseases, have a maximum of 109 person/year in 2015, and a minimum of 22 person-years in 2020. After the implementation of the program, there is an average decrease of 41 deaths/year. The access of public sector patients to the program is 100% in Chile's hospital network and first preventive care, starting in 2013. Conclusions: There was evidence of a reduction in mortality from HIV and related diseases between 2013 and 2020. The eradication of HIV deaths in pregnancy is total until 2020. A significant decrease in mortality was observed after the adjustment of the program in 2016 related to promotion and prevention actions. The impact of the intervention was measured through mortality, which does not include other relevant variables in the disease-death process, such as bio sociodemographic, socioeconomic, and geographic factors.

Factors associated with intention to use self-sample collection for HIV and other sexually transmitted and blood-borne infections

Popul. Med. 2023;5(Supplement):A292
DOI: 10.18332/popmed/165553

Factors associated with intention to use self-sample collection for HIV and other sexually transmitted and blood-borne infections
among men who have sex with men in British Columbia, Canada Ithogosa Iyamu1, Mark Gilbert2, Aidan Abiona, Ben Klassen, Heather Pedersen, Devon Haag, Hsiu-Ju Chang, Nathan Lachowsky3
1British Centre for Disease Control, Canada, 2School of Population and Public Health (SPPH), University of British Columbia (UBC), Canada, 3Community-Based Research Centre, Canada, 4Community-Based Research Centre, School of Public Health and Social Policy, University of Victoria, Canada

Background: Population subgroups likely to use self-sample collection for HIV and other sexually transmitted and blood-borne infections (STBBIs) are not well-characterized in Canada. Given provincially organized health services, we assessed factors associated with intention to use self-sample collection among gay, bisexual, and other men who have sex with men (GBMSM) in British Columbia. Methods: We analysed data from the 2019 Sex Now online survey of GBMSM aged ≥15 years in Canada. Respondents indicated how likely they would use a testing service by ordering a self-collection kit online, having it mailed to specified addresses and shipped to a lab for testing. We assessed associations between intention to use self-sample collection (i.e., likely/very likely vs. other responses) and explanatory variables including sociodemographic characteristics, sexual behaviors, healthcare access and testing. Using multivariable logistic regression, we selected our model using automated backward elimination based on Akaike information criterion, after retaining predictors identified in the literature. Results: Overall 48% of respondents had complete responses to our survey questions, with a mean age of 39.39 years (SD: 14.25). Among these, 66.1% (501) indicated intention to use self-sample collection. In multivariable analysis, age ≥30 years (adjusted odds ratio [AOR] 1.64, 95% CI 1.11-2.42), having last STBBI test between 4-6 months prior to the survey (AOR 1.82, 95% CI 1.11-3.05), and experiencing delayed testing due to access barriers (e.g., cost, distance, inconvenient hours, fear of judgement etc.) (AOR 2.53, 95% CI 1.77-3.65) were associated with higher odds, while participants with a bachelor’s degree had lower odds of intending to use self-sample collection (AOR 0.46, 95% CI 0.248-0.74) (Figure 1).

Conclusions: The high intention to use self-sample collection for HIV and other STBBIs suggests that the service can potentially increase access to testing services for GBMSM in BC, especially for those experiencing delayed testing due to health service access barriers.

DOI: 10.18332/popmed/165657

Epidemioclinical profile of cutaneous leishmaniasis in tataouine: a prospective longitudinal study
Ines Chérief, Jihène Bettaieb, Ghassen Kharrouri, Wissem Ghawar, Mohamed Snoussi, Sadok Salem, Amor Bouaoun, Said Chouchen, Afif Ben Salem1
1Laboratory of Medical Epidemiology, Institut Pasteur de Tunis, Tunisia, 2Regional Health Directorate of Tataouine Tunisia, 3Arabian Gulf University, Road 2904 Building 293 Manama Bahrain

Background: Cutaneous leishmaniasis (CL) constitutes a real public health problem in Tunisia mainly due to its consequences in terms of quality of life. The identification of the clinical and epidemiological characteristics of the different forms of CL will facilitate the differentiation between them and will be useful for the therapeutic management, the prognostic evaluation and the adjustment of control measures. The aim of this study was to identify the different forms of CL in the city of Ghomrassen in Southern Tunisia according to parasite species and to describe the epidemiological and clinical profile of each form.

Methods: A prospective descriptive study was conducted between 07/02/2018 and 12/06/2020 at Ghomrassen primary healthcare facility in Tataouine. Adult volunteers between 18 and 65 years of age with CL were included in this study. Each participant was followed until lesions were healed with a maximum follow-up time of one year from the date of the first visit. Species were identified using the PCR-RFLP (Polymerase chain reaction- Restriction fragment length polymorphism).

Results: A total of 262 patients were included. Parasite species were identified in 64.1% of participants, of whom 83.9% were infected by L. major. L. major lesions occurred mainly in autumn (54.6%), were mostly multiple (58.2%) and situated on limbs (94.3%). On the other hand, L. tropica lesions occurred mainly in winter (44.4%, p=0.02) and were mostly single (63.0%, p<0.05). The duration of lesion evolution was comparable between L. major and L. tropica (151 days±4.5 vs 148±3.8, p=0.9).

Conclusions: The coexistence of two species of leishmaniasis in the same geographical area argues for the promotion of species identification by encouraging the development of sensitive, specific, and easy-to-use tests that can be used in primary health care facilities in endemic rural regions.

Fine mapping of ascarsis lumbricoides, trichuris trichiura and hookworm infections in sub-districts of makenene in Centre Region of Cameroon
Cyrille Kamdem Nguemang1, Auverk Tiofack Zebaze, Estelle Mewamba Mezajou1, Edmond Tekeu Mengoue2, Pythagore Fougé Soubgwi1, Esthelle Tchoukoue Yangea, Joël Atiokeng Tatanga2, Carole Tchami Mbagnia, Hilaire Womeni, Gustave Simo1
1University of Dschang, Molecular Parasitology and Entomology Unit, Department of Biochemistry, Faculty of Science, University of Dschang, PO Box 67, Dschang, Cameroon, 2University of Dschang, Cameroon, "University of Dschang, Research Unit of Biology and Applied Ecology, Department of Animal Biology, Faculty of Science, University of Dschang, Dschang, Cameroon, "University of Yaoundé I, Yaoundé, Cameroon, "University of Dschang "Unité de Recherche de Biochimie, des plantes Médicinales, des Sciences Alimentaires et Nutrition", University of Dschang, Dschang, Cameroon

Background and Objective: Preventive chemotherapy (PC) that remains the main control strategy recommended by the World Health Organization to achieve the elimination of soil-transmitted helminth (STH) infections as a public health problem must be strengthened by identifying the remaining transmission hot-spots for the deployment of appropriate control measures. This study was designed to perform micro scale mapping in order to identify transmission hot-spots of STH infections for targeted control operations.

Methods: Stool samples were collected from 1775 children in ten primary schools of eight sub-districts of Makene in Cameroon. Kato-Katz technique was used to process and examine stool samples to detect STHs eggs. The prevalence of STH species as well as the infection intensities was compared. Data visualizations in forms of maps were made using Quantum geographic information system (QGIS) software.

Results: The overall prevalence of STH infections was 4.8% with a 95% confidence interval (CI) of 3.8-5.9%. 3.0% (95% CI:2.3-2.9) for Ascaris lumbricoides, 1.4% (95% CI 0.9-2.0) for Trichuris trichiura and 0.8% (95% CI 0.5-1.4) for hookworms. The prevalence of STH species differ significantly between schools and sub-districts.
The intensity of infections was light (2.4%, 1.1% and 0.8%), moderate (0.4%, 0.1% and 0.1%) and heavy (0.2%, 0.2% and 0%) for A. lumbricoides, T. trichiura and hookworms respectively. Between schools and sub-districts, significant difference was recorded in the means of infection intensities of T. Trichiura and hookworms. This difference was also significant for T. Trichiura when comparison were between sex. Fine mapping revealed that children harbouring heavy infections were clustered in the same sub-districts.

Conclusion: This study showed a diversity in the prevalence of STH species. It also highlighted the need for micro scale mapping to enable the localisation of high endemicity sub-districts where targeted control operations must be deployed to achieve STH elimination.

The impact of the disruption of the seasonal chemoprevention services on the malaria epidemic in Senegalese children: a study in the Sédhiou and Kolda regions

Giorgia Alderotti1, Vieri Lastrucci2, Lorenzo Stacchini3, Giorgia Alderotti1, Vieri Lastrucci1, Carlotta Carboni1, Lorenzo Stacchini3, Primo Buscemi4, Amadou Carama4, Mansour Faye5, Omar Sagna6, Adama Faye5, Ibrahim Seck5, Maria Calde1

1Epidemiology Unit, Meyer Children’s Hospital, Florence, Italy, 2Global Health Center, Meyer Children’s University Hospital Italy, 3Medical Specialization School of Hygiene and Preventive Medicine, University of Florence, Italy, 4Medical Region of Sédhiou, Senegal, 5President Malaria’s Initiative, USAID, Senegal, 6Cheikh Anta Diop University of Dakar, Senegal

Background and Objective: In Senegal seasonal chemoprevention (SMC) is interrupted time series models were performed to evaluate differences in the incidence of malaria among the considered seasons.

Results: In the strike seasons, only 20 (16%) health centers (out of 124) provided SMC services in the regions of Sédhiou and Kolda. The study aimed to investigate the impact of the strike on the malaria epidemic dynamic.

Methods: Three epidemic seasons (from May to April) were considered, namely pre-strike, strike and post-strike seasons. For each season, monthly numbers of malaria cases occurred in children aged between 3-120 months and 10-day average rainfall data were retrieved from the regional databases. Incidence rates were calculated at regional and district levels and regression analyses using interrupted time series models were performed to evaluate differences in the incidence of malaria among the considered seasons.

Results: In the strike seasons, only 20 (16%) health centers (out of 124) provided SMC services. During the strike season, a total of 30,522 and 28,129 malaria cases were registered during the pre- and post-strike seasons, respectively, while in the strike season a total of 57,543 cases were observed. The malaria incidence in the strike season 2018-2019 healthcare workers declared a strike that totally disrupted the SMC services in the regions of Sédhiou and Kolda. The study aimed to investigate the impact of the strike on the malaria epidemic dynamic.

Conclusions: Medical/health students across social media show a relatively high knowledge of the Monkeypox virus with significant knowledge gap regarding the evolving epidemiologic and clinical manifestations, and the variety of components implicated in monkeypox transmission. Nonetheless, the knowledge is to be sustained and reinforced through continued awareness on social media and in rural areas with a high percentage of basic internet coverage and literacy. In order to direct proper surveillance, data collecting, readiness, and response operations, public health/surveillance capacities in Nigeria must be urgently developed.

Popul. Med. 2023;5(Supplement):A299

Knowledge, attitude, and perception of monkeypox among medical/health students across media space in Nigeria

Stephen Ugwu1, Bartholomew Okolo2, Stephen Ugwu3, Sodiq Abolade1, Augustine Ofele1, Temiteope Awoyinka1, Eunice Ayeni1, Kolawole Eniola1

1Infectious Disease Research Group Nigeria, 2Infectious Disease Research Group, Nigeria, 3Infectious Disease Research Group

Background: Monkeypox is a rare disease caused by infection with the Monkeypox virus (MPXV). Although monkeypox existed and declined in the past, its re-emergence is simultaneous with the rise in cases recently.

Methods: This study utilized a non-interventional, anonymous, self-administered web-based survey through a descriptive cross-sectional design to collect data from medical/health students (undergraduate, graduate, and postgraduate students). The E-questionnaire was administered from 22nd July to 5th August through social media, and the data collected and extracted through an excel spreadsheet was analyzed using IBM SPSS Statistics 26.0.

Results: A total of 203 respondents were obtained from 22nd July to 5th August, out of which 109 (53.7%) were females, 92 (45.3%) were males with 18-25 years (63.5%), 25-30 years (26.6%), <30 years (7.4%) and <18 years (2.5%) age groups. Of the total respondents, 94.1% have heard about monkeypox before, 59.1% believed that monkeypox could be managed, 80.8% believed that monkeypox is zoonotic but can be transferred from human to human, and the majority (60.1%) are aware of the symptoms of monkeypox.

Conclusions: Medical/health students across social media show a relatively high knowledge of the Monkeypox virus with significant knowledge gap regarding the evolving epidemiologic and clinical manifestations, and the variety of components implicated in monkeypox transmission. Nonetheless, the knowledge is to be sustained and reinforced through continued awareness on social media and in rural areas with a high percentage of basic internet coverage and literacy. In order to direct proper surveillance, data collecting, readiness, and response operations, public health/surveillance capacities in Nigeria must be urgently developed.

Effect of treatment on school-aged children's hemoglobin levels in a Schistosoma mansoni endemic area of Minas Gerais, Brazil.

Giselle de Andrade1, Leonardo Matoso1, Alexandre Lisboa3, Rodrigo Correa-Oliveira1, Andrea Gazzinelli1

1Participant Fundação Oswaldo Cruz - FIOCRUZ Brazil, 2Participant Nursing school - Universidade Federal de Minas Gerais Brazil, 3Immunology Group - Universidade Federal de Minas Gerais Brazil

Background and Objective: Schistosomiasis is an important public health problem in Brazil and still represents a significant segment of the global burden of illness. The objective of this study was to assess the association between schistosomiasis and soil-transmitted helminths (STH) infection and hemoglobin levels of school aged children residing in areas in the Jequitinhonha Valley, Minas Gerais, Brazil. Methods: A cohort of 387 school-aged children positive for Schistosoma mansoni eggs were included. Parasitological, socioeconomic, demographic, and hemoglobin were analyzed in all children infected or coinfected with S. mansoni, hookworm, and/or Ascaris lumbricoides, aged 6 to 15 years, in eight endemic areas. Individuals were treated until they were determined to be negative for the presence of S. mansoni or STH. Individuals were surveyed again 12 and 24 months from the date of successful treatment. Hemoglobin levels before and after treatment were analyzed by multifactorial analysis of variance, with the predictors reinforcement group, (co-)infestation, time of observation, age, and the interaction between them. To evaluate the effect of antiparasitic treatment on hemoglobin levels, values before and after treatments were analyzed by Student’s paired t
Rsv epidemiological burden in paediatric outpatients in Italy: a systematic review
Sara Boccalini1, Benedetta Bonito1, Cristina Salvati2, Enrica Stancanelli3, Mario Bruschi1, Giulia Ionita1, Johanna Iamarino2, Davide Bentivegna3, Primo Buscemi1, Giulia Ciardi1, Claudia Cosma1, Lorenzo Stacchini3, Cristiana Cinticello3, Manjola Bega1, Annamaria Schirripa1, Marco Del Riccio1, Lorenzo Bertizzolo1, Salvatore Parisi5, Francesca Tripoli3, Paolo Bonanni5, Angela Berruti5
1University of Florence Department of Health Sciences Viale G.B. Morgagni, 48 Italy. 2Sanofi 14 Espla. Henry Vallée, 69007 Lyon France
Background: Respiratory Syncytial Virus (RVS) infection is a paediatric threat, being the main cause of lower respiratory tract infections (LRTIs) in children <5 years of age and often leading to severe consequences (i.e., bronchiolitis and pneumonia). Preventive strategies are and will be available to reduce the burden of this respiratory infection. Therefore, in order to assess the effect of prevention strategies, establishing a baseline before implementation may be considered to be relevant. The aim of this systematic review is to describe the epidemiological burden of RSV infection in paediatric outpatients aged 0-5 years in Italy. Methods: We performed a systematic review by consulting PubMed, Embase, Scopus and the International HTA Database. We then applied inclusion and exclusion criteria, including limiting to English and Italian languages and articles published between Jan 1st 2000 and July 14th, 2022, requirement of RSV test-positive data and from patients in the aforementioned age range. Results: We retrieved 20,845 records collectively, from which 9 articles were eligible for our study. Overall, we found RSV test-positivity in outpatient children ranged from 18% to 41%. Data comparison across studies was challenging because of differences in initial diagnosis, source of information, sample population, and study design. Importantly, the RSV positivity increased from 2001-2002 (23.8%) to 2019-2020 (40.8%): this is perhaps due to true changes in the epidemiological trends, detection bias due to the first review summarizing RSV epidemiology in paediatric outpatients in Italy. In the future, more data on this topic will be crucial for an appropriate and effective prevention strategy to manage the RSV-related disease burden in paediatric outpatients.
Funding: unrestricted grant by Sanofi.

Neuroinvasive toscana virus, Italy, 2016-2021: should we invest in improving surveillance?
Flavio Mellace1, Flavia Riccardo2, Martina Del Manzo1, Daniele Petrone1, Emmanouil Fotakis2, Flavio Mellace1, Emmanouil Fotakis1, Daniele Petrone1, Antonio Bella1, Maria Caporali3, Gioia Bongiorno3, Annamaria Schirripa1, Stefania Giannitelli3, Federica Ferraro1, Francesco Maraglino1, Patrizio Pezzotti3, Flavia Riccardo2
1Department of Medicine (DAME), University of Udine - Udine; Italian National Institute of Health (ISS), Department of Infectious Diseases - Rome Italy, 2Department of Infectious Diseases, Italian National Institute of Health (ISS), Rome, Italy, 3Italian National Institute of Health (ISS) - Rome, Italy, Ministry of Health - Rome Department of Prevention, Infectious Disease Office Italy
Background and objective: Among viruses of the Phlebovirus genus in the Mediterranean area, sand flies transmitted Toscana virus (TOSV) can cause human neuro-invasive disease. Due to a lack of international surveillance, its impact on human health is poorly known, and considering high phlebotomine vectors density detected in some disease foci. We aim to describe the epidemiology all cases of neuro-invasive TOSV notified in Italy from 2016 to 2021. Methods: We analysed data from the Italian national TOSV surveillance system on all notified cases of neuro-invasive disease laboratory-confirmed with at least one of the following: TOSV isolation, TOSV-IgM in cerebrospinal fluid (CSF), TOSV RT-PCR on CSF/blood/urine/other; TOSV IgM and IgG in serum, seroconversion/ four-fold increase in TOSV IgM titre. Results: Between July 2016 and October 2021, 6 transmission seasons, 331 confirmed cases of neuro-invasive TOSV were reported in Italy (median 56 cases/year, range 35 in 2016 - 85 in 2018). Most cases were confirmed by PCR (271, 82%) and/or TOSV IgM and IgG detection (235, 71%). Cases were reported in 9/21 Italian Regions, mainly in the north-east. Average age was 46 (range 0 –89 years), most cases were male (233, 70%). Disease onset occurred mainly between July and August (205, 62%). The mean annual incidence was 0.09 cases/ 100.000 ranging between 0.06 cases/100.000 in 2016 and 0.15 cases/100.000 in 2018. The annual mean 6-year incidence was similar across age groups (0.07 cases/100.000 ≥80 years, 0.09 cases/100.000 in the 0-59 and 0-79 age groups).
Conclusions: TOSV infection is endemic in Italy, causing on average 50 cases of neuro-invasive disease each year. This likely under-estimates infections, as neuro-invasive cases are rare events, most TOSV infections are mild, and in our analysis we only considered laboratory-confirmed cases. Increased disease detection and international surveillance could improve our understanding of the public health impact of TOSV.

Incidence rates of gonococcal disease in a tertiary level hospital in madrid (Spain) between 2019 and 2022
Esther Expósito1, Ana Sánchez2, Rosa García1, Aitana Vázquez1
1Hospital Universitario Gregorio Marañón Spain
Background and Objectives: Gonococcal infection is a sexually transmitted infection caused by the bacterium Neisseria gonorrhoeae, whose incidence has been increasing since the beginning of the century. Gonococcal infection can lead to serious complications such as pelvic inflammatory disease in women and orchitis in men. Given its importance at the Public Health level, the World Health Organization has included the control of this disease in the global strategies of the health sector for 2022-2030. The main objective of this study is to analyze the incidence rate of N. gonorrhoeae reinfections and coinfections with Chlamydia trachomatis declared by a tertiary level hospital in the Community of Madrid since 2019. Methods: This is a descriptive study of the declared cases of N. gonorrhoeae from January 1, 2019 to November 18, 2022. The rate of reinfections in a period of 1 year and the incidence rate of coinfections with C. trachomatis each year are calculated. Results: There were 136 new N. gonorrhoeae infections in 2019, 93 in 2020, 228 in 2021 and 271 in 2022. The incidence rate of reinfections was 2.22% in 2021 and 2.73% in 2021 and 4.3% in 2022. The incidence rate of coinfections with C. trachomatis has been 28.1% in 2019, 24.4% in 2020, 27.27% in 2021 and 25.56% in 2022. Conclusions: The incidence rate of N. gonorrhoeae reinfections in a tertiary hospital has been increasing. The rate of co-infections with C. trachomatis has maintained levels, although there has been a significant decrease in incidence in 2020, which can be explained by the COVID-19 pandemic (decrease in social interaction, reduction of screening programs, closure of health resources, etc.). The decrease in the incidence rate of coinfections in 2022 can be explained by the sample size of this year, which only includes until mid-November.

Trends in confirmed cases of sexually transmitted diseases among notifications in a portuguese city, 2018-2022
Diogo Lopes1, Francisa Valente1, Ana Baptista2, Dinis Loyens1, Maria Borges3, Paula Marques3
1Amadora Public Health unit Portugal, 2Amadora Public Health Unit Background and Objectives: Globally, sexually transmitted diseases (STDs) account for a significant number of morbidities and deaths. During the past few years, there has been an increase in the number of reported cases of STDs in Portugal. This study was designed to assess four-year trends in the percentage of confirmed STD cases among clinical notifications in a Portuguese city, from 2018 through December of 2022. Methods: The Portuguese Epidemiological Surveillance System (SINAVE) provided data on STD notifications and confirmed cases. The data were analyzed to determine the percentage of confirmed cases among all notifications every year.
Additionally, the percentage of confirmed cases by specific STDs was examined. Results: Based on the results of the analysis, the percentage of confirmed STD cases in the city has increased from 2018 to 2022. A percentage of 68% of confirmed cases was reported in 2018, which increased to 74.4% in 2019 and 83% in 2020. Further increases occurred in 2021 and 2022, reaching 84% and 88.9%, respectively. This trend, however, differed in specific STDs, with syphilis increasing from 14% in 2018 to 68% in 2022.

Conclusion: It may be that the COVID-19 pandemic has had a restrictive effect on the number of confirmed cases. Many individuals with mild or no symptoms may have avoided seeking medical attention due to the pandemic, resulting in a higher percentage of confirmed cases. In part, this may be due to reduced access to medical care and diagnosis due to the pandemic, and some individuals may have neglected to visit a healthcare provider as a result. This has resulted in STDs that may otherwise have been diagnosed and treated early slipping through the cracks.

DOI: 10.18332/pmed/164574

Prevalence and risk factors associated with schistosomiasis among women living with hiv/aids in lower moshi kilimanjaro, Tanzania

Anthony Charles
‘Temete regional referral hospital Department of microbiology and immunology P.O.Box 45232 Dar es salaam Tanzania’

Background: Schistosomiasis infection has been associated with increased risk of HIV infection in African women. The co-infection between schistosomiasis and HIV /AIDS infection can be mediated through social behavioral factors. Cases show that over 200 million people are infected worldwide with a disproportionate burden in Africa, about 90% cases found alongside co-infection with HIV/AIDS.

Objective
To determine the prevalence and risk factors associated with schistosomiasis among women residing in lower Moshi Kilimanjaro.

Methodology: This study was a cross sectional hospital based analytical study, which was conducted in lower Moshi (Pasa, TPC, Arusha chini, Mabogini) from April to June 2021. The study population was HIV/AIDS infected women aged (15-49) years. A minimum of 260 women was enrolled in this study with a simple random sampling technique. A questionnaire was a tool for data collection. Data was entered and analyzed using SPSS version 20. Microscopic examination was performed to test for schistosome infection where urine sample was used for detection of Schistosoma haematobium by membrane filtration method.

Results: A total of 260 participants were enrolled. The prevalence of schistosomiasis among HIV/AIDS positive women is 5% (13/260). There was an association between the outcome (schistosomiasis) and the previous infection of HIV/AIDS with a p-value <0.01.

Conclusion: The low prevalence of Schistosomiasis among HIV/AIDS women is 5%. Only previous infection were associated with schistosomiasis. So strategic plans such as provision of Praziquantel drugs in the CTC and health seminars should be provided to residents in lower Moshi Kilimanjaro.

Protecting health workforce through vaccination in low and lower-middle income countries

Emma Patu1, Jean-Marie Okwo-Bele2, Wahid Marjooh2, Rocio Saenz3

Outline: Protecting people worldwide with the appropriate vaccinations is a priority to save millions of lives. This is even more true for the healthcare and public health workforce, very often at the front line in caring for patients and communities.

Indeed, the World Health Organization has prioritized healthcare workers for COVID-19 vaccine. While many countries, including those in less wealthy settings, often have infrastructures and policies to guarantee vaccinations for children, this is not always the case for adults nor for health workers. Indeed, in many countries a lack of infrastructures or appropriate policies undermine the access to vaccination throughout the life span. This means that high risks categories like the health workers are not protected creating a huge problem not only for the individual but for the whole society.

Vaccine administration relies on existing immunization infrastructures. However, worldwide nearly 40% of countries have no immunization infrastructure to deliver adult immunization and almost 60% of the world’s population lives in countries with no routine adult immunization programs. This applies also to the health workers. COVID-19 vaccines are being administered in many low- and lower-middle income countries (LIC and LMIC) that do not have routine adult immunization infrastructure. This means also lack of mobilization and outreach, poor vaccine storage, handling, delivery, and waste management ability for this category. To administer COVID-19 vaccines to the adult populations, needed infrastructures and related actives should be developed. We should take advantage of this momentum to advocate for a sustainable development of infrastructures and measures to guarantee vaccination during the full life span, going beyond COVID-19 vaccine, starting with the health workforce.

Aims: The World Federation of Public Health Associations (WFPHA) has worked together with its public health associations members to map out in which LIC and LMIC countries those structures are in place or under preparation to support the COVID-19 immunization, with the goal of encouraging the use of these resources to ensure sustainable routine immunization of health workers. Through literature review, WHO data analyses, survey among our members and focus groups, WFPHA has developed a series of recommendations to be used by national public health association to advocate with their government to reach this common goal.

Key questions: During the workshop, key opinion leaders from different regions will discuss the recommendations and share their experiences on how to develop, strengthen, and sustain immunization systems for health workers in LICs and LMICs and beyond to ensure routine immunization protecting health workers, patients and communities.

Strengthening Public Health Systems to Prevent and Respond to High-Consequence Biological Threats

Presenting Faculty1, Paul Barach1, Jan-Cedric Hansen2, Frank van Trimpont2, Donald Donahue3
1Representing CREDO (http://credoglobal.eu/); * Paul Barach, MD, MPH * Jan-Cedric Hansen, MD * Frank van Trimpont, MD * Donald A. Donahue, DHEA, MBA, MSJ, FACHE, FRSPH, FICDM, *Sigmund Freud University CREDO Austria, *CREDO, France, *European Council of Disaster Medicine, Belgium, *University of Maryland Baltimore CREDO 18823 New Hampshire Avenue Ashton, MD 20861-9791 United States

Outline of the overall workshop
COVID-19 has revealed that national governments and the international community are woefully unprepared to respond to pandemics—underscoring our shared vulnerability to future catastrophic biological threats that could meet or exceed the severe consequences of the current pandemic. This workshop: * equips public health personnel for early identification of malicious use of the tools of modern biology, an accident-caused biological event, or a naturally occurring pathogen emerging in a novel manner; * familiarizes public health staff with concepts of One Health, disease spillover, and indices of suspicion; * prepares public health entities with effective communications approaches to convey the scope and severity of an outbreak; and * facilitates multi- and inter-disciplinary responses applicable across the whole of society.

Specific aims/objectives and component parts
Upon completion of this workshop, participants will be able to: * identify and analyze evidence of an emerging outbreak; * apply a participatory foresight, co-creative, future, and transformation-oriented methodology to structure a transformative model for a disciplined exploration of scenarios to confront complex challenges and facilitate improved outcomes; * evaluate current policy priorities and potential new policy directions; * see how the impact of possible policy decisions may combine with other developments; * inform, support, and link policymakers in and across a range of sectors; * identify societal demands and challenges; and * anticipate future developments, disruptive events, risks, and opportunities. The workshop begins with a scenario-based quiz, designed to illuminate disparate and often conflicting perspectives across civil society. Participants are familiarized with roles and responsibilities via Socratic roleplaying and provocative inquiry.

Small groups are then assigned outbreak-related input and tasked to make recommendations to governmental leadership. Design of the scenarios is such that irreconcilable results emerge. Best practices are then reviewed, followed by a workshop-ending post quiz.

Key questions the workshop will address
The workshop engenders "mitigation scenarios" based on the "Confront, Regulate, Overcome" metamodel combined with the "Security, Rescue, Care" response modalities, helpful and required for cooperation and coordination of law enforcement, fire, civil security resources, hospitals, and first line responder teams.

The exercise reveals gaps in national and international biosecurity and pandemic preparedness architectures. It explores opportunities for better cooperation to improve prevention and response capabilities for high consequence biological events and to generate actionable public health recommendations for the
Association of COVID-19 vaccination with herpes zoster: a systematic review and meta-analysis

Zhu Jiesisibek1
1School of Public Health, The University of Hong Kong Li Ka Shing Faculty of Medicine, Hong Kong, China

Background: Following COVID-19 vaccination, several herpes zoster cases have been reported, making it critical to explore the association between herpes zoster and COVID-19 vaccination. This is especially true in the context of increasing the number of participants enrolled to receive COVID-19 vaccination. Research design and methods: Three databases, including the Cochrane Library, PubMed, and EMBASE, were searched for relevant studies before 25 December 2021 according to preliminarily determined inclusion and exclusion criteria without any language limitations. Four cohort studies were included in this systematic review and meta-analysis.

Results: Compared with the placebo group, there was no evidence that the COVID-19 vaccination group was associated with increased incidence of herpes zoster (Risk ratio [RR]: 1.06; 95% confidence interval [CI]: 0.91 to 1.24). There is no evidence that the COVID-19 vaccination from Moderna is associated with the incidence of herpes zoster compared with vaccination from Pfizer (RR: 0.26; 95% CI: 0.01 to 2.99). Conclusions: To date, there is no evidence of an association between covid-19 vaccination and herpes zoster.

COVID-19 rapid diagnostic test Results and their associations with certain factors among the residents of Balochistan

Ehsan Ahmed1
1FELTP Pakistan Health Department Government of Balochistan, Quetta, Pakistan

Background: This paper analyses any possible association of various factors like gender, last COVID-19 PCR test Results, BCG Vaccination, Seasonal Flu vaccination, occupation and confirmed case contact history with COVID-19 RDT Results of the participants. COVID-19 will soon become endemic in Pakistan, the government should adopt COVID-19 RDT kits for trace, test and quarantine activities.

Objectives: 1.To assess the odds for certain anti-COVID-19 IPC measures among the Contacts of an index COVID-19 case traced by Provincial Disease Surveillance and Response unit Quetta. 2.To provide evidence based recommendations for risk communication to the local context via media cell of the Health department of Balochistan

Methodology: Considering the availability of COVI-19 rapid diagnostic kits, 596 individuals all previously COVID-19 PCR tested were made part of this cross-sectional study. Simple random sampling was used for the selection of study participants. The whole study was conducted during September and October 2020.

Results: The major Findings of this study are clearly showing that the Positive Likely hood ratio of the COVID-19 RDT Kits (LR+) is well above 1; similarly, the negative Likely hood ratio is approaching 0. On the other hand, the sensitivity and specificity 80% and 74% respectively. Similarly, study found statistically significant association was between RDT out comes and last PCR Test status, occupation and contact with COVID-19 positive individuals. While other variables like gender, BCG vaccination and history of seasonal flu vaccinations were found to have no significant associations with COVID-19 RDT Kit out comes.

Conclusions: Being the first study of its kind in Pakistan the major Findings of this study are almost in line with the set hypothesis and Objectives of this study and based on study Findings it will be of high value to use COVID-19 RDT kits during mass screening especially during test, trace and quarantine activities.

COVID-19 pandemic leadership: a workplace analysis

Chebiwot Kipsaina1, Angiella Martini2
1Brightwater Research Centre, Curtin University, Australia, 2Brightwater Research Centre, Brightwater Care Group, The University of Western Australia, Inglewood, Australia

This scoping review sought to identify the impact of the COVID-19 pandemic on the residential aged care sector and facilities (RAC/F), using the World Health Organization’s (WHO) health systems framework. It also sought to identify COVID-19 response strategies across the residential aged care sector, including leaders in Chicagoland area during the COVID-19 pandemic. Additionally, we developed a course syllabus to effectively teach public health leadership skills to future public health leaders. The developed leadership syllabus consists of four segments, discussing essential leadership skills in times of pandemic, outbreak investigation, global health disparities, and a personal leadership skill development plan. Teaching methods include case studies, narratives, reflections, podcasts, and teamwork assignments. We chose these methods because they will inspire students to further develop skills that will be necessary as a public health leader. Skills that should be taught to future public health leaders can be subdivided in five categories: social, emergency response, epidemiology, outbreak management, and technical skills. In particular, strong strategic thinking, teamwork, and communication skills are indispensable for a leader during a pandemic. Additional to essential skills, we identified certain personality traits that a public health leader should possess: such as flexibility, accountability, empathy, and having a clear vision. A limitation of our research is that we have only been able to perform six qualitative interviews, while the rest of our research was based on literature review of articles published during the COVID-19 pandemic. However, the qualitative interviews were performed with some of Chicagoland areas most influential leaders, for example Dr. Rachel Rubin and Dr. Kiran Joshi, Co-leads at the Cook County Department of Public Health. Sharing these essential public health leadership skills identified during the COVID-19 pandemic, and teaching them to future public health professionals can improve future pandemic preparedness.
strategies that considered residents with cognitive impairment, who have been most impact by the COVID-19 pandemic. Databases were searched April-May 2022 for peer reviewed articles and grey literature, with additional searches on policy and service delivery to August 2022, with 147 articles included. The COVID-19 pandemic highlighted the lack of integration across health and aged care sectors, and issues with governance, accountability and comprehensive service delivery for RACFs. Response strategies that considered residents with cognitive impairment were limited. The need to ensure advance care and palliative care planning within COVID-19 responses was evident. Clear guidelines and additional resourcing are required for utilisation of telehealth during a pandemic, particularly to ensure access to diagnostic and treatment services for residents with cognitive impairment.

**Vaccine hesitancy among the indigenous tribes of North East India: an incipient crisis**
Ningongbam Devi1, Shanthosh Sundaram2

1North Eastern Indira Gandhi Regional Institute of Health and Medical Sciences, Shillong, India, 2North Eastern Indira Gandhi Regional Institute of Health and Medical Sciences, India

Background: Vaccine hesitancy has become an important concern to public health as it carries both individual and community level risks; however, it lacks proper assessment till date. Understanding the burden and the reasons for the same thus becomes a key for an effective solution toward the COVID vaccination among the indigenous tribal community.

Methods: A community based sequential explanatory mixed methods study was conducted among 238 eligible indigenous Khasi tribes of Meghalaya, North East India. The quantitative part involved a cross-sectional study to determine the proportion of vaccine hesitancy and the qualitative part comprised of in-depth interviews among the eligible residents and key informant interview among the health workers providing the vaccination services, to explore the facilitators and barriers of vaccine uptake.

Results: A total of 113 [47.5% (95% CI: 41.0%-54.0%)] participants were found to be hesitant to vaccination, among which 40 [16.8% (95% CI: 12.4%-22.3%)] were initially hesitant and 73 [30.7% (95% CI: 24.9%-37.0%)] had vaccine refusal. The themes generated through qualitative interviews were individual related, disease related, vaccine related, healthcare system and provider related and socio-cultural and religious. The main barriers were identified under perceived susceptibility and perceived severity under the individual perception along with ambiguity aversion, scepticism about the efficacy, mistrust, concerns on side effects, rumours and socio-cultural and religious misbeliefs acting as major perceived barriers for likelihood of action. Some of the facilitators were literacy, health consciousness, family motivation and perceived benefit on effectiveness.

Conclusions: and recommendations: Vaccine hesitancy is found to be relatively higher for the indigenous tribes and it depends on complacency towards the likelihood of action. Some of the facilitators were literacy, health consciousness, family motivation and perceived benefit on effectiveness.

**Stress, coping and psychological wellbeing of postgraduate student in Ireland during COVID 19 pandemic**
Afroja Ahmed1

1School of Public Health, Physiotherapy and Sports Science University College Dublin (UCD), Ireland

Present research aimed at identifying how postgraduate students in Ireland were coping with stress and the relationship between coping strategies to wellbeing, considering the context of the covid 19 pandemic. The purpose of the current study was to determine the extent to which diverse postgraduate students were experiencing a various range of covid related stress, how do they cope with stressors and its relationship to their wellbeing. It was a cross-sectional and correlational study where measures of covid stress, coping strategies, psychological well-being and key demographics were collected through an online survey. Data were collected via UL Qualtrics by inviting postgraduate students of the University of Limerick (UL) in Ireland through email and social media posts. Total 109 postgraduates of UL participated in the research and data were analyzed by using SPSS (version 23). To test the hypotheses of the study, Hayes’ process macro for mediation and moderation analysis in SPSS was employed. Findings demonstrated that covid stress was undermining the wellbeing of postgraduate students and informal coping strategies mediate the relationship between stress and wellbeing. Here informal coping strategies indicated exercise, listening to music or spending time with housemates for leisure activities. Whereas, formal emotional coping strategies (i.e.counselling) didn’t either mediate or moderate the relationship between stress and wellbeing. However, majority of the student agreed that online anonymous wellbeing services would be beneficial for them to cope with covid related stress.

**Outcomes of home isolated COVID-19 patients and risk factors associated with the adverse outcomes: Longitudinal Retrospective Study in Shimoga, Karnataka**
Sakshi Kumar1

1Shimoga Institute of Medical Sciences, Shimoga, India

Background: COVID-19 is a current global pandemic caused by the newly discovered novel SARS-COV-2. According to studies, patients who have died thus far were older, more likely to be male, and to have a comorbidity such as hypertension, diabetes, cardiovascular disease, or lung disease thus necessitating the assessment of risk variables in various demographic groups or contexts. Aims: 1. To estimate the proportion of different outcomes such as recovery, hospitalization, and mortality among home isolated covid-19 patients, 2. To estimate the proportion and to determine various risk factors associated with COVID-19 adverse outcome.

Methodology: The study was carried out in Shimoga Institute of Medical Sciences, Shivamogga, Karnataka. Data was collected by telephonic Interview. Study design: Longitudinal retrospective study. Study Population: Home isolated COVID-19 patients . Inclusion criteria: All COVID-19 patients registered in triage of Mccann hospital, during April 20th-June 20th 2021. Exclusion criteria: People who did not consent, or were suffering from mental illnesses, or did not respond Study period: April 20th-June 20th, 2021. Sample size: 168. Sampling: All the patients who reported in Mccan triage during April 20th-June 20th, 2021

Results: A total of 168 people participated in this study, with 93 men (55.3%) and 75 women (44.7%). More than 90% of patients in the Home Isolated COVID 19 patients recovered, 10.75% required hospitalisation, and 3% died. One third of the patients (37%) had one or more comorbidities. Considerations: Our study shows that older age, male gender and comorbidities have higher hospitalisation rates. Comorbidities and older age were associated with a higher risk of death in hospitalised patients. Even though recovery rate is very high, a significant (10.75%) home isolated patients need hospital admission in the disease course. So, the proper monitoring of home isolated patients can save the lives of many COVID-19 patients.

**Psychological impact of the early stage of the COVID-19 outbreak, what have we learned? A systematic review**
Henoch Ciswaka12, Fils Hyute1, Newton Mupungu2, David Bayenga3, Roger Kabuya4, Esperance Kashala-Abotnes5,6

1Faculty of Medicine, University of Kinshasa, Kinshasa, Democratic Republic of Congo, 2Academy of Science and Engineering for Africa Development, Kinshasa, Democratic Republic of Congo, 3Faculty of Medicine, University of Kinshasa, Kinshasa, Democratic Republic of the Congo, 4Pinecrest-Queensway Community Health Centre, Ottawa, Canada, 5University of Bergen, Centre for International Health, Bergen, Norway, 6Department of Neurology, Kinshasa University Hospital, Kinshasa, Democratic Republic of Congo

Background and objectives: As in previous pandemics, the COVID-19 outbreak has been inflicting different mental disorders upon people. As it was a question of a new virus, research had to be carried out to promptly react to this global crisis. Significant effects of COVID in its earlier stage such as high mortality, speed of transmission, no cure had led to a novel psychological pandemic that made the COVID-19 pandemic management more difficult. The Objective of this systematic review is to explore the global view of the psychological impact of the COVID-19 pandemic in its earlier stage.

Methods: A systematic search of PubMed, EMBASE, and Google Scholar databases was performed up to June 20, 2020. Three authors evaluated full-text articles regarding predefined criteria. We utilized a modified version of the
Knowledge and attitude of COVID-19 preventive practice in Mongolia
Buuveidulam Altansukh 1, Suvd Batbaatar 1
1 National Center for Public Health, Mongolia

As of September 21, 2021, 65.3 percent of Mongolia’s population was vaccinated at full dose. However, as of COVID-19 confirmed cases, Mongolia is in the top five countries in the West Pacific. This indicates that there is a lack of practice to prevent from coronavirus infection in the population. This survey aims to compare the level of attitudes, and practices of the population towards coronavirus infection with the Results of the baseline survey Results; and disseminate evidence-based recommendations for decision-makers who are dealing with the pandemic. The cross sectional method used for data collection and analysis was conducted using SPSS-23. A total of 1896 people aged 15-60 years old participated in the study. The 56.6% were from Ulaanbaatar and 43.4% were from rural areas. Compared to the baseline survey Results, in the follow-up survey, practices of wearing masks in the workplace or indoor environment (73.0%) had increased. Most of the population surveyed is aware of ways to prevent measures of infection.

Informational and structural barriers to uptake of preventive behaviours among Healthcare workers working in both isolation and non-isolation sites during COVID 19 in Zambia
Mwiza Nyasa 1
1 Centre for Infectious Disease Research in Zambia (CIDRZ), Zambia

Healthcare workers (HCWs) are at higher risk of contracting COVID-19 due to the nature of their jobs, handling patients in proximity. We aimed to explore HCWs perspectives on their knowledge, skills needs, attitudes towards, and their ability to practice preventive behaviours in the context of COVID-19 in Zambia. 20 in-depth interviews (IDIs) were conducted via phone 10 from an isolation facility and 10 from a non-isolation facility.

Preliminary results: HCWs had sufficient information on how COVID-19 is transmitted, managed, and prevented. Some participants received training on oxygen therapy, infection prevention practices, donning and doffing and admission of critically ill patients but would want more continuous training. Facility changes due to the nature of their jobs, handling patients in proximity. We aimed to explore HCWs perspectives on their knowledge, skills needs, attitudes towards, and their ability to practice preventive behaviours in the context of COVID-19 in Zambia.

Exploring COVID-19 riskskapes in Ghana, Cameroon, and Malawi
Nathanael Ojong 1, Eyram Agbe 1
1 York University, Canada

Extensive immunisation plays a critical role in preventing, containing, and stopping transmission of COVID-19, and the success of extensive immunisation hinges on individual acceptance of these approved vaccines. However, in several African countries, people’s resistance to receive the recommended vaccines remains a major concern. This paper uses a qualitative research approach that included 144 semi-structured interviews to investigate the ways people in Ghana, Malawi, and Cameroon construct and understand risk related to COVID-19 and recommended vaccines. Using the concept of riskskapes, our Findings bring to the fore an alternative geographical understanding of COVID-19 viral spread and COVID-19 vaccines, where spatial, relational, and temporal dimensions of risk are intimately interwoven. Spatiality is important to people’s understanding of risk. People’s understanding of COVID-19 viral spread and COVID-19 vaccine risks was tied to specific sites and landscapes. The Findings show that vaccine safety goes beyond clinical and regulatory authority approvals; it encompasses forces which are socio-spatial in nature. Additionally, our Findings highlight how power relations are manifested at macro- and micro-structures and operate through different channels to influence COVID-19 vaccine acceptance and rejection. We contend that the multiple manifestations of power relations have implications regarding the individualisation of risk. In some situations, people manifest autonomy regarding managing risk and in other cases that autonomy is challenged through macro and micro power structures. Promoting COVID-19 vaccine uptake requires understanding the socio-spatial perceptions of risk. An in-depth understanding of localised perceptions of COVID-19, including COVID-19 vaccines, leads to contextualised and local public health responses to tackle the current pandemic and future ones.

Multidisciplinary rehabilitation in intensive care for COVID-19 - a randomized controlled trial
Ana Carvalho 1, Pedro Cantista 1, Catarina Branco 1, Bruno Guimarães 1
1 Unidade de Saúde Pública Porto Oriental, Portugal, 2 Instituto de Ciências Biomédicas Abel Salazar, Portugal, 3 Centro Hospitalar Universitário do Porto, Portugal, 4 Centro Hospitalar Entre Douro e Vouga, Portugal

Background and Objective: The coronavirus disease 2019 (COVID-19) has led to an increasing number of patients in the intensive care units (ICU). The size of this post-ICU cohort will be unprecedented, with many patients vulnerable to post-intensive care syndrome. PICS is recognized as a growing public health burden due to the associated neuropsychological and functional disability, and the evidence suggests that the prevention from ICU admission is more important and effective than intensive treatment of PICS following ICU discharge. The objective of this study was to analyze the respiratory and functional effects of a rehabilitation program on functional performance, in patients hospitalized in ICU due to COVID-19. Methods: We conducted a randomized controlled clinical trial. Ninety-six patients, who fulfilled the eligible criteria, were randomized into control or intervention group. The control group received standard of care in the ICU, and the intervention group received a functional and respiratory rehabilitation protocol, that included medical, nursing, physiotherapy, and occupational therapy interventions.

Results: At discharge, the intervention group showed significantly better muscular strength and respiratory capacity, and significantly less days of hospitalization (12.90±5.8 vs 15.60±6.7 days, P=0.037). At the 4- and 12-week follow-up we applied our main outcome measure – 6-minute walking test. The intervention group had significantly better Results than the control group on the 6-minute walking test (639±53 vs 611±67, P=0.025). Conclusions: These results support the role of a multidisciplinary rehabilitation program in COVID-19 patients hospitalized in ICU and adds evidence that the implementation of rehabilitation programs in ICU could Result in beneficial outcomes for the critical ill patients.

Assessment of the usability of SARS-CoV-2 self-tests in a peer-assisted model among factory workers in Bengaluru, India
Meghana Pydi 1, Neha Parikh 1
1 Swasti Health Catalyst, Bengaluru, India, 2 Swasti Health Catalyst, Karnataka, India

Background: The covid-19 pandemic exacerbated inequities in healthcare for vulnerable populations and exposed structural gaps in the health system in India.
During the pandemics peak, access to quick, accurate, and affordable testing method was scarce due to overburdened public and private testing centers. Self-testing kits for home-based use for detecting the sars-cov-2 virus were introduced as a tool to bridge the gaps of conventional testing. This study aimed to determine the usability of SARS-CoV-2 self-tests in a peer-assisted model among factory workers in Bengaluru, India. Methods: This mixed-method cross-sectional study of 106 factory workers in Bengaluru, India evaluated the usability of a nasal sampling-based covid-19 antigen self-test kit (PANBIO®) in a peer-assisted model from February to march 2022. An observer used a product-specific usability checklist consisting of critical and non-critical steps in the IFU to record the usability of the test kit and the mobile application as the participant performed the test with peer assistance.

Results: the average usability score of the test kit was 80.6% and the average usability score for uploading results through the mobile application was 34.01%. 62.0% of participants were confident in performing and interpreting the test with the assistance of a peer. Whereas, 43.9% of participants were confident in performing and interpreting the test on their own suggesting that peer assistance is a key determinant for the usability of self-tests in marginalized populations.

Conclusions: Results of the usability and acceptability study suggest that a nasal sampling-based self-testing kit for covid-19 shows overall moderate to high levels of usability and high levels of acceptability in a peer-assisted workplace testing model. The feasibility of implementing this model at scale is the next step to inform and advocate for other workplace self-testing programs for vulnerable populations.

Inflammatory markers and hematologic indices in the prediction of severity of COVID-19: a single center study in Southern Philippines
Meccar Elino1, Michael Pecaco1
1Department of Health, Southern Philippines Medical Center, Davao City, Philippines

Various diagnostic tests across COVID-19 literatures were employed as surrogate markers in COVID-19, wherein interleukin-6 (IL-6) – gauge for cytokine storm or impending severity – is not readily available on third world countries particularly Philippines. This study determined the clinical value of inflammatory markers and hematologic indices as warning indicators in the prediction of severity of COVID-19 infection. Cut-off values were also determined.

Methods: Demographics, baseline inflammatory markers and hematologic indices were retrieved from the database covering April-December 2020 as a single-center retrospective cohort. Univariate, Multivariate, and Receiver Operator Characteristic analyses were done. There were 1,368 patients: 845 noneverse cases (61.77%) and 523 severe cases (38.23%). Diabetes, hypertension, leukemia, cancer, cardiovascular disease, chronic lung disease, liver disease and chronic kidney disease are seen more in severe group. HIV did not establish significant difference between two groups. Markers C-reactive protein (CRP), lactate dehydrogenase (LDH), ferritin & procalcitonin; and indices neutrophil-to-lymphocyte ratio (NLR), fibrinogen, & D-dimer are significantly higher in severe group. Diabetes (OR 2.19, 95% CI 1.01-4.76 p<0.05) and cancer (OR 4.58, 95% CI 1.24-4.76 p<0.05) emerged as potent independent risk factors for COVID severity. CRP (OR 1.24, 95% CI 1.12-1.37 p<0.05), LDH (OR 1.02, 95% CI 1.00-1.04 p<0.05), and ferritin (OR 1.004, 0.998-1.009 p<0.05) show the highest predictive value in developing severe COVID-19.

Optimal cut-off values predict severity of determined more than 1.85 mg/dL for CRP (79% Sensitivity, 84% Specificity), more than 644.85 U/L for LDH (78.7% Sensitivity, 81.6% Specificity), and more than 621.4 mg/mL for ferritin (71.3% Sensitivity, 74.8% Specificity). Noneverse cases with diabetes, cancer, and high levels of CRP (>1.85 mg/dL), LDH (>644.85 U/L), and ferritin (>621.4 mg/mL) have high predilection to become severe or O2-requiring in the course of infection. utmost caution and monitoring at the onset are warranted.

Hand Hygiene (HH) pre and post-SARS-CoV2 pandemic: What are we missing?
Valeria Reynolds-Cortez1, Maria Haro2, Maria Carralero-Palomero2,4, Mar Gomez-Santillana3,4, Edgar Silva-Contreras2,4,5
1Servicio de Salud de Castilla-La Mancha (SESCAM), Spain, 2Hospital Virgen de la Luz, SESCAM, Cuenca, Spain, 3Servicio de Salud de Castilla-La Mancha (SESCAM), Spain, 4Hospital Virgen de la Luz, Spain, 5Hospital Virgen De La Luz, Spain

Healthcare-associated infections (HAI)s are a public health problem. Many of the HAI’s are preventable by following the 5 Moments for HH from WHO. We compared the degree of compliance of HH(DCHH) and the consumption of alcohol-based solutions (ABS) in our hospital in the years 2017-2019 (pre-pandemic) and 2021 (post-pandemic). The observation of DCHH was carried out annually from 2017-2021 according to the WHO methodology; with the exception of 2020 due to the COVID-19 pandemic. Self-reporting of healthcare-associated infection is reported by the purchasing department and is an indirect indicator of the DCHH. The variables studied are: Consumption of ABS in liters x 1000/Patient Days per year (LPP); Number of HH actions observed (HAAO) x 100/Number of HH opportunities observed per year for each of the moment from WHO. For the analysis we used the program SPSS 24.0, x2 or t-student with [95%] and p<0.05. In 2017, LPP was 11.9% (925000/772277); overall HAAO 31.8%(84 actions/264 opportunities); Indication 1(I1) 28.3% (30/106); Indication 2(I2) 14.7% (5/34) Indication 3(I3) 11.1%(2/18); Indication 4-5(I4-5) 44.3% (47/106). LPP was 44.2% (337660/76475); overall HAAO 48.2%(370/768); I1 41.9%(136/325); I2 12.6%(52/239); I3 56.8%(45/79); I4-5 51.4%(167/325). 2019: LPP was 12.5%(839487/67153); overall HAAO 31.5%(218/692); I1 25.0%(73/292); I2 6.5%(2/31); I3 2.6%(7/77); I4-5 48.3%(141/292). 2021: LPP was 9.5%(669580/70161); overall HAAO 38.5%(119309); I1 27.8%(27/97); I2 18.6%(11/59); I3 39.3%(22/56); I4-5 60.8%(59/97). LPP from 2017-2019 was 23.2%(5141278/220855) vs. 2021’s 9.5%(669580/70161). For the year 2021, the global HAO RR 0.9[0.5-1.2] p =0.8; I1 RR 0.8[0.5-1.2] p =0.3; I2 RR 0.7[0.9-1.009 p<0.05); I3 RR 1.40 [1.22-1.60] p<0.05; I4-5 RR 1.5[1.1-2.2] p<0.05. LPP for 2021 was lower (9.5%) than in pre-pandemic years (23.2%). The I-4-5 was significant. Healthcare workers appear to perceive the potential risk of cross-transmission only after making contact with the patient, or perhaps their actions are based on self-protection. It is essential to continue training in HH in favor of patient safety.

Loneliness across the COVID-19 Pandemic: an Irish cohort study.
Joanna Power1, Philip Hyland2, Michael Daly2
1Department of Psychology, Maynooth University, Maynooth, Ireland, 2Department of Psychology, Maynooth University, Maynooth, Republic of Ireland

Background and Objectives: Loneliness and existential loneliness are undesirable states which may have been inflated during the COVID-19 pandemic across the population. The Objective was to assess trajectory of loneliness among Irish adults during the COVID-19 pandemic, predictors of baseline and changes in loneliness over time, and to evaluate existential loneliness towards the end of the pandemic, and its correlates.

Methods: Longitudinal panel data were gathered from 1041 participants aged 18-80 from 31st March 2020 across four waves. Latent growth models in a structural equation modelling context were used to evaluate change in loneliness over time. A separate structural equation model was used to evaluate correlates of existential loneliness.

Results: At a group level there was little change in loneliness over time (estimate = 0.04) and participants were on average moderately lonely at baseline (intercept estimate = 1.62). At baseline loneliness was associated with: being younger, not being in a relationship, being employed in healthcare, lower levels of neighbourhood belongingness, social contact from family, and higher levels of depression. Change in loneliness was associated with: being employed in healthcare (negative change, possibly regression to mean), and depression levels (negative change, again likely regression to mean). Existential loneliness was associated, cross-sectionally, with loneliness (beta = .46), depression (beta = .31), sex (beta = -.134), age (beta = -.19), relationship status (beta = .14), and empathy (beta = .151).

Conclusions: We describe correlates of loneliness in the first Irish lockdown of 2020, as well as predictors of changes in loneliness across the pandemic, and correlates of existential loneliness at a later stage in the pandemic. Results indicate that those working in healthcare in particular had highest levels of loneliness during the first lockdown. Results are discussed in the context of potentially informative theoretical frameworks of loneliness.

Characteristics and outcomes of COVID-19 among people living with HIV at Eka Kotebe General Hospital, Addis Ababa, Ethiopia
Nebiyat Ahmed1
1Department of Internal Medicine, Eka Kotebe General Hospital, Ethiopia

Introduction: Evidence about the interplay between HIV and COVID-19 are not entirely consistent.
Objectives: Compare the adverse outcomes of COVID-19 among people living with and without HIV/AIDS and explore factors that determine outcomes. Methods: We conducted a retrospective cohort study on medical records of patients who had a positive RT-PCR for COVID-19 and were admitted to Eka Kotebe General Hospital from March 2020 to October 2021. Results: Four hundred twenty-seven, 108 exposed (people living with HIV/AIDS) and 319 non-exposed (people without HIV/AIDS) were included in the study. The median age for PLWH and people without HIV was 49.5 (40–59) and 48 (32–65) respectively. Of those, 258 (60.4%) were male. There were significant differences between PLWH and people without HIV in terms of age, TB, pregnancy, chronic liver disease, complications, shock, WBC count, and end outcome (alive or dead). There was no association between HIV status and the need for oxygen, ICU admission, and disease severity. After adjusting for other variables, mortality was significantly higher among PLWH (AOR = 2.25, 95% CI 1.11-5.56, p=0.023). Conclusions: PLWH with COVID-19 have a higher rate of in-hospital mortality than people without HIV, although there was no association between HIV status and the requirement for ICU admission, mechanical ventilation, oxygen support, or the severity of the disease at the time of admission.

Social connectedness and emotional health during the COVID-19 pandemic: a population-based latent profile analysis examining changes in connectedness and emotional health amongst adolescents in British Columbia, Canada

Eva Oberle1, Maram Livermore1, Eva Oberle1, Maram Livermore1, Ryan Ji1
1The University of British Columbia, Canada

This study examined profiles of social connectedness among early adolescents in grade 7 before the COVID-19 pandemic was declared (Winter 2020), and again in grade 8 during the second Wave of the pandemic (Winter 2021), applying a person-centered approach. Linked data from 1753 early adolescents (49% female) from British Columbia (BC), Canada who completed the Middle Years Development Instrument (MDI) survey in grade 7 and 8 were used. Elementary and middle schools in the province of BC were open for in-person instruction during the 2021 school year. Students reported on positive (life satisfaction) and negative (depressive symptoms) mental wellbeing indicators and connectedness with peers, and adults at home, school and in the community. Latent Profile Analysis was performed to identify profiles of connectedness for students in grades 7 and 8. Latent Transition Analysis was performed to examine transitions in connectedness profiles from grade 7 to grade 8. Multiple regression analyses examined the associations between profile membership in grade 7 and mental wellbeing in grade 8. Further analysis examined the association between transitions in profile membership between grades 7 and 8 (i.e., increases versus decreases in connectedness over time) and mental wellbeing in grade 8. We found that connectedness in multiple domains in grade 7 was related to significantly higher levels of mental wellbeing in grade 8, controlling for early adolescents’ demographic Background, wellbeing in grade 7, and COVID-related mental health worries. Wellbeing was highest for those who felt highly connected in all domains and lowest for those who felt consistently lower levels of connection. Profile membership was relatively stable over the two time points. However, for those who transitioned to a different connectedness profile, increases in connectedness were related to improvements in mental wellbeing and decreases were related to a decline in wellbeing over time.

Strength of community engagement in controlling and preventing COVID-19 in a highly vulnerable Māori populated region in New Zealand

Anura Jayasinghe1, Hine Mokee-Murray2
1Health New Zealand, Taifirihiti, Gisborne, New Zealand, 2Te Kupenga Net Trust, New Zealand

Background and objectives: Taifirihiti district in New Zealand has a unique demographic and geographic makeup in which Māori represent 53% of the population and are disproportionately represented in adverse health and social outcomes. In this context, an equitable response was required to ensure all families and communities could access timely support to minimise the impact of COVID-19, despite existing stressors, including comorbidities, economic deprivation and housing stress. The programs primary Objectives are to establish a community-led, clinically partnered and locally structured program to respond to the COVID pandemic, to coordinate responses to reduce the risk of fragmented service to families, and to mitigate community transmission of COVID. Methods: Public Health identified a well-established community organisation named “Te Kupenga Net Trust” which had already delivered a range of welfare services to indigenous population groups in the region. Representatives of the leading partners engaged with the trust, and the service structure was transformed into a COVID service provider named “Takatū Hub”. Public Health and the main co-partners through the Takatū Hub provided welfare, psychosocial support, primary care, and support for testing and isolation. Results: The majority of 16,784 local COVID patients and their families received immediate medical and welfare advice from the service. Taifirihiti Māori COVID hospitalization rate is remarkably lower (1.8/1000) than the national rate (3.08/1000). This could be related to better community care in Taifirihiti through this specific programme. This programme generated other positive effects, such as: a new and unique workforce trained with the agility and ability to respond to exceptional circumstances, strengthened relationships between agencies, and shared learnings and successes evident in different parts of the service continuum. Conclusions: This exercise has demonstrated that localised and community-led establishments can be transformed into other health settings in public health crises and provide community support and care to reduce hospitalization.

DOI: 10.18332/popmed/165024

Effects of COVID-19 vaccination type and doses on symptoms and hospitalization of healthcare professionals having SARS-CoV2 infection

Fatma Akcakaya1, Bedia Ozyildirim1, Sezanur Turkoglu2, Leyda Acar2
1Department of Public Health, Faculty of Medicine, Bezmialem Vakif University, Türkiye, 2Department of Public Health, Faculty of Medicine, Bezmialem Vakif University, Türkiye

Background: It is an important issue for public health to protect healthcare professionals who are fighting the virus most closely in the COVID-19 pandemic from illness and hospitalization with vaccines. It was aimed to investigate the effects of different types and numbers of vaccines administered for COVID-19 in isolated healthcare professionals in Turkey on symptoms and hospitalization. Methods: Between February 2021-March 2022, questionnaire were applied to healthcare professionals who tested positive for COVID-19 infection, at home or on the first day of the isolation process in the hospital, by telephone interview. The data obtained were evaluated as a retrospective cohort study. Results: 71.3% of people in the study (N=690) were female, mean age was 31.6 ± 8.9 years. 634 people (91.9%) said they had at least one dose of vaccine, 150 people (21.7%) said they had COVID at least once before our follow-up. 182 people (26.4%) who had at least one dose of vaccine received only sinovac vaccine, 112 people (16.2%) received only biontech vaccine and 293 people (42.5%) received both vaccine types. The most common symptoms on the first day of our calls among 690 people were nasal discharge/congestion (58%), cough (57%), musculoskeletal pain (56.5%), sore throat (55.5%) and fever/chills/chills (43.2%). After the diagnosis of COVID-19 14 people (2.0%) were hospitalized. Hospitalization was found to be statistically higher in those who were not vaccinated (p=0.003). The rate of loss of taste and smell and dizziness were found to be statistically higher in the unvaccinated compared to the vaccinated (respectively p=0.036, 0.032, 0.030). The high rate of hospitalization, loss of taste and smell, and dizziness in unvaccinated patients is an important indicator of workforce loss in healthcare professionals and poses a serious threat to public health. Giving priority to healthcare professionals in vaccination programs is extremely important for the uninterrupted continuation of health services in future pandemics. The continuation of this study with a larger sample is a significant issue that should be considered in terms of protecting public health.

DOI: 10.18332/popmed/165011

Pediatric COVID-19 population in Tunisia from 2020 to 2022: clinical characteristics and risk factors of severity

Arwa Nefati1, Hela Ghali1, Rania Bannour2, Sana Bhir1, Aroua Kamel3, Emna Hariz1, Fatmaezalha Khourya1, Souhir Ayadi4, Salwa Kefachi5, Asma Cheikh1, Houyem Said1
1Department of Prevention and Safety of Care, Sahluol University Hospital, Sousse, Tunisia, 2Department of Prevention and Safety of Care, Sahluol University hospital, Sousse, Tunisia, 3Department of Prevention and Safety of Care, Sahluol university hospital, Sousse, Tunisia

Background: Tunisia was one of the countries with the highest COVID-19 mortality worldwide. Although clinical characteristics and risk factors for severe disease in COVID-19 patients have been described in many studies, works on the pediatric population are still scarce. Objectives: The aim of our study was to describe...
the clinical characteristics of COVID-19 in pediatric patients in a tertiary care center since the start of the pandemic until the end of hospitalization to identify their association to severe forms. Methods: Since the start of the pandemic, the prevention and security of care department has been recording all new cases of COVID-19 hospitalized in the various units in which these patients were hospitalized. Daily monitoring of the evolution of the patient's conditions was promoted by the hygiene technicians of our department. Results: Overall, 180 confirmed COVID-19 pediatric patients have been admitted in our hospital. Most patients were male (51.1%); the median age was 11 [8; 8] years. The median length of stay was 3 days [2; 8]. Comorbidities were present among 43.9% renal diseases (13.3%), coronary artery diseases (11.7%) and neurological diseases 6.7%. Most patients had an important degree of hypoxemia, with 12.8% of them requiring supplemental oxygen, and 4.4% needed intubation. The overall case fatality rate was 6.7%. The multivariate analysis revealed independent risk factors which were: male gender (p = 0.019, OR 1.363, IC [1.053;1.763]); use of nasal cannula (p = 0.03 - OR, 2.025, IC [1.397; 2.933]); optiflow (p = 0.10 - OR, 11.042, IC [6.366-19.155]); noninvasive ventilation (p = 10 - OR, 24.14, IC [13.78-42.29]); comorbidities (p = 0.001, 1.733[1.24; 2.42]) such as Hypertension, diabetes (p = 0.016,1.4[1.07, 1.93]), neurological disorders (p = 0.025, 1.6[1;06; 2.53] and obesity (p =10-3;941;838.45)). Conclusions: Identifying these risk factors is of tremendous importance to improve the management of pediatric patients at risk of severe forms and to guide the development of preventive measures.

Popul. Med. 2023;5(Supplement):A330 DOI: 10.18332/popmed/165038

Voices of Society: the emergence and contributions of civil-society practices aiming to engage in COVID-19 management

Sophie Kemper1, Renate Broek2, Sarah Hamerens3, Frank Kupper4, Marloes Mouters5, Marion Vries6, Aura Timen7
1 National Coordination Centre for Communicable Disease Control, National Institute for Public Health and the Environment, Bilthoven, The Netherlands, 2 National Coordination Centre for Communicable Disease Control, The National Institute for Public Health and the Environment, Bilthoven, The Netherlands, 3 National Coordination Centre for Communicable Disease Control, The National Institute for Public Health and the Environment, Bilthoven, The Netherlands, 4 Athena Institute, Faculty of Science, VU University Amsterdam, Amsterdam, The Netherlands, 5 National Coordination Centre for Communicable Disease Control, National Institute for Public Health and the Environment, The Netherlands, 6 National Centre for Public Health and Environment, The Netherlands, 7 Department of Primary and Community Care, Radboud University Medical Center, Nijmegen, The Netherlands

Background: In COVID-19 management (CM) complex trade-offs are made between health, society, and economy. During the pandemic, parts of the public have mobilized themselves in civil-society engagement practices (CSEPs), to improve or suggest alternative CM-practices. This study explores the motivators to establish CSEPs aiming to influence CM and their perceived contributions to CM, with the main aim to study whether integrating views of CSEPs has added value in CM. Methods: A systematic online search identified eligible CSEPs in the Netherlands. Their corresponding characteristics were mapped based on publicly available information, such as local/national scope, the topic of focus in CM, and the goals CSEPs aimed to achieve. Subsequently, CSEPs were interviewed to collect the motivators to establish and perceived contributions to CM. Results: Twenty-two CSEPs were identified, of which fourteen were interviewed. Interviewed CSEPs indicated several motivators for establishing: a perceived lack of governmental action, democratic values, and diversity of perspectives in CM. A shortage of equipment and means to help, solidarity to contribute to controlling COVID-19, and differences in views with the government regarding CM Aims. All CSEPs believed to have contributed to policy or society, such as influencing opinions of citizens and persons with decision-making authority, or occasionally altering CM. Moreover, CSEPs encountered obstacles in their attempts to contribute to CM such as not being able to establish contact with authorities, and feeling unheard or misunderstood during contact. Also, CSEPs indicated that the interplay of political interests complicated their ability to contribute. Conclusions: Overall, CSEPs have fulfilled various roles such as providing ideas, producing equipment and informing. The emergence of CSEPs uncover discrepancies between CM and public views. These insights, together with the identified perceived barriers of CSEPs, can be used to improve the connection between (future) management of pandemics and public priorities and interests.

COVID antibodies in patients treated with immune suppressive drugs after 4 doses of vaccination

Jose Alfonso-Sánchez1, Luis Lopez-Cerrillo2, Paula Julian-Pachés3, Andrea Benavides-Hernández4, Martina Gimenez-Azagra5, José Mayordomo-Sánchez6, Isabel Jesús-Maria7, Ignacio Banerre-Hernández2, Andrea Agurto-Ramírez2, José Martín Moreno1
1 Universidad de Valencia, Spain, 2 Hospital General Universitario de Valencia, Spain

Introduction: CD20 is a phosphoprotein expressed on the surface of B lymphocytes. Antigen binding to CD20 causes a reduction in the number of CD20+ cells through three mechanisms: antibody-dependent cell-mediated cytotoxicity, complement-mediated cytotoxicity, and induction of B cell apoptosis. Objective: to know the level of COVID antibodies produced in immunosuppressed patients with anti-CD20 drugs after their 4 doses of COVID-19 vaccine. Material and Methods: A group of patients with autoimmune pathologies was obtained with inclusion criteria (being in conditions of immunosuppression or autoimmune disease, being able to control them for antibodies, knowing their basic characteristics) and exclusion criteria (lost patients). In the end, 447 patients were included. Variables studied Ac of COVID (Quanti), age in years, sex, drug, treatment time.

Results: In the final analysis of the results, the mean age was 63 years, being somewhat higher in men than in women, and the mean of Ac of covid was 243. In the multiple regression taking the number of antibodies as the dependent variable, the significant variables were: the treatment time coefficient 2.47 (1.5-3.2), and the age of the patients with 1 9 (1.3-2.8). The interactions between the different variables were not significant. Conclusions: The factors that conditioned the level of antibody response in covid-19 vaccination in this type of patient were the time of treatment and age. Keywords: covid vaccination, antibodies, immunosuppression

Popul. Med. 2023;5(Supplement):A332 DOI: 10.18332/popmed/165081

Yousif Khattee1
1 Azadi Public Hospital, Iraq

The healthcare landscape in many countries around the world has failed to change quickly to respond to the necessities of the COVID-19 pandemic. Meanwhile, the demand for healthcare services during the pandemic has plunged rapidly and government responses were limited to the healthcare system, the human labor in the healthcare system, healthcare infrastructure, and government financial contribution prior COVID-19 and the government preparedness for pandemics. COVID-19 has been a serious challenge for the global markets and for labor in all sectors, however, the healthcare worker have had many difficult and serious challenges including encountering COVID-19 with limited information on this contagious virus, dealing with the infected patients, dealing with their family needs and running hospitals and healthcare centers to assure required healthcare services are delivered properly. For healthcare workers hospitals impose mandatory work at healthcare locations, while for many other organizations and institutions a new trend of working remote or online from home was practiced. The sudden switch to work in hospitals and in COVID-19 centers has created fear even for healthcare workers to expose to the threat directly because when healthcare workers were infected hospitals did not have enough capacity to even take care to their workers. The sample of this study will focus on Easter European economics while compare them to the Middle Eastern economics, the healthcare workers in both regions as the two case studies will be analyzed. The study is guided by few essential questions are: to what extent healthcare workers got supported to avoid them encounter serious financial difficulties during the COVID-19 pandemic? Compliance to health risk warning in notification of COVID-19 - close contacts of exposure and Self-monitoring requirements

Si Chong1, Benjamin Seah2, Andrea Lim1, Xin Chong1, Peter Law1, Joan Lee1
1 Ministry of Health, Singapore

Aim: We aim to describe the overall compliance rates in the electronic acknowledgement of HRW notification receipt and submission of ART results and its contribution to effective pandemic management. Methodology and Results: Based on electronic records held centrally. From 1 Nov 21 to 31 Jan 22, a total of 435,598 Health Risk Warning (HRW) notifications were sent via SMS to close contacts of COVID-19 cases. 95.56% of the intended recipients
acknowledged receipt electronically and 95.04% of the pHRWs submitted ART result submission compliance rates. Discussion: Plausible explanations for the trend observed include a relatively higher proportion of the elderly being non-conversant in the English language or who had a lower level of digital literacy. Those living alone and/or who are socially isolated during the pandemic may have experienced difficulties obtaining assistance in terms of interpreting and responding to these electronic messages. Given the widespread acceptability of SMSs as an electronic means to quickly notify close contacts of all ages, their exposure and prescribed public health actions, we are of the opinion that it is a valuable tool and should be used for future pandemics in populations characterised by a high level of social responsibility and high mobile phone penetration rate. However, particular attention should be paid to individuals aged 81 to 85 years old and in the adjacent age bands as they were noted to be characterised by low acknowledgement and compliance rates, presumably due to lower IT literacy and limited accessibility to electronic devices.

Young people’s guide to the COVID galaxy: preferences for COVID-19 research communication

Caitlin Douglass 1

DOI: 10.18332/popmed/165087

Background and Objective: Research communication is critical for raising awareness of COVID-19 prevention measures and optimising public health responses. However, research is often communicated in ways that exclude participants, including young people. This study aimed to understand young people’s preferences for COVID-19 research communication in Australia. Methods: In February 2022, we conducted four online Zoom workshops with two groups of young people aged 18-22 years. Workshops went for two hours each and involved activities where participants could contribute ideas through verbal discussion and text, pictures and drawings on a virtual whiteboard. Workshop one focused on building relationships between participants and researchers and developing skills to ask open ended questions. Workshop two explored perceptions of existing research communication. Workshop three explored young people’s ideas for communicating COVID-19 research and workshop four involved generating recommendations. Data including transcripts and whiteboard materials, were entered into NVivo and thematically analysed. Results: Nine young people participated in the workshops (3 female, 3 male and 3 non-binary). Participants expressed the need to communicate research relevant to their experiences, including the challenges they faced throughout the pandemic and their positive contributions to society. Although participants trusted evidence communicated by reputable organisations, they identified an opportunity for young people to collaborate with researchers to produce authentic and reliable content. Young people appreciated when researchers highlighted their most important Findings using clear visuals, animations, infographics and humour. Given the overwhelming amount of COVID-19 information, research needed to be accessible and integrated into platforms young people were already using, such as short videos on TikTok and Instagram. Conclusions: Findings suggest there are opportunities to make COVID-19 research communication more relevant for young people by incorporating their experiences and ideas. Further studies where researchers partner with young people are needed to develop and test content using social media.

Severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2) infection in household contacts and related factors during the first and second waves of the COVID-19 pandemic in Chile: a longitudinal cohort study

Carmen Urquidi 1,2, Ornella Realini 3,4, Maria Valenzuela 1, Maximiliano5

DOI: 10.18332/popmed/165114

Background: Households are the high-risk setting for SARS-CoV-2 transmission, especially for close and prolonged person-to-person contact. However, the role of household structural and clinical factors, especially angiotensin-converting enzyme 2 (ACE2), is scarce studied. We analyzed the household SARS-CoV-2 transmission patterns during the first and second waves of the COVID-19 outbreak and associated factors in household contacts. Methods: We conducted a prospective cohort study of 109 household clusters with a 60-day follow-up (109 index cases and 248 household contacts) in a selected population in Santiago de Chile. Home interviews measured: compliance with non-pharmaceutical interventions, household structures, symptoms questionnaire; comorbidities and peridontal condition self-report; and saliva samples and nasopharyngeal swabs for ACE2 and SARS-CoV-2 viral load determination. The secondary attack rate (SAR) of SARS-CoV-2 risk factors was assessed using Poisson random-mixed models. Incidence Rate Ratios (IRR) and p-values are reported. Results: The baseline SAR in household contacts was 0.478 (within household variations of 0.03) and 0.488 at the end of the follow-up. Of infected households, 13.6% of contacts were asymptomatic at baseline 23.7% and 12.7% at 7-day and 14-day follow-up, respectively. Infected household contacts were younger (35.9 vs. 41.1 y, p=0.02), less hypertensive (9.3% vs. 18.5%, p=0.03), and had lower levels of ACE2 (0.04 ng/dl vs. 0.07 ng/dl, p=0.02) than those uninfected. Factors associated with household transmission were a greater number of adult inhabitants (IRR 0.77, p<0.01) and a greater number of rooms (IRR 0.8, p=.003). Conclusions: In our study, during a COVID-19 when index cases were enrolled, more than 48% of their household contacts were already infected. The composition and structure of the home play an essential role in preventing household SARS-CoV-2 transmission. The ACE2 levels may play an important role in household contacts, but further studies are needed.

Hospital hand hygiene after COVID-19: has the pandemic heightened healthcare workers’ awareness?

Margherita Zeduri 1, Alice Sgueglia 1, Giacomo Vigezzi 2, Marina Lanave 2, Rebecca Galvi 2, Alba Mizzi 2, Anna Odone 2

1Department of Public Health, Università degli Studi di Pavia, Pavia, Italy, 2Medical Direction, Fondazione IRCCS Policlinico San Matteo, Pavia, Italy

Hand hygiene (HH) is the most effective, low-cost measure for preventing transmission of healthcare-associated infections (HAI), and a cornerstone to COVID-19 prevention. Aim of this study is to assess Healthcare Workers’ (HCW) adherence to WHO optimal practices, in order to promote a culture of safety and quality infection prevention and control (IPC) activities. Fondazione IRCCS Policlinico San Matteo, Pavia (Italy), implemented a monitoring plan in which HCWs’ adherence to HH procedures was evaluated using WHO’S 5 moments guidelines, technical manual and observation form. Direct field observations by trained personnel took place from March to October 2022. Process index was HH adherence, stratified by profession, opportunity and unit, with each being inspected at least twice. Overall, 953 HCWs were observed within 18 hospital units (334 physicians, 375 nurses, 190 healthcare assistants, 25 students). Out of 4245 opportunities, global adherence was 52% with 606 handwashings and 1605 handrubings. The indication with the highest adherence was “after body fluid exposure risk” (69%), whereas the lowest were “before touching a patient” (43%) and “after touching the patient’s setting” (44%). Adherence was higher in specialist surgeries and haematology units, while the worst performances were reported in general surgery ward (33%), Physicians’ and nurses’ adherence was respectively 46% and 60%. Audits occasionally revealed non-conformities in glove use (i.e., unnecessary use, not changed between patients, hand rubbing on gloves). These findings could be directly linked to habits acquired during the pandemic, when HCWs tended to consider COVID-19 patients as a whole block, to shield themselves from infections. HH awareness has changed in the wake of the pandemic and our study reports how specific initiatives are needed to promote correct HH and optimal practices among HCWs. Therefore, the COVID-19 pandemic reinforced the importance of handwashing and IPC, showing the key role of the HCWs’ adherence to HH procedures.

Mitigating the psychological impact of COVID-19 on care givers at Dodoma Municipality, Tanzania

Caring for Long COVID patients in primary health care: a cross-sectional study among general practitioners in Belgium and Malta

Sarah Moreels¹, Sarah Cusciieri², Sherrane Bensemmann³, Robrecht Schreye³

¹Epidemiology and Public Health, Sciensano, Brussels, Belgium, ²Department of Anatomy, Faculty of Medicine and Surgery, University of Malta, Msida, Malta, ³Epidemiology and Public Health-Sciensano, Brussels, Belgium

Background and Objective: At least 10% of COVID-19 recovered individuals experience persistent symptoms (Long COVID), with primary health care and general practitioners (GPs) at forefront in their care. In this study, GPs’ knowledge, perception and experience on Long COVID, and the definition used across two countries are investigated to provide insight in their care at cross-country level.

Methods: A cross-sectional study targeting GPs was conducted in Belgium and Malta during mid-2022. An online survey on Long COVID was disseminated. Country-specific practice and demographic characteristics were collected. Descriptive and logistic regression analyses were performed.

Results: A total of 150 GPs (Belgium=105; Malta=45) responded. Female GPs represented 58.0%, median age was 49 years (IQR: 37-61). In both countries, two in three GPs felt that Long COVID patients were not well followed up by primary care. Most GPs reported insufficient scientific knowledge and information on Long COVID diagnosis and treatment. Accessibility to educational material was limited and an awareness-rising campaign is merited, especially in Malta (OR=6.81, 95%CI [1.49;31.12]). For diagnosing Long COVID, 54.7% reported the requirement of a positive COVID-19 test, especially among Belgian than Maltese GPs (64.3% vs 45.2%, p=0.036). To assess Long COVID, GPs mainly implemented diagnostic criteria by themselves (47.3%) together with persistence of symptoms (4 weeks to 5 months). 76.0% GPs reported caring for Long COVID patients, irrespective of practice type and GPs’ country, sex or age (p=0.353; p=0.241; p=0.194; p=0.058). 48.3% of GPs reported to follow-up these patients by themselves (47.3%) together with persistence of symptoms (4 weeks to 5 months). 76.0% GPs reported caring for Long COVID patients, irrespective of practice type and GPs’ country, sex or age (p=0.353; p=0.241; p=0.194; p=0.058).

Conclusions: At cross-country level, most GPs provide similar (multidisciplinary) care to Long COVID patients. Although GPs perceive lack of scientific knowledge and training on Long COVID, similar diagnostic criteria were noted. Uniform guidelines, scientific support and training for GPs across Europe is a priority to augment their Long COVID approach.

Impact of COVID-19 vaccination on mortality from COVID-19 in Brazilian municipalities in 2021

Rômulo Paes-Sousa¹, Gabriela Silva¹, Mônica Castro², Anelise Souza¹, Gustavo Fernandes¹

¹Brazil, ²René Rachou Institute, Oswaldo Cruz Foundation, Brazil, ³Federal University of Ouro Preto, Brazil, ⁴Fiocruz, Brazil

Background and Objective: During the COVID-19 pandemic, Brazil had difficulties in carrying out a timely vaccination campaign throughout its territory, already marked by strong social and health inequalities. The combination of vaccination of delay and structural inequality produced a heterogeneous vaccine coverage across the country. This work aims to evaluate the differences in the impact of COVID-19 vaccination on mortality due to COVID-19 severe acute respiratory syndrome (SRAG-COVID) in the country municipalities. In 2022, the initial difficulties on providing adequate vaccination coverage were overpassed.

Methods: Ecological study from January to December 2021, with monthly data from 200 Brazilian municipalities in five Brazilian regions with at least 25 deaths from COVID-19 in January 2021. A linear regression model was performed for the country and regions, with log-log transformation and fixed effects in the estimation. First dose coverage was used as the independent variable and the dependent variable, first dose coverage as the independent variable and a significance level of 5%.

Results: The monthly average standardized mortality rate in January 2021 was 33.1 deaths/100,000 inhabitants, being higher in municipalities in the North and Midwest regions. Vaccination started in January 2021 and reached an average first dose coverage of 74.5% in December 2021, while the average mortality rate was 2.2 deaths/100,000 inhabitants, fifteen times lower than January 2021. A 10% increase in vaccination coverage caused an average decrease of 5.6% in the municipalities monthly mortality rate, with a significant effect in all regions, greater in the North (8.7%) and Northeast (6.3%).

Conclusions: Also in Brazil, vaccination was crucial for reducing deaths from COVID-19 and had a greater effect in the poorest regions of Brazil. A homogeneous increase in vaccination coverage, with a timely and well-articulated campaign by the central government, could be an important tool for reducing the country territorial inequalities.

Knowledge, attitudes, practices and perceptions around SARS

Rômulo Paes-Sousa¹, Gabriela Silva¹, Mônica Castro², Anelise Souza¹, Gustavo Fernandes¹

¹Brazil, ²René Rachou Institute, Oswaldo Cruz Foundation, Brazil, ³Federal University of Ouro Preto, Brazil, ⁴Fiocruz, Brazil

Background and Objective: During the COVID-19 pandemic, Brazil had difficulties in carrying out a timely vaccination campaign throughout its territory, already marked by strong social and health inequalities. The combination of vaccination of delay and structural inequality produced a heterogeneous vaccine coverage across the country. This work aims to evaluate the differences in the impact of COVID-19 vaccination on mortality due to COVID-19 severe acute respiratory syndrome (SRAG-COVID) in the country municipalities. In 2022, the initial difficulties on providing adequate vaccination coverage were overpassed.

Conclusions: Also in Brazil, vaccination was crucial for reducing deaths from COVID-19 and had a greater effect in the poorest regions of Brazil. A homogeneous increase in vaccination coverage, with a timely and well-articulated campaign by the central government, could be an important tool for reducing the country territorial inequalities.

Impact of COVID-19 on public health systems and practice in 3 districts from the perspective of public health leaders: a qualitative study in Uganda

Tanzania Background: COVID-19 outbreak started at Wuhan city in China, December 2019. On January, 2020 WHO declared it as, public health emergency and upon projection Sub-Saharan Africa was expected to see high number of deaths by 2020, because of poor and limited healthcare systems. In Tanzania by June 2022, there were 509 reported cases and 21 deaths from COVID-19 infection, among all reported cases were 82.6% asymptomatic COVID-19 cases and 17.4% had mild to moderate disease. The pandemic psychological impact was still unclear therefore understanding the psychological burden of the COVID-19 pandemic among caregivers is crucial in guiding policies and interventions to maintain their psychological well-being. Study Objective is to assess the psychological impact of COVID-19 in care givers of Dodoma Municipality in Tanzania. Methods: A cross-sectional study design was used, random sampling and purposeful sampling for select participants employed. The study established a brief, confidential, self-administered questionnaire containing DAS-21 (Depression, Anxiety, and Stress Scales) designed enquiry, in software data collector (KoBo toolbox), data analyzed by IBM SPSS software version 23.

Results: The current study employed a sample of 246 Dodoma residents’ adults caregivers of COVID-19 patients, which found that psychological impact experienced by caregivers were commonly, anxiety, stress and depression was 83.7%, 76.4% 67.5 respectively, and peaking among nurses and family care givers, serving the frontline at hospital and quarantine center of COVID-19 patients. Mitigation of psychological burden, were achieved through taking precautionary measures of COVID-19, clear disease information, psychological support from family member, fellow staff and hospital managements, vaccination and least religious conviction. Conclusions: Generally, psychological burden has increased in COVID-19 caregivers, particularly among frontline health care workers, this may increase the risk of mood, sleep and functional disorders, therefore early psychotherapeutic interventions targeting this vulnerable group may be beneficial.
CoV rapid antigen self-tests among urban poor communities of Mohammadpur and Bangalore, India
Neha Parikh1, Syama Syam2, Ravneet Kaur1, Angela Chaudhuri1, Shankar A.G.1
1Swasti Health Catalyst, India

Background and Objectives: Urban poor are low-income, marginalized communities, particularly at risk of infectious diseases. COVID-19 exposed them to a range of problems that hindered access and utilization of health services perpetuating poor health outcomes and increased transmission. The knowledge and uptake of community-based-testing in vulnerable communities remains difficult, even in long prevailing conditions like HIV, more so for covid-19. Testing alone is insufficient unless it is integrated with the continuum of primary care. Although self-tests are approved for individual use, the feasibility, and acceptability of tests for the disadvantaged remains unclear. This study is aimed to determine the feasibility and acceptability of sars-cov-2 self-testing using a health worker-assisted model among 2 urban slums in India.

Methods: A mixed methods study is being conducted (aug- dec 2022) among urban poor in Mohammadpur and Bangalore, where health worker assisted self testing is introduced as part of an ongoing community intervention that provides comprehensive healthcare services.

Results: Preliminary findings indicate limited knowledge about self tests in urban poor. Reported uptake of tests was poor at 15%, with reasons of apprehension ranging from ability to complete tests, concerns about results and potential stigma from communities. Self reported willingness to undergo self-testing was high at 91%. Around 77% participants preferred some sort of assistance for conducting the self tests preferring tests to be conducted at existing community institutions. The next round of this study will measure the change in capacities and acceptability of the study at the endline.

Conclusions: Conventional covid-19-rtpcr testing presents a huge barrier for urban poor in terms of costs, access, loss of livelihood and stigma. Self tests are empowering, allowing vulnerable individuals control over their health. Results from this intervention will provide learnings for implementation and scale of self-tests bringing relevant findings for point-of-care devices and enable health system preparedness.

Popul. Med. 2023;5(Supplement):A342 DOI: 10.18332/popmed/165247

COVID-19 vaccine hesitancy in Western Balkans
Sanja Matovic-Miljanovic1, Smiljana Cvetkovic2, Vida Stojkovic2, Stefan Mandic-Rajcevic3, Janko Jankovic4, Michele Gross4
1Euro Health Group A/S, Saborg, Denmark, 2Department of Humanities, Faculty of Medicine, University of Belgrade, Belgrade, Serbia, 3Institute of Social Medicine, Belgrade, Serbia, 4Faculty of Medicine, University of Belgrade, Belgrade, Serbia, 5Public Health, Euro Health Group A/S, Saborg, Denmark

Background and Objectives: The uptake of COVID-19 vaccines in Western Balkan countries is lagging far behind the European Union average, with vaccine hesitancy as a serious threat and reason for the insufficient vaccination coverage and suboptimal herd immunity. Understanding factors that influence vaccine uptake in those countries is critical for development of effective vaccination promotion strategies for Western Balkans.

Methods: Cross-sectional research was carried out from July to October 2021. Convenience sampling included 1605 individuals aged 18 and above from Albania, Bosnia and Herzegovina, North Macedonia, Montenegro and Serbia. Online questionnaire was shared through social media. Results: In all countries both vaccinated and unvaccinated respondents consider the vaccine against COVID-19 to be more safe than effective. The most positive attitudes towards COVID-19 vaccine safety are found in North Macedonia (M=3.61, SD=1.17) and Serbia (M=3.50, SD=1.26). Around 40% of respondents believe that pharmaceutical companies are reluctant to publish research reports on risks of adverse reactions to vaccines. Over 70% respondents in Albania and North Macedonia and 66.5% in Montenegro and Bosnia see important role for primary health physicians in educating people on importance of vaccination and consider them as trusted sources of information about COVID-19. Women and those with higher education (Bosnia and Herzegovina, Montenegro and Serbia) manifest a more pronounced personal sense of social responsibility in achieving collective immunity. Respondents who assessed themselves as more religious consider vaccine against COVID-19 as less safe and effective, demonstrate less trust towards societal factors and are less likely to demonstrate social responsibility in the context of vaccine behaviour.

Conclusions: Family physicians should have a key role in promoting vaccination and educating public in Western Balkans. Partnerships with representatives of religious groups and awareness campaigns with focus on young people should be the core of public health interventions addressing vaccine hesitancy in Western Balkans.

Popul. Med. 2022;5(Supplement):A343 DOI: 10.18332/popmed/165263

Analysis of the preparedness for the COVID-19 pandemic in the rural areas of the Bolivian Chaco
Daria Bucci1, Vieri Lastrucci2, Francesco Cosmi3, Carlo Signorelli4,5, Maria Caldes6
1School of Medicine, Vita-Salute San Raffaele University, Milan, Italy, 2Department of Health Science, University of Florence, Italy, 3Epidemiology Unit, Meyer Children’s University Hospital, Florence, Italy, 4Convenio de Salud, Camiri, Bolivia, 5IRCCS San Raffaele Hospital, Milan, Italy, 6Centro di Salute Globale di Toscana Region, Meyer Children’s University Hospital, Florence, Italy

Public health emergency preparedness is essential to mitigate pandemics effects, especially in low-resource contexts. This retrospective analysis evaluates planning and response capacities, available resources, and care management, among indigenous communities living in rural areas of the Gran Chaco Region of Santa Cruz Department, Bolivia, during the first wave of the COVID-19 pandemic. Authors derived and pooled original data from local databases on positive cases, deaths, tests executed, and vaccination registers. The population was administered two surveys by convenience sampling of healthcare facilities of rural communities insisting in four municipalities of the Province and to heads of communities, accordingly. Data collection period was from May 2022 to June 2022. The first COVID-19 case in the area was recorded on April 17, 2020, and the maximum peak of daily reports during the first wave was 113 cases in September 2020. A total of 39 healthcare facilities were surveyed, insisting in 117 communities. Data from the healthcare facilities survey showed that 50% were prepared for the pandemic. Although approximately 85% of the pooled received information from the MoH on the contact tracing methodology, 65% received practical guidance on the clinical management of patients. 58% of the facilities arranged temporary beds, 71% in different locations (e.g. schools). Most facilities were supplied with equipment such as pulse-oximeters (79%), oxygen cylinders (75%), and antibiotics (63%). Only eight per cent of respondents stated the equipment was present before the pandemic began, while 46% received it afterward. 69% of respondents reported unpreparedness for the following wave. Rural communities of the Chaco were largely unprepared and suffering from pre-existing resource challenges for communities care. Although the first wave arrived six months later than the rest of the world, half of the responders reported an adequate preparedness level, and public policies did not address the region with appropriate interventions.

Popul. Med. 2022;5(Supplement):A344 DOI: 10.18332/popmed/165266

Involving cases and contacts more actively and autonomously in contact tracing through digital tools: a mixed methodsinvestigation among Dutch public health professionals involved in COVID-19 contact tracing
Yannick Helms1, Mart Stein2, Nora Hamdiui1, Akke Baron1, Renske Eilers1, José Ferreira1, Rick Crutzen1, Aura Timen1, Mirjam Kretzschmar2
1National Institute for Public Health and the Environment (RIVM), The Netherlands, 2National Institute for Public Health and the Environment (RIVM), Netherlands, 3Maastricht University/CAPHRI, The Netherlands, 4Radboud University Medical Centre, The Netherlands, 5Radboud University, The Netherlands, 6Utrecht University Medical Centre, The Netherlands, 7Julius Center for Health Sciences and Primary Care, The Netherlands

Background and Objective: Contact tracing (CT) can be an effective tool to prevent transmission of communicable diseases. However, public health services may not always have sufficient human resources at their disposal to facilitate CT adequately. In the EU-project ‘CORESMA’, we investigated if and how this may be compensated by involving cases and contacts more actively and autonomously in the identification, notification, and monitoring of contacts through digital tools, from the perspective of Dutch public health professionals (PHPs).

Methods: Between November 2020 and April 2022, we conducted interviews (N=17) and distributed an online questionnaire (N=637) among PHPs involved in CT for COVID-19 in the Netherlands. An inductive thematic analysis of the interviews was performed to identify barriers/facilitators influencing PHPs’ intention to involve cases and contacts in CT through digital tools. Random forest analyses of the questionnaire data were performed to prioritize the qualitatively identified barriers/facilitators to inform the future development and implementation of
Impact of the COVID-19 pandemic on stroke and ST-segment elevation myocardial infarction patient management: French regional registry

Florence Franca 1, Emilie Lesaïne 1, Sandrine Domecq 1, Laura Cetran 1, Pierre Costel 1, Sahal Habib 1, Catherine Pradeau 2, François Rouanet 7, Floriane Sevin 8, Igor Sibon 1, Florence Saillour-Glénisson 9

1 CHU de Bordeaux, France, 2 Bordeaux Population Health, University of Bordeaux, Bordeaux, France, 3 Centre Hospitalier Universitaire (CHU) de Bordeaux, Bordeaux, France, 4 CHU de Bordeaux, 5 Coro...
Background and Objective: The COVID19 pandemic associates a continuous diffusion at low intensity, with a majority of patients with poor clinical signs, and rapid accelerations with the combination of super spreading patients and situations, with high rates of severe cases. The nature and intensity of social relationships play a central role to predict its evolution. To better take into account the role of these relationships, we built a model based on percolation theory, and showed that it was a good predictor of the incidence of hospitalization. In this work, we compare our model, called PERCOVID, to the SEIR (Suspected, Exposed, Infected, Recovered) model considered as the reference for modeling epidemics. Methods: Time study was divided in five periods which played a major role in the propagation of the pandemic in France: initial underground propagation (December 2019 / January 2020), first wave and first lockdown (February / March 2020), first summer after lockdown (June / August 2020), spread of alpha variant (March / May 2021), decline of vaccine efficiency (October / November 2021). For each period, we shall compare the results of the PERCOVID and SEIR models for the same epidemiological and sociological parameters, emphasizing the role of local spread of the epidemic as compared to long-range contamination.

Results: In the periods of underground propagation and acceleration of the virus or its variants, SEIR type predictions largely overestimate the incidence rate as compared to predictions from PERCOVID. Both models perform similarly in the period of epidemic slowdowns, particularly when the mobility of the population is important. Conclusions: PERCOVID is a powerful tool in order to disentangle the intrinsic properties of the virus, like its infectiousness, from the nature of social relationships in the population under study and from the influence of any matter regarding the chronic consequences of the COVID-19 pandemic, although further studies are needed.

The impact of Long COVID Syndrome treatment and rehabilitation: systematic review and meta-analysis of patient-reported outcomes
Gianfranco Damiani1, Domenico Pascucci2, Mario Nurchis2, Gerardo Altamura2, Gian Raspolini3, Aurora Alizadeh1, Giuseppe Santoli1, Giulio Pasca2

1Institute for Collective Health, Università Cattolica del Sacro Cuore, Italy, 2Università Cattolica del Sacro Cuore, Italy

Background and Objective: COVID-19 pandemic resulted in an unprecedented public health crisis, in which efforts mostly focused on containment and treatment of acute disease. However, important disease sequelae are increasingly reported by clinicians and addressed in terms of treatment and rehabilitation needs. The long COVID syndrome (or post-COVID-19 condition) is a still poorly investigated condition, which makes the patients’ subjective evaluation of symptoms via Patient-Reported Outcome Measures (PROMs) vital. The aim is to evaluate treatment and rehabilitation interventions for long COVID management, through PROMs.

Methods: A systematic review was performed querying Medline, Scopus and Web of Science databases, according to the following inclusion criteria: evidence involving patients of all age groups diagnosed with long COVID syndrome, undergoing several physical and/or psychological interventions, and using PROMs to collect patients’ feedback. For each type of intervention meta-analyses were computed adopting the Paule-Mandel random-effects model, while T-tests were performed to investigate differences in efficacy between rehabilitation and treatment. All statistical analyses were conducted using statistical software STATA.

Results: Out of 481 papers reviewed, 16 met the inclusion criteria. Most frequently used PROMs were Euro-QL-5D, Hospital Anxiety and Depression Scale, and Perceived Stress Scale. Efficacy of physical interventions (SMD 0.29 95% CI 0.12–0.51), psychological ones (SMD 0.17 95% CI 0.05–0.36) and both (SMD 0.35 95% CI 0.18–0.71) was consistently proved. Evidence supported the efficacy of online-delivered interventions for all the categories; no statistical differences were found regarding the positive impact of both rehabilitation and treatment for all interventions (p>0.05).

Conclusions: There is promising evidence regarding Long COVID treatment and rehabilitation impact on patients’ quality of life and general well-being. This paper partially fills a literature gap on an actual and potentially persistent public health matter regarding the chronic consequences of the COVID-19 pandemic, although further studies are needed.

Achieving COVID-19 vaccination equity in South Eastern Metropolitan Victoria, Australia

Popul. Med. 2023;5( Supplement): A330
DOI: 10.18332/popmed/165330

Background: Implementation of quarantine and lockdown to COVID-19 pandemic has created dramatic negative psychological impact mainly the general populations health worldwide. We aimed to assess the prevalence and predictors of anxiety and stress severity among the Palestinian population.

Methods: A cross-sectional web-based survey was conducted. An anonymous online questionnaire and snowball recruiting technique were used to target the general public in Palestine between 6 and 14 April, 2020 during COVID-19 pandemic lockdowns. Multivariate logistic regression models were developed for the outcome variables.

Results: Of the 2819 individuals who completed the questionnaire, more than two thirds of them (72.6%) were females. Nearly (83.5%), were residing at the West Bank. The mean age of participants was 29.47 (SD = 10.97) years. The anxiety prevalence was (20.3%). In multivariate analysis, exposure to confirmed case of COVID-19, inadequacy of food supply and jobs that acquire leaving home during lockdown were significantly related to higher anxiety degree. As for stress, low monthly income, cohabitation with a person of a high-risk group and inadequacy of food supply were significantly related to higher stress degree.

Conclusions: Young adults with low socioeconomic status and inadequate food supply were more likely to have a higher degree of stress and/or anxiety. Providing alternative economical sources for those in need, and spreading more awareness regarding the pandemic, supporting the populations psychological wellbeing, community connection and the availability of specialist mental health services are crucial to overcome the mental impacts of COVID-19 in Palestine.

Popul. Med. 2023;5( Supplement): A349
DOI: 10.18332/popmed/165314

COVID-19 preventive behaviors and information sources: a cross-sectional study in Japan
Manae Uchibori1

1Keio University, Japan

Background and Objective: Individual preventive behaviours are one of the key ways needed to prevent the spread of COVID-19. The objective of this study was to identify the factors associated with the adoption of COVID-19 preventive behaviors, focusing on use and trust of information sources about covid-19.

Methods: A nationally representative cross-sectional survey of 30053 Japanese adults was conducted in February 2021. We estimated the associations between the adoption of COVID-19 preventive measures and a broad array of individual factors. A total of three multivariable logistic regression models was constructed to identify the factors associated with the adoption of each of three preventive measures: 3cs avoidance (“closed spaces”, “crowded places”, and “close-contact settings”), hand hygiene and respiratory hygiene.

Results: The prevalence of preventive behaviours was 35.92% for 3cs avoidance, 80.43% for hand hygiene and 67.66% for respiratory hygiene. After adjusting for covariates, socioeconomic variables, psychological variables, and the use and trust of information sources were statistically significantly associated with the adoption of three preventive measures. Trust in social media was associated with lower odds (0.91, confidence intervals 0.86-0.96), while trust in healthcare professionals was associated with higher odds (1.10, 1.05-1.16). The number of information sources used and the odds of adopting 3cs avoidance were positively associated, e.g. An odds ratio of 2.70 (2.48-2.94) for five or more sources in reference to one source. In addition, the greater the number of social media used as an information source, the higher the odds of avoiding the 3cs, e.g., an odds ratio of 4.55 (2.03-10.19) for six or more sources in reference to none. Similar results were observed for hand hygiene and respiratory hygiene. Conclusions: The findings indicate that access to multiple sources of information and social networks to provide public health messages may be important in promoting prevention measures for COVID-19.

What the COVID-19 pandemic teaches us about modeling epidemics?
Jean-François Mathiot1, Laurent Gerbaud2, Vincent Breton3

1Laboratoire de Physique de Clermont, Centre national de la recherche scientifique (CNRS), France, 2CHU Clermont-Ferrand, Clermont-Auvergne University, France, 3Laboratoire de Physique de Clermont, Centre National de la Recherche Scientifique (CNRS), France

Background and Objective: The COVID19 pandemic associates a continuous diffusion at low intensity, with a majority of patients with poor clinical signs, and rapid accelerations with the combination of super spreading patients and situations, with high rates of severe cases. The nature and intensity of social relationships play a central role to predict its evolution. To better take into account the role of these relationships, we built a model based on percolation theory, and showed that it was a good predictor of the incidence of hospitalization. In this work, we compare our model, called PERCOVID, to the SEIR (Suspected, Exposed, Infected, Recovered) model considered as the reference for modeling epidemics. Methods: Time study was divided in five periods which played a major role in the propagation of the pandemic in France: initial underground propagation (December 2019 / January 2020), first wave and first lockdown (February / March 2020), first summer after lockdown (June / August 2020), spread of alpha variant (March / May 2021), decline of vaccine efficiency (October / November 2021). For each period, we shall compare the results of the PERCOVID and SEIR models for the same epidemiological and sociological parameters, emphasizing the role of local spread of the epidemic as compared to long-range contamination.

Results: In the periods of underground propagation and acceleration of the virus or its variants, SEIR type predictions largely overestimate the incidence rate as compared to predictions from PERCOVID. Both models perform similarly in the period of epidemic slowdowns, particularly when the mobility of the population is important. Conclusions: PERCOVID is a powerful tool in order to disentangle the intrinsic properties of the virus, like its infectiousness, from the nature of social relationships in the population under study and from the influence of any...
The effect of health literacy on delayed COVID-19 vaccine: a cross-sectional study in Hong Kong
Yue Tian1, Eliza Wong1, Phoenix Mo1, Dong Dong1, Annie Cheung1
1 Jockey Club School of Public Health and Primary Care, Faculty of Medicine, The Chinese University of Hong Kong, Hong Kong, China

Background and Objective: Health literacy (HL) is an important determinant of health outcomes, as it determines individuals' abilities to process and use health-related information. However, the association between HL and vaccine delay remains unclear. This study aimed to assess how HL affected the delayed vaccination among Hong Kong adults.

Methods: A cross-sectional study using Quota sampling was conducted. Self-administered online questionnaires were distributed to a web panel. Multivariable logistic regression models were used to explore associations among three domains (i.e., functional, interactive, and critical) of HL and vaccine delay while adjusting for social demographic and health-related characteristics. Sensitivity analyses were performed to ensure the robustness of the Results.

Results: A total of 401 participants were recruited between August to September 2022. Over half (52%) of the participants have inadequate HL. The proportion of participants with delayed first and third doses of COVID-19 vaccination is 30.9% and 28.2%, respectively. In multivariable analysis, the risk of delaying the first dose was higher among participants with inadequate functional HL (OR = 0.58, p = 0.015) and adequate levels of two subdomains of critical HL (OR = 1.82, p = 0.013; OR = 1.91, p < 0.01). Participants who delayed their third doses were likely to have inadequate interactive HL (OR = 0.52, p = 0.014) and an adequate level of one subdomain of critical HL (OR = 1.71, p = 0.039). The sensitivity analyses confirmed these findings.

Conclusions: Functional and interactive HL were positively associated with COVID-19 vaccination. However, a negative association between critical HL and vaccination was reported. These findings indicate a challenge for health partners to promote vaccination campaigns to the public, especially those
with low functional and interactive HL and high critical HL. Researchers and policymakers may need to monitor and report HL when they study vaccination decision behaviours.

### Geographical intelligence applied to public health: the examples of Rio de Janeiro and Niterói municipalities (Rio de Janeiro, Brazil) to face SARS-CoV-2

Marcelle Rodrigues1, Antonio Oscar-Júnior1, Pedro Castro2, Francisco Mendonça3, Mariana Silva4, Júlia Silva5, Thiago Fogaça6

1Programa de Pós-Graduação em Geografia da Rio de Janeiro State University (PPGEO/UEJ), Rio de Janeiro, Brazil, 2Rio de Janeiro State University, Rio de Janeiro, Brazil, 3Programa de Pós-graduação em Geografia Universidade Federal do Paraná, Brazil, 4PPGEO/UEJ, Rio de Janeiro State University, Rio de Janeiro, Brazil, 5PPGEO/UFPF, Federal University of Paraíba, Brazil

This paper aimed to apply geographical intelligence to analyze the spread of coronavirus, between March 2020 and November 2022, in two municipalities in Rio de Janeiro state: Rio de Janeiro and Niterói, with national strategic and economic importance. Geographers has been produced important contributions in the analysis of geographical elements associated with the dissemination of diseases, taking into account their determinants/conditioners and the analysis of geographical space. To this end, analyzing the spread of diseases goes beyond its spatialization, identifying also its social determinants/conditioners and those territorial technical networks preferred for virus dissemination. Our hypothesis is that, in the absence of clinical control, geographical intelligence had the capacity to anticipate the dynamics of virus diffusion, qualifying the decision-making process by public agents and, later, with vaccination, to evaluate its impact and reorient decision-making, especially in face of growing antivaccine movement. In the first stage were identified patterns in time series data of confirmed cases and deaths with Petitt’s technique and these results was analyzed together with the vaccination schedule, circulation of new strains and public policies measures. The results indicated that the emergence of less lethal strains, such as Delta variant, and vaccine advances were decisive to reduce the populations tendency to become infected. After, Kernel technique was applied to the epidemiological data, revealing the temporal-spatial dynamics of disease spread, which took advantage of the logistical infrastructure and technical network, inequalities in vaccination coverage and deficiencies in the public health system. Finally, contamination scenarios were built up and confirmed the trends of virus diffusion, demonstrating the importance of geographic intelligence for decision making in public health and the health-disease-care process as an object of interest of Geography.

### A household survey; contamination related characteristics of COVID-19

Duygu Atımlı1, Hanife Erk1, Şahin Özaltın2, Gülcin Dizman2, Gizem Karahan2, İlke Önder2, Aysalpın Alp3, Levent Akın3

1Department of Public Health, Faculty of Medicine, Hacettepe University, Türkiye, 2Etimesgut District Health Directorate, Ankara, Türkiye, 3Department of Infectious Diseases and Clinical Microbiology, Faculty of Medicine, Hacettepe University, Türkiye, 4Faculty of Medicine Department of Infectious Diseases and Clinical Microbiology, Hacettepe University, Türkiye, 5Department of Medical Microbiology, Faculty of Medicine, Hacettepe University, Türkiye, 6Department of Public Health, Faculty of Medicine, Hacettepe University, Türkiye

Background: Household transmission studies are suitable setting to examine determinants of disease by controlling many environmental variables. This study is a prospective, case-based study evaluating the household transmission and possible risk factors on the demographical and behavioral characteristics of individuals diagnosed with COVID-19 and households. Methods: Between 1 August 2021 and 1 February 2022, individuals who were RT-PCR positive and their household members were invited to the study. Swab samples were taken from contacts and RT-PCR test was performed. Secondary attack rate (SAR) was calculated to assess household transmission. Descriptive analyzes and Logistic Regression analyzes were used in the study. Statistical Package for Social Sciences program was used for analysis. Statistical significance was accepted as p<0.05. Ethical approval was obtained from Hacettepe University Ethics Committee. The research was supported by Sanofi. Results: 42 index cases and 112 contacts were involved in the study. 43% of index cases and 54% of contacts were women. The median age of index cases was 40 and contacts’ was 34. SAR was 25%. SAR was also high in contacts sleeping in the same room (%40), hugging (%39), eating together (%30), sharing goods (%38). SAR was high in contacts of index cases who were under 40 (%22), women (%39) and vaccinated (%30). Contacts living with five or more people (OR:5.54), contacts who were spouse or children of the index case (OR:3.53) had high risk of infection. Conclusions: Living in crowded house was the most important risk factor for infection transmission. In order to prevent contagion, such measures as the use of masks in the house, frequent ventilation of house, not eating in the same environment during the quarantine period should be shared with the public and policies should be developed in this direction. Keywords: SARS-CoV-2, family characteristics, close contact transmission

### A scalable model to ensure sustainability of resources and quality in health emergency management in public administration

Giuseppe Furia1, Maddalena Quintili2, Francesca Troiano3, Carmela Puleo4, Patrizia Chierchini5, Debora Angeletti6, Anna Zoppegno5, Anna Gagliardi3,5, Maddalena Quintili3

1Hospital Management Area, Local Health Authority Roma 1, Rome, Italy, 2Risk Management Area, Local Health Authority, Roma, Italy, 3Risk Management, Local Health Authority Roma 1, Roma, Italy, 4Information Technology and Communication Technology, Local Health Authority Roma 1, Rome, Italy, 5Health Professionals Area, Local Health Authority Roma 1, Rome, Italy, 6Department of Economics, University of Foggia, Foggia, Italy, 7Risk Management Area, Istituto di Ricovero e Cura a Carattere Scientifico IRCCS Casa Sollievo della Sofferenza, San Giovanni Rotondo, Italy, 8Risk Management Area, Local Health Authority Roma 1, Rome, Italy

Background and Objective: During the COVID-19 pandemic, standard criteria were defined for optimization of spaces to be used as vaccination centers, in relation to the objectives of the 2030 UN Agenda on environmental sustainability. The aim of the study is to describe a scalable model based on the criteria of economic sustainability of the public administration, potentially expandable in other sectors such as cooperation and development.

Methods: To define the essential requirements of the new vaccination centres, a Rapid Response Team was set up and WHO guidelines were adopted following a specific checklist elaborated from a SWOT Analysis. The project was carefully calculated and measured in all phases of the vaccination cycle process. The new centers have also been designed to ensure social inclusion and user privacy. Results: The centers were set up in about 20 days. The checklist and data collection has allowed to optimize the process and the efficiency of the linear conformation, guaranteeing a 15% increase in space for each phase of the vaccination cycle based on the length of stay of the workers. All steps have been fully digitized with 100% accuracy in data handling. In 13 months, the saving of paper filing, compared to CO2 emissions, was 64.34kt.

Conclusions: Our model can be easily reproduced in other contexts, guaranteeing efficiency, taking advantage of new digital technologies and the quality of education.

### Predicting inflection points in the disease curve through wastewater-based epidemiology: learnings from SARS-CoV-2 monitoring in Bengaluru, India

Shirish Harshar1, Angela Chaudhuri2, Chhavi Sadhi2, Nitish Kumar3, Varsha Shridhar2, Shirish Harshar1, Aditya Pangaria3

1Department of Medical Microbiology, Faculty of Medicine, Bengaluru, India, 2Molecular Solutions Care Health, Bangalore, India

Background: The covid-19 pandemic was a watershed event for wastewater-based epidemiology. it highlighted the inability of existing disease surveillance systems to provide sufficient forewarning on the existing scale of disease spread and underscored the need for effective Early Warning Systems (EWSS). In keeping with WBE’S potential, the covid action collab [1] launched the precision pandemic health monitoring in Bengaluru, India

Wastewater samples were collected from 28 networked and 46 non-networked sites. Inclusion of non-sewered sites enabled equitable disease surveillance at the wider-population level. The samples were tested for Sars-CoV-2 using a quantitative RT-PCR kit. For detecting early warning signals, the exponential weighted moving average filter was used on longitudinal viral load data. A 70% weight was assigned to the latest data points and 30% weightage to older data. Furthermore, control chart limits and an internally-designed heuristic
The construction of the primary health care organizational model index to fight COVID-19: scope, limits and perspectives in the Brazilian remote rural context

Aylene Bousquiat, Simone Schenkmann
University of Sao Paulo, Brazil

Background and Objective: The socio-spatial singularities of remote rural locations are rarely recognized in their classification; nor are they remembered in the formulation and implementation of public policies. These must prioritize the conditions of access to health, the form of organization of Primary Health Care (PHC), services and practices and the workforce attraction, molded in relation to local contexts, far beyond a simple opposition to the urban locale. In the context of fightting against the covid-19 pandemic, cohesion between political initiatives, organization of services and health surveillance are essential, based on the power and capillarity of PHC. Our aim is to contextualize the creation of the organizational model index for coping with COVID-19 and to analyze its application in the Brazilian rural remote municipalities.

Methods: Document and statistical analysis, including correlations, factorial and consistency analysis and logistic regression, from the construction of the instrument to its application. The index consists of six dimensions: Political Conduct, Social Isolation, Border Surveillance, Case Surveillance, Service Organization and Social Support.

Results: The determining variables for success in combating the pandemic were the state of alert for the high case rate, lower death rate than the state of origin and longer time to define containment strategies, with two sets of protectors: wealthier localities, with a lower % of income transfer or higher Family Health Strategy coverage and PHC services density. Health surveillance was essential in case detection, along with specialized care, and in the identification of deaths, with both rates being higher in the Midwest and Amazon regions.

Conclusions: The index successfully discriminated the different remote rural locations, with a gradient being observed between the Midwest region and Northern Minas Gerais state; with the best results, whereas the Amazon region presented intermediate levels, followed by the new northeastern agricultural frontier and the northeastern Semiarid region.

Health protection and risk reduction related to SARS-CoV-2 in health services in Brazil

Mariluce Souza,1 Patricia Araújo,2 Edina Costa,1 Yara Lima,1 Gisélia Souza,1 Ana Souto,1 Biana Paz,1 Eliana Costa,1 Laise Soares2
Universidade Federal da Bahia (UFBA), Brazil, 1Universidade do Estado da Bahia (UNEB), Brazil, 2Universidade Federal da Bahia, Brazil

Background and Objective: The COVID-19 pandemic impacted the safety of health services. This study aims to analyze actions for health protection and risk reduction related to SARS-CoV-2 in health services. Methods: Exploratory, descriptive research, with qualitative analysis based on interviews with managers of health surveillance services and blood collection units in three Brazilian state capitals. The Iramuteq software was used to process the textual corpus and the Descending Hierarchical Classification was analyzed. Study developed with the support from the National Council for Scientific and Technological Development (CNPq).

Results: The study showed characteristics about the organization and conditions of work, about the protection of the health of workers and the population. The work at Health Surveillance during the pandemic reiterated old structural difficulties, staff shortages, insufficient training of teams and managers in the face of challenges in controlling health risks. There was a predominance of action centered on inspection/ supervision and insufficient risk communication activity and guidance to the population. Joint actions of inspection, epidemiological surveillance and worker health surveillance were highlighted. Additionally, there were increased computerization, organization of remote work and joint efforts with other sectors. Regarding the effects of the pandemic on blood collection units/hemotherapy services, differences in infrastructure between services were identified. Measures such as the reorganization of the physical space to avoid crowds, measures to protect the health of workers, dissemination of information and various strategies to mobilize candidates and donors were observed. Conclusions: Both services required adjustments in the organization and adaptations in working conditions in order to minimize risks and preserve the protection of the health of workers and the population.

Pentraxin (PTX-3) as a prognostic marker of clinical implication of COVID-19 in a cohort of healthcare workers from the A.O.U. ‘G. Martino’ of Messina

Giosuè Pianto,1 Anna Carpa,2 Alessio Ardizzone3,4, Emmanuela Esposito1,5, Raffaele Squeri6
1Department of Biomedical Sciences and Morphological and Functional Images, University of Messina, Italy, 2Department of Chemical, Biological, Pharmaceutical and Environmental Sciences, University of Messina, Italy, 3Genetics and Pharmacogenetics Unit, Department of Chemical, Biological, Pharmaceutical and Environmental Sciences, University of Messina, Italy

Introduction: Pentraxin (PTX-3) is an acute phase protein, which has significant functions in humoral innate immunity, such as regulation of inflammatory responses and a role in the development of atherosclerosis.
Mortality from COVID-19 in Belgrade
Svetlana Miltonovic
1Institute of Public Health of Belgrade, Belgrade, Serbia

Background and Objective: Coronavirus disease (COVID19) has spread worldwide in a short time. It caused a lot of deaths of infected patients. Mortality data provides insight of fatal consequences among population. Risk factors for mortality have not been well summarized, but it was possible to show findings on the association between age, gender and comorbidities from COVID-19 infection. Mortality statistics are fundamental to public health decision making. Mortality varies by time and place and its measurement is affected by some biases that have been exacerbated during the pandemic. This paper aims to present mortality from the COVID-19 pandemic in Belgrade, Serbia.

Methods: An analysis of death certificates shows an insight into the causes of death of Belgrade inhabitants. The paper presents data from database of deceased persons in Belgrade, 2012- 2021, analyzed using frequencies and incidence rates by gender, age groups, month of death.

Results: Mortality (mt) incidence rate in Belgrade 2012 - 2021 is increasing. The highest mortality rate was in 2021, 17.72/100 population at the age 20 to 64, the highest rate was also in 2021, male (m) 6.73/1000, female (f) 3.48/1000 older age (65 and more) shows highest mt rates in 2021, male 86.92/1000, female 63.46/1000 between march 2020 and December 2021, highest mortality rate from covid19 in man and women at the age 20-64 was in October 2021 (m: 39.12/100000, f: 20.32/100.000). Man 65 and older most frequently died in December 2020 (479,67/100.000), women in October 2021 (282,04/100.000). Male 65 and older most frequently died in December 2020 (479,67/100.000), women in October 2021 (282,04/100.000). most common comorbidity was diseases of circulatory system, endocrine, metabolic diseases, neoplasms, etc.

Conclusions: Older age (65 years old), male gender and particular comorbidities were associated with greater risk of death from COVID-19 infection in Belgrade, Serbia. These findings could help clinicians and public health authorities to prevent unnecessary death outcomes.

Have public health responses to COVID-19 considered social inequalities in health? Insights from Brazil, Canada, France & Mali
Marie-Catherine Gagnon-Dufresne1, Lara Gautier1, Camille Beaujouin1, Zoé Richard2, Pauline Boivin3, Stéphanie Medeiro4, Valery Ridde4, Kate Zinszer5
1School of Public Health (ESPUM), University of Montréal, Montréal, Canada, 2Centre Population et Développement (CEPED), University of Paris, Paris, France, 3Association Miséli, Bamako, Mali, 4Universidade Federal de Pernambuco, Recife, Brazil, 5School of Public Health (ESPUM), University of Montréal, Québec, Canada

Background: Research has indicated an increased risk of self-harm repetition and suicide among individuals with frequent self-harm episodes. Co-occurring physical and mental illness further increases the risk of self-harm and suicide. However, the association between this co-occurrence and frequent self-harm episodes is not well understood. We examined the profile of individuals with frequent self-harm episodes and the association between physical and mental illness, self-harm repetition and highly lethal self-harm acts.

Methods: The study included consecutive patients with five or more self-harm presentations to Emergency Departments across three general hospitals in the Republic of Ireland. The study included file reviews (n=183) and semi-structured interviews (n=36). Multivariate logistic regression models were used to test the association between the sociodemographic and the comorbidity variables on highly lethal self-harm acts. Thematic analysis was applied to identify themes related to the comorbidity and frequent self-harm repetition.

Findings: Most of the participants were female (56.8%), single (56.1%) and unemployed (57.4%). The predominant current self-harm method was drug overdose (60%). Almost 90 % of the participants had a history of a mental or behavioural disorder, and 56.8% had recent physical illness. The most common psychiatric diagnoses were alcohol use disorders (51.1%), borderline personality disorder (44.0%), and major depressive disorder (37.8%). Male gender (OR=2.89) and alcohol abuse (OR=2.64) were associated with highly lethal self-harm acts.

Major qualitative themes were a) the functional meaning of self-harm b) self-harm and comorbidity c) family psychiatric history and d) contacts with mental health services. Participants described experiencing an uncontrollable self-harm urge, and self-harm was referred to as a way to get relief from emotional pain or self-punishment to cope with anger and stressors.

Conclusions: Physical and mental illness comorbidity was high among the participants. The mental and physical illness comorbidity of these patients should be addressed via a biopsychosocial assessment and subsequent interventions.

Strategies to fight the COVID-19 pandemic in remote rural municipalities of Piauí state, Brazil
Aylene Boussquat1, Carinne Magnago2, Angela Carneiro3, Kamila Santos4
1University of Sao Paulo (USP), Brazil, 2Federal University of Vale do Sao Francisco (UNIVASF), Brazil, 3Federal University of Vale do Sao Francisco (UNIVASF), Brazil

Background and Objective: Ensuring the provision of health services in rural remote municipalities (MMR) remains a challenge for the Brazilian Public Health System-SUS. This problem increased dramatically during the COVID-19 pandemic, as MMR context amplifies the devastating potential of the virus, such as insufficient supply of professionals/services and the great distance from urban centers (technological density). Our aim is to analyze the initiatives to combat the pandemic adopted in Piauí MMR; discuss the role of primary healthcare (PHC) in the pandemic; and identify itineraries of patients diagnosed with COVID-19.

Methods: Exploratory qualitative case study, developed in two MMR of Piauí, both with less than 4000 inhabitants. Data were collected in 2022, through individual in-depth interviews with PHC professionals, SUS users SARS-CoV-2 infected and community leaders. The interviews were conducted with open questions about coping with the pandemic (professionals and leaders) and the experience and care received during the illness caused by COVID-19 (users). The interviews were recorded, transcribed and treated qualitatively, applying content analysis technique.

Results: Initiatives adopted: sanitary barriers, mandatory use of masks, social isolation, ban on parties/gatherings, closure of non-essential establishments, "covit kit", distribution, testing of suspected cases and vaccination. PHC: concentrated care for COVID-19 cases, protagonism and work overload of community workers (CHW), on barriers, home visits, vaccination and service through messaging applications. Itineraries: non or mildly-symptomatic were advised to isolate themselves at home, severe cases were referred by ambulance to reference hospitals in other municipalities in Piauí. Conclusions: Primary care coordinated and/or actively participated in coping with the pandemic. Positive points: population bonds and CHW’s assistance. Users felt supported. Distance from larger cities was not considered a protective factor against COVID-19. Previous results suggest the existence of long-term COVID-19 cases, with different clinical presentations, and an increase in mental disorders' prevalence (depression, alcoholism and drug use).
The reach of health and social protection policies for the homeless population during the COVID-19 pandemic in Belo Horizonte, Minas Gerais, Brazil

Rômulo Paes-Sousa1,2, Helvécio Junior1,4, Rômulo Paes-Sousa1,4, Anelise Souza1,4, Luísa Fernandes3,4, Ana Martins1,5, Ana Oliveira1, Gabriela Silva1, Gustavo Lucius1, Ana Dantas1, Rafaela Marinho1,2
1Research Group of Health and Social Protection Policies, Belo Horizonte, Brazil, 2Rene Rachow Institute, Oswaldo Cruz Foundation, Belo Horizonte, Brazil, 3Oswaldo Cruz Foundation, Brazil, 4Rene Rachow Institute, Brazil, 5Research Group of Health and Social Protection Policies, René Rachow Institute, Brazil

Introduction: The COVID-19 pandemic aggravated the homeless populations (HP) vulnerability. The study of targeted policies is necessary to improve response and ensure "no one is left behind" following the sustainable development goals (SDG). Brazil has a National Public Health System (SUS) and a National Social Protection System (SUAS), and both were active during the pandemic. Belo Horizonte (BH) is Brazil's third-largest city, and it is known to have a robust SUS and SUAS. The town was an example of the emergency and preparedness response, reducing potential death. However, the reach of the initiatives to vulnerable populations wasn't assessed. Objective: This study investigated the effectiveness of health and social protection initiatives during the pandemic tailored for HP in BH. Methods: A mixed method study was conducted, including the statistical analysis of HP, who received care during the pandemic, and a content analysis of the discourses collected. Primary data was collected through in-depth interviews and focus groups with policymakers, workers, and HP. The secondary data analyzed used a linkage of the city's electronic health records and the database for social protection beneficiaries (caducino). Results indicated the implemented policies reached the HP; however, important access barriers were observed for SUAS existing services. Despite the initial decrease in consuls, sus continued to care for the HP, followed by an increase in HP with respiratory symptoms attended by primary care units. The social isolation housing for symptomatic HP was a successful new measure, jointly coordinated. Strong Non-Governmental Organization (NGO) participation was identified as the primary support during the city lockdown. Conclusions: The emergency and preparedness initiatives implemented during the pandemic reached the HP, with an NGO's support, attending to SDG principles. Collaborative governance and infrastructure were key to reaching HP.

COVID-19 and financial transfers- an analysis of Minas Gerais, Brazil, from 2020 to March 2021

Taissa Maia1,2, Allan Barbosa3, Philippe Mendes1,2
1Secretaria de Estado de Saúde de Minas Gerais (SES-MG), Belo Horizonte, Brazil, 2UFMG, Brazil, 3CEDEPLAR/UFMG, Brazil

The study analysed the financial transfers made to directly cope with the COVID-19 pandemic in the State of Minas Gerais, Brazil, in the years 2020 and 2021, aiming at the allocation of resources by area of greater contamination, hospitalization and deaths caused. The allocation of financial resources in an emergency can boost care actions and reflect the strategic preference used to cope with the pandemic, be it preventive, health testing and promotion, hospitalizations, acquisition of supplies and expansion of beds. This paper presents in a first moment normative aspects related to transfers and sources destined to health, with special emphasis on the period that comprises the pandemic. Subsequently, to contextualize the institutional and legal amienity of Minas Gerais, Brazil, in confronting COVID-19, a research was made of the creation of well committees and working groups and normative acts with emergency actions for the territory of Minas Gerais, Brazil. Finally, results of the transfers in this period are presented as well as the analyses that indicate aspects that may hinder the effective coping of the pandemic. The results suggest, in addition to a review of the values considered inadequate to cope with, the need for an allocating review by territory proven the need for care, as well as a strategic restructuring of coping with the pandemic. Minas Gerais has major public policy challenges, especially maintaining equity given territorial extension, and regional disparities, further aggravated by a pandemic state in a still developing country. It also has the greatest challenge of effectively thinking about levels of care that can minimize or mitigate the effects of the health emergency. Added to this is the need to adjust the timing of the transfer to the dynamics imposed by health needs, which would certainly allow alignment between spending and coping in “real time”.

Symptom presentation and quality of life are comparable in Myalgic Encephalomyelitis/Chronic Fatigue Syndrome and post COVID-19 condition

Breena Weigel1, Natalie Eaton-Fitch1, Kiran Thapaliya2, Sonya Marshall2

1University of Oeste do Pará, Brazil, 2Rene Rachow Institute, Oswaldo Cruz Foundation, Brazil, 3Oswaldo Cruz Foundation, Brazil, 4Rene Rachow Institute, Brazil, 5Research Group of Health and Social Protection Policies, René Rachow Institute, Brazil

Introduction: The COVID-19 pandemic aggravated the homeless populations (HP) vulnerability. The study of targeted policies is necessary to improve response and ensure "no one is left behind" following the sustainable development goals (SDG). Brazil has a National Public Health System (SUS) and a National Social Protection System (SUAS), and both were active during the pandemic. Belo Horizonte (BH) is Brazil's third-largest city, and it is known to have a robust SUS and SUAS. The town was an example of the emergency and preparedness response, reducing potential death. However, the reach of the initiatives to vulnerable populations wasn't assessed. Objective: This study investigated the effectiveness of health and social protection initiatives during the pandemic tailored for HP in BH. Methods: A mixed method study was conducted, including the statistical analysis of HP, who received care during the pandemic, and a content analysis of the discourses collected. Primary data was collected through in-depth interviews and focus groups with policymakers, workers, and HP. The secondary data analyzed used a linkage of the city's electronic health records and the database for social protection beneficiaries (caducino). Results indicated the implemented policies reached the HP; however, important access barriers were observed for SUAS existing services. Despite the initial decrease in consuls, sus continued to care for the HP, followed by an increase in HP with respiratory symptoms attended by primary care units. The social isolation housing for symptomatic HP was a successful new measure, jointly coordinated. Strong Non-Governmental Organization (NGO) participation was identified as the primary support during the city lockdown. Conclusions: The emergency and preparedness initiatives implemented during the pandemic reached the HP, with an NGO's support, attending to SDG principles. Collaborative governance and infrastructure were key to reaching HP.

Assessment of excess mortality in Italy in 2020-2021 as a function of selected macro-factors

Emiliano Ceccarelli¹, Giada Minelli², Giovanna Lasinio²

¹Istituto Superiore di Sanità, Italy, ²Sapienza University of Rome, Italy

Background: Excess mortality (EM) can reliably capture the impact of a pandemic, as the increase in deaths is not related to the COVID-19 deaths alone. This study describes assessing the numerous factors associated with EM during the pandemic in Italy.

Methods: Mortality records (ISTAT 2015-2021) aggregated in the 610 Italian Labour Market Areas (LMAs) were used to obtain the EM P-score to correlate EM with socioeconomic variables. A two-step analysis was implemented: 1) Functional representation of EM and clustering using the Discriminative Functional Mixture Model. 2) Distinct functional regression by cluster to assess relationships between EM and covariates.

Results: The LMAs are divided into 4 clusters: 1) low EM; 2) moderate EM; 3) high EM; 4) high EM-first wave. From the functional regression models estimate, Low-Income showed a negative association with EM clusters 1 and 4. Population density and percentage of over 70 did not seem to affect EM significantly. Bed availability positively correlates with EM during the first wave. The employment rate positively correlates with EM during the first two waves, becoming negatively associated when the vaccination campaign began.

Conclusions: The clustering shows diverse behaviors by geography and time, the impact of socioeconomic characteristics, and local governments and health services responses. The LMAs allow drawing a clear picture of local characteristics associated with the spread of the virus. The employment rate and the beds availability trends confirmed that essential and health workers were at risk, especially during the first wave. The beds availability trend shows also the nosocomial nature of the disease during the pandemics first wave. The proportion of the elderly is mostly not significant, except for two clusters with lower EM during the first wave, showing a positive association with EM.

COVID-19 conspiracy beliefs, government legitimacy and societal priorities in the age of pandemic

Aldo Rosano¹, Pasquale Padora², Luca Regazzi¹, Chiara Cadeddu³

¹National Centre for Public Policy Analysis, Rome, Italy, ²Department of Life Sciences and Public Health, Università Cattolica del Sacro Cuore, Rome, Italy

Background: Conspiracy beliefs can be a major hindrance causing a lack of compliance with public health measures and, more in general, a government’s ability to enforce rules adopted to protect the public. During the pandemic, trust in scientists, government, and its responses to the health emergencies represented crucial questions. The study examines conspiracy beliefs, government legitimacy, and societal priorities in relationship with COVID-19 in 17 European countries: Bulgaria, Croatia, Czechia, Estonia, Finland, Greece, Hungary, Italy, Lithuania, Netherlands, North Macedonia, Norway, Portugal, Slovakia, Slovenia, Switzerland using data from the 10th round of the European Social Survey held in 2021-2022.

Results: Respondents are 33.351 aged 15 or more. Trust in scientists ranges from 54% in Slovakia and Bulgaria to over 84% in Finland and Iceland. One-fourth of respondents believe that groups of scientists manipulate evidence to deceive the public, from a high of 50% in Bulgaria and North Macedonia to a low of 20% in Italy, Switzerland, and Nordic countries. About 56% of respondents affirm that it is more important to prioritize public health when fighting a pandemic rather than economic activity, with slight differences among countries. Most respondents are satisfied with the way health services coped with the coronavirus pandemic, less in Bulgaria and Slovakia (80%). Those more prone to conspiracy, who believe in manipulation by scientists, have a lower education, older age, and lower interest in political and cultural life.

Conclusions: This study paints a picture of the opinions of European citizens on government legitimacy and priorities related to the pandemic. The share of European people prone to conspiracy thinking is large, especially in Eastern Europe. This is of great concern for compliance with rules to be adopted during health emergencies.

DOI: 10.18332/popmed/165690

Trust in the scientific community and conspiracy thinking in Italy during the COVID-19 pandemic

Chiara Cadeddu¹, Luca Regazzi¹, Aldo Rosano²

¹Department of Life Sciences and Public Health, Università Cattolica del Sacro Cuore, Rome, Italy

Background: Considerable overlap exists in the clinical presentation of Post COVID-19 Condition and Myalgic Encephalomyelitis/Chronic Fatigue Syndrome (ME/CFS). The current study aimed to compare symptoms and patient-reported quality of life (QoL) among people with Post COVID-19 Condition and ME/CFS in Australia. Methods: Qol data was collected from n=61 ME/CFS patients, n=31 Post COVID-19 Condition patients, and n=54 Healthy Controls (HCs) via validated instruments. The ME/CFS and Post COVID-19 Condition participants also provided self-reported severity and frequency of symptoms derived from the Canadian and International Consensus Criteria for ME/CFS and the World Health Organization case definition for Post COVID-19 Condition. Study variables were compared with Chi-square, Fisher’s exact, Fisher-Freeman-Halton, Mann-Whitney U, and Kruskal-Wallis H tests using Statistical Package for the Social Sciences version 29. Symptom clusters among the two illness cohorts were identified with hierarchical cluster analysis.

Results: ME/CFS was associated with a higher prevalence of short-term memory loss (p=0.039), muscle weakness (p<0.001), lymphadenopathy (p=0.013), and nausea (p=0.003). People with ME/CFS also reported more severe light-headedness (p<0.01) and more frequent unrefreshed sleep (p<0.01), but less frequent heart palpitations (p=0.040). Symptom prevalence, severity, and frequency were otherwise comparable. Few differences existed in the QoL of the two illness cohorts, both of which returned significantly impaired QoL scores when compared with HCs (p<0.001). Cluster analysis of symptom prevalence revealed four clusters: 1) Low gastrointestinal, low neurosenous; 2) Moderate gastrointestinal, high orthostatic and memory loss; 3) Moderate gastrointestinal, low orthostatic and memory loss; and 4) High gastrointestinal, high pain, which did not differ in sociodemographic information, illness status, or diagnostic criteria met. Conclusions: Post COVID-19 Condition and ME/CFS are remarkably similar in presentation and, like ME/CFS, Post COVID-19 Condition has a profound and negative impact on patient QoL. Gastrointestinal symptoms may have a role in determining ME/CFS and Post COVID-19 Condition subtypes.

How to reshape trade for vaccine equity: gaps in policy discourse

Toby Pepperrell¹, Alison McCallum¹, Toby Pepperrell¹, Alison McCallum¹

¹University of Edinburgh, United Kingdom, ²Centre for Population Health Sciences, United Kingdom

Background and Objective: While trade-related impacts on health are often difficult to assess, the COVID-19 pandemic revealed vaccine inequity as a unifying health need, an example of trade as a commercial determinant of health (CDH). We analysed stakeholder views and priorities regarding trade and vaccine equity, exploring where policy and action may shift to reshape trade relationships for wider transition to wellbeing economics, and to build a transferable analytical framework for policy analysis of trade as a CDH.

Methods: We undertook a systematic literature search (01/03/22-01/06/22) exploring major stakeholder libraries, Policy Commons, and linked reference searches from 2010. Stakeholder views on contributors to vaccine inequity were mapped onto an adapted rights, responsibilities, redistribution framework as causal process observations to create a network of policy recommendations. Results: The available policy advice was fragmented and revealed significant gaps. While existing tools and legal flexibilities were acknowledged, the deep-set politico-economic barriers that limit successful use were not. Technocratic solutions lacked incentives or requirements for cooperation. The determinants of vaccine equity and application of collaborative mechanisms, other than trade agreements, were rarely considered. The shrinkage of policy space inhabited by governments, public health, and NGOs by current approaches to free trade agreements was not addressed. Few spaces for real change were explored, even when distributional inequity was clear.

Conclusions: Our analytical framework illustrates gaps in the consideration of policy options and implementation mechanisms that would help address current levels of vaccine inequity. The narrow policy discourse and resistance to implement existing mechanisms designed to mitigate inequity has delayed essential action and limited co-creation of solutions. In addition to a TRIPS+ waiver, trade-related factors that increase health inequity must be tackled explicitly. Alternative collaborative mechanisms with the potential for real change must be prioritised above trade agreements that serve corporate over community interests.

DOI: 10.18332/popmed/165673

Population density and negative impact on patient QoL. Gastrointestinal symptoms may have a role in assessing the numerous factors associated with EM during the pandemic in Italy. The narrow policy discourse and resistance to implement existing mechanisms designed to mitigate inequity has delayed essential action and limited co-creation of solutions. In addition to a TRIPS+ waiver, trade-related factors that increase health inequity must be tackled explicitly. Alternative collaborative mechanisms with the potential for real change must be prioritised above trade agreements that serve corporate over community interests.
Background and Objective: Trust in scientists (TiS) plays a major role in determining people's acceptance of evidence-based health-related measures. Previous research shows that in Italy, lack of TiS is associated with a higher inclination towards conspiracy beliefs (ItCB). Our aim is to analyse TiS and ItCB among Italian citizens during the COVID-19 pandemic.

Methods: A mixed research methodology was utilized in which quantitative and qualitative approaches were combined. Of the 21 FQHCs that qualified for the study, 17, or 81.0%, provided the research team with data on service utilization, patients served, staff, operating costs, and revenue received from 2018 to 2020. Moreover, individual and group interviews were conducted with patients, members of the Board of Directors, community leaders, clinical staff, and senior management from a sample of 17 even FQHCs. We then triangulated the data and information collected from both components.

Results: Puerto Rico’s FQHCs demonstrated great flexibility, adaptability, and innovative capacity during their response to the pandemic. The primary health care services provided played an important role in assisting, supporting, and mitigating the impact of COVID-19 on the health of thousands of vulnerable persons, families, and communities around the island.

Conclusions: While there is clearly much work to be done to overcome this public health challenge, the current moment offers an opportunity for Puerto Rico’s local and state political leaders to use the creativity, innovations, and lessons learned from the FQHCs’ response to the COVID-19 pandemic to maintain and strengthen an equitable primary health care system that is resilient and accessible in the future.

Investigating household transmission of SARS-CoV-2: an analysis of 1453 households
Ecem Şensoy1, Ahmet Emecen1, Salih Keskin1, Ahmet Süner2, Neslişah Sıyıve1, Öykü Turunç2, Belgin Ünal3
1, Department of Public Health, Faculty of Medicine, Dokuz Eylül University, Turkey, 2Mardin Provincial Health Directorate, Turkey, 3Department of Public Health, Dokuz Eylül University Faculty of Medicine, Turkey

Background&Objective: Household transmission is the dominant way of SARS-CoV-2 transmission. Implementing strict protective measures is difficult to apply within households. In this study, we aimed to investigate individual and household-level factors contributing to SARS-CoV-2 transmission among household members.

Methods: A total of 1453 households belonging to SARS-CoV-2 RT-PCR positive or having symptomatic illness for the people who were epidemiologically linked to the confirmed case.

Results: Among the 5228 people coming from 1453 households, 3194 people were symptomatic (61.1%). The null model revealed there is a significant variation among households (Variance partition coefficient-VPC: 21%). According to the full model which included individual and household-level variables and had adjustment for household size and population (VPC: 20%); significant individual variables were being over age 65 (odds ratio-OR, 95% confidence interval-CI: 7.85, 5.38-11.45), having a chronic disease (OR, 95%CI: 1.60, 1.31-1.96) and being a nuclear family member (OR, 95%CI: 3.30, 2.71-4.1). For household-level variables, having a housekeeper in the household (OR, 95%CI: 2.44, 1.00-5.96), never wearing a mask (OR, 95%CI: 1.60, 1.15-2.23), eating at the same table (OR, 95%CI: 1.92, 1.42-2.60) and traveling in the same car (OR, 95%CI: 1.58, 1.17-2.13) were significant. Gender, natural ventilation, type of building and being isolated in a separate room were not statistically significant.

Conclusions: The results of the study may represent a useful contribution to understanding the household transmission of SARS-CoV-2. In line with the study
Impact of COVID-19 in Irish Nursing Homes: an assessment of variables associated with performance during first wave of the pandemic
John Loughrey1, Codd Mary1, Conyard Karl1, Parnain Jallili1, Eamonn Gormley1, Patrick Wall1
1University College Dublin, Dublin, Ireland, 2ASPHER, Ireland, 3University College Dublin, Ireland

Background and Objective: The COVID-19 pandemic has had a devastating impact globally, particularly on long-term care facilities (LTCF), in which elderly and vulnerable populations reside. In Ireland, LTCF residents were severely affected in the first wave; 3-5% of all LTCF residents died in this timeframe, accounting for 56% of all COVID-19 deaths in the country. Continued investigation of the reasons for this is vital. The aim of this research was to establish whether risk factors for high LTCF mortality established elsewhere were significantly associated with Irish LTCF performance in the first wave. Specifically, cumulative incidence rate, facility size, occupancy rates, private vs public ownership and compliance with health inspection regulations were investigated.

Methods: The main outcome considered was deaths per 100 beds. Data on crude mortality were available for 580 LTCFs up to 23 May 2020. Estimates of occupancy and compliance with regulations were averaged for these LTCFs from a novel dataset of 1130 available LTCF regulatory inspection reports up to January 2022. Focused geographic, temporal and correlation analyses looked at the relationship between deaths and studied variables. Bivariate and multivariate regression analysis was carried out to predict LTCF performance.

Results: The most significant predictor of deaths from COVID-19 in LTCFs resulting from this research was cumulative COVID-19 incidence in a county followed by facility size, in concordance with international literature. Occupancy rates and ownership factors were not found to have a significant effect. Compliance with regulatory standards showed borderline significant association with worse performance.

Conclusions: In conclusion, to protect LTCF residents in Ireland in the present and for potential future pandemics, attention should be paid to monitoring and suppressing local incidence rates, a move towards smaller facilities with individual rooms and closer attention to compliance with regulatory guidelines.

Healthcare assistant and carers in Ireland: battling for resources during SARS-CoV-2, Wave 1: a rapid-response survey
Karl Conyard1,2, Allison McCalfe3, Nicole McAllister1, Parnain Jallili1, John Loughrey3, Patrick Wall1, Mary Coddi
1Association of Schools of Public Health in the European Region (ASPHER), Dublin, Ireland, 2University College Dublin, Dublin, Ireland, 3HCA and Carers Ireland, Kildare, Ireland, 4University College Dublin, Ireland, 5Woodview House, School of Public Health, Physiotherapy and Sports Science, University College Dublin, Ireland, 6School of Public Health, Physiotherapy and Sports Science, University College Dublin, Ireland, 7School of Public Health, Health, Physiotherapy and Sports Science, University College Dublin, Ireland, 8Association of Schools of Public Health in the European Region, Dublin, Ireland

Background and Objective: The first wave of SARS-CoV-2 enveloped the world with uncertainty and fear. At-risk-populations including the elderly, those living with disabilities and those who were immuno-compromised relied heavily on frontline healthcare staff for much of their care. In Ireland, little is known of key workers at the helm of this effort, notably Healthcare Assistants and qualified carers (HCAs).

This study highlights how HCAs managed in the most difficult period of the SARS-CoV-2 pandemic and the already delicate systems in which they function.

Methods: A mixed method rapid-response survey was carried out by the HCA Research Group at University College Dublin in conjunction with HCA and Carers Ireland, a national social association for healthcare assistants and qualified carers which provided education and assistance for research activities for policy change. The rapid-response survey was made available online for a 24-hour period in April 2020. The information was gained in a confidential and anonymous manner.

Results: Of 456 responses received within 24-hours, the majority worked in the private sector (56%). Homecare was the most common healthcare environment (44%) followed by nursing homes (29%). At the time of the survey 31% had not received any training in infection prevention and control (IPC), 29% of respondents worked in different locations weekly; 38% did not have access to an adequate supply of personal professional equipment (PPE), 55% did not have appropriate PPE for their duties; 29% did not feel supported at work.

Conclusions: Fear of the unknown was a common concern early in the pandemic. SARs-CoV-2 was an emerging infection about which little was known and early information was conflicting. Lack of prior IPC training and inadequate supplies of appropriate PPE in residential care settings reflected failure to direct resources to these important preventative measures. HCAs and carers are a vital source of this important information.

DOI: 10.18332/popmed/165733

SARS-CoV-2 Delta and Omicron variant transmission and the impact of vaccine in schools and child-care settings in Australia
Archana Koirala1,2, Kristine Macartney3, Noni Winkler4, Helen Quinn5, Evangeline Gardiner2, Bette Lui4, Joanna Forbes4, Caroline Sharpe6, Trish Tussenbroek7, Nicholas Wood8
1University of Sydney, Australia, 2National Centre for Immunisation Research and Surveillance, Australia, 3National Centre for Immunisation Research and Surveillance, University of Sydney, Australia, 4National Centre for Immunisation Research and Surveillance, University of New South Wales, Australia, 5New South Wales Health, Australia, 6New South Wales Department of Education, Australia

Background: Over 214 million students globally have been affected by school closures during the COVID-19 pandemic. To address knowledge gaps on transmission of SARS-CoV-2 delta (B.1.617.2) and omicron (B.1.1.529) variants in educational settings we examined virus transmission in schools and early childhood education and care settings (ECECs) in New South Wales (NSW), Australia in relation to mitigation measures, including COVID-19 vaccination.

Methods: Secondary transmission from children and adults with laboratory-confirmed SARS-CoV-2 infection who attended a school (n=3170) or ECECs (n=5800) while infectious was investigated over two periods: 1) June 16 to September 18, 2021 (delta outbreak), and; 2) October 18 to December 18, 2021 (delta and omicron; schools only). Close contacts of cases underwent 14 days quarantine and SARS-CoV-2 nucleic acid testing. Secondary attack rates (SARS) were calculated and compared with state-wide notification data, school attendance, and vaccination status.

Findings: 1187 schools and 300 ECECs had students (n=1349) or staff

DOI: 10.18332/popmed/165739
(n=440) attend while infectious. Of 24279 contacts investigated, most (93.2%; 22627/24279) were tested and 912 secondary cases identified. The secondary attack rate (SAR) was 5.6% in 139 ECECs and 3.5% in 312 schools. The risk of becoming a secondary case was higher in unvaccinated school staff (OR 5.7; 95%CI: 2.0–16.0), particularly ECEC staff (OR 11.3; 95%CI: 4.5–28.4) and unvaccinated school students than in vaccinated school staff. SARs were similar for delta (4.4%) and omicron BA.1 (5.0%) in the unvaccinated and higher compared with vaccinated contacts (1.3% and 2.2%, respectively). Increasing school attendance rates raised case incursions and secondary case numbers, but not community-wide infection rates. Interpretation: Vaccination reduced SARS-CoV-2 transmission rates in schools, although less so for omicron than delta variants. Despite higher community-based transmission rates, in-school transmission remained low and stable with high attendance, suggesting that community restrictions, rather than school closures, best mitigated COVID-19 impacts.

Quality of National Disease Surveillance Reporting before and during COVID-19
Hanevi Djasri1, Muhammad Hardhantyo1, Aldillas Nurseyto1, Bernadetta Racheri1, Andiani Yu lan1
1Center for Health Policy and Management, Indonesia
Background: Global COVID-19 outbreaks in early 2020 have burdened health workers, among them surveillance workers who have the responsibility to undertake routine disease surveillance activities. The aim of this study was to describe the quality of the implementation of Indonesia’s Early Warning and Response Alert System (EWARS) for disease surveillance and to measure the burden of disease surveillance reporting quality before and during the COVID-19 epidemic in Indonesia. Methods: A mixed-method approach was used. A total of 38 informants from regional health offices participated in Focus Group Discussion (FGD) and In-Depth Interview (IDI) for informants from Ministry of Health. The FGD and IDI were conducted using online video communication. Yearly completeness and timeliness of reporting of 34 provinces were collected from the application. Qualitative data were analyzed thematically, and quantitative data were analyzed descriptively. Results: Major implementation gaps were found in poorly distributed human resources and regional infrastructure inequity. National reporting from 2017–2019 showed an increasing trend of completeness (55%, 64%, and 75%, respectively) and timeliness (55%, 64%, and 75%, respectively). However, the quality of the reporting dropped to 53% and 34% in 2020 concomitant with the SARS-CoV2 epidemic. Conclusions: Report completeness and timeliness are likely related to regional infrastructure inequity and the COVID-19 epidemic. It is recommended to increase report capacities with an automatic EWARS application linked systems in hospitals and laboratories.

High coverage and equitable distribution: status and correlates of COVID-19 vaccine uptake in two vulnerable sites in Bangladesh
Islam Muhammed Nazmul1, Emmanuel Bonnet1, Malabika Sarker1, Manuela De Allegri2, Valery Ridde3
1BRAC James P Grant School of Public Health, BRAC University 22 Sheikh Shaheb Bazar Road, Azimpur; Dha-1205, Bangladesh, 2Institut de recherche pour le développement, 3Heidelberg Institute of Global Health, Heidelberg University Germany
Bangladesh has fully vaccinated 76 per 100 population against COVID-19. However, ensuring higher coverage in vulnerable sites is subject to various challenges. We report the COVID-19 vaccine uptake and its correlates among the adults residing in two vulnerable sites in Bangladesh. We conducted a cross-sectional study between August and September 2022 in two sites with a high prevalence of in- and out-migration. Duaripara, a slum in northeast Dhaka, was selected as the in-migration site. Tala, a distant prone sub-district located in southwest Sakihira, was selected as the out-migration site. We surveyed 2502 adults (1239 from Duaripara; 1263 from Tala) from 1211 randomly selected households. We reported coverage and examined associations between the uptake and background characteristics using Poisson, and Two-part regression models. Additionally, we checked for spatial autocorrelation to assess equitable distribution geographically. The coverage for the first and second doses of the COVID-19 vaccine were about 91% and 80.3% in Duaripara, and 96.6% and 92.2% in Tala, respectively. For the third dose, it was about 14% in Duaripara and 52.4% in Tala. For Tala, the uptake was significantly associated with age, education, and occupation. Interestingly, it was associated positively with television access (Incidence rate ratio: 1.04, p-value = 0.01) and negatively with smart-phone access (IRR: 0.96, p-value = 0.04). Respondents who temporarily migrated were more likely to remain unvaccinated (IRR: 0.90, p-value <0.001). For Duaripara, age and occupation were associated with the uptake. For both sites, the uptake was neither associated with income or wealth, nor correlated with geographical location, indicating equitable distribution. The credit for high COVID-19 vaccine coverage in Bangladesh dates back to its long history of implementing immunization programs through community mobilization and creating demand through health education. However, full vaccination is essential to reduce COVID-19-related deaths. Health authorities need to pay special attention to vulnerable sites.

Roles of health professionals in infodemic management related with the novel coronavirus disease
Dilek Aslan1, Selen Yegenoglu2, Bilge Sozen Sahne2, Meltem Sengelen3
1Hacettepe University, Faculty of Medicine, Department of Public Health, 06100, Sihhiye, Ankara, Turkey
Background and objective: Infodemic is a global threat. This study is carried out with one of the qualitative research methods, in-depth interview, aimed at determining the views and roles of healthcare professionals on the widespread “infodemic” during the COVID-19 pandemic. Secondary aim is to develop possible solution proposals regarding the roles of healthcare professionals in the fight against infodemic.
Methods: Within the scope of the research, in-depth interviews were held with 23 academic staff from the field of health at Hacettepe University (Health) Campus in the 2021-2022 period. Eight physicians, 5 pharmacists, 3 nurses, 3 dieticians, 2 dentists, 1 physiotherapist and 1 child development specialist participated. Due to the pandemic conditions, various online meeting platforms were used for the interviews. The interviews were transcribed by the researchers. Themes categories and codes were determined for content analysis. In the end, categories and codes compatible with 6 themes were determined. The Project was funded by Hacettepe University Scientific Research Projects Coordination Unit (Nb. 19340).
Results: In the interviews, participants stated that infodemic was a problem before COVID-19. Thus, its frequency became more visible with the pandemic. The infodemic, in general, has made life difficult in many ways. All participants think that health workers have a significant role in the fight against infodemic. Although being a health worker is the common ground in the stated roles, different occupational groups also underlined their expertise-specific roles. Besides they declared that the fight against infodemic was stated as a multidisciplinary field of study and an institutional approach must be developed. Conducting future studies with an interdisciplinary approach, development of individual and community education, professionalism and strengthening of healthcare and other systems were emphasized.
Conclusion: Planning sustainable programs will be helpful to respond to the actual needs in infodemic management.

One size does not fit all! barriers and drivers towards COVID-19 prevention measures in the Netherlands
Valerie Ejrojd1, Nora Bünnemann1, Nicky Renna1, Anja Schreijer2
1Pandemic and Disaster Preparedness Center Netherlands
Background and Objective: Identifying barriers and drivers towards health protective behaviours is an important step when designing interventions because a one-size-fits-all approach may not reach the whole population. The objective of this project is developing, testing and evaluating targeted interventions for underserved groups during pandemics in the Netherlands. We did so by using the Tailoring Immunization Programmes (TIP) approach developed by the World Health Organization (WHO). We now present the findings of the situation analysis. The aim was to get an overview of existing barriers and drivers to COVID-19 vaccination, testing and adherence to measures, and the interventions initiated in the Netherlands.
Methods: We conducted a literature scan followed by semi-structured interviews with 23 experts. The data were discussed and enriched during a national expert meeting facilitated by the Pandemic and Disaster Preparedness Center (PDPC) and the WHO regional office for Europe.
Results: The findings revealed that underserved groups are heterogeneous, with different and multifactorial barriers (e.g. mistrust in the government, mis-
disinformation, accessibility) and drivers (e.g. self-protection, moral duty to protect others). Research has predominantly focused on vaccination behaviour among the general population. Over 45 interventions and projects were identified. These interventions were designed with limited use of behavioural insights, due to limited available qualitative research and lack of time during the crisis to gain such insights.

Conclusion: More research is needed to understand the differences between underserved groups. Although many interventions were initiated, there is a need to design tailored interventions informed by insights, and the need for monitoring and evaluation. In the next phase of this project, we will explore the barriers and drivers to COVID-19 vaccination among elderly migrants using a qualitative approach. These results will be used to develop tailored interventions to improve vaccination uptake and can inform long-term pandemic preparedness and response.

**A feasibility study about covid-19 patients management in general hospital wards in Italy: an organizational assessment approach**

Giulia Libero1, Valerio Bordin1, Paolo Ragusa1, Alessandro Prinzivalli1, Palma Desantis2, Paola Gatti2, Adriana Trombott2, Davide Minniti2, Roberta Siliquini2, Fabrizio Bert1

1University of Turin, Department of Public Health Sciences, Italy; 2University of Pisa, Department of Clinical and Experimental Medicine, Italy; 3University of Pisa, Department of Surgery, 4University of Pisa, Department of Public Health Sciences; 5University of Pisa, Department of Public Health Sciences; Health Local Unit ASL T03, Italy

Background and objectives: In the COVID-19 pandemic, healthcare-associated transmission has been a major concern and hospitals had to implement ways of isolating COVID-19 patients. Our study aimed to identify public health variables affecting the organizational approach of managing COVID-19 positive patients in hospital wards and describe our experience in three hospitals of Northern Italy.

Methods: We searched in the scientific literature organizational models for cohorting patients with COVID-19. We created a focus group and a SWOT analysis in order to define the best organizational assessment for each hospital.

Results: There is poor literature about organizational assessment for cohorting COVID-19 patients. We analyzed the floor plans, the hospital ventilation system, the personal protective equipment (PPE) use during a shift, workload for healthcare workers (HCW) and patient safety.

The variables that we identified were: 1) structural variables: presence or absence of single rooms of dedicated bathroom in hospital wards, presence or absence of an anteroom for donning and doffing, ventilation system; 2) patient care variables: safe patient care, patient well-being, necessity to move patient for diagnostic tests; 3) HCW variables: use of PPE, HCW workload; 4) Economic variables: costs for PPE supply, additional personnel costs, loss of COVID-free beds in particular, we focused our attention on structural variables, patient care variables, HCW variables and economic variables.

Conclusions: The analysis of variables led us to define different organizational assessments for the three hospitals. Our evaluation showed that Hospital structure is the most important variable to evaluate. If there are no single rooms and no dedicated bathroom, it is impossible to guarantee isolation of patients.

The cost in PPE use and for additional personnel may be higher with the single room isolation system than with the ward isolation system. Feasibility studies are needed to define which organizational model best suits the hospital setting.

**Identifying essential resources for pandemic response: an international delphi study within the EU-PANDEM-2 project**

Berend Beishuizen1, Mart Steen1, Anne-Romy Peelen1, Joeri Buis1, Alma Tostmann1, Caroline Green2, James Duggan2, Laura Carrozzi2, Guglielmo Arzilli3, Ileana Federigi4, Monica Moran3, Barbara Nattabi1, Rohan Rasiah1

1The University of Western Australia, Australia; 2The University of Galway, Ireland; 3AOU City of Health and Sciences of Turin, Italy; 4University of Pisa, Department of Public Health Sciences; AOU City of Health and Sciences of Turin, Italy; 5University of Turin, Department of Public Health Sciences; Health Local Unit ASL T03, Italy

In the ongoing COVID-19 pandemic highlights the crucial role of healthcare and public health resource management, where shortages impair the immediate response to a pandemic resulting in increased transmission and delayed patient care. In the European PANDEM-2 project, we aimed to identify essential resources for pandemic planning in the context of an emerging viral respiratory illness.

We performed a Delphi study consisting of a systematic literature review, a structured questionnaire and two international consensus rounds. Resources were categorized as material, human or pharmaceutical. A panel of public health experts (PHEs) and a panel of clinicians participated in the questionnaire (53 resources: 23 material, 18 human and 12 pharmaceutical) and a consensus round. We performed descriptive analyses for both panels. Seventeen PHEs and 16 clinicians from nine and four countries respectively participated in the study. Consensus between the two panels was observed on 40 resources (16 material, 14 human, 10 pharmaceutical; 33 included and seven rejected). Notably, clinicians selected three home care resources while PHEs did not, and PHEs included two pharmaceutical resources which clinicians did not. No consensus was observed on 13 resources. Eleven additional resources were suggested (five by PHEs and six by clinicians) and included amongst which personal protective equipment for mobile teams, resources for primary care and resources related to mechanical ventilation.

There was consensus on 40 resources, of which 33 were included and seven rejected. There was no consensus on 13 resources, notably regarding home care and pharmaceutical resources, which reflects the different priorities of PHEs and clinicians in pandemic planning. This study highlights a set of resources to prioritize for pandemic preparedness activities, and shows the importance of including experts from varied backgrounds. Including these resources in pandemic models and preparedness exercise scenarios allows training on resource gaps and supports evidence-based decision making during future outbreaks.

**Supporting ruraly dwelling adults with disabilities: the experiences of two organisations in Western Australia during the COVID-19 pandemic**

Zoe Lawrence-Haughey1, Monica Moran4, Barbara Nattabi1, Rohan Rasiah1

1The University of Western Australia, Australia; 2The Western Australian Centre for Rural Health, Australia

Background and Objective: The COVID-19 pandemic disproportionately impacted people with disability and people living in rural areas, worsening existing inequalities. Many people with disability in Australia are assisted by disability support workers (DSWs) and disability support organisations (DSOs), though there has been little research done on how DSWs and DSOs have been affected by COVID-19. The aim of our study was to explore the experiences of staff from two rural DSOs in a large rural town in Western Australia (WA) who supported adults with disability during the COVID-19 pandemic and determine what challenges and opportunities they faced during this time.

Methods: Eleven employees from two DSOs in Western Australia were recruited mid-2022 using non-random purposive sampling. Three individual and two group semi-structured in-depth interviews were conducted via video-call software and reflexive thematic analysis was used in data analysis.

Results: Four major themes were identified. The study revealed that there were difficulties with the government pandemic response, increasingly unclear work boundaries for DSWs, and a high burden of the pandemic on DSOs, though organisations and employees adapted as best they could. Participants raised concerns over a perceived lack of inclusion of the disability sector and people with disability during the pandemic.

Conclusion: Whilst DSOs and DSWs believe that they have been able to maintain supports for clients during the pandemic, the lack of systematic public health approach for people with disability was evident. Future pandemic response in Australia requires consultation with the disability sector, utilisation of appropriate communication channels, and improved advocacy services for people with disability.

**Integrated environmental and clinical surveillance of viral acute respiratory infections in close communities: opportunities and challenges**

Annalaura Carducci1, Laura Carrozzi2, Guglielmo Arzilli3, Ileana Federigi4, Marco Fornili5, Giulia Lauretani4, Tommaso Lomonaco6, Nebiyu Tariku1, Monica Moran3, Barbara Nattabi1, Rohan Rasiah1, Zoe Lawrence-Haughey1

1University of Western Australia, Australia; 2The University of Galway, Ireland; 3AOU City of Health and Sciences of Turin, Italy; 4University of Pisa, Department of Public Health Sciences; 5University of Pisa, Department of Pathology and Critical Care Medicine, Via Paradisa, 2, Pisa, Italy; 6University of Pisa, Department of Translational Research and New Technologies in Medicine and Surgery, Via S. Zeno, 35-37, 56123 Pisa, Italy; 7University of Pisa, Department of Surgical, medical and molecular pathology and critical care medicine, Via Paradisa, 2, Pisa, Italy; 8University of Pisa, Department of Biological, Via S. Zeno, 35-37, 56123 Pisa, Italy; 9University of Pisa, Department of Clinical and Experimental Medicine, Via Roma, 67, Pisa, Italy; 10University of Pisa, Department of Chemistry and Industrial Chemistry, Via Moruzzi, 3 - Pisa, Italy
Background and Objectives: The epidemiological relevance of viral acute respiratory infections (VARIs) has been dramatically highlighted by COVID19, but other viruses cannot be neglected, such as influenza virus, respiratory syncytial virus, rhinovirus, other coronaviruses, adenovirus, metapneumovirus. The transmission of these viruses occurs mainly in closed spaces and is dependent both on human and environmental factors. Besides schools, closed communities, such as hospitals with isolation wards are the most vulnerable settings, where the real extent of VARIs is often difficult to evaluate, due to the natural history of the diseases and to case ascertainment. In the COVID19 pandemic the Wastewater Based surveillance has shown its great potential for monitoring the virus diffusion and evolution in the environment. Our aim is to pilot an integrated surveillance system for closed communities, carried out through a syndromic surveillance, environmental monitoring (air, surfaces, and wastewater), and the collection on environmental and behavioral risk factors.

Methods: The Project funded by the National Recovery and Resilience Plan NRRP - Tuscany Health Ecosystem will consist in design and validate tools for epidemiological and environmental surveillance and analytical methods for environmental matrices, including viral sensors for viruses detection. The integration of all these information into risk assessment models will provide a useful tool for early warning and risk management.

Results: In the first phase of the project we will design and validate tools, such as clinical, epidemiological and environmental-based questionnaires, for each setting coupled with analytical methods for viruses’ detection. The integrated surveillance system for closed communities, will be carry-out through syndromic surveillance, environmental monitoring (air, surfaces, and wastewater) and collection of environmental risk factors.

Conclusion: Integrating different surveillance systems for VARIs appears crucial to inform early warning and risk assessment tools available at local, regional and National level, but methods and strategies need to be set up.

Parameters in mathematical modelling of indoor spread of COVID-19: a scoping review

Cosimo Savoia1, Roberta Pastorino1, Angelo Pezzullo1, Stefania Boccia1
1Università Cattolica del Sacro Cuore, Italy

Background and Objective: The spread of COVID-19 in indoor environments is a critical concern during the ongoing pandemic and mathematical modelling can provide insight into the transmission of SARS-CoV-2 in these settings. However, input factors used in these models have not been clearly described or analysed. The objective of this work was to retrieve and report the parameters related to the biological characteristics of SARS-CoV-2 and the physical parameters of the indoor environment that are used in the mathematical modelling of infectious disease transmission in indoor environments. This research was conducted within the framework of the national “OPtimal bEhavior in paNdemic ScenarioS” (OPENNESS) project, funded by Regione Lazio. Methods: We searched the PubMed database up to 31/11/2022 for English-language articles on quantitative risk assessment of indoor transmission of COVID-19. Articles addressing other infections or including outdoor-developing diseases were excluded. Results: The research generated 110 outputs, of which 2 studies were retained. One study employed a deterministic approach, while the other adopted a probabilistic mathematical method. The common parameters identified in the two studies were: the pathogen quanta emission rate, exposure to quanta concentration, number of quanta received by an exposed susceptible person, time-dependent particle number concentration, and deposition of particles in the host’s respiratory system. The deterministic model better predicts particle filtration and deposition into receptor respiratory systems, whereas the probabilistic model provides more accurate results in environmental conditions with less clearly specified parameters. Conclusion: The parameters identified in this review and their subsequent analysis lay the groundwork for future research on the mathematical modelling of SARS-CoV-2 indoor transmission. More research is needed to understand better the role of these parameters to validate and refine existing mathematical models, in order to inform public health decision-making and prevent COVID-19 from spreading in indoor environments.

An assessment on the interplay of digital proximity app use and vaccine uptake for SARS-CoV-2 transmission mitigation in Switzerland

Paola Danio1, Andrè Moser1, Marc Högliinger1, Nicole Probst Hensch1, Medea Imboden1, Thomas Vermes2, Dirk Keidel3, Murielle Bochu3, Natalia Ortega Herrero4, Stéphane Baggio5, Patricia Chocano-Bedoya6, Nicolas Rodondi7, Stefano Tancredi7, Cornelia Wagner8, Stéphane Cullati9, Silvia Stringhini9, Semira Gonseth Nusslé9, Caroline Veya-Takeuchi10, Claire Zuppinger10, Erika Harju10, Gisela Michel10, Irene Frank10, Christian Kahlet10, Emiliano Albane12, Luca Crivelli12, Sara Levati13, Rebecca Amati13, Marco Kauffmann14, Marco Geigges14, Tala Ballouz14, Anja Frei14, Jan Fehr14, Viktor von Wyl14
1University of Zurich, Institute for Implementation Science in Health Care, Switzerland, 2University of Bern, 3Winterthur Institute of Health Economics, Switzerland, 4Swiss Tropical and Public Health Institute, Switzerland, 5University of Basel, Switzerland, 6Bern University Hospitals, Switzerland, 7University of Fribourg, Switzerland, 8University of Geneva, Switzerland, 9University of Lausanne, Switzerland, 10University of Lucerne, Switzerland, 11Lucerne Cantonal Hospital, Switzerland, 12Cantonal Hospital St. Gallen, Switzerland, 13Università della Svizzera italiana, Switzerland, 14University of Zurich, Switzerland

Background and Objective: During the first year of the SARS-CoV-2 pandemic, digital proximity tracing apps were introduced to mitigate viral spread in absence of vaccines. Adherence to such measures leading up to and following widespread vaccine rollout remains unclear. Our study aimed to evaluate adherence to digital proximity tracing app use and preventive measures across different vaccination uptake trends.

Methods: We report findings from two population-based longitudinal cohorts in Switzerland from January to December 2021. Failure time analyses were conducted for each study cohort for SARS-CoV-2 vaccine uptake and uninstalling of the SwissCOVID digital proximity tracing app outcomes, stratified by age group. Cox proportional hazards regression models were used to estimate adjusted hazard ratios (aHR).

Conclusions: We found strong evidence that adherence to digital proximity tracing app use and preventive measures is associated with higher vaccine uptake. In evolving pandemic contexts, these findings can assist public health authorities in designing evidence-based communication strategies to enable adoption of preventive measures and novel health technologies across all population groups.

Opinions matter: public opinions on data-sharing and how they can shape pathogen genomic surveillance in Canada

Tian Rabbani1, Sarah A. Savic Kallesøe2, Erin E. Gill3, Fiona S.L. Brinkman3, Emma J. Griffiths1, Ma’H n. Zawati1, Hanshi Liu4, Nicole Poulm4, Yann Joly5, William W.L. Hsiao1
1Faculty of Health Sciences, Simon Fraser University, Burnaby, Canada, 2Nuffield Department of Population Health, University of Oxford, Oxford, United Kingdom, 3Department of Molecular Biology and Biochemistry, Simon Fraser University, Burnaby, Canada, 4Department of Human Genetics, McGill University Faculty of Medicine and Health Sciences, Montreal, Canada

Background and Objective: Intersections of public health and pathogen genomics have played a vital role in surveilling the Coronavirus Disease 2019 (COVID-19) pandemic and building resilient health systems. Individual-level COVID-19 data collected by Canadian provincial/territorial health authorities is not yet readily available to the public, including researchers. Lack of data-sharing delays or prohibits national data interpretation, harmonization, integration, and surveillance. To inform pathogen genomic-based surveillance practice and research innovation, (e.g. virusseq.dataportal.ca [1]; covaretum.ca [2]), we explored public opinions on sharing de-identified COVID-19 data publicly in Canada.

Methods: In March 2022, a national survey was open to those 18 years or older and currently living in Canada. Opinions on publicly sharing 16 de-identified COVID-19
A review of the association between micronutrients and risk and severity of COVID-19
Parnian Jalili¹, Catherine Phillips¹
¹University College Dublin, School of public health, physiotherapy, and sports sciences, Woodview House, Belfield, UCD, Dublin4, Ireland
Introduction: The end of 2019 was marked by the rapid epidemic of Severe Acute Respiratory Syndrome (SARS) due to COVID-19 in Wuhan, China. The most common medical treatment pathways have been supportive rather curative. However, multiple studies have found impaired levels of micronutrients in patients. These associations with disease outcomes could be taken into consideration. Micronutrient deficiencies (MNDs) are a global health concern and an underdiagnosed epidemic highly affecting developing countries. The most vulnerable groups for MNDs are women, children, and the elderly. MNDs can cause a huge number of morbidities and mortalities indicating the significance of effective prevention and treatment strategies to further control the consequences.
Objectives: The aim of this study was to review and summarise the literature on dietary intake and supplementation and the associations of micronutrient insufficiencies with disease susceptibility and severity of symptoms.
Methods: A narrative review of the literature was conducted through two online databases in PubMed and Google Scholar. Articles that were published since the start of the pandemic and had different types of study designs were included. Of 5,073 identified articles, 38 studies were selected according to defined inclusion criteria.
Results: The most prevalent nutritional insufficiencies and their associations with prevention and disease severity among COVID-19 patients were identified. Patients had impaired levels of a wide range of micronutrients, including vitamin D, Zinc, and Selenium followed by vitamins B1 and C.
Conclusion: Malnutrition and undernutrition are global concerns and modifiable risk factors in many countries impacting the prevalence of infectious diseases. Medical nutrition therapy (MNT) is an overarching method to combat nutritional deficiencies. Thus, alongside preventive measures like acquiring herd immunity by vaccination, achieving an optimal nutritional status could be a contributing factor for better outcomes in patients.

Health-related quality of life among long-COVID patients - Tunisia, 2020-2022
Sonia Dhaouadi¹, Mouna Safer¹, Letaief Hejer¹, Aicha Hechaichi¹, Hind Bougerra¹, Amenallah Zouayti¹, Arwa Neffati¹, Myriam Bougafet¹, Nissaf Bouafifi¹, Kholoud Talmoudi¹, Nissaf Bouafifi²
¹National Observatory of New and Emerging Diseases, Tunis, Tunisia
Introduction: Coronavirus disease 2019 (COVID-19) has become a global health threat not only because of its acute phase, but because of the “long COVID” that cause a substantial disease burden. Long-covid include also long-term consequences affecting patients’ wellness and quality of life. Our study aimed to assess the impact of long-covid on the patients’ quality of life in Tunisia.
Methods: We conducted a cross sectional retrospective survey among a representative sample of COVID-19 survivors in Tunisia registered at the national SARS-Cov-2 surveillance database from September 2020 to September 2021. Trained health care workers interviewed consenting respondents by phone using a standardized questionnaire (EQ-5D-3L) including five dimensions: mobility, self-care, usual activities, pain-discomfort and anxiety-depression. Each dimension has three levels: no problem; some problem and extreme problems.
Results: A total of 22910 adults from four major cities in Tunisia were interviewed. About 20% of the respondents received the COVID-19 vaccine. The highest educational-related inequality in accessing COVID-19 was in favor of educated compared to uneducated adults. After disintegration by regions, the high extent of inequalities was observed among adults in Mwanza (CI: 0.093, P<0.001) and Arusha (CI: 0.062, P<0.001) regions. The contributors to inequalities in accessing COVID-19 vaccinations were age, sex, marital status, and occupation.
Conclusion: The current study is the first to investigate the regional variation of inequality in the COVID-19 vaccination in areas with high hesitancy. Establishing policies or strategies which will consider regional variations in educational inequality might be a way forward toward achieving universal coverage of COVID-19 vaccination, especially in areas with high hesitancy.
long-covid. Results: Of 1094 persons contacted, 416 responded (38%). Long-covid prevalence was 64% (95%CI:59%-69%); 128 (31%) of participants reported any problem in all dimensions: 41% among long-covid patients vs 13% among non-long covid (p<0.03).

Compared to non-long covid patients, long-covid patients reported more problem on all dimensions: mobility: 14.8% vs 4.1% (p<0.03), usual activity: 12.6% vs 4.8% (p<0.01), pain/discomfort: 22.4% vs 3.4% (p<0.03) and anxiety-depression: 19.8% vs 8.1% (p=0.002). The VAS was significantly lower among long-covid patients compared to non-long covid: 73.1 vs 83.9 (p<0.10).

Alpha Cronbach’s value was 0.66. Conclusion: Long-covid impact quality of life, affect mobility and cause disability. Psychological support during and after acute COVID-19 episode is recommended to preserve the well-being of affected patients. This additional burden shows the importance of the public health prevention measures and vaccine strategies.

Post-acute COVID-19 syndrome in the workplace
Nicola Magnavita1, Gabriele Arnesano2, Igor Meraglia3, Marco Merrella3
1 School of Occupational health, Università Cattolica del Sacro Cuore, Largo F. Vito 1, 00168 Roma, Italy, 2Occupational health, UCSC, Largo F. Vito 1, 00168 Roma, Italy, 3Occupational Health, USCS, Largo F. Vito 1, Italy

Background and Objective: COVID-19 is a multi-organ disease that can cause a wide range of persistent symptoms following the initial acute infection. The health status of the workforce was examined as part of a health promotion program integrated into workplace medical surveillance.

Methods: In order to determine the prevalence of infection, stress, mental health issues, sleep problems, and work ability, 1378 workers exposed to occupational risks in the health and other sectors conducted a medical examination in addition to a questionnaire.

Results: In 2020 and 2021, 164 employees (or 11.6%) contracted COVID-19. Compared to other occupational sectors (7.4%), the frequency was higher among hospital employees (15%). 4 weeks after the infection had ended, 86% of the workers said that some symptoms were still present.

The infected employees exhibited similar levels of occupational stress and anxiety as the other employees, but they slept less soundly (p < 0.05). In comparison to healthy respondents, Post-COVID workers showed lower levels of sleep quality, and higher levels of fatigue, anxiety, and depression (p < 0.001). 1.3% of individuals stated that infections caused exacerbations of pre-existing diseases. These workers had a considerably lower working capacity (p<0.001) than other workers, in addition to the characteristics mentioned above.

Conclusions: As of December 13th, 2022, 654 million people worldwide have been infected with COVID-19 ([https://www.worldometers.info/coronavirus/]). Assuming a conservative estimate of 6.2% survivors who experience persistent symptoms, long-term effects of COVID-19 could have an impact on almost 40,500,000 people. It has been noted that long-term impacts could compound exponentially if this virus continues to spread among humans. Post-COVID employees need specialized disability management care.
Lessons learned from Tunisia prevention, preparedness, response and resilience to COVID-19 pandemic
1National Observatory of New and Emerging Diseases, Full professor, 1-7 Rue El Khartoum, immeuble diplomate, 13ème étage, Tunis Belvédère 1002, Tunisia; 2National Observatory of New and Emerging Diseases, Tunisia Background and Objective: Although Tunisia implemented a multisectoral prevention, preparedness, response and resilience plan to emerging and reemerging diseases, the COVID-19 pandemic highlighted the continued need to establish an effective Early Warning and Rapid Response System (EWARs) in order to better prepare for future pandemics. The objective of this study is to characterize Tunisia response to the COVID-19 pandemic in order to highlight effective strategies to control outbreaks.
Methods: An Intra-action Review (IAR) of COVID-19 response was conducted in Tunisia (June 2021 and March 2022) to identify challenges and best practices and to identify recommendations for addressing identified challenges and institutionalization of the best practices. The review covered all pillars and included more than 50 experts and stakeholders from different departments involved in COVID-19 response.
Results: Five pillars of the successful fight against emerging and reemerging diseases and rapid response to a new outbreak to control community transmission were identified: A strong multisectoral coordination structure from the local to the national level with high political commitment, an Electronic Integrated Surveillance System with an Early Alert System, An effective laboratories networking with pathogens, A public health workforce adequately trained that can work with an Early Alert System, and An effective control strategies for reemerging agents.
Conclusion: The COVID-19 pandemic highlighted the importance of multidisciplinary coordination and the need to increase the investment global health security and public health.
Popul. Med. 2023;5(Supplement):A402
DOI: 10.18332/popmed/163891

The assistance GAPS in the struggle against covid-19 in Brazil: the temporal course in the beginning of vaccination of indigenous and quilombolas peoples
Rafael Moreira, Lucas Santos, Tainá Mafra, Herika Mauricio.
1Oswaldo Cruz Foundation and UFPE, ABRASCO, Av. Professor Moraes Rego, s/n - Cidade Universitária - Recife/PE. CEP 50.740-465, Brazil, 2Oswaldo Cruz Foundation, Av. Professor Moraes Rego, s/n - Cidade Universitária - Recife/PE. CEP 50.740-465., Brazil, 3Universidade de Pernambuco, ABRASCO, Rua Amôbio Marques, 310 - Santo Amaro, Recife/PE CEP: 50100-130, Brazil.
Background/Objective: With the pandemic of covid-19, the infection rate grew rapidly in Brazil, ranking among the countries with the highest cases and death rates. The national vaccination began in January 2021, focused on priority groups, including indigenous peoples and quilombolas, given their social vulnerability and difficulties in accessing health services. This study aimed to analyze the temporal evolution of vaccination against covid-19 in indigenous peoples and quilombolas in Brazil between the 3rd and 21st Epidemiological Week (EW) of 2021.
Methods: A temporal analysis comprising 19 EW was performed. Cases were structured by priority group of indigenous and quilombola populations, dose, vaccine (Coronavac or Astrazeneca), and place of vaccination. The Vaccination Rate (VR) per 100 inhabitants was calculated. Temporal analysis of VR identified significant trends (≤5%), and results were converted into temporal cluster graphs by EY.
Results: By the end of may 2021, 1,176,173 doses of Astrazeneca (AZ2) or Coronavac (CV) Vaccines had been administered to indigenous peoples and quilombolas. Nationally, 21.7% of CV and 99% of AZ vaccination schedules were incomplete for this priority group. The temporal analysis identified high VR of the CV first and second dose in the first weeks (EW 1 to 7), with a significant drop in subsequent weeks; and high VR of both doses of AZ concentrated in the final weeks (10 to 19).
Conclusion: The indigenous and quilombola populations had low vaccination rates nationally. It is important to consider the decrease in CV vaccine in the analyzed period, highlighting that from may onwards the AZ vaccine distribution was predominant due to a decrease in the CV national production. Possible factors contributing to the reduction of VR in these populations were poor access to health services; inconsistent national vaccination plan; geographical barriers; and hesitancy to vaccinate as a consequence of the spread of fake news.

Evidence-based comparison on COVID-19 pandemic control strategies--Taiwan as an example
Shu-Ti Chiou.
1Health & Sustainable Development Foundation, Taiwan Background and Objective: Taiwan was predicted to bear high risk of COVID-19 importation at the beginning of 2020. The author examined available evidence to explore what made Taiwan perform well in 2020, fix its breach in 2021, and overtake the other forerunners in 2022.
Methods: Pandemic control strategies were categorized into 3 types: elimination, suppression and mitigation. Annual COVID-19 mortality rate, annual excess deaths and Google community mobility trend were used as impact indicators. Cumulative vaccination coverage rate was used to indicate preparedness, and tests per 1000 per day and stringency index in different periods were used to compare public health input.
Results: In 2020, Taiwan applied swift and strict elimination strategy. At a population size of 23 million, there were only 852 confirmed COVID-19 cases, 7 deaths, and 253 consecutive days with 0 domestic case in 2020. In 2021, a significant breach pushed the daily incidence close to that of UK at the same period, but Taiwan maintained its elimination strategy and eventually returned to zero though it took 3 months with inadequate testing capacity and refusal to lockdown. In 2022, Taiwan cleaned up several Omicron breaches with only 3 deaths by March 31. However, it suddenly announced returning to normalcy with the "New Taiwan Model" on April 1. The daily incidence grew explosively and by November 26, its annual cumulative mortality rate has exceeded most of the other countries. Conclusion: By cross-sectional comparison between countries and before-after comparison of the same country, the study shows that community activities were least restricted under elimination, and mitigation was consistently associated with hundred times higher health impact but didn't bring about normalcy in daily lives when incidence was high. Some countries managed to keep weekly excess death rate within 20% after abandoning elimination, but not Taiwan.

DOI: 10.18332/popmed/163929

Comparative analysis of maternal mortality in Central Asia region before and during COVID-19 pandemic
Karina Nukestsayeva, Oizhaz Shamtanayev, Zhanerke Bolatova, Gaukhur Kayyupova, Nurbek Yerdesov.
1Karaganda Medical University, Kazakhstan Background and Objective: The maternal mortality ratio (MMR) is the key indicator that characterizes the state of a healthcare system. Various countries report indicate a significant impact of the COVID-19 pandemic on MMR. We aimed to determine MMR trends in Central Asia (CA) countries and its association with the total health expenditures before and after pandemic. We also compared the maternal mortality causes before and during the pandemic in Kazakhstan.
Methods: We conducted a retrospective study working with the secondary data which were collected on selected health indicators using information from open sources, and official statistical data on the Republic of Kazakhstan, Republic of Kyrgyzstan, Republic of Uzbekistan, and Tajikistan. We applied the linear regression analysis to identify statistically significant trends of MMR in CA countries from 2000 to 2020 in the study. Pearson correlation analysis was used to assess the associations between the national MMR and CA total health expenditures expressed in national currency units. R-studio soft version 1.2.5033 was used for the statistical analysis.
Results: During the pre-pandemic period, Central Asian nations had a downward trend of maternal mortality. Except for Uzbekistan, where this indicator decreased, all Central Asia countries experienced a sharp increase in maternal mortality ratio in 2020. The share of indirect causes of maternal deaths in Kazakhstan reached 76.3% in 2020. There is an association between the maternal mortality ratio in Central Asia countries and their total health expenditures expressed in national currency units (r max = -0.89 and min=-0.66, p < 0.01).
Conclusion: The COVID-19 pandemic has noticeably impacted the maternal mortality levels in most of the CA countries. The findings suggest that there must be additional efforts from the local authorities to enhance the preparedness of CA healthcare systems for the new public health challenges and improve health data accessibility.
Lessons learned from coronavirus disease: India's preparedness and response strategies for future pandemic
Soumya Mohapatra1, Ramesh Sethi1
1Kalinga Institute of Industrial Technology (KIIT), Deemed to be University, Bhubaneshwar, India

Background: The coronavirus disease (COVID-19) pandemic has impacted all nation-states and globally 66.34 lakhs deaths had been recorded whereas India has contributed 5.30 lakhs of deaths (as on 13th December, 2022 WHO). It has exposed persistent inequalities in demographic indicators across territorial boundaries along with structural and social issues like interconnected threats to population health and well-being rooted in socio-economic-political and physical environmental determinants of health. While developed nations had to face tremendous challenges related to overstretched capacity and fragmentation, developing nation's weak health provisions jeopardized its health delivery system and disrupted millions of lives and livelihoods.

Objective: To learn lessons from COVID-19 pandemic across the globe and fostering an enabling ecosystem with multi-sectoral integrative efforts to strengthen preparedness and response strategies to meet future pandemic.

Methods: The study synthesizes on available evidence based on secondary sources of data and focuses on both qualitative and quantitative methods.

Results: The study reveals pandemic trajectory of India witnessed slow and sustained decline of COVID-19 cases. India's strong and decisive leadership, proactive top-down approach, inter-sectoral coordination, massive vaccination drive and timely guidance for national response to the pandemic helped in reducing its cases and deaths per million to 25,158 cases per million and 345 deaths per million population respectively (as on 17th December, 2021) which is one of the lowest in the world. This indicates lessons learned from worldwide supported India to rebalance resilience health care system and accelerate towards achieving global goals.

Conclusion: Healthcare system in most of the countries have not evolved for resilience in times of catastrophe. and also not for efficient rapid responses to pandemic. However, the countries undergone unprecedented health crisis have learnt lessons from COVID-19 which recommends the healthcare institutions need to be streamlined and instituted for increasing efficiency, coherence, and preparedness to prevent future pandemic.

A low burden of severe illness: the COVID-19 Omicron outbreak in the remote Torres and Cape region of Far North Queensland, Australia
Johanna Neville1, Caroline Taunton1, Leanne Hawthorn1, Rittia Mattyse1, Marlowe Costes1, Emma Pickering1, Valmay Fisher1, Allison Hempenstall1, Simon Smith1, Josh Hanson2
1Torres and Cape Hospital and Health Service, Nil, L3/120 Bunda street, Cairns 4870, Queensland, Australia, 2Cairns Hinterland Hospital Service, Australia

The arrival of the highly transmissible Omicron variant reignited concerns that outbreaks of COVID-19 could have devastating consequences for First Nations Australians living in remote areas. The Far North Queensland region of Australia is home to 19,500 First Nations people (68.8% of population). To prepare for a COVID-19 outbreak, Torres and Cape Hospital and Health Service TCHHS in partnership with local First Nations councils undertook extensive outbreak preparation including the establishment of a COVID-19 public health team and the delivery of a logistically complex outreach vaccination service. The first outbreak was declared in December 2021. Here we report local outbreak epidemiology for the first ten-month outbreak period from December 2021 to October 2022.

Outreach vaccination and walk-in fever clinics were established at 28 health facilities with 12 utilising point-of-care PCR machines. The public health team contacted cases by telephone throughout the period to undertake health screening; offer medical certificates; provide information about case isolation and close contact quarantine requirements; triage cases for treatment eligibility; and offer participation in the COVID-19 care-in-the-home program which provided wellbeing support telephone calls throughout mandatory isolation.

COVID-19 vaccination rates among those aged ≥12 years climbed from 43.4% to 79.3% (single dose) and from 22.2% to 67.6% (double dose) between early September and late December 2021. A total of 7784 cases were notified, with 65.5% of cases among First Nations people. The attack rate was 25.6% (95%CI 25.1%-26.1%), the hospitalisation rate was 1.6% (95%CI 1.5%-1.9%) and the crude case fatality rate was 0.05% (95%CI 0.01%-0.13%). Genomic results were available for 213 specimens, with all (100%) identified as the Omicron variant. We attribute the excellent outcomes to the mild Omicron variant and vaccination coverage along with local community leadership, strong partnerships, community engagement in testing and isolation, and community participation in the culturally considered COVID-19 cool-down-the-home program.

Crossing the border: Adherence to the Vaccination Campaigning in multicultural provinces of South Tyrol during COVID-19 Pandemic, a cross-sectional study
Francesco Uguzzoni1, Lucia Palandri2, Antonio Lorenzon3, Catalina Cristofo3, Filippo Lozza4, Riccardo Poluzzi5, Maria Scassera6, Cristina Rizzi7, Pierpaolo Bertoli8, Florian Zerzer9, Elena Righi10
1University of Modena and Reggio Emilia, Department of Biomedical, Metabolic and Neural Sciences, University of Modena and Reggio Emilia, Modena, Italy, 2South Tyrol Health Care Service, Epidemiological Surveillance Unit, Via Lorenz Böhler 5, 39100, Bolzano, Italy, 3South Tyrol Health Care Service, Medical Management, Via Lorenz Böhler 5, 39100, Bolzano, Italy, 4South Tyrol Health Care Service, General Management, Via Thomas Alva Edison 10/0, 39100, Bolzano, Italy

Objectives and Background: “South-Tyro” Alpine region in Italy is administered as an “autonomous statute region”, bordering Austria. This geographically heterogeneous environment is divided in 20 districts and is inhabited by a unique multicultural population. Poor evidence exists on factors influencing adherence to vaccination in peculiar contests, therefore the aim of this study was to investigate the role played by geographical, cultural and socio-demographical characteristics on COVID-19 vaccination adherence during the first year of the Italian vaccination campaign.

Methods: We carried out an ecological study by analysing data collected from each district of South-Tyro: altitude, population density, linguistic belonging, Austrian border proximity, cultural heritage, winter tourism, COVID-19 incidence, complete primary vaccination cycle and booster dose. Data refer to February 2022, one year after the beginning of the vaccination campaign. Spearman correlation, Kruskal-Wallis and Mann-Whitney-U tests were performed to assess relationships between variables.

Results: On February 2022 district percentages of vaccination adherence varied widely ranging between 57.1% and 74.8%. Adherence to vaccination appears to be negatively correlated to altitude (Rho=-0.626, p<0.003; Rho=-0.693, p<0.001, respectively for primary vaccination and booster dose) and positively correlated to population density (Rho=0.585, p=0.007; Rho=0.600, p=0.005). Furthermore, primary vaccination appeared significantly lower in districts with a higher prevalence of German speaking population (69.2% vs 74.7%, p<0.05) and in those more isolated or with a prevalent German cultural heritage.

Conclusion: In analysing vaccination adherence, diversity in geographic, cultural and demographic factors should be taken in great account, even when the target population appears homogeneous from a clinical standpoint and overall adherence to vaccination campaign is satisfying. To plan a more effective and homogeneous vaccination campaign, specific public health interventions more focused on cultural heritage and geomorphological peculiarities should be considered and implemented for specific subpopulations and areas.

Cardiovascular and respiratory events following COVID-19 hospitalisation: a cohort study in Portuguese hospitals
Andreia Leite1, Maria Brazão2, Sofia Nóbrega2, Maria Lobão2, Luísa Eça Guimarães1, Rita Moça1, Lélita Santos2, Joana Paixão1, Helena Rodrigues1, Ana Ramalho1, Inês Simões1, Andreia Costa2, Gabriel Atanásio1
1NOVA National School of Public Health, Portugal, 2Hospital Central do Funchal, Portugal, 3Hospital de Cascais, 4Centro Hospitalar Póvoa de Varzim-Vila do Conde, Portugal, 5Centro Hospitalar e Universitário de Coimbra, Portugal, 6Hospital Terras do Infante, Portugal, 7Centro Hospitalar de Trás-os-Montes e Alto Douro, Portugal, 8Centro Hospitalar Tondela/Viseu, Portugal

Background and Objective: Several studies have shown an increased frequency of cardiovascular and respiratory events, a part of the long COVID presentation. We aimed to describe the incidence of pre-specified cardiovascular and respiratory events after a COVID-19 hospitalisation.

Methods: We retrospectively collected data from individuals hospitalised due to
COVID-19 between March 2020 and March 2021 in six Portuguese hospitals. The cardiovascular events considered were: heart failure, myocarditis, arrhythmia, acute myocardial infarction, deep vein thrombosis, ischemic stroke, and hemorrhagic heart attack; and the respiratory events considered were: pulmonary thromboembolism, pulmonary fibrosis, chronic or prolonged respiratory failure, obstructive/restrictive lung disease, and organising pneumonia. We estimated incidence and 95% confidence intervals.

Results: Data collection is still ongoing. For this preliminary analysis, 1438 individuals were included. The median age was 70, 53% were male, and 12% died after hospital discharge. Individuals were in the study for a median of 17 months. Most individuals (66%) had moderate COVID-19, corresponding to supplementary oxygen use during hospitalisation, and 14% had severe COVID-19, needing ventilation or admission to ICU. During the study period, 98 cardiovascular and 85 respiratory events were registered, corresponding to an incidence of 3.5 (95% CI: 2.8; 4.3) and 3.9 (95% CI: 3.1; 4.9) cases per 1000 person-years, respectively. Overall, 172 events were registered, corresponding to an incidence of 107.9 (95% CI: 92.4; 125.3) cases per person-years. The incidence of cardiovascular and/or respiratory events increased according to the severity of the COVID-19 episode (mild – 75.7 (95% CI: 48.5; 112.6), moderate – 109.3 (95% CI: 90.1; 131.4) and severe – 143.9 (95% CI: 100.2; 200.1) cases per person-years, respectively).

Conclusion: Comparisons with the expected incidence rates in the absence of COVID-19 are required; nevertheless, our preliminary results indicate that the frequency of events increases with increasing COVID-19 severity.

Romina Estepa de Sanità-ISS and the Polytechnic University of Marche-UNIVPM are reported.

Results: In UC-A (ISS), 1,088,026 hospitalizations were identified in Italy in 2017-2019. Median time from diagnosis to surgery in 2020 was 39 days (1st -3rd Q: 26-61), 39 days (1st -3rd Q: 24-56) in 2017-2019 (p =0.08).

Methods: We analysed reported symptoms and subjective well-being from 2295 participants (of which 576 reported previous infection) in an ongoing longitudinal cohort study taking place in Israel, in which participants regularly report their health status. We measured SWB using the WHO-5 standardized tool and estimated changes in SWB associated with reported selected symptoms at three follow-up time points (3-6, 12-18 months post-infection) among participants reporting previous SARS-CoV-2 infection, adjusting for key demographic variables, using linear regression.

Results: Our results suggest that the biggest and most sustained changes in SWB stems from non-specific symptoms (fatigue -7.7 percentage points (pp), confusion/lack of concentration -10.7 pp, and sleep disorders -11.5pp, p<0.005), whereas the effect of symptom-specific symptoms, such as musculoskeletal symptoms (weakness in muscles and muscle pain) on SWB, are less profound and more transient. Each symptom was individually associated with a decrease of SWB after adjusting for other symptoms.

Conclusion: Post-acute COVID19 symptoms can have a profound and lasting effect on well-being, especially among individuals experiencing several symptoms. Taking a similar approach for other symptoms and following individuals over time to describe trends in SWB changes attributable to specific symptoms will help understand the post-acute phase of COVID-19 and how it should be defined and better managed.

Impact of COVID-19 Lockdowns on Gastrointestinal Cancer Incidence: A Registry-Based Study in Bavaria - Germany

Amir Hakimhashemi1, Sven Vogländler2, Nina Grundmann3, Martin Meyer4, Jacqueline Müller-Nordhorn4

Bavarian Cancer Registry, Bavarian Health and Food Safety Authority, Germany

Background and Objective: Recent scientific studies show that the COVID-19 pandemic affected the cancer screening programs and, consequently, cancer incidence in different countries worldwide. This study investigated the impact of the two lockdowns in March 21 to May 3, 2020 (first lockdown) and December 9, 2020 to March 7, 2021 (second lockdown), on gastrointestinal cancers (ICD-O-3: C15 - C26) in Bavaria, Germany.

Methods: We gathered incident cancer data including malignant and in situ cases from approximately 50% of pathological centres in Bavaria. We aggregated the number of incident gastrointestinal cancers in months stratified by cancer site and malignancy in pre-pandemic (03.2019 to 02.2020) and pandemic (03.2020 to 02.2021) periods. We estimated the relative changes of numbers of cancers between pandemic and pre-pandemic periods with corresponding confidence intervals using a Bonferroni correction (13 tests with $α = 0.0038$).

Results: The number of malignant gastrointestinal cancers significantly declined from 10,587 in the pre-pandemic period to 9,749 in the pandemic period with a relative difference of -7.9% (95% CI: -11.6% to -4.1%). It significantly reduced for colon cancer from 4,032 to 3,568 (relative change: -11.5%; 95% CI: -17.2% to -5.4%) and rectum cancer from 2,095 to 1,772 (relative change: -15.4%; 95% CI: -23.0% to -7.1%). We found no significant reductions for other sites. The number of in situ cases decreased from 451 to 327 with a relative change of -27.5% (95% CI: -41.2% to -10.5%). It also declined in colon cancer from 261 to 170 cases (relative change: -39.5% 95% CI: -54.3% to -19.9%), but not in the other sites.

Conclusion: The COVID-19 pandemic affected the number of pathological diagnoses of gastrointestinal cancers in Bavaria. The reduction was mainly due to the reduction in diagnoses of colon and rectum, which could be a result of decreases in screening cases during the lockdowns.

How were place of death trends for cancer patients affected by the COVID-19 pandemic? An international death certificate study
Risk/protective factors associated with anti-SARS-CoV-2 antibody response in a sample of workers from the emilia romagna region, Italy

Michele Granata\(^1\), Pasquale Galante\(^1\), Stefania Paduano\(^1\), Alberto Modenes\(^e\), Alessandro Foggi\(^1\), Isabella Marchesi\(^1\), Roberto Vivel\(^1\), Rossana Bellucci\(^1\), Sara Verri\(^2\), Simona Marchetti\(^2\), Fabriziamor Gobba\(^1\), Annalisa Bargellini\(^1\), Sara Turchi\(^1\)

1Department of Biomedical, Metabolic and Neural Sciences, Section of Public Health, University of Modena and Reggio Emilia, Modena, Italy, 2Department of Biomedical, Metabolic and Neural Sciences, Section of Public Health, University of Modena and Reggio Emilia, Modena, Italy, 3Laboratorio Analisi TEST Srl, Modena, Italy

Background and Objectives: The COVID-19 pandemic has hit worldwide. Italy was one of the first European countries to be severely affected. Many factors can play relevant roles in SARS-CoV-2 infection, both in virus replication and in activating the host’s immune system. This case-control study aims to assess the possible relationship between SARS-CoV-2 infection, evaluated through antibody response and the main socio-demographic, occupational, clinical-anamnetic and biochemical factors, in a population mostly residing in the Modena province (northern Italy) and mainly composed of workers.

Methods: Enrollment was performed among subjects who voluntarily underwent serological testing. Subjects with antibody positivity for IgM and/or IgG (cases) and a similar number of negatives (controls), matched by sex, age and Italian region or foreign country of birth, were selected. Additional parameters (zinc/iron/copper/chromium/nickel, vitamins D/B12, folates, triglycerides, LDL/HDL/total cholesterol) were determined. Moreover, a questionnaire on the main relevant sociodemographic occupational and clinical data was administered through telephone interviews.

Results: A total of 405 subjects have been enrolled, 166 cases (mean age 50.6±12.4 years), 71 (42.8%) men and 95 (57.2%) women, and 239 controls (mean age 50.6±11.6 years), 106 (44.3%) men and 133 (55.7%) women. The smokers’ percentage was significantly lower in cases (12.7%) compared to controls (20.6%). Among cases a higher percentage of subjects with diabetes (2.4% vs 0.8%) and a lower percentage of persons affected by respiratory diseases (9.7% vs 12.6%) were found. By analysing biochemical data, a lower median serum level of folates was detected among cases.

Conclusion: Our results suggest an inverse association of SARS-CoV-2 infection evaluated through antibody response with smoke and also with folates serum level. The first association, also observed in other studies, is controversial due to the role of potential confounding factors. Regarding the inverse association with folates, a recent study shows that folates bind and inactivate a viral protease.

Background: Several studies have shown that antibody responses in people with HIV depend on CD4 count and people with HIV with CD4 counts below 500 may have a weaker response to vaccination. This systematic review aims at evaluating vaccine effectiveness reported by real world studies on HIV patients.

Material and Methods: PubMed, medRxiv/bioRxiv, WHO covid-19 databases, the VIEW-hub platform and the 2022 CROI (Conference on Retroviruses and Opportunistic Infections) site were searched using the terms “COVID-19”, “SARS-CoV-2”, “vaccine efficacy”, “people living with HIV”.

Results: Real world studies were conducted in Zambia [3], Taiwan [4], South Africa [5], and the Russian Federation [6]. Vaccine effectiveness estimates range widely across included studies according to the outcome considered: - infection: 65.8% [6.6% - 100%] [4], severe disease/hospitalization/ICU admission: 73.2% - 79.3% [5] - death/in-hospital mortality: 67.2 [5] - 76.0 % [3] Vaccine effectiveness author outcome hiv+ Vaccinated hiv+ unvaccinated ve% 95CI events total %95CI events 95%CI gushchin infection 71 2545 2.3 (2.2 - 3.5) 1354 1660 6.6 (6.1 - 8.6) 65.8(56.7-72.9) LIN infection 0 336 0 (0 - 1) 57 2795 1.3 (0.9 - 1.8) 100 bekker hospitalization 18 3802 0.50 (0.3 - 0.8) 66 3731 1.8 (1.4 - 2.3) 73.2(55.9-84.1) bekker ICU admission 4 3802 0.1 (0.0 - 0.3) 19 3736 0.63 (0.3 - 0.8) 79.3 (93.9-99.9) bekker death 5 3803 0.1 (0.0 - 0.3) 15 3738 0.4 (0.2 - 0.6) 67.2 (9.9-88.1) hines in-hospital mortality 17 159 5.8 (3.4 - 9.1) 295 1229 24.0(21.6 - 26.5) 76.0(61.5 - 85.0) Conclusions: Taken together, the available evidence shows that PLWHA are protected by current WHO recommended COVID-19 vaccines.

Wastewater monitoring system for emerging infectious diseases in Thailand

Ratanapon Tangwangvirat, Chadaporn Phiancharoen

Department of Disease control Thailand

Background and Objective: Wastewater surveillance is a beneficial method to monitor the virus especially the outbreak period but there are different benefits in each phrases including pre-outbreak, during the outbreak and post-outbreak. This method is able to use for large area and it could be more efficient for the place which has the good wastewater management system. This study aimed to identify the beneficial of wastewater monitoring system in different settings and phrases.

Method: The samples were collected from different settings and phrases of the COVID-19 and Monkeypox outbreak in Thailand. The selected settings were community apartments, fresh markets, prisons, and hotels. All samples were tested for COVID-19 (E gene, ORF1ab gene and N gene) and Orthopoxvirus.

Results: The results demonstrated that SARS-CoV-2 and Orthopoxvirus can be detected in untreated water. The virus could be detected the next few days after the absence of the patients. The benefits of sample collection in different outbreak phrases are vary. For the pre-outbreak phrase, the surveillance aimed to detect the new emerging virus as well as the infected patient to start the interventions for disease prevent and control. During the outbreak, the surveillance aimed to identify the patients and monitor the viral trend such as the mutated strain as same as the post-outbreak phrase.

Conclusion: We suggested that wastewater monitoring system is a useful method to detect the new emerging diseases and for wide-scale surveillance. Unfortunately, the different outbreak phrases have an effect for sample interpretation and usage. The implementation of this method should be identified clearly before starting the protocol.

Vulnerability, COVID-19 and quality of acute neuro-cardiovascular care

Bordeaux University Hospital, Bordeaux University France, CIC-EC, Bordeaux University Hospital, CIC-EC 14-01, Bordeaux University hospital France, CIC-EC 14-01, Bordeaux University Hospital France The AVICOVID Group Bordeaux University France

Background and Objective: Myocardial infarction and stroke are two highly time-sensitive emergencies, which require standardized guidelines of timed care pathway to reduce treatment times. COVID-19 profoundly modified use and organization of care, as well as its access in a backdrop of pre-existing health disparities in neuro-cardiovascular diseases. Our aim was to evaluate if the first wave of COVID-19 had deteriorated quality of care for socially or clinically vulnerable stroke and myocardial infarction patients.

Methods: We included myocardial infarction and stroke patients from two French regional cohorts between January 2019 and August 2020. Associations between vulnerabilities (clinical: age over 65 years, neuro-cardiovascular history; socioeconomic: deprivation index) and care management times were analyzed through multivariate linear mixed models, with an interaction on the time period (pre, per, post-wave).

Results: 9218 patients were included (6436 strokes, 2782 myocardial infarctions). The first medical contact-to-procedure time was longer for the elderly (p<0.001) and the "very disadvantaged" (p=0.003) myocardial infarction patients, without any interaction with the Covid-19 period (age: p=0.541, neuro-cardiovascular history: p=0.697, deprivation: p=0.642). In the "stroke" cohort, no significant association was found between the vulnerabilities studied and the admission-to-imaging time, with no interaction with the Covid-19 period (age: p=0.807, neuro-cardiovascular history: p=0.339, deprivation: p=0.945).

Conclusion: Pre-existing disparities in care management times for vulnerable myocardial infarction and stroke patients were neither accentuated nor reduced during the first-wave Covid-19. Measures implemented during the crisis did not alter the well-structured emergency pathways for these vulnerable patients.

Gender differences in comorbidities and outcomes of COVID-19 patients: findings from the “MASSI” study

Andrea Maugeri, Martina Barchitta, Giuliana Favara, Roberta San Lio, Martina Puglisi, Dario Sinatra, Giuseppe Libertì, Antonella Agodì

University of Catania Italy, Provincial Health Authority of Catania Italy

Background and Objective: In the current COVID-19 pandemic scenario, it is necessary to understand if gender differences exist in terms of patients’ characteristics and clinical outcomes. Here, we explore gender-differences in the pre-existing medical conditions, and evaluate how they might affect the risk of death among COVID-19 patients.

Methods: We used data from the MASSI (“Modelli innovativi per l’Analisi dati della Sorveglianza Sanitaria Integrata COVID-19”) study, which integrates surveillance data obtained from the Provincial Health Authority of Catania and the national surveillance system coordinated by the Italian National Institute of Health. The analysis was conducted on 1424 patients diagnosed with COVID-19 from February 2020 to December 2021 in Catania (Italy), and included patients with at least one medical condition - cancer, cardiovascular diseases (CVDs), HIV infection, chronic neurological, respiratory, corneal, kidney and liver diseases, diabetes, obesity, and other metabolic diseases.

Results: Compared to females, males were younger, more likely to exhibit diabetes (p<0.001), and less likely to exhibit other metabolic diseases, and obesity (p-values<0.01). However, no gender-differences were found for other medical conditions (p-value>0.05). The regression model confirmed that diabetes was more common in males (OR=1.786, 95%CI=1.362-2.343, p<0.001), while other metabolic diseases and obesity were less common (OR=0.607; 95%CI=0.436-0.846; p=0.003 and OR=0.626; 95%CI=0.451-0.868; p =0.005, respectively). Although no difference in mortality was evident between genders (p=0.141), CVDs, diabetes, kidney, chronic neurological and respiratory diseases significantly contributed to the risk of dying among males. Instead, factors that affected the probability of death among females were kidney diseases, chronic neurological and CVDs.

Conclusions: Our findings confirm gender-differences in pre-existing medical conditions of COVID-19 patients, which may influence the risk of death. Further studies, however, are needed to understand physiological and pathological mechanisms underpinning these differences.

DOI: 10.18332/popmed/164137

The effect of COVID-19 pandemic on Google search activity on foods: an analysis of the public interest in Italy

Giuliana Favara, Andrea Maugeri, Martina Barchitta, Roberta San Lio, Antonella Agodì

University of Catania Italy

Background and Objective: COVID-19 pandemic had a great effect on lifestyles and behaviors, which however remains to be clarified in terms of strength and direction. Here, we analyzed Google Trends data to evaluate changes in the interest of Italian people on food categories, before and during the pandemic. Methods: Data on internet searches from January 2018 to June 2022 were obtained from Google Trends, using the terms: fruits, vegetables, legumes, whole-grains, nuts and seeds, milk, red meat, processed meat, and sugar-sweetened beverages. For each term, relative search volume was measured and ranged from 0 (no interest) to 100 (highest interest). Jointpoint regression analysis was used to assess changes in public interest on foods, and results were expressed as weekly percent change (WPC).

Results: Public interest in fruit, vegetables, milk, and whole-grains exhibited a similar trend, with the highest peak observed during the first COVID-19 lockdown. Particularly, public interest in fruits and vegetables increased up to the highest peaks reached from 15th to 22nd March 2020 (WPC= +37.13%) and from 22nd to 29th March 2020 (WPC= +20.21%), respectively. The public interest in milk, instead, reached its peak from 23rd February to 22nd March 2020 (WPC= +36.38%). The trend was similar for whole-grains, even if the public interest reached the peak slightly after (from 12th to 19th April 2020; WPC= +4.99%). However, the interest in these foods returned to the pre-pandemic levels after the first lockdown period. Moreover, we pointed out other changes in public interest for some foods (i.e., legumes and red meat), which however were not related to the COVID-19 pandemic.
Conclusion: Our findings showed a significant influence of COVID-19 pandemic on public interest in food categories, even if this effect was limited to the first lockdown. Thus, further research should be encouraged to evaluate the long-term effect of pandemic.

Effects of bivalent Omicron-containing vaccine boosters and prior infection against SARS-CoV-2 Omicron infections in Luxembourg, September-December 2022

Dritan Bejko1, Dritan Bejko1, Corinna Ernst1, Anne Vergison2, Joël Mossaong1, Health Directorate 2A, rue Thomas Edison L-1445 Strassen Luxembourg, Health Directorate

Background and Objective: In Luxembourg, bivalent mRNA booster vaccines containing Omicron BA.1 or BA.4/BA.5 were introduced in September 2022 mainly targeting persons aged 60 years and older. The protection conferred by bivalent booster doses or by natural immunity due to prior infections against Omicron infections is unknown. We evaluated the effectiveness of a fourth bivalent Omicron-containing booster dose and natural immunity due to prior infection against laboratory confirmed SARS-CoV-2 infection.

Methods: We conducted a test-negative matched case-control study in persons aged 60 years and older in Luxembourg during a time period when SARS-CoV-2 Omicron BA.1 or BA.4/BA.5 and its sub-lineages predominated. Matching was based on age group, sex and week of test. Effectiveness was assessed using conditional logistic regression adjusting for nursing home residency, time since last dose of vaccine, geographic region, and immigration background.

Results: Data from 4714 cases and 9881 matched negative controls from September 22 through December 7 2022 were included in the analysis. The effectiveness of the fourth bivalent booster dose was 54% (95% CI 35%-67%) compared to no vaccination and 38% (95% CI 15%-55%) compared to three and 36% (95% CI 14%-52%) compared to four monovalent booster doses. Effectiveness for BA.1 and BA.4/BA.5 containing vaccines were similar (p=0.05). Effectiveness of prior Omicron and pre-Omicron infection were 80% (95% CI 77%-82%) and 45% (95% CI 37%-52%), respectively. Effectiveness of prior Omicron infections and bivalent booster vaccination was 87% (95% CI 72%-94%).

Conclusion: Bivalent Omicron-containing boosters were more protective against Omicron infection than monovalent boosters. Prior infection with Omicron provided a high protection, significantly better than prior infection from the pre-Omicron era. Hybrid immunity with Omicron infections and bivalent booster vaccination conferred the highest levels of protection.

Arrangement of influenza pandemic preparation and response Plan (PanFlu) in the reality of ULSS 6 Euganea

Luca Sbrogi1, Paolo Fortuna1, Chiara Bovo1, Piero Realdon1, Francesca Scotton1, Elena Marcante1, Paola Anello1, Luca Cessaro1, Carlo Giordani1, Lorena Gottardello1, Natalina Frison1, Irene Marin1, Tullio Zampieri1

ULSS 6 Euganea Italy, ULSS 6 Euganea Italy

Background and Objective: The recent Sars-CoV-2 pandemic has shown the need to provide a plan capable of responding to unpredictable events. On the basis of WHO recommendations, in January 2021 Italy adopted the National Pandemic Preparedness Plan, which was consequently implemented at regional level. Each local health authority has the task of implementing these documents by bringing it down to a local level. The ULSS6, making the most of the experience gained during COVID-19 pandemic, has organized the PanFlu Plan by identifying the main actions to be taken in preparation to a possible future pandemic.

Methods: Preparedness in public health has been assimilated to a process, so continuous improvement techniques could be used in the preparation of the plan. Ulss 6 used the Plan-Do-Check-Act (PDCA) model, organizing the work in four phases. Processes, objectives and resources were established in the Plan phase, then in the Do phase the identified managers implemented the actions. In the Check phase, feedback and results achieved were analyzed and finally the Act phase makes the document dynamic, leading to continuous improvement.

Results: The PanFlu coordination group prepared the Plan within the established deadlines. The document provides for the organizational declination of 198 actions divided into 13 macro-areas of interest involving territory, hospital facilities, prevention departments and administrative area through the various phases of a pandemic, considering aspects ranging from supplies to continuous training, from personnel recruitment to communication and logistical aspects.

Conclusion: The PanFlu Plan arrangement made it possible to define the processes and the related managers for each of the actions identified, making the document an easily applicable tool for all operators. A solid healthcare system that is aware of its internal processes and interconnections, and manages to coordinate them efficiently, will also be able to better deal with any future emergency situations.

Resurgence of the respiratory syncytial virus epidemic in infants after the easing of the COVID-19 containment measures: a retrospective cohort study from Tuscany Region, Italy

Vieri Lastrucci1, Martina Pacifici1, Giorgia Aldorotti1, Lorenzo Stacchini2, Elettra Berti3, Monica Puglia1, Giulia Hyerczi1, Giuseppe Roberto1, Rosa Gini1, Fabio Vollerr2

1Epidemiology Unit, Meyer Children’s Hospital, Florence, Italy, 2Observatory of Epidemiology, Regional Health Agency of Tuscany, Florence, Italy, 3Medical Specialization School of Hygiene and Preventive Medicine, University of Florence, Italy, 4Neonatal Intensive Care Unit, Meyer Children’s Hospital, Florence, Italy

Background & objective: COVID-19 pandemic reduced the incidence of many viral infections in children, raising concerns about future larger epidemics with the easing of the containment measures. Respiratory syncytial virus (RSV) is a leading cause of hospitalization in infants aged<2 years, and Palivizumab is used for RSV prophylaxis. This study aimed to evaluate the impact of COVID-19 pandemic on the RSV hospitalization and palivizumab prescriptions.

Methods: The study was funded by Tuscany Region. Five RSV epidemic seasons (2017-2022) were considered. For each RSV season, all the Tuscany Region infants aged <2 years were retrospectively followed-up in administrative databases to evaluate the occurrence of a RSV infection-based hospitalization. Trend of hospitalizations by months, seasonal incidence rates (per 1,000 person-days), and palivizumab prescriptions were the main outcomes.

Results: In total 1,756 RSV hospitalizations occurred in a population of 313,444 infants in the five seasons. In the first RSV season during pandemic (2020/2021), the RSV hospitalization incidence rate was zero. In the 2021/2022 season, the RSV epidemic started earlier and incidence rates of RSV hospitalization and severe hospitalization (23.45, 95%CI 22.84-25.25 and 5.76, 95%CI 5.46–6.69, respectively) were about three times higher compared with pre-pandemic seasons; a significant difference in the distribution of the RSV hospitalizations for infants’ gestational age at birth (GA) was observed only for GA of 32-35 weeks, while age on admission was significantly higher in 2021/2022 compared with pre-pandemic seasons. In the 2020/2021 and 2021/2022 seasons palivizumab prescriptions remained, respectively, stable (1,416) and increased (1,858), compared with the pre-pandemic average (1,343).

Conclusion COVID-19 pandemic has caused a significant effect on the RSV epidemic. The epidemic resurgence and anticipation probably reflects the containment measures relaxation and the immune debt incurred in the previous season. Palivizumab prophylaxis was not affected by any indirect effects of the pandemic on the health service use.

Identifying risk factors for SARS-CoV-2 infection in university students after COVID-19 vaccine release: a nested case-control study

Erika Renzi1, Valentina Baccolini1, Antonio Covelli1, Giuseppe Migliara1, Azzurra Massimi1, Corrado Vito1, Carolina Marzuillo1, Paolo Villari1

1Sapienza University of Rome Department of Public Health and Infectious Diseases, Sapienza University of Rome Italy, 2Sapienza University of Rome Medical Specialization School of Hygiene and Preventive Medicine, Sapienza University of Rome, Rome, Italy

Background and Objective: During the SARS-CoV-2 testing program offered through the RT-PCR test by Sapienza University of Rome, we conducted a test-negative nested case-control study between September 2021 and February 2022 to identify risk factors for acquiring SARS-CoV-2 infection among university students.

Methods: Each positive student (case) was matched with two negative students (controls), randomly selected from individuals who tested on the same day. Participants underwent a 10-minute structured interview about exposure to modifiable and non-modifiable risk factors for acquiring SARS-CoV-2 in two weeks before testing. Multivariable conditional logistic regression analyses were performed. Adjusted odds ratio (aOR) and 95% CI were calculated. A second model was restricted to participants who did not report attending campus in the two weeks before testing.

Results: Out of 8,730 tests for SARS-CoV-2, 122 of 173 cases were included in the study (response rate: 70.5%). A total of 366 students took part in the analysis. Most students were female (73.2%), with a mean age of 23.3±3.6 years, and vaccinated for SARS-CoV-2 (97.8%). At the multivariable analysis, significant
assessments were found for being a case and having had a contact with COVID-19 positive person or with influenza like (ILI) symptoms (aOR: 6.51, 95%CI 3.48-12.18), attending clubs (aOR: 4.07, 95%CI:1.52-10.90), and having only the primary vaccine cycle (aOR: 2.94, 95%CI:1.24-6.96). Instead, attending lectures at the campus (aOR: 0.34 95%CI:0.15-0.77) was a negative predictor. No association was found with other predictors. The second model showed that exposure to a COVID-19 case or someone with ILI symptoms increased the likelihood of SARS-CoV-2 infection, while being female seemed to be less associated with acquiring the infection.

Conclusions: The results highlight how students who attend lectures in-person adhering to non-pharmacological preventive measures seem less exposed to SARS-CoV-2 infection. This finding suggests that the university environment appears to be safe.

COVID-19’s lessons learned from Primary Care and General Practice: enduring rafts against Pandemic Waves
Lucia Palandri1, Lucia Palandri2, Alice Serafini2, Giulia Ugolini3, Chiara Gianzsche4, Davide Formaciani5, Alberto Ferrari1, Marco Saletti2, Marina Scarp2, Maria Padula3, Silvia Riccomi4, Elena Righi5
1University of Modena and Reggio Emilia “1. Department of Biomedical, Metabolic and Neural Sciences, University of Modena and Reggio Emilia, Modena, Italy” Via Campi 287, Modena, Italy, 2University of Modena and Reggio Emilia Department of Biomedical, Metabolic and Neural Sciences, University of Modena and Reggio Emilia, Modena, Italy. Clinical and Experimental Medicine PhD Program, University of Modena and Reggio Emilia, Modena, Italy Via Campi 287, Modena, Italy, 3Local Health Unit of Modena, Modena, Italy, 4Local Health Unit of Modena, Modena, Italy, 5Local Health Unit of Modena, Modena, Italy, 6Local Health Unit of Modena, Modena, Italy, 7Local Health Unit of Modena, Modena, Italy, 8Local Health Unit of Modena, Modena, Italy.

Background: The Pandemic heavily hit northern Italy. Since most infections have mild to moderate symptoms thus Primary Care(PC) had to quickly adapt and reorganize to contribute to reducing hospital overload end ensure continuity of care. Italian literature on COVID-19 outpatient management is scarce, and little is known about overall management strategies. The study aims to describe the overall reorganization in pharmacological and monitoring strategies adopted by Italian general practitioners(GPs) to care for SARS-CoV-2 infected outpatients during the pandemic’s first waves and to evaluate their effectiveness in COVID-19 hospitalisation.

Methods: This is a retrospective cohort study of SARS-CoV-2 infected adult outpatients managed by their GPs from March 2020 to April 2021 in the province of Modena(Italy). Using electronic medical records, we extracted data on pharmacological and management strategies (home visits and remote monitoring), patient characteristics, and hospitalizations. We stratified data on pharmacological and management strategies (home visits and remote monitoring), patient characteristics, and hospitalizations.

Results: Of 5340 patients, 56% (83% with pneumonia) were actively monitored by 46 GPs and specifically created continuity-of-care units. A significant reduction in paracetamol, antibiotics and hydroxychloroquine prescriptions was observed over time in concordance with newly released guidelines. FANS for moderate patients (OR=0.50 95%CI:0.25-0.99), and steroids (OR=0.50 95%CI:0.32-0.84), antibiotics (OR=0.42 95%CI:0.25-0.70) and heparin (OR=0.63 95%CI:0.38-1.04) for severe-critical patients were effective in reducing the probability of hospitalisation, yet none as much as GPs’ active monitoring (OR up to 0.32 95%CI:0.14-0.70) or home visits (OR up to 0.42 95%CI:0.20-0.88).

Conclusion: Italian Primary Care showed to be resilient and prone to adapt management and pharmacological strategies effective in reducing hospitalization overload. Considering a new potential pandemic and given that the ending of the current one is still proceeding at a slow pace, strengthening and investing in territorial health systems is a key strategy for controlling hospital overload and its consequences on patients health.

Background and Objective: In Italy, the COVID-19 pandemic has caused over 4.6 million cases in individuals aged between 0 and 19. This study aims to evaluate the role of vaccination against COVID-19 in order to reduce the spread of the SARS-CoV-2 virus within schools in Modena province.

Methods: A retrospective cohort study was performed in the period 1 September-15 December 2021 among teachers and students aged 0-19 years, screened for SARS-CoV-2 infection by nasopharyngeal swab following the detection of an index case within classroom.

Results: In the study period, 13934 subjects were tested, of which 12534 (90%) students and 1400 (10%) teachers, from 594 different classes. A total of 1373 cases were identified, 594 index cases and 779 secondary cases, respectively. In detail, 9.8% (1225 cases) of students tested were positive for SARS-CoV-2 and 10.6% (148 cases) of teachers. Out of entire population 32.7% (4562) of participants (64.9% of teachers and 29.2% of students) were vaccinated with at least one dose of the anti-SARS-CoV-2 vaccine at the test time. Among 779 secondary cases, only 7.7% (60) were vaccinated compared to 35.1% (4408) of negative tested subjects. Most of the subjects who tested positive attended primary school (50.8%) with the highest ratio of secondary cases on index cases rate (2.19), followed by middle (24%), high school (15.2%), infant (7.2%) and nursery school (2.7%).

Conclusion: The results of this study show the differential spread of SARS-CoV-2 within various age groups and indicate that the vaccination, available in the study period only for the population aged ≤12, may have mitigated virus spread in middle and high schools. Conversely, infant and nursery schools seemed to benefit from organization in small classes.

Prevention and control of covid-19: A multicentric study of the Brazilian population in the territories covered by primary health care
Maria Guilm1, Carla Teixeira1, Julio Schweickardt2, Diana Gutiérrez Diaz de Azevedo3, Kamile Siqueira3, Jonatas Bessa4, Natália Cardoso5, José Pedroso6
1Fundação Oswaldo Cruz researcher Brazil, 2Fundação Oswaldo Cruz, 3Universidade Federal Fluminense, 4Universidade Federal da Bahia researcher Brazil, 5Universidade Federal do Rio de Janeiro researcher Brazil, 6Universidade Federal do Piauí researcher Brazil

Background: The COVID-19 pandemic highlighted the importance of Primary Health Care (PHC) functions in Brazil, a privileged locus for health teams to carry out educational, social, and assistance actions in the prevention and control of the disease.

Objective: This study aims to analyze the information sources and daily-life practices of the strategies for COVID-19 prevention and control in the individual, family, and collective spheres of the population in the territories covered by the PHC.

Methods: Clipping of a multicenter, national study. Cross-sectional, descriptive design, with a quantitative approach, involving 128 health units, 88 municipalities, and 5 regions of the country. Selected for convenience, with a minimum sample calculation of 6,290 families, a structured online questionnaire was used for data collection, which took place between January and September 2021. Descriptive statistics were generated for the analyses.

Results: 6,775 families were included, 41.9% stated that one or more family members had been diagnosed with COVID-19. As for self-perception about the coronavirus, 55.2% say they are very confident in preventive methods; 92.9% considered social isolation as an important preventive measure; a 95.4% reported that COVID-19 is serious and a 67.1% reported low possibility of contagion by COVID-19. As for the perception of information about COVID-19 through social networks, a 57.2% of respondents reported feeling poorly informed; a 42% reported that a health and education action was carried out to prevent COVID-19 by the team of professionals from the health unit in the territory, a 78.8% reported that a health and education action was carried out to prevent COVID-19 by the team of professionals from the health unit in the territory.

Conclusion: Health teams contribute to the informational universe of their users through medical-scientific guidelines. Knowing the practices of coping with the COVID-19 pandemic by the Brazilian population contributes to teams...
Impact of national-scale targeted point-of-care symptomatic lateral flow testing on trends in COVID-19 infections and hospitalisations during the second epidemic wave in Austria

Stephanie Reitzinger1, Thomas Czyzynia2, Werner Leber1, Jasmina Panovska-Griffiths1, Oliver Lammel1
1Institute for Advanced Studies Austria, 2Institute for Advanced Studies Department of Health Policy, London School of Economics Austria, 3Queen Mary University of London United Kingdom, 4The Big Data Institute, University of Oxford United Kingdom, 5Practice Dr. Lammel, Ramsau am Dachstein

Background: In October 2020, amidst the second COVID-19 epidemic wave and before the second-national lockdown, Austria introduced a policy of population-wide point-of-care lateral flow antigen testing (POC-LFT). This study explores the impact of this policy by quantifying the association between trends in POC-LFT-activity with trends in PCR-positivity (as a proxy for symptomatic infection) and hospitalisations related to COVID-19 between October 22 and December 06, 2020.

Methods: We stratified 94 Austrian districts according to POC-LFT-activity (number of POC-LFT-tests performed per 100,000 inhabitants over the study period), into three population cohorts: (i) high(N=24), (ii) medium(N=45) and (iii) low(N=25). Across the cohorts we a) compared trends in POC-LFT-activity with PCR-positivity and hospital admissions; and, b) compared the epidemic growth rate before and after the epidemic peak.

Results: The trend in POC-LFT activity was similar to PCR-positivity and hospitalisations trends across high, medium and low POC-LFT activity cohorts. Compared to the low POC-LFT-activity cohort, the high-activity cohort had steeper pre-peak daily increase in PCR-positivity (2.24 more cases per day, per district and per 100,000 inhabitants; 95% CI: 0.02, 0.18; p<0.15), and 6 days earlier peak of PCR-positivity. The high-activity cohort also had steeper daily reduction in the post-peak trend in PCR-positivity (-3.6, 95% CI: -4.8, -2.3; p<0.001) and hospitalisations (-0.2, 95% CI: -0.32, -0.08; p<0.05).

Conclusions: High POC-LFT-use was associated with increased and earlier case finding during the second Austrian COVID-19 epidemic wave, and early and significant reduction in cases and hospitalisations during the second national lockdown. A national policy promoting symptomatic POC-LFT in primary care, can capture trends in PCR-positivity and hospitalisations. Symptomatic POC-LFT delivered at scale and combined with immediate self-quarantining and contact tracing can thus be a proxy for epidemic status, and hence a useful tool that can replace large-scale PCR testing.

Neutralizing anti-sars-cov-2 antibody titer after three doses of mrna vaccine in a sample of italian nursing home personnel

Annalisa Bargellini1, Alberto Modenese1, Stefania Paduano1, Sara Turchi1, Isabella Marchesi1, Rossana Bellucci1, Simona Marchetti2, Roberto Vivoli1, Fulvio Bruno1, Pietro Grazioli2, Fabriziomaria Gobba1
1Department of Biomedical, Metabolic and Neural Sciences, Section of Public Health, University of Modena and Reggio Emilia, Modena, Italy, 2Laboratorio Analisi TEST Srl, Modena, Italy, 3Fondazione Scarpari Forattini Onlus, Schivenoglia, Italy

Background and Objectives: The titre of the anti-SARS-Cov-2 antibodies 6 months after the completion of primary vaccination cycle (two doses) shows a relevant decay, as also demonstrated in our previous study in a group of Italian nursing home personnel. We decided to evaluate the trend of antibody response after a third dose of anti-COVID-19 vaccine in the same workers. The possible role of individual factors was also explored.

Methods: A mixed retrospective-prospective observational study was performed on a sample of workers (healthcare workers (HCWs) and non-HCWs from an Italian nursing home. Antibody titre was evaluated after the third BNT162B2 vaccine dose and compared with the values determined 6 months after the second dose (baseline). Moreover, individual socio-demographic and anamnestic characteristics were collected through a self-administered questionnaire.

Results: Forty-five nursing home employees vaccinated with three doses of BNT162B2 vaccine were enrolled in this follow up. Results show a significant increase of the neutralizing antibody titre after the third dose compared to the baseline (1221 BAU/ml vs 647 BAU/ml, as median values). A previous COVID-19 diagnosis and being non-HCWs were found to be associated with a higher increase of antibody titre. Analysis on individual characteristics is still ongoing, but preliminary results suggest a possible role of BMI, and age on antibody titre variation after the third vaccine dose.

Conclusion: The results show a significant increase of antibody titre in the employees of the nursing home after the third dose of BNT162B2 vaccine, supporting the importance of adherence to the proposed vaccine campaigns for the prevention of COVID-19 infection in workers.

DOI: 10.18332/npopmed/164194

COVID-19 testing experience among users of primary health care in communities with high socioeconomic vulnerability in northeast Brazil

Thais Aranha-Rossi1, Sandra Barros1, Ana Carvalho2, Denise Cruz2, Sisse Figueiredo2, Camila Reis1, Lailo Magno1, Ines Dourado1
1State University of Bahia - UNEB Av Silveira Martins, 2555. Cabula. Salvador/Bahia/Brazil, 2Federal University of Bahia, 3Federal University of Bahia Av Basilio da Gama, 62. Canela. Salvador/Bahia/Brazil, 4Federal University of Bahia, Brazil

Background and objective: We aimed to understand the testing experience for COVID-19 (C19) among users of PrimaryHealthCare (PHC) located in communities with high socioeconomic vulnerability in a northeastern Brazilian capital. Within the PHC model, Brazil launched the Family Health Program (FHP) in 1994, which provides a broad range of primary care services.

Methodology: This is the formative research component of an intervention study to expand the testing and monitoring of C19. A qualitative approach carried out between December/21-February/22 was used to evaluate the C19 testing experience. Seventy semi-structured interviews were conducted with PHC users. The interviews were transcribed, coded, and analyzed through thematic content analysis.

Results: Of the 70 interviews, 32 were conducted in Basic Health Units and 38 in units of the FHP. The age range was 19 to 82 years old; 62(88.6%) females and 8(11.4%) males; 47.1% of mixed race, 47.1% blacks. Only 21.4% were employed, 14.3% were retired, 27.1% did not work and 21.4% were unemployed. 31 users (44.3%) received social protection benefits (93.5% a cash transfer program or the pandemic emergency aid). Users reported barriers to accessing health services and C19 testing in PHC units during the pandemic. The reported difficulties were a limited number of tests in PHC units, long waiting time, and difficulty to access the test results. Nevertheless, almost all (69) were able to test in expanding testing options provided by the National Health System.

Conclusion: Based on the formative research results an intervention was developed for PHC in two Brazilian capitals, to respond to the barriers to accessing C19 testing. The proposed intervention seeks to expand testing; surveillance strategies, a digital platform with a real-time situation panel, availability of test results, telemonitoring and user tracking, health education material, and prevention strategies for C19.

What makes health systems resilient? an analytical framework drawing on learnings from the covid-19 pandemic

Miriam Reiss1, Thomas Czyzynia1, Miriam Reiss1, Markus Kraus1, Monika Riedel1
1Institute for Advanced Studies (IHS), Vienna Austria

Background and Objective: The COVID-19 pandemic posed an unprecedented challenge which caught many health systems worldwide widely unprepared. The aim of this research was to develop a comprehensive analytical framework on health system resilience in the context of infectious diseases.

Methods: The analytical framework was developed based on a two-tiered approach. First, a comprehensive review of the existing literature was conducted to identify relevant frameworks on health system resilience. Second, input was gathered in several rounds of internal and external consultations with designated field experts and stakeholders, drawing on their experiences from the pandemic.

Results: The framework distinguishes between prerequisites of health system resilience, which address precautions to be taken in ‘normal’ times, and response strategies in the face of shocks (e.g., pandemics). Both sections are further divided into six building blocks that were adapted from the WHO health system framework: governance and leadership, information and research, financing, physical resources, human resources, service delivery. A comprehensive understanding of health systems is applied, as resilience is addressed in the action areas of public health, primary care, secondary care and long-term care. An
overarching component on contextual factors – including, e.g., social cohesion, trust, international connectedness and health literacy – represents a distinctive feature of the framework and an important addition to the existing spectrum of resilience frameworks.

Conclusion: In order to be better prepared for future health crises, the foundations for a resilient health system must already be laid in ‘normal’ times and in all areas of the health system. In the face of an imminent shock, adequate response strategies need to be developed. An essential learning from the COVID-19 crisis has been that contextual factors of societies and sub-groups play a major role in the ability of health systems to overcome a shock.

DOI: 10.18332/popmed/164225

COVID-19 pandemic and management of migrants on quarantine vessels in Italy
Salvatore Zichichi1, Emanuela Frisicale1, Francesca Basile2, Ignazio Schintu2, Laura Pecoraro2, Claudia Marrotas3, Domenico Stabile3, Claudio Pulvirenti3, Roberto Falvo3, Ulrico Angeloni4, Giorgia Battaglia4, Giovanni Rezza4, Fabrizio Stracci3
1 University of Perugia School of Specialization in Hygiene and Prevention, University of Perugia, Perugia, Italy, 2Italian Red Cross - National Committee Italy, 3USMAF/SASN Regional Directorate of Sicily, Ministry of Health, 4General Directorate of Health Prevention, Ministry of Health - Italy

Background and objective: COVID-19 pandemic made the management of the thousands of migrants who have arrived on the sicilian coasts more complex and difficult. At the same time, restrictions to enter Italy were in force and reception facilities were not ready to handle several subjects in isolation and quarantine. Ships were converted into isolation structures. Symdrome surveillance and health conditions monitoring was carried out. This study describes the sample hosted in quarantine vessels and the management of covid-19 cases on board.

Methods: Vessels were converted according to the “ship safety” guidelines of the ministry of health. Ship crews, medical and logistic personnel of the italian red cross were on board. Migrants were hosted according to the country of origin, gender, families, pathologies and in dedicated areas if they resulted positive to the sars-cov-2 when arrived at the italian coasts. Health data of the first access were recorded in a database from april 2020 to june 2022. Results: 59,700 migrants (6,065 women, 53,619 men, 16 not available) of 56 nationalities were hosted. The most represented countries were Tunisia (15210 migrants), Bangladesh (8959), Egypt (6918); 32 subjects declared a European nationality. The average age of the migrants who declared their age was 24,79 years old (0,38%<1y, 6,97%<18y, 8,12%=18y, 92,43%>18y). 4832 subjects (7,34%) were tested and resulted positive to the SARS-CoV-2 (58,6% before boarding and 41,4% during the quarantine period).

Conclusion: The system provided a solution quickly applicable in a context in which it was necessary to find physical places for this large number of migrants, in order to carry out isolation and quarantine with respect for human dignity. Although the system presented critical points and difficulties, it reduced the potential risk of spreading the virus among the population and in the reception system.

DOI: 10.18332/popmed/164263

Inequalities in healthcare utilization among older adults during the second year of covid-19 pandemic: findings from the share cohort
Jitka Pikhartova1, Shakirah Shariff1, Hynek Pikhart1, 1Masaryk University RECETOX Brno Czech Republic, 2UCL IEHC London United Kingdom

Background and objective: Reorganisation of healthcare resources during the COVID-19 pandemic resulted in a global disruption of healthcare services, widening health inequalities among the vulnerable, particularly the older population. This study aims to investigate the sociodemographic and geographic factors associated with healthcare disruption among older European adults in second year of pandemic.

Methods: We used Survey of Health, Ageing and Retirement in Europe (SHARE) data comprising 35,923 participants aged 50 years and above from 27 countries. The influence of sociodemographic factors from wave 7 and geographic factors (country-level COVID-19 context and welfare regime typology) on forgone, postponed and denied healthcare in 2021 (wave 9), controlling for health needs, health behaviours, and COVID-19 vaccination status was investigated using three multilevel logistic regression models.

Results: Among older Europeans, the reported prevalance of forgone, postponed, and denied healthcare were 8.8%, 12.1% and 5.7%, respectively. Those higher educated had higher likelihood of healthcare disruption. Compared to primary-educated, those tertiary-educated had 44% (95% CI 28-62%), 24% (13-37%) and 50% (28-75%) higher odds of forgone, postponed and denied healthcare, respectively. Those with secondary compared to primary education had 15% (4-27%) higher odds of forgone healthcare. Retirees faced higher chance of postponed healthcare compared to employed (OR: 1.26, 1.00-1.62). Those living with partners were less likely (0.91, 0.83-0.99) to experience forgone healthcare. Country-level COVID-19 case and death numbers, stringency of measures against COVID-19 and welfare regime typology were not associated with healthcare disruption. The models for each outcome variable explained 8-9% differences between countries.

Conclusion: Differences in healthcare utilisation among older Europeans based on sociodemographic factors persisted in the second year of COVID-19 pandemic. Strategies to mitigate the repercussion of missed and unmet healthcare should be put in place to ensure preservation of health and wellbeing of this vulnerable population.

Use of the anti-covid vaccination status to support bed management activity as a preventive measure in the development of epidemic outbreaks
Michele Lagioia1, Veronica Ciorba2, Michele Capraro1
1IRCCS Istituto Clinico Humanitas Italy, 2IRCCS Istituto Clinico Humanitas Italy

Background and objective: The large-scale introduction of anti-COVID vaccination has been shown to reduce the probability of contracting and spreading the infection by the vaccinated person. The diagnostic capacity of the nasopharyngeal swab for COVID-19 is limited at the time of its execution, failing to identify subjects who are in the incubation period and therefore with limited efficacy in preventive identification at the time of hospitalization. To limit the development of intra-hospital clusters of COVID-19, a bed management model was structured based on the vaccination status recorded in the electronic medical record and on the length of hospitalization.

Methods: Starting from April 2021, the vaccination status for all hospitalizations, recorded on electronic health records, was extracted in daily reports provided to bed management. The bed management model used provided for the prohibition of sharing the hospital room between unvaccinated subjects or the possible association of long-term patients.

Results: The incidence of clusters (more than two cases in 7 days per unit of stay) in the hospital in the quarter following the implementation of this model showed a percentage reduction of 72.5%.

Conclusion: optimal management of patient placement in small cohorts according to public health criteria can help reduce the occurrence of infectious complications.

DOI: 10.18332/popmed/164288

Primary care during the pandemic: lessons learnt from five European countries
Markus Kraus1, Christoph Stegner2, Miriam Reiss1, Thomas Czyzonka1, Monika Riedel1
1Institute for Advanced Studies (IHS), Vienna Josefstaedter Straße 39 1080 Vienna Austria, 2Institute for Advanced Studies (IHS), Vienna Austria

Background and objective: The COVID-19 pandemic necessitated wide-ranging adaptations to the organisation of health systems, and primary care is no exception. This study aims to collate insights on the various impacts of the pandemic on primary care. The gained knowledge should help to increase pandemic preparedness and resilience of the primary care system.

Methods: We conducted a qualitative study employing semi-structured interviews with primary care providers in Austria, Denmark, France, Hungary, and Italy. A total of 31 interviews were conducted between June and August 2022 and subjected to an overarching analysis to identify key themes.

Results: Disruptions to service delivery led to a widespread adoption of telemedicine. Despite the rapid increase in telemedicine usage and efforts of primary care providers to organise face-to-face care delivery in a safe way, some patient populations such as elderly or chronically ill patients were particularly affected by disruptions in service delivery. Moreover, primary care providers perceived a substantial propagation of misinformation about COVID-19 and vaccines among the population, which also threatened patient-physician relationships. At the same time, primary care providers faced an increased workload, had to work with insufficient personal protective equipment and were provided with incongruous guidelines while pandemic response policies were mostly focused on hospitals.

There was a consensus among primary care providers that they were mostly sidelined by public health policy in the context of pandemic management.
Association between BnT162b2 vaccination and quality of life up to 18 months post-COVID19 among sars-cov-2 infected individuals in Israel: a cross sectional survey

Paul Otku1, Hiba Zayyad2, Ofir Wertheim1, Kamal Jabal3, Amiel Dror4, Saleh Nazzal5, Daniel Glikman6, Michael Edelstein7

1Aziiri Faculty of Medicine, Bar-Ilan University Israel, 2Baruch Padeh Hospital Israel, 3Ziv Medical Centre Israel, 4Galilee Medical Centre Israel Background and objectives: Reduces approximately 10-30% proportion of SARS-CoV-2 infected individuals continue to report symptoms months after the acute infection. Despite a growing consensus that vaccination mitigates the reporting of these long-term symptoms, whether vaccination mitigates changes in quality of life (QoL) associated with post-acute COVID19 symptoms has not been fully investigated. We aimed to identify any association between the BnT162b2 vaccination use in Israel and QoL among individuals previously infected with SARS-CoV-2 in Israel, 3 to 18 months after infection.

Methods: We invited individuals aged 18 years and older whose SARS-CoV-2 r polymerase chain reaction (PCR) test was analysed between 15th March 2020 and 15th June 2022 in one of three government hospitals in Northern Israel, to fill a questionnaire pertaining to their physical, mental and psychosocial health. We examined associations between their vaccination status and post-COVID HRQoL (measured using the EQ5D-5L Utility index (UI) that ranges from less than 0 (lowest QoL) to 1) using linear regression, after adjusting for potential confounders.

Results: 951 participants with complete data were included. Mean UI for participants unvaccinated at the time of infection was 0.77, compared to 0.82 and 0.83 for double and triple vaccinated participants respectively. After adjusting for potential confounders, double and triple vaccination was associated with a 6.1 and 5.6 percentage-point increase in QoL respectively 3-18 months post-SARS-CoV-2 infection, compared to those unvaccinated (p< 0.05).

Conclusions: Vaccination with 2 doses or more of BNT162b2 vaccine was associated with better QoL outcomes 3-18 months post infection compared to those unvaccinated at the time of infection. Our results suggests COVID-19 vaccination not only reduces post-acute COVID19 symptoms but may also mitigate the decrease in quality of life associated with symptoms post-acute COVID19 illness.
Leveraging Electronic Immunization Registry to monitor the two-year impact of COVID-19 on uptake of routine immunizations in children under 2 years of age in Sindh, Pakistan: insights from big data analysis with > 6.9 million children

Muhammad Siddique1, Sundus Ifikhar1, Mubarak Shah2, Vijay Dharma3, Danya Siddiqi4, Subhash Chandri5, Mariem Mehmood6

1IRD Pakistan Pakistan, 2IRD Global Canada, 3IRD Global United Kingdom, 4IRD Global United States, 5IRD Pakistan

Background and objective: The COVID-19 pandemic has disrupted routine immunizations globally, with low-middle-income countries (LMICs) struggling to achieve pre-COVID-19 coverage rates. We leveraged real-time immunization records of > 6.9 million children from the government's electronic immunization registry (Sindh) to quantify the pandemic's 2-year impact on routine childhood immunizations, including the success and inclusiveness of catch-up strategies.

Methods: We extracted individual immunization records from the Sindh registry between March 23, 2019 to March 22, 2022. Comparing baseline (1-year preceding the first lockdown) and the 2-year COVID-19 period, we analyzed the impact on daily immunization coverage rates and impact heterogeneity in coverage across gender and geographies. Furthermore, we examined the success and inclusiveness of post-COVID-19 catch-up strategies for missed children.

Results: We found a 48% (21,440/45,024) and 89% (40,033/45,024) decline in the daily average number of vaccine doses administered during the first and second COVID-19 lockdowns compared to the baseline. Immunizations declined more for girls vs. boys and in slums and rural areas compared to non-slums and urban areas. Of the 1.8 million children who missed immunizations during the 2-year COVID-19 period, 76% (2,919,683/3,818,716) were covered at the 2-year 2022 mark. Despite COVID-19 disruptions, the daily average number of vaccine doses administered at the one- and two-year mark surpassed the baseline rates in sindh by 22% (10,063/45,024) and 21% (9,365/45,024). Moreover, the female-based gender equity improved at the 2-year mark (crude male-to-female ratio (m:f) = 1.01.09) compared to baseline (crude m:f = 1.10)

Conclusion: Seir was crucial in supporting epi activities to trace, target and immunize children who missed immunizations during the 2-year COVID-19 period. Pakistan is among the countries that successfully leveraged eirs during the pandemic to monitor immunization trends and transform data into actionable insights for evidence-based decision-making.

Living rapid review update 18: what is the specific role of schools and daycares in COVID-19 transmission

Selina Akaraci1, Sarah Neil-Sztramko2, Leah Hagerman1, Emily Clark1, Emily Belita1, Stephanie Hopkins2, Robyn Traynor1, Karlene Stoby1, Maureen Dobbins3

1Centre for Public Health, Queen’s University Belfast United Kingdom, 2National Collaborating Centre for Methods and Tools, McMaster University, 3National Collaborating Centre for Methods and Tools, McMaster University Canada, 4McMaster University

Countries have implemented various policies to tackle the COVID-19 pandemic. As pandemic conditions evolved and the body of evidence grew, the question of how to safely operate schools and daycares remained unanswered. To support evidence-informed-decision-making, the National Collaborating Centre for Methods and Tools maintained a living rapid review to synthesize evidence on the role of schools and daycares on COVID-19 transmission. The search included 31 databases and grey literature sources, including Medline, Embase, PsycINFO, ERIC and medRxiv. Included studies reported data from 2021 forward on transmission (number of cases, cases/population or secondary attack rates (SAR)) within schools/daycares, the impact of infection prevention and control (IPAC) measures on transmission within schools/daycares, or the impact of operating schools/daycares on community transmission. All studies were critically appraised, and the certainty of evidence was evaluated using the Grading of Recommendations Assessment, Development and Evaluation (GRADE) approach. In the most recent update (December 2022), 58 single studies and 7 syntheses were identified. Results illustrate that SARs are low within school settings when IPAC measures are in place (certainty: moderate). Regarding IPAC measures, face masks may reduce the risk of transmission (certainty: low), test-to-stay policies may not increase transmission risk vs mandatory quarantine (certainty: low), cohorting and hybrid learning may make little to no difference in transmission (certainty: low), and the impact of surveillance testing within schools remained inconclusive (certainty: low). Incidence rates among students and staff were similar to community trends, indicating that school settings do not meaningfully contribute to community incidence, hospitalizations or mortality (certainty: low). The 18th
update to this living review includes higher-quality surveillance data and whole-genome sequencing studies, which build upon early case reports and prevalence studies to increase the certainty of findings. Living reviews may help to support ongoing decision-making in the context of evolving pandemic conditions.

**Prequisites and response strategies for tackling a pandemic: lessons for secondary care from five European countries**
Monika Riedel1, Miriam Reiss1, Markus Kraus1, Thomas Czypionka1
1 IHS Austria

Background and objective: The COVID-19 pandemic clearly highlighted the limited capacities in health systems including hospitals. This study collates experience and insights on challenges and strategies in secondary care management during the pandemic. The gained knowledge should help to facilitate pandemic preparedness in hospital care.

Methods: 52 semi-structured interviews with managers and executive staff of hospitals in Denmark, France, Germany, Hungary and Italy were conducted in Summer 2022 and were analysed by researchers in the respective countries.

Subsequently, an overarching analysis was conducted to identify key themes and derive recommendations for improved preparedness.

Results: Despite marked differences between their national health systems, the investigated countries encountered similar problems. Concerning prequisites, experts from most countries noted lack of up-to-date or sufficiently tested pandemic plans, too scarce resources dedicated to information transfer, including insufficient availability or usability of IT systems within and across organisations. Pandemic responses worked best in case of pre-existing cooperations and due to highly motivated staff. Often, in-house solutions for emerging problems were developed before support from authorities arrived. Keeping staff motivated and healthy got increasingly difficult due to the duration of the crisis, burden of work, diminishing social support, poor governance regarding administrative burdens and (monetary) recognition of work.

Conclusion: The pandemic intensified pre-existing problems in the hospital sector – most notably, staff shortages and information management deficits – and accelerated developments that had begun already pre-pandemic. Experts from all five countries agreed that better equipped and integrated primary care and more suitable e-health solutions could take strain off hospitals. Professional managerial support for health organizations could improve processes. Regular practical tests of pandemic plans would point out needs for updates as well as trainings and other resources, thus enabling providers to concentrate on their core tasks in times of crisis.

**COVID-19 infection in healthcare workers in ancona, Italy, 2020-2022: an observational longitudinal study**
Davide Detto Rinaldi1, Corrina Fortunato1, Giulia Paolorossi1, Jacopo Dolcini2, Mark Jwenish Kumawat1, Devisri Sundaram2, Mary Codd3, Eamonn Gormley4, Anne Scriver1, Peter Coulahan1, Patrick Wall1
1 University College Dublin School of Public Health, Physiotherapy and Sports Science "University College Dublin, Woodview House, Belfield, D04 V1W8, Dublin" Ireland, 2 University College Dublin

Background and Objective: As of January 2020, a new type of Coronavirus started to spread globally. Healthcare workers (HCWs) are exposed to a high risk of infection. Our study aims to describe the trend of SARS-CoV-2 infections within HCWs of the Azienda Ospedaliera Universitaria (AOU) delle Marche.

Methods: We carried out an observational longitudinal study; data has been collected from the records of the Hospital Hygiene Department of the AOU delle Marche. Among all the employees with a permanent contract, 3280, only those with a positive SARS-CoV-2 swab result in the period from the 17/03/2020 to 6/06/2022 in order to investigate healthcare interventions were delivered by Italian Red Cross personnel with the collaboration of the Ministry of Health. This study aims at exploring which healthcare interventions were delivered on board from 17/04/2020 to 6/06/2022 in order to investigate migrants’ health needs.

Methods: All data were collected on board and registered in an informative system. A descriptive analysis of the sample and of healthcare interventions was carried out through Excel functions.

Results: 20 “Ship Missions” were conducted during the reference period. 59.684 migrants (10% female, 7% minors) were welcomed and managed in 13 quarantine vessels. 23.775 healthcare interventions were delivered, among these 27% were psychological counselling, 16% dermatological consults, 12% dressings, 9% gastroenterological consultations, 5% otolaryngology visits, 4% orthopedics consults. The remaining ones were medical or nursing interventions (for example psychiatric or ophthalmic). Overall, just 134 (0.6%) medical transfer to hospitals or healthcare services on the ground were carried out.

Conclusion: Most of migrants asked for psychological support probably due to their past. Most of the other interventions delivered seem to be at the same time indicative of health needs emerged during migration route. Moreover, the presence of healthcare personnel on board, leading to promptly manage migrants’ health and healthcare needs, avoided medical transfers and the overburdening of local health services.

**Epidemiological transmission patterns and use of whole genome sequencing in investigating campus based covid-19 outbreaks during the second and third waves of SARS-CoV-2 infection**
Jwenish Kumawat1, Devisri Sundaram2, Mary Codd3, Eamonn Gormley4, Anne Scrivener1, Peter Coulahan1, Patrick Wall1
1 University College Dublin School of Public Health, Physiotherapy and Sports Science "University College Dublin, Woodview House, Belfield, D04 V1W8, Dublin" Ireland, 2 University College Dublin

Background: This study describes the investigation and management of multiple outbreaks of SARS-CoV-2 during the second and third wave of the pandemic at University College Dublin, Ireland from September 2020 to September 2021.

Methods: Relevant data were gathered as part of the public health outbreak investigations led by the UCD Internal COVID Control Team (IUCT) in collaboration with the public health teams of the Health Service Executive (HSE). Results are presented for PCR (polymerase chain reaction) confirmed cases and their close contacts, reported to the UCD IUCT between September 2020 to September 2021. Results: There were 189 cases notified to IUCT. Among these, 77 cases were in residence on-campus cases. Ten epidemiologically linked clusters identified, where the number of cases linked with each cluster varied between 2 to 12. Additional cases during this period had no obvious epidemiological link to the
Policies and practices to attract, retain, support and reskill health and care workers during the covid-19 pandemic and future workforce development in Thailand

Vichai Tienthavorn¹, Wanicha Chuenkongkaew¹, Vasuton Tanvatanakul², Sukjai Chareonsuk³, Phayong Thepaksorn⁴, Praboromarajchanok Institute, Ministry of Public Health Thailand, ¹Sirindhorn College of Public Health, Trang, Faculty of Public Health and Allied Health Sciences, Praboromarajchanok Institute

The low number of COVID-19-positive cases in Thailand indicates the robustness of Thailand’s Ministry of Public Health (MoPH) and health-care system in responding to public health responses and emergencies. Its comprehensive duty is to lead the emergency response to prevent, contain, and control health challenges ranging from the national agenda to primary care in the communities. Key elements for tackling burdens include building the health workforce capacity and crafting public health policy that facilitate the capacity to respond to this pandemic. To enhance the capacity of health-care workers to respond to the pandemic, Praboromarajchanok Institute (PI) is a higher educational institution whose mission is to produce and develop human resources according to the needs of the MoPH. PI has both implemented new policies and strengthened current policies to attract, retain, support and re-and up-skill health care workers during COVID-19 in Thailand. PI promotes community health through its affiliated colleges, which are located in every region of the country. PI also has close relationships with the communities it serves, which are akin to family. PI has been fully integrated at the primary health-care level, through its community and health promoting hospitals that provide first-contact services available to everyone. To make health systems more resilient to disaster preparedness and crises, PI plays a major role in producing health science graduates. These graduates serve as health personnel in rural areas, and make up more than half of the health workforce in the country. The MoPH and PI have greatly contributed to solving the national crisis on COVID-19. It promoted proactive action to prevent and monitor the spread of COVID-19 through village health volunteers (VHVs). VHVs use a smartphone application tool for surveillance of the COVID-19 epidemic. PI also now offers additional instruction for VHVs in nursing assistant and public health assistant program.

The use of telemedicine by physicians during the covid-19 pandemic in Brazil

Ana de Sousa van Stralen¹, Cristiano Carvalho², Samuel Gomes da Silva³, Jackson Araujo¹, Lucas Der Maas¹, Joana Celli¹, Ana Maciel Chagas¹, Valeria Penzin Goulart¹, Leda de Oliveira¹, Sabado Girardi⁴

Background and objectives: The COVID-19 pandemic had a stimulating effect on the use of telemedicine worldwide. The present study aimed to investigate the use of telemedicine by physicians in Brazil prior to and during the pandemic. Methods: We carried out a descriptive exploratory cross-sectional study through an online survey with 2,541 physicians in Brazil between October 2020 and January 2021. Respondents were classified according to their primary specialties. Results: The prior use of telemedicine was more common among primary care physicians: 22% of respondents in this group already used telemedicine and 13.7% started to use it after the pandemic. However, most of the respondents started using telemedicine after the break of the COVID-19 pandemic: 41% of clinical specialists, 35% of primary care physicians, and 27.6% of surgical specialists. Among diagnostic/therapeutic specialists, 44% declared that they did not use or intend to use telemedicine in the future. More than half of the respondents declared not to have received any additional payments related to telemedicine, especially among primary healthcare physicians (80%). 66% and more of the respondents from all specialty groups believe that the use of telemedicine expands access to health care services. However, with the exception of primary care physicians, the majority opinion of the respondents is that telemedicine can reduce the quality and safety of care. Conclusion: The use of telemedicine prior to the pandemic was more common among primary care physicians. Despite having expanded the use of this tool in all groups of specialists, in comparison to the others, primary care physicians still demonstrate greater familiarity with the use of telemedicine and possible benefits for health services.

Epidemiological profile of covid-19 deaths in tunisia, 2020-2022

Rim Mhedhebi¹, Sonia Dhaooudi², Nissaf Alaya³, Aycha Haichar¹, Amendallah Zouayli³, Hejer Letai³, Mouna Safer¹, Chiraz Borji², Emna Mziou³, Fatma Youssef², Leila Bouabid³, Souha Bougatef³, Sondes Deroiche³

¹National Observatory of New and Emerging Diseases Ministry of Health, Tunisia Tunisia ¹6 Rue Bayrem Tounssi Tunisia, ²National Observatory of New and Emerging Diseases Ministry of Health, Tunisia, ³Ministry of Health, Tunisia Tunisia

Background

The impact of SARS-CoV-2 on global public health and excess of mortality related to coronavirus disease-2019 were proven worldwide. This study aimed to describe the epidemiological profile of COVID-19 deaths in Tunisia from march 2020 to November 2022, to inform prevention and control policies.

Methods: Tunisian COVID-19 deaths register were implemented since March 2020 by National Observatory of New and Emerging Diseases, Tunisia from three data sources (Regional Directorate of health, public and private health care centers...). Qualitative variables were described by number and percentages. Crude mortality rate (CMR) per 100,000 inhabitants was calculated as the rate between the number of COVID-19 deaths and the size of population.

Results: Between 18 March 2020 and 13 November 2022, Tunisia has reported 29266 covid-19 deaths (CMR=247.9 per 100,000 inhabitants). The southern region has been the most affected throughout the COVID-19 epidemic (2020-2022) with the highest CMR. The epidemiology of COVID-19 in Tunisia was found to be spatiotemporally diverse. The epidemiological death indicators varied by region and time with periodic large outbreaks. The severity varied over time with 5 outbreaks occurring between September 2020 and November 2022 with the circulation of new variants of concern.

The median age of deaths were 72 years (0 days (newborn) to 112 years). The sex-ratio M/F=1.4, the number of COVID-19 death was higher among male and adult population. About 7% occurred at home or in way to a health care center and 93% occurred in health care centers (10% of these deaths occurred in private centers).

Conclusion: The combination of public health, non-pharmaceutical measures and the high Vaccine coverage were the most important pillars to contain this pandemic and mitigate its severity The implementation of the national immunization program must continue to contain the pandemic.

A multi-country assessment of societal resilience and preparedness during covid-19 times. A review among the coronadx horizon 2020 project

Anna D’Amelio¹, Cristina Renzi², Sarah Cataldi³, Giulia Dallagioma³, Gianmarco Imperiali², Anna Odone⁴, Carlo Signorelli₀

¹San Raffaele University - UniSR, ²Via Olgietta, 60 Milan Italy, ³San Raffaele University - UniSR Italy, ⁴University of Pavia Italy

Background and Objective: The COVID-19 pandemic has led to complex challenges concerning the spreading of misinformation about origin, symptoms, and prevention of SARS-CoV-2. Unclear, changing, and variable guidelines confuse the public and plant seeds for misinformation. A wide range of strategies were used by leaders across many sectors to foster positive social norms and encourage people to protect their community and selves from COVID-19. The study provides an overview of communications important role in influencing societys behaviour during the COVID-19 pandemic in ten different countries. Methods: This paper presents a narrative analysis of the currently available data
on societal responses and resilience during the COVID-19 pandemic, spanning from February 1, 2020, to March 1, 2022. Ten nations — Italy, Denmark, Sweden, Israel, Spain, Portugal, Romania, France and Germany, United Kingdom, and Israel — were selected for inclusion both within and outside the EU, based on their heterogeneous COVID-19 responses. Academic literature was retrieved using PubMed/Medline and Google Scholar. Grey literature was consulted ranging from institutional reports to archival records, policy briefs, books, websites, and news from verified sources.

Results: Adoption of domestic and travel regulations was different across countries, some more efficient than others. Some specific official communication strategies about COVID-19 have shown to be effective in increasing vaccine uptake while social media as source of information was strongly related to vaccine hesitancy. Israel and Portugal were exploited as benchmarks for vaccination strategies by other countries.

Conclusions: Low public confidence due to infodemic and inconsistent policies underscored the central role of Public Health to develop proper strategies and exploit digital tools to increase awareness. The potential of social media and digital platforms in tackling health emergencies should be better understood. Additionally, healthcare workers’ communication skills can be improved to effectively deal with future epidemics and be trusted by the population.

Gender differences in covid-19 vaccine hesitancy in Western Balkans
Stefan Mandić-Raječević1, Janko Janković2, Smiljana Cvjetković1, Vida Jeremić-Stojković2, Sanja Matovič-Miljanović2, Aleksandar Stevanović2, Michele Gross3
1University of Belgrade, Faculty of Medicine, Belgrade, Serbia Institute of Social Medicine and School of Public Health and Health Management Dr Subotica 15 7000 Belgrade, Serbia; 2Institute of Social Medicine and School of Public Health and Health Management, Serbia, University of Belgrade, Faculty of Medicine, Belgrade, Serbia Department of Humanities Pasterova 2 Serbia, University of Belgrade, Faculty of Medicine, Belgrade, Serbia Department of Humanities Serbia, 3Euro Health Group Serbia, 4Institute for Health and Welfare, Helsinki, Finland, 5Euro Health Group Serbia, 6Euro Health Group Serbia

Background and Objectives: COVID-19 vaccines represent a life-saving solution for the pandemic which has resulted in millions of deaths around the world, but vaccine uptake has remained low in Western Balkan countries. Vaccine hesitancy is the result of a plethora of factors which are usually addressed using general messaging in vaccination promotion strategies. The aim of this study was to identify gender differences in factors influencing vaccine behaviour in the Western Balkans.

Method: This cross-sectional study was carried out from July to October 2021. Convenience sampling included 1605 individuals over the age of 18 from Albania, Bosnia and Herzegovina, North Macedonia, Montenegro and Serbia. The questionnaire was shared online through social media.

Results: Females were more commonly vaccinated in Serbia (73% vs 56%) and Bosnia and Herzegovina (40% vs 28%) while males were more often vaccinated in Albania (56% vs 37%), Montenegro (60% vs 53%), and North Macedonia (74% vs 57%). Statistically significant differences were seen between males and females in responses to questions on vaccine safety (p<0.01), vaccine efficacy (p<0.01), compulsory vaccination (p<0.01), disease comprehension (p<0.01), risk of disease and susceptibility (p<0.01) and trust in societal factors (p<0.01). Statistically significant differences between males and females were also seen in sources of information and health literacy, but these differences varied between Western Balkan countries.

Conclusions: Strategies to combat vaccine hesitancy should take into account the specificities of target populations. General strategies which were applied in most Western Balkan countries were set to fail as they did not address specific factors influencing vaccine hesitancy.

Sex differences in psychosocial and economic impact of covid-19 among migrant origin populations compared with the general Finnish population
Sanna Nýkänen1, Natalia Skogberg1, Regina Velázquez2, Anu Castaneda3, Päivikki Koponen1, Laura Musta1

Backward and Objective: COVID-19 impacted particularly migrant origin populations. While studies focusing on general populations have reported sex differences in COVID-19, few studies have addressed sex differences in migrant origin populations. This study examines sex differences in psychosocial and economic impact of COVID-19 among migrant origin populations in Finland.

Methods: Data from the impact of the Coronavirus on the Wellbeing of the Foreign-born Population (MigCOVID Survey) (10/2020/2/2021; n=3668) conducted among adults aged 20-66 years was used, with participants in the FinHealth 2017 follow-up study as the general population reference group (n=3490). Perceived impact on economic situation, loneliness, hope for the future, contact with friends, and sleeping difficulties were examined. Prevalence rates and their 95% confidence intervals (95%CI) were calculated. Multivariate logistic regression analysis was applied to examine differences by sex, adjusting for sociodemographics.

Results: In preliminary analyses, loneliness increased 37.9% (95% CI 38.8-42.1) of migrant origin women, 33.2% (95% CI 29.3-37.4) of migrant origin men, and 34.8% (95% CI 31.2-38.5) of general population women, and 20.7% (95%CI17.6-24.3) of general population men. Hope for the future decreased 36.5% (95% CI 32.5-40.6) of migrant origin women, 39.0% (34.8-43.3) of migrant origin men, 35.8% (95% CI 32.3-39.5) of general population women, and 24.3% (21.1-27.8) of general population men. Financial situation worsened 43.3% (95% CI 39.0-47.6) of migrant origin men, 42.0% (95% CI 37.9-46.2) of migrant origin women, 21.5% (95% CI 18.5-25.0) of general population women and 16.6% (95% CI 13.9-18.4) general population men. Logistic regression analyses will be reported in the presentation.

Conclusion: General population women reported greater psychosocial and economic impact than men. Sex differences within migrant origin populations were not significant, although men and women reported significantly higher adverse psychosocial and economic impact compared with men in the general population. Findings with intersectional approach should be used when planning restorative measures to reduce adverse societal impact in future crises.

SARS-CoV2 pandemic and its confrontation in indigenous people: An experience with 34 Brazilian districts
Viviane Lourenço1, Soraya Andrade1, Viviane Lourenço2, Rodrigo Santana2, Augusto Drumond1, David Nadder1, Ademir Lapa2, Alexandre Pozza2, 1Leader of innovation and digital health Brazil, 2Ministry of health, Brazil Brazil, 3Federal University of Tocantins, Brazil

Background: Studies show that indigenous peoples are more vulnerable to epidemics due to social, economic conditions and access to health, which amplifies the potential for the spread of diseases such as the coronavirus (COVID-19), an infectious disease caused by the SARS-CoV-2. Objective: To present the Brazilian Government strategy to tackle the COVID-19 in indigenous communities, considering multiple stakeholders.

Methods: Besides communication strategies, this paper also discusses the proposal a repository with contingency plans for specific territorial realities.

Results: The strategies were developed under the Brazilian Governments leadership, with the support of the 34 indigenous districts (DSEI). The types of strategies developed involve policy ordinances, technical reports, reports, recommendations, clinical management protocols, epidemiological bulletins, multidisciplinary actions and a Communication Hub. The Communication Hub has involved social network channels with approximately four hundred thousand accesses, even in regions with difficult internet access. Brazil has continental dimensions and has one of the largest indigenous population in the world; therefore, the Brazilian Government articulated a strategy to ensure that the indigenous people would have access to health, food, security isolation and social benefits.

Conclusions: Features of this reported experience might be exported and adapted to local circumstances elsewhere to prevent widespread mortality in indigenous communities. As suggestions for future research related to fighting COVID-19, we recommend a study divided among health systems in countries with indigenous populations, as well as a study comparing the vulnerability of indigenous populations with general population and misinformation related to indigenous health.

Popul. Med. 2023;5(Supplement):A453

Impact of lifting COVID-19 restrictions in mental well-being: a quasi-experimental approach
João Santos,1 Teresa Léao2
1Faculty of Medicine - University of Porto Portugal, 2Faculty of Medicine - University of Porto; Institute of Public Health of Porto University
Background and objective: Despite the contribution to SARS-CoV-2 dissemination coming from lockdown measures, lockdowns mainly affected the population’s well-being. Previous cross-sectional studies described the prevalence of anxiety and depression symptoms during the pandemic, but longitudinal approaches are needed to understand the impact of implementation and lifting lockdown measures in populations’ well-being.

With that purpose, we aimed to assess the impact of lifting lockdown policies in the mental health of the Portuguese population through the COVID-19 pandemic, among different socioeconomic strata.

Methods: We used the Diaries of a Pandemic database – a longitudinal, web-based, and self-administered questionnaire implemented in Portugal in 2020 and 2021. Using data from the weekly reports of fear, sleep disorders, and negative feelings, we performed an interrupted time series analysis using weekly-aggregated data and a longitudinal analysis using individual data. We further compared the effects across different income, education, and caregiver status.

Results: We observed negative trends in the proportions of negative feelings [b2020=-1.02, 95%CI2020=(-1.40; -0.64); b2021=-1.12 95%CI2021=(-1.55; -0.69)], sleep disorders [b2020=-2.65, 95%CI2020=(-4.70; -2.61); b2021=-0.87 95%CI2021=(-1.25; -0.49)], and feelings of fear [b2020=3.65, 95%CI2020=(-4.70; -2.61); b2021=0.53 95%CI2021=(-0.78; 0.29)], during both lockdowns, and a statistically significant short-term reduction in the risk of negative feelings in 2020 [b2020=-6.32, 95%CI2020=(-8.33; -4.30)], sleep disorders [b2021= -4.35, 95%CI2021=(-8.10; -0.60)], and feelings of fear in 2021 [b2021=-3.25, 95%CI2021=(-5.47; -1.03)]. Trends became stable after restrictions’ lifting in both waves. Results from the individual-data longitudinal analysis reflected those from the interrupted time series analysis with aggregated data, except for reports of fear, where a statistically significant increase after lockdown was observed in 2020. Regarding socioeconomic factors, although most favoured groups had lower proportions of symptoms, trends were overall similar to those observed in the non-stratified sample.

Conclusion: Mental health symptoms became less frequent during the 2020 and 2021 COVID-19 waves and its frequency was affected by the lifting of lockdown measures, globally and across socioeconomic groups.

Long-covid experience and perceptions among primary care practitioners in germany - results from a nation-wide online-survey 2022-2023
Salma Mekkes 1, John Gubernath 2, Giselle Sarganas 2, Christa Scheidt-Nave 2, Sydne Odonkor 2, Juliette Schreiber 3, Lorenz Dini 2
1Charité Universitätsmedizin Berlin Germany, 2Robert Koch Institute Germany, 3Charité Universitätsmedizin Berlin, Institute of General Practice Germany, 4Charité Universitätsmedizin Berlin EUPHA Germany

After the onset of the COVID-19 pandemic, a growing number of patients began to report prolonged COVID-19 symptoms lasting for more than four weeks after infection (Long COVID). These symptoms include among others, fatigue, difficulty concentrating, respiratory, cardiovascular, and metabolic issues, which cannot be explained by other causes. Persistence or reappearance of these symptoms often persist over more than three months. Lasting symptoms are diffuse and may vary depending on severity of SARS-CoV-2 infection, comorbidities, SARS-CoV-2 vaccination status, gender, age or circulating virus strain, among others. Most of these patients are seen in primary care and this problem has been increasing. Because patients with Long COVID are not considered a source of infection to others, there is no mandatory reporting to public health authorities, making the surveillance and monitoring of this condition more difficult. Clinical management guidelines are being discussed and there is still a lack of a harmonized definition and a clear patient referral pathway. Adding to the direct pathophysiological effects of the SARS-CoV-2 infection, the indirect effects such as the consequences of the pandemic-containment-measures is also leading to a higher psychosocial and economic burden for these patients and the society. In many countries national public health authorities are working towards assessing Long COVID from multiple perspectives including building alliances and networks with different stakeholders including primary care providers, rehabilitation clinics and patients’ self-help groups.

This presentation is meant to share the results from the Germany about the experiences and expectations on the management of Long COVID including of the
Sulodexide as a promising treatment of post COVID-19 symptomatic patients with endothelial dysfunction

3Cardiology department, Tahar Sfar Hospital Mahdia, Tunisia
4Internal medicine department, Mongi Slim LaMarra Hospital, Tunis, Tunisia
5Cardiology department, Habib Bourguiba Hospital Medenine, Tunisia
Clinic Pasteur Tunis, Tunisia
Background: It is established that COVID-19 infection causes endothelial dysfunction resulting in most of its acute symptoms and its long-term effects also known as post covid-19 syndrome.

Aim: The aim of the study was to evaluate the effect of Sulodexide, a purified glycosaminoglycan mixture, in the improvement of the endothelial function due to long COVID-19 syndrome.

Methods: We conducted a multicenter Tunisian prospective quasi-experimental analysis from the large TUN End-COV trial. Patients with long COVID-19 symptoms and endothelial dysfunction were included. The subset of symptomatic patients with proven endothelial dysfunction (Endothelial Quality Index (EQI)<2) assessed by a post-occlusive reactive hyperemia (PORH) finger thermal monitoring (EQ4-diagnose, Polymath Company) were assigned into two groups. The sulodexide group received sulodexide (Vessel, AlfaSigma) 250 RU twice a day during 21 days. The control group adhered to the study protocol without any medical treatment.

Results: A total of 290 patients from TUN End-COV study with long COVID-19 symptoms and endothelial dysfunction were included. The study population was assigned to a sulodexide group (144 patients) or a no-medical treatment group (146 patients). Clinical characteristics were similar at inclusion in the two groups. The sulodexide group presented significantly less chest pain and palpitations than controls (p<10^-3 and p=0.009 respectively). The sulodexide group presented also a significant endothelial function amelioration compared to control group (median delta-EQI 0.66 (0.6) vs 0.18 (0.3); p<10^-3). Endothelial function improvement was significantly correlated to chest pain and palpitations recovery (AUC = 0.66, CI = 0.57-0.75, p = 0.001 and AUC =0.60, CI = 0.51-0.69, p = 0.03 respectively).

Conclusion: Our results support that sulodexide may accelerate long COVID-19 patients’ recovery in parallel with vascular endothelium restoration.

Physical activity promotes social relationships during "lenient" COVID-19 protection strategies
Mahmoud Alomari1, Khaled Alshaji2, Ahmad Al-Emadi3
1Jordan University of Science and Technology Department of Rehabilitation Sciences; Jordan University of Science and Technology POBox 3030 Department of Rehabilitation Sciences, Jordan University of Science and Technology Irbid, Jordan
2College of Basic Education, PAAET Khalid Bibi Qatar University Department of Physical Education, Qatar University Department of Physical Education, Qatar University, Doha, Qatar
32713. Qatar, Qatar University Department of Psychological Sciences, Qatar University Department of Psychological Sciences, Qatar University, Doha, Qatar

Background and objective: During COVID19 outbreak, many governments worldwide shutdown public places including gyms, schools, universities, colleges, workplaces, and malls. These COVID19-induced procedures limited participating in physical and social activities immensely. In Qatar, however, the government allowed outdoor physical activities only with family members. The effect of such "lenient" COVID19 confinement procedures on physical and social activities is not known. Therefore, the current study examined the association between changes in physical activity and social relationships during COVID19 lockdown in Qatar.

Methods: The changes in physical and sedentary activities and social relationships during COVID19 were collected from 488 Qatari (mean age=26.9±9.6 years) using an online survey.

Results: The participants reported an increase in physical and sedentary activities during versus before the pandemic. Further analysis revealed that this increase was reported among the participants who experienced improvement or no change in the relationship with spouses, children, parents, siblings, uncles, neighbors, work colleagues, and overall relationships. However, the participants reported worsened social relationships experienced no increase in physical activity during the pandemic.

Conclusion: The results show that "lenient" COVID19 regulations contribute to enhancing participation in physical activities. Uniquely, this increase is associated with improvement in social relationships. These results might suggest that participating in physical activities can help "mitigate" the possible deterioration in social relationships due to pandemic-induced confinement. Therefore, efforts should be made to promote physical activities during pandemic breakouts to protect the welfare of the social relationship. However, future studies are needed to confirm the current findings and verify these speculations.

The experience of the covid-19 pandemic in fortaleza, Brazil: Public health in turmoil?
Carl Kendall1, Liaja Kerri2
1Tulane University Visiting Professor, Federal University of Cearã Programa de Pós-Graduação em Saúde Pública Universidade Federal do Cearã, Fortaleza, Brazil; 2Federal University of Ceará, Brazil

Background: While the title and goal of our conference is a positive response to having lived through the last three years of an infectious disease pandemic that we were promised as recently as the 1980s was part of the world’s past – is public health in any condition to respond? Staff burnout, cuts in health budgets, low vaccine coverage, and a public fatigued with everything but new conspiracy theories and targets to blame is not a propitious start. While technological advances in rapid home tests, vaccines, antivirals, and surveillance methods were brilliant achievements and saved millions of lives, the behavioral and social sciences contributed relatively little to policy and program, and only a few national programs appear to have achieved transmission control goals. This presentation reviews public response to testing, isolation, vaccination, distancing, and mask use in the northeast state of Ceará.

Methods: Ethnographic case study applying formative research with expert and lay interviewees. A desk review of relevant published and unpublished information describes the chronology of response events, cases, and deaths attributed to COVID-19. Means of promoting recommendations, evaluating responses, and interactions among health authorities and political leaders will be described.

Results: Early efforts (spelled out in the paper) were successful at slowing COVID-19. Means of promoting recommendations, evaluating responses, and interactions among health authorities and political leaders will be described.

Conclusions: As awareness of the magnitude of the pandemic grew, national and international coordination was required to sustain a response. Absent this, local political, rather than epidemiologic facts determined the next steps. Without an effective national response individuals calculated their own risk and acted accordingly.

Virtual mourning, the experiences of Iranian diaspora during COVID-19
AHMADI Ali1, Ali Ahmadii2
1BPH Bordeaux, University of Allameh Tabatabi France, 2BPH Bordeaux, University of Allameh Tabatabi France

With the onset of the COVID-19 pandemic, the phenomenon of mourning was marked worldwide by an unprecedented disruption of family visits not only for migrants living abroad, who were confronted with the closure of borders, but also for all family members who lived in the same city. In such a situation, the evolution of funeral rites and commemorations was more and more evident: visiting relatives at the end of life and seeing the deceased before death being impossible, burial ceremonies and almost all commemorations were restricted in order to respect the social distancing. Given the unprecedented ban on mourning ceremonies, social networks, and later special sites tailored to Iranian culture and rituals, became places for families of the deceased perform funeral and mourning rites. Thus, microblogging platforms have made it possible to invent ritual practices and to extend this process of expression to migrants.

The objective of this research is to understand the processes of distance mourning in migration by studying the experience of the Iranian diaspora in France and to discover the characteristics of virtual mourning. To achieve this objective, observation of social media and virtual mourning platforms and semi-structured
Interviews were conducted. This study shows that migrants who are unable to attend the mourning ceremony of their family members for various reasons, including asylum or restrictions of the COVID-19, attempt to fill this gap by using social networks and communication platforms. According to this study, online platforms are a place to meet and visit families after a long time but some limits such as not being able to hug and cry with family members and inability of emotional emojis for express feelings. Online grieving is an opportunity to move from intrapersonal to interpersonal communication that may facilitate the completion of grieving tasks.

**Overdose deaths and the covid-19 pandemic in british columbia, canada**
Heather Palis1, Amanda Slaunwhite1, Marc-Andre Belair2, Kevin Hu1, Andrew Tu1, Jane Buxton6
1BC Centre for Disease Control Canada, 2PHAC, 3BC Coroner Service Canada, 4BC Centre for Disease Control

**Background:** British Columbia (BC) declared an overdose public health emergency in 2016. Since then, BC has consistently reported the highest overdose death rates of any province in Canada. In the context of the COVID-19 pandemic, overdose deaths in BC reached a record high in 2020. This analysis reports on changes in the profile of people who have died of overdose since BC’s declaration of COVID-19 as a public health emergency on March 17th 2020.

**Methods:** Using BC coroners service data, chi-square tests and multivariable logistic regression were conducted to compare demographic, geographic, and post-mortem toxicology data between people who died of overdose before (March 17th-December 31st 2019) and after (March 17th-December 31st 2020) BC’s declaration of COVID-19 as a public health emergency.

**Results:** Overdose deaths observed since March 17th 2020 (n=1516) more than doubled those observed in the same period in 2019 (n=744). In the adjusted logistic regression model, odds of death in the post compared to pre-COVID-19 period was significantly higher among males compared to females, among all older age groups compared to people aged 30-39, and was higher outside compared to private residences.

**Conclusions:** Alongside a significant increase in overdose deaths, the demographics of people who have died of overdose has changed since March 2020. Ongoing overdose prevention efforts must seek to reach people who remain most isolated, including older adults, who during dual public health emergencies are facing compounded risk of preventable mortality.

**Etiological and prognostic roles of socioeconomic characteristics in the development of sars-cov-2 infection and related severe health outcomes: systematic review of population-based studies**
Jinane Ghatta1, Makovski Tatjana2, James Cottam3, Stephanie Bensard4, Monika Ambrozova5, Barbara Vasinova5, Rodrigo Feteira-Santos6, Peter Bezzegh5, Felipe Bollmann5, Romana Haneef5, Brecht Devleesschauwer1,2, Niko Speybroeck1,2, Joel Coste7, Laure Carcaillet-Bentata7
1Université Catholique de Louvain (UCLouvain) Institut de recherche santé et société (IRSS), Université catholique de Louvain, Louvain-la-Neuve, Belgium, 2Santé publique France, 3Department of Epidemiology and Public Health, 4Faculty of Tropical Medicine, 5Antwerp, Belgium, 6Santé publique France Department of non-communicable diseases and injuries, Santé publique France, Saint-Maurice, Île-de-France, 7Institute of Health Information and Statistics of the Czech Republic, 8Institute of Health Information and Statistics of the Czech Republic. Department of Epidemiology and Public Health, Institute of Tropical Medicine, Antwerp, Belgium, 9Institute of Health Information and Statistics of the Czech Republic.

**Background and Objective:** There is growing evidence on the role of biomedical factors and socioeconomic status in increasing vulnerability to COVID-19. We conducted a systematic review to investigate the etiological and prognostic roles of multimorbidity, frailty and socioeconomic determinants in COVID-19 outcomes severity among population-representative samples. This presentation focuses on socioeconomic determinants.

**Methods:** The following databases were searched: PubMed, Embase, WHO COVID-19 Global Literature on Coronavirus Disease and PsycINFO between January 2020 and 7th April 2021. For the etiological role of socioeconomic determinants, the following outcomes were of interest: infection, hospitalisation, ICU admission, mechanical ventilation and mortality. For the prognostic role, we investigated hospitalisation for COVID-19, ICU admission, mechanical ventilation, death, functional decline, quality of life, disability, mental health difficulties, work absence.

**Results:** Out of 9701 reviewed titles and 411 articles read in full-text, 78 studies reporting on socioeconomic characteristics met the eligibility criteria and were included in the final synthesis. 47 studies reported on the etiological role, 24 studies reported on the prognostic role, and 7 reported on both. No studies reported on long term effects of socioeconomic determinants. Only short term COVID-19 related outcomes, such as COVID-19 infections, mortality, ICU admission, hospitalization etc. were identified. Data was often retrieved using administrative and hospital records. The evidence suggests that worse health outcomes were often seen in black and Asian populations, and associated with lower education level and higher deprivation score. Most of the studies cover populations in the United States and the United Kingdom.

**Conclusions:** The risk of severe short-term COVID-19 outcomes increase with socioeconomic vulnerability and among certain ethnic groups. There is a need for more evidence on the role of socioeconomic characteristics in short-term and long-term COVID-19 outcomes in other European, Asian and African countries. Future research should target specific races and ethnic groups.

**Interviewing the interviewers: capturing oral histories and other qualitative evidence to describe the impact of covid-19 contact tracing**
Anita Apau1, Perri Carroll2, Sarah Linden3, Marcia Pearlowitz4, Katherine Feldman5

**Background and Objective:** Contact tracing was a crucial component of the public health response to prevent the spread of COVID-19, albeit a time-consuming activity requiring many human and technical resources. Maryland contact tracers provided vital assistance to COVID-19 patients and close contacts. The purpose of this evaluation was to capture qualitative aspects of COVID-19 contact tracing to document impact (e.g., stories describing experiences contact tracers had while interacting with cases and close contacts).

**Methods:** We conducted semi-structured qualitative interviews with 14 contact tracers from various counties in Maryland via videoconference. We collected information about why they became contact tracers, explored the impacts they had on cases and close contacts, and captured the memorable experiences, challenges, and rewarding parts of contact tracing. Themes and quotes were manually coded from interview transcripts and analyzed manually using the classic method of qualitative data analysis.

**Results:** Data analyses revealed themes including altruism, being a source of support, being overwhelmed, satisfaction in closing cases, and interest in continuing a career in public health. Most participants indicated they became contact tracers to help fight the pandemic. Contact tracers recalled experiences of calling 911 for clients over the phone and sometimes being the last and only
Risk of sars-cov-2 reinfection in sicily: A population-based evaluation of covid-19 events using current health databases

Dario Genovese1, Domenica Matranga2, Laura Maniscalco1, Vincenzo Pisciotta1, Giuseppe Vella2, Alessandra Casuccio1, Emanuele Amadio1
1University of Palermo Department of Health Promotion, Mother and Child Care, Internal Medicine, and Medical Specialties "G. D'Alessandro" Via del Vespro, 133 - Palermo (PA) Italy, 2University of Palermo

Background and Objective: Worldwide, the COVID-19 outbreak resulted in more than 640 million cases as of 15 December 2022. As immunity to natural infection deteriorates with time and SARS-CoV-2 strains mutate, reinfections began to occur. The current study sought to assess the probability of SARS-CoV-2 reinfection among residents of Sicily, Italy, in relation to sex, age, number of mRNA COVID-19 vaccine doses administered, and occurrence of hospitalization during a previous infection.

Methods: A population-based retrospective cohort analysis was designed using the Sicilian COVID-19 monitoring system run by the National Institute of Health and vaccination flows acquired through a regional registry in Sicily. Only Sicilian adults were included in the study, and hazard ratios were calculated using Cox regression.

Results: After an average of 198 days, there were 39,509 reinfections among 1,089,782 previously infected people (overall cumulative incidence: 3.62%) from the start of the pandemic to 3 September 2022. Almost all reinfections (37,084; 93.9%) occurred during the Omicron variant period, with the remaining 6.1% attributed almost entirely to the period in which Delta and Omicron variants co-circulated (2,011; 5.1%). The risk of reinfection was significantly lower among males than females (HR:0.74, 95%C.I.:0.73-0.76), decreased with age (from HR:1.24, 95%C.I.:1.20-1.28 for 30-39 years old people to HR:0.36, 95%C.I.:0.33-0.38 for 80+ individuals compared to 18-29 group), and lower for people receiving two or more mRNA vaccine doses (HR:0.39, 95%C.I.:0.38-0.40 compared to the individuals who did not receive vaccination). Interestingly, those who were hospitalized during their previous SARS-CoV-2 infection exhibited a significantly lower chance of reinfection (HR:0.74, 95%C.I.:0.70-0.78).

Conclusion: SARS-CoV-2 reinfection was found to be a relatively common occurrence, predominantly caused by the Omicron strain. COVID-19 vaccination provides significant protection against reinfection. Furthermore, the lower risk observed in the elderly and previously hospitalized persons reflects more stringent adherence to the use of personal protective equipment.

COVID-19 travel restrictions and Mongolians stranded abroad: mental health, discrimination, and social inequality

Javkhlanbayar Dorjdagva1, Javkhlanbayar Dorjdagva1, Enkhjargal Batbataar1, Jussi Kauhanen2
1Institute of Public Health and Clinical Nutrition, University of Eastern Finland, 4University of Eastern Finland Institute of Public Health and Clinical Nutrition "Faculty of Health Sciences, University of Eastern Finland Kuopio Campus, Yliopistonranta 1 FI-70211 Kuopio, Finland, 2University of Eastern Finland, 3University of Eastern Finland Institute of Public Health and Clinical Nutrition "Kuopio Campus, Yliopistonranta 1 FI-70211 Kuopio, Finland

Introduction and Objective: Since the early stage of the COVID-19 pandemic, the government of Mongolia has taken strong measures, including border restrictions to protect its citizens from COVID-19. The border to all passengers, including Mongolians, was closed on March 11, 2020. Consequently, thousands of Mongolians were stuck abroad for months and faced enormous risks.

The aim of this study was to evaluate the mental health and financial situation of Mongolians who were stuck abroad due to COVID-19 during their temporary travels and to support public health policymakers to make quick responses to save lives.

Methods: The data was collected between April 27 and May 4, 2020 through an online Google form survey. A total of 118 Mongolian citizens stranded abroad during their temporary travels due to COVID-19 from 25 different countries completed the questionnaire. The policies and regulations for evacuation flights for Mongolian citizens were reviewed in this study.

Results: The study participants travelled abroad for tourism, medical, family, training, and business purposes. The majority of the participants reported that they felt discrimination and anxiety, and faced financial difficulties in the stranded countries.

Language barriers, visa expiration, chronic diseases, and a lack of knowledge of the corona virus among the participants, and a limited number of evacuation flights have increased the uncertainty. Lower-income people might have been left behind not affording the high price of evacuation flight tickets and quarantine costs.

Conclusion: The Mongolians who were stuck abroad due to COVID-19 and border closure had greatly suffered mentally and financially. We recommended the government to provide financial aid, and online mental and health services for those in need. These aids from the government should be included in the support packages for citizens stranded abroad as pandemic preparedness for future pandemics. Ensuring equality during the process of evacuation is essential.

Using the ophelia process with marginalised communities during covid-19 crisis

Shandell Elmer1, Richard Osborne1
1Swinburne University of Technology 453/469-477 Burwood Road, Hawthorn, Australia Australia

Background and objective: In August 2021, Melbourne (Australia) entered another period of lockdown and restrictions in response to the COVID-19 pandemic. Messages about vaccinations and other COVID-safe behaviours were not reaching everyone because people's particular health literacy needs were not considered. People experiencing vulnerability and disadvantage, such as those living in social and public housing were most at risk. This research aimed to develop a granular understanding of the experiences and health literacy needs of people residing in these settings to optimise communication and engagement for COVID-19 prevention and safety.

Methods: The Ophelia (Optimising Health Literacy and Access) process, a participatory community-based method, was chosen for this research project to accelerate the generation and deployment of fit-for-purpose interventions. Community engagement processes included approaches through trusted local entities, incentives, and repeat targeting (with incremental trust development). Postcards were disseminated to recruit people for an online or phone survey. Doorknocking occurred in tandem with service providers to conduct the survey face-to-face. The research team also attended community events such as pop-up vaccination hubs. Sixteen workshops were held with 4 teams of health workers and weekly sense-making meetings were held over 9 months with executives from 5 health services.

Results: 460 people participated from public and community housing, housing houses, caravan parks, supported residential services, disability services and homeless hotels. Overall, their health literacy was much lower than national average. Fifty vignettes of typical residents were developed, and these then elicited >400 rapid practice solutions for health workers and managers to implement.

Conclusion: The combination of COVID-19 related and other variables provided insights into the mechanisms required to inform and generate context-specific interventions. This is important, because it is this diversity that helps us understand why public health messages and engagement strategies, designed to reach the average person, can leave so many behind.

Capacity-Building for Complex Crises: Developing public health leadership and meeting decision-makers' evidence needs

Learning from the COVID-19 pandemic response to strengthen undocumented migrant-sensitive health systems: case studies from four countries

Eleonora Genovese1, Kathleen Page1, Johann Caillot1, Yves Jackson1
1University of Milan-Bicocca Italy, 2Johns Hopkins University, 3University of Geneva Switzerland, 4University of Paris Nord, Bobigny France

Background and objective: Undocumented migrants are among the most vulnerable in the COVID-19 pandemic. The study objective is to identify lessons learnt to strengthen migrant-sensitive health services and systems.

Methods: Review of empirical observations by clinicians and public health practitioners, peer-reviewed journals, and grey literature analyzed through country case studies (Italy, Switzerland, France, US) on the Governance, Service Delivery, and Information building blocks of Health Systems.

Results: Governance: Some countries expanded COVID-19 health services and alleviated immigration concerns, but implementation varied at sub-national level due to lack of specific migrant-sensitive provisions in policies, plans, and programs. Service delivery: Implementing outreach, engaging migrant communities, and integrating third sector actors are key elements to improve accessibility and uptake of health services including vaccination. Yet, these mostly operated through fixed delivery strategy, while targeted outreach through mobile clinics and outposts is more effective for people on the move. Socio-culturally sensitive information for risk communication was not developed, translated, and disseminated through the most used sources such as community networks. Authorities did not engage migrant communities and third sector actors as key partners with capacity and access. Information: Information about undocumented migrants’ health is mostly based on ad hoc surveys at selected health facilities, while there is a lack of systematic monitoring and evaluation with collection and analysis of migrant-specific data.

Conclusion: Migrant-sensitive health services including vaccination are essential for public health. Yet, ad hoc approaches resulted in low and inequitable coverage, besides lacking information for monitoring and evaluation. Health Systems can be strengthened by: (1) learning from the COVID-19 pandemic response, (2) evaluating sustainable policy and financing changes, (3) sustaining multistakeholder partnerships, (4) expanding community engagement, (5) strengthening the health workforce, (6) developing systematic monitoring and evaluation of undocumented migrants’ data, (7) consider migration, including undocumented status, as a social determinant of health.

Socioeconomic inequalities in vaccination against COVID-19 in Ecuador

Maria Rivadeneira1, Eulalia Torres2, Maribel Moreno2
1Pontificia Universidad Católica del Ecuador PhD, MD Ecuador, 2Pontificia Universidad Católica del Ecuador Ecuador

Introduction: In January 2021, Ecuador began the administration of vaccination against COVID-19 following a staggered and phased process. It is necessary to identify gaps in vaccination coverage that could be related to the presence of future outbreaks of the disease.

General objective

Analyze the socioeconomic gaps in relation to vaccination against COVID-19, in the five of the most important cities in Ecuador: Quito, Guayaquil, Cuenca, Ambato and Machala Methodology: Analytical cross-sectional study, based on secondary data from the National Employment, Unemployment and Underemployment Survey (ENEMDU) that included a vaccination component against COVID-19 in 2021. Data from 91,169 surveyed people were included (with factor of proposed expansion 17,917,508 people). Poisson regressions were performed for complex samples, with crude and adjusted analysis.

Results: The coverage of the second dose reached percentages from 30.2% to 85.5% in the five cities studied. Significant differences were found in vaccination coverage by area of residence (Prevalence Ratio, PR, 0.51, 95% CI 0.45-0.55 for rural vs. urban areas), ethnicity (indigenous PR 0.21, 95% CI 0.19-0.23), education (PR 0.05, 95% CI 0.03-0.09 for illiterates compared to higher level), income (PR 0.27, 95% CI 0.17-0.43 for those who earn less than USD 400, compared to those who earn USD 1,600 or more), significance was maintained after the adjusted analysis.

Conclusions: There are socioeconomic inequalities in vaccination coverage against COVID-19 in Ecuador. It is necessary to strengthen vaccination in rural and indigenous populations and in sectors with scarce economic resources, as well as establish policies and strategies that ensure timely access to vaccination for the entire population, including more specific strategies for vulnerable populations.

Developing the individual capacity, the sense of health responsibility of hacettepe university faculty of education undergraduate students in the novel coronavirus disease (covid-19) struggle.

Jayati Khattar1, Ali Korkmaz 1, Dilek Aslan 1
1Hacettepe University, Faculty of Medicine, Department of Public Health, Turkey

It was aimed to evaluate the knowledge, the adaptation to preventive behaviours, the sense of health responsibility about COVID-19 and to contribute to the development of the capacity of the Hacettepe University Faculty of Education students to fight against the disease through health education. In this educational intervention study, the intervention was carried out for two weeks with a total of eight hours. Before and after the intervention, pre-test and post-test were applied and the targeted differences, that were in line with the aims of the study, were determined. The data collection form was created by the researchers and the “Fear of COVID-19 Scale” and “Attitudes Towards the COVID-19 Vaccine” were used. SPSS 23.0 was used for the analysis. Ethics committee approval and other relevant official permissions were obtained. 73.1% of all 245 participants were women and the mean age was 21.76±2.75. 79.2% of the participants had never had COVID-19 disease. 98.8% had at least one dose of COVID-19 vaccine, and 51.4% had vaccine hesitancy before being vaccinated. When some combinations of the participants were compared between the pre-test and post-test, statistically significant results were found in fear scale scores (p<0.001), in disease knowledge scores (p<0.001), in infodemic scores (p<0.001), in ability to distinguish high and low quality health resources on the internet (p<0.001) and in attitudes towards COVID-19 vaccine (p<0.001).

In terms of protecting their own health and their students' health, it’s important to increase the capacity of teacher candidates to fight against COVID-19. It’s also important for them to learn and develop these through health promotion activities before their graduation so they can perform the skills which are expected from them. In this research, it’s been proven that health education intervention can be beneficial. In matters concerning public health, intersectoral cooperations and joint works are important.

Changes in behavioral cancer risk factors during the covid-19 pandemic: an umbrella review

Jayati Khattar1, Laura Anderson2, Jayson Habib2, Kiara Pannozzo2, Nicolette Christodoulakis1, Jayati Khattar1, Laura Anderson2
1khattar@mcmaster.ca Canada, 2McMaster University, Canada

Background and objective: The COVID-19 pandemic significantly impacted behaviours and activities of daily life worldwide. Public health restrictions that were necessary to control the virus resulted in changes in health behaviours. This includes changes in established cancer risk factors, defined for this review as smoking, alcohol consumption, decreased physical activity, increased sedentary behavior, decreased consumption of fruits and vegetables, and increased red meat/meat intake. The objective of this umbrella review was to assess how the COVID-19 pandemic, compared to pre-pandemic, impacted the prevalence of behavioral cancer risk factors among community-based adults.

Methods: On October 12th 2022, five databases (PubMed, Web of Science, MEDLINE, Embase and the Cochrane Database of Systematic Reviews) were searched onwards of January 2020. Studies were eligible for inclusion if they were a systematic review, with or without meta-analysis, and if they examined the change in an identified cancer risk factor during the COVID-19 pandemic. Studies were excluded if they did not focus on the general adult population. Five reviewers independently assessed the studies for eligibility, extracted data and conducted critical appraisal using the AMSTAR-2.

Results: After screening, 31 reviews were included for smoking (n=3), alcohol (n=9), physical activity (n=14), sedentary behaviour (n=8), fruits and vegetables (n=6), and red meat/meat (n=5). Preliminary results based on low quality heterogeneous evidence did not suggest a consistent increase in smoking and alcohol use. Similarly, the evidence was mixed regarding fruit, vegetable and red meat/meat consumption and was dependent on study population. In contrast, the evidence consistently indicated a decrease in physical activity and an increase in sedentary behavior during the pandemic compared to the pre-pandemic period.

Conclusions: The results of our review suggest the COVID-19 pandemic had a mixed impact on cancer risk factors. Public health interventions should concentrate on mitigating negative consequences of changes in cancer risk post-pandemic.

Background and objective: The COVID-19 pandemic significantly impacted the health and welfare of people worldwide. Healthcare workers (HCWs) represent a particularly vulnerable group due to increasing work stress. Our study aimed to describe the prevalence of job strain among healthcare workers (HCWs) in private clinics in Sousse and evaluate the association between job strain and mental health.

Methods: A cross-sectional study conducted among HCWs working in private clinics in Sousse, from September 2020 to November 2020. The calculated sample size was 454 employees. In collaboration with the Group of Occupational Medicine of Sousse (GOMS), convenience sampling was conducted to include five private clinics and GOMS. Hospital Anxiety and Depression Scale (HADS) used to assess anxiety and depression disorder and the KARASEK model to assess work-related stress. We used SPSS 20 software for statistical analysis.

Results: A total of 543 participants with a female predominance (68.3%) and a sex ratio of 0.36. The mean age was 34.15±8.73 years. The prevalence of job strain was 17.5% (n=95). It was higher in women (19.1%) than men and in employees between 25-35 years (18.4%). Also, employees who had certain anxiety according to the HADS scale were more predisposed to have a Job-Strain (25.9%) than those with doubtful or no anxiety (p=0.002). The same for employees suffering from anxiety and depression disorder.

Background: According to the WHO, COVID-19 pandemic has had a negative impact on the health, well-being of people worldwide. Healthcare workers (HCWs) represent a particularly vulnerable group due to increasing work stress. Our study aimed to describe the prevalence of job strain among healthcare workers (HCWs) in private clinics in Sousse and evaluate the association between job strain and mental health.

Methods: A cross-sectional study conducted among HCWs working in private clinics Sousse, from September 2020 to November 2020. The calculated sample size was 454 employees. In collaboration with the Group of Occupational Medicine of Sousse (GOMS), convenience sampling was conducted to include five private clinics and GOMS. Hospital Anxiety and Depression Scale (HADS) used to assess anxiety and depression disorder and the KARASEK model to assess work-related stress. We used SPSS 20 software for statistical analysis.

Results: A total of 543 participants with a female predominance (68.3%) and a sex ratio of 0.36. The mean age was 34.15±8.73 years. The prevalence of job strain was 17.5% (n=95). It was higher in women (19.1%) than men and in employees between 25-35 years (18.4%). DOI: 10.18332/popmed/164599
From certain depression were more likely to have a job strain with a percentage (24%) than those with doubtful or no depression (p=0.007). Being a laborer was significantly associated to having a job strain (24.2%) than the others job positions (p=0.035). Conclusion: HCWs are at the forefront of combating any emerging diseases, which increases the risk of job strain and mental health problems. Studying our COVID-19 experience can help us be more prepared in case of another health emergency or pandemic.

Results: 138 out of 521 unvaccinated became infected (26.5%); infection rate in vaccinated resulted 7.3% for patients with primary cycle completed (120/1643), 11.1% for vaccinated with 1st booster shot (1085/9718) and 11.4% among patients who received a 2nd booster dose (4970/43422). Overall infection rate was significantly higher in unvaccinated (26.5%) than vaccinated (0.11%) cohort. Among unvaccinated patients, 6 were hospitalized (1.2%) and 15 died (2.9%). Hospitalization rate in vaccinated was 0.3%, mortality rate 0.5%: in patients with primary cycle completed, 5 hospitalizations (0.3%) and 8 deaths (0.5%) were counted. Hospitalization rate was 0.4% and 0.2%, respectively, in 1st boost (n=395) and 2nd boost cohorts (n=108). Furthermore, mortality rate resulted 0.1% among vaccinated with 1st booster shot (n=67) and slightly increased to 0.4% among 2nd booster group (n=198).

Conclusion: Infection, hospitalization and mortality rates significantly decrease as patients complete at least the primary vaccination cycle. Data confirm the importance of COVID-19 vaccination campaign as prevention tool in elderly patients residing in long-term care facilities.

Efficacy of COVID-19 vaccination campaign in elderly people residing in long-term care facilities: a retrospective observational study from Lombardy region, Italy
young children. Methods: We implemented a prospective observational surveillance study in 3 preschool and 2 primary schools in the canton of Geneva, Switzerland. We sampled children between 2 and 6 years of age, educational staff, and household members. We collected oral-swab PCR tests, capillary blood for anti-spike serology and questionnaires for household and class members at the time of outbreak detection and at two subsequent time points (day+2 and day+30). All available virological samples underwent whole genome sequencing. We developed a mathematical model of SARS-CoV-2 transmission to infer time-varying force of infection within schools and from the community at large. Results: Between March 2021 and June 2022, we recruited a total of 351 children and 107 staff, and 111 of their household members. We investigated eleven SARS-CoV-2 outbreaks (two Alpha, six Delta and three Omicron), involving a total of 33 classes. Phylogenetic analysis on 56 available sequences from seven of the outbreaks (one Alpha, three Delta and three Omicron) indicate that clustering differed between variants, with a higher degree within-school clustering for the Alpha outbreak and lower for the Omicron outbreaks. Modeling results integrating epidemiological and genetic data supported a changing importance of within-school vs. community transmission as more infectious variants emerged. Conclusion: The importance of within-school SARS-CoV-2 transmission changed with the emergence of more infectious variants. The potential impact of interventions in educational settings depends on these changes and could be tailored to specific transmission scenarios.

Impacts of the oswaldo cruz foundation plan to combat covid 19 in the favelas of Rio de Janeiro: Community participation and inter-institutional work in response to the pandemic

Richardis Martins1, 1Fiocruz Brazil. Background and objective: The Oswaldo Cruz Foundation (Fiocruz) Plan to Combat COVID19 in the Favelas of Rio de Janeiro (PFECFRJ) is an inter-institutional action coordinated by Fiocruz, in partnership with the Brazilian Association of Collective Health, Brazilian Society of Progress for Science, universities and civil society, which acts directly to mitigate the multidimensional effects of COVID19 pandemic in favelas. With a budget of USD 4 million dollars, PFECFRJ supported 54 projects with a focus on comprehensive territorial-based health actions aimed at reducing COVID19. The main objective of this work is to analyze the results of the implementation of this public health policy between 2020-2022 and point recommendations for health actions aimed at socially vulnerable populations in contexts of health emergencies.

Methods: The research methodology has as its object the analysis of the genesis, formulation and implementation of the PFECFRJ, based on thematic axes: political actors; political process; agenda setting; policy formulation; and policy implementation. The theoretical approach focuses on Kingdon’s multiple flows model (Kingdon, 2003). The research used data from the monthly and final reports of the 54 projects supported by the PFECFRJ as a source and carried out 70 semi-structured interviews with actors who acted in the set of these health actions. Results: The study shows the direct impact of the actions carried out on indicators associated with the reduction of food insecurity in the analyzed territories, the expansion of territorial-based health surveillance actions and the expansion of communication in health with a focus on the prevention of COVID19. Conclusion: The research points out that the partnership between academia, public health management and civil society has a greater potential for incidence in territories in contexts of greater social vulnerability in the response to COVID19 when community participation is a structural element of the organization of the health network.

Buffer spaces in healthcare facilities: strategies for managing and designing strategic areas

Marco Gola1, 1Università Cattolica del Sacro Cuore Italy, 2Columbia University United States. Background: The recent covid-19 experience highlighted the difficulty of healthcare facilities in responding promptly to emergencies. Hospitals had to reorganize their spaces, suspending the ordinary medical activities for ensuring the emergency management of the patients’ surplus. A working group of the postgraduate training course in healthcare management by altemps school in rome conducted a survey on the buffer space (bs), which could support, in case of emergency, the hospitals. Methodology: The team elaborated a double questionnaire to be administered respectively to healthcare staff and designers with a series of questions aimed at understanding the features of bss. The questions were divided into general information, activities carried out during the pandemic and specific questions on the features of bss. many questions were the same for the two types of participants, while some differed in relation to the respective organizational and design skills of the users. Results: 102 healthcare professionals and 56 designers took part to the survey. the data analysis permitted to highlight a series of specific inputs that the bs project should take in consideration, such as: a) proximity to the emergency department (ed), intensive care (icu) and inpatient wards (iws); b) location within the hospital but separate from other medical areas; c) independent access; d) organizational and spatial features similar to ed, icu and iws; e) configuration of an operational space ready for whatever type of need; f) the bs should host approximately 12% of the ed stations (40 sqm/per station). Conclusions: The research aims to become a starting milestone for future investigations: in fact it is necessary to carry out a widespread analysis at the international level. Although the research was focused in hospital settings, the covid-19 pandemic referred also to the territorial healthcare facilities and therefore some considerations on that issue need to be improved.

Mental health during the covid-19 pandemic, a population-based observational study of antidepressant dispensing

Julie Arnott1, Paul Corcoran2, Ivan Perry3. 1University College Cork School of Public Health Western Road Western Gateway Building Ireland, 2University College Cork. Background: In Ireland, national surveys have been conducted to measure the impact of COVID-19 pandemic on well-being, however national statistics on mental distress are lacking. This study aimed to investigate the effect of the pandemic by analysing a key indicator of mental distress, antidepressant prescribing. Methods: Population-based observational study over 7 years analysing two national datasets of anonymised aggregate dispensing data of WHO ATC classification N06A (antidepressants). The Health Market Research Ireland Ltd. (HMR) dataset is based on national retail pharmacy sales for both private and public patients; and the General Medical Services (GMS) dataset is based on publicly-funded prescriptions (approx. 31% of population eligible). Non-GMS figures are derived from the HMR and GMS datasets. Gender and agegroup data only available for GMS dataset. Descriptive statistics, and poisson regression were performed using STATA 15. Incidence Rate Ratios (IRR) with a p-value of <0.05 were considered statistically significant. Results: Annual trends found statistically significant changes in the prescribing of antidepressants. Rates increased year on year in both datasets. In the HMR dataset increased prescribing was accelerated by the pandemic; a rate of prescribing in 2020 was 1.07 times higher than 2019 (IRR:1.03), increasing further in 2021 (IRR:1.09). However, in the GMS dataset, the rates decelerated from an IRR of 1.05 in 2019 to 1.04 in 2020 and 1.01 in 2021. By deducting the GMS figures from the HMR figures ‘non-GMS’ prescriptions increased from 1.02 in 2019 to 1.09 in 2020 to 1.16 in 2021. Conclusion: This study validates national well-being studies with findings that mental distress increased over time during the pandemic. A novel finding is the different impact on two study populations. In the publicly funded GMS dataset, females accounted for two thirds of prescriptions, and the pandemic impacted the mental health of younger age groups greatest, particularly young females.

Brazilian northeast’s responses to the covid-19 pandemic: what was missed to end the epidemic?

Ligia Sansigolo Kerr1, Carl Kendall2. 1Universidade Federal Do Ceara Professor Rua Cumbuco, 94 Residencial Alphaville Fortaleza Brazil, 2Tulane University Federal University of Ceará Brazil. Background: Brazil’s response to the COVID-19 pandemic was one of the worst in the world. However, governors and mayors of the northeast region of the country,
among the poorest states in Brazil, joined to organize their technical, economic and political responses to the pandemic to reduce hospitalizations, deaths and the economic impact of the pandemic. However, as the pandemic continued, the response became less effective and appropriate. The aim of this study is to document and review this history and the reasons for the growing ineffectiveness of the planning and implementation of the actions.

Methods: A timeline of intervention events was established for the nine states. Surveillance data was added to the timeline. A desk review was conducted reviewing published and unpublished accounts of policies and programs as well as pandemic major news and political events that captured public attention. The narrative construction was then shared with expert public health specialists in the nine states to guarantee accurateness.

Results: In the first wave of the pandemic, most governors in northeastern Brazil responded actively to mitigate the impact of the pandemic. Physical distancing was promoted, including some lockdowns, the use of masks was made mandatory throughout 2020 and part of 2021, vaccination was carried out as doses were received from the federal government, the number of ICU beds was increased, economic measures were instituted to alleviate the situation of families that were left without permanent or temporary employment. However, over time as economic pressure increased and despite the entry of several more transmissible variants, masks were withdrawn, emphasis on immunization was reduced, communication with the population regarding the increase in cases declined, as well as the need to return to masks, complementing doses or boosters of the vaccine and the impact of repeated reinfections on the body, even among those with frank disease.

The role of biomarkers in diagnosis of COVID-19: a systematic review
Raveena Khasla1
'1St George's University of London, United Kingdom
Background: COVID-19 impacted healthcare worldwide. Biomarkers are a critical tool in monitoring health and guiding treatment to the novel strain. Aim: To assess whether biomarkers can successfully predict clinical outcomes and associate with the severity of the disease. Methods: A systematic review of the literature was carried out to identify relevant articles using six different databases. Keywords to refine the search included COVID-19, SARS-CoV2, Biomarkers, among others. Only studies which reported data on pre-defined outcomes were included. Key Findings: Thirty-four relevant articles were identified which reviewed the following biomarkers: C-reactive protein, serum amyloid A, interleukin-6, lactate dehydrogenase, neutrophil-to-lymphocyte ratio, D-dimer, cardiac troponin, renal biomarkers, lymphocytes and platelet count. Of these, all but two, showed significantly higher levels in patients with severe complications of COVID-19 infection compared to their non-severe counterparts. Lymphocytes and platelet count showed significantly lower levels in severe patients compared to non-severe patients. Conclusions: Although research is still in its early stages, the discovery of how different biomarkers behave during the course of the disease could help clinicians in identifying severe disease earlier and subsequently improve prognosis. Nevertheless, we urge for more research across the globe to corroborate these findings. Keywords: biomarkers; blood tests; COVID-19; SARS-CoV-2. Links: — [1] maltrm1606869@sgul.ac.uk

Regional differences in population ageing and death rate due to COVID-19 in Bulgaria
Dina Tsonova1; Eleonora Mineva-Dimitrova1; Stela Georgieva1; Mariela Kamburova1
1'Department of Social Medicine and Health Management, Faculty of Public Health, Medical University-Pleven, Bulgaria, '2Department of Social Medicine and Health Management, Faculty of Public Health, Medical University of Pleven, Pleven, Bulgaria, '3Department of Social Medicine and Health Management, Faculty of Public Health, Medical University-Pleven, Pleven, Bulgaria
Background: Bulgaria is one of the countries with the highest level of ageing using the share of people over 65 years of age (22% for 2022) - on the eighth position in the world ranking. The population ageing in Bulgaria is one of the most significant demographic problems nowadays. The level of ageing in different regions of Bulgaria has varied values. This report aims to investigate and conduct a comparative analysis of indicators of the death rate due to COVID-19 and population ageing in 2021 in Bulgaria. Methods: The regional indicators for ageing and mortality could help clinicians in identifying severe disease earlier and subsequently improve prognosis. Nevertheless, we urge for more research across the globe to corroborate these findings. Keywords: biomarkers; blood tests; COVID-19; SARS-CoV-2. Links: — [1] maltrm1606869@sgul.ac.uk
statistically processed with SPSS v.24. To establish the relationship between death rates and ageing, Pearson's correlation coefficient has been used.

Results: The study found that the death rate due to COVID-19 in Bulgaria for 2021 is 401.12 per 100,000 population but there are six regions where the level of the indicator is above 500 – Silistra, Vratsa, Gabrovo, Montana, Vidin, and Kyustendil. Kyustendil, Gabrovo, and Vidin are the regions with the highest level of ageing in our study: 29.2%, 29.1%, and 29.6%, respectively. The level for the whole country is 21.67%. The statistical analysis shows that there is a positive correlation between ageing and death rate due to COVID – 19, The Pearson coefficient is 0.503. Conclusions: The regional health inequalities in Bulgaria are very important in order to control and decrease the level of mortality in the country especially the death rate due to COVID-19.

Effect of the COVID-19 pandemic on diet among university students in France
Marie-Pierre Tavolacci1, Joel Ladner2, Lisa Miller3
1Clinical Investigation Centre CIC 1404, INSERM and CHU Rouen, France.
2CHU Rouen INSERM, France, 3Department of Health Promotion, CHU de Rouen, France
Introduction: The COVID-19 pandemic and the lockdowns have affected many aspects of university students' daily lives, including their dietary habits. This study aimed to evaluate the change of diet quality of university students before and during the COVID-19 period, and the factors associated with unfavorable changes in diet quality. Methods: An online cross-sectional study was performed in May 2021 among Rouen (France) university students. Socio-demographic characteristics, body mass index, depression (CESD-8), academic stress, risk of eating disorders (SCOFF test) and food security (FSSM) were collected. The French “Programme National Nutrition Santé– Guidelines Score 2” (PNNS-GS2) was used to access diet quality.

Results: A total of 3508 students were included, 74.4% were female, the mean age was 20.7 (SD = 2.3). Mild and food insecurity concerned 11.3% and 7.0% of the university students, respectively. The risk of eating disorder was detected among 46.6% of the university students. The PNNS-GS2 score decreased between the pre- and the COVID-19 pandemic period for 33.1% of university students. After logistic regression, the associated factors with the decrease in the PNNS-GS2 score were food insecurity, financial insecurity, not living with parents, depression, academic stress, eating disorders, being in the two first years of study and having been infected by COVID-19. Conclusions: Diets with healthy components decreased for one-third of university students since the COVID-19 pandemic, and this was shown to be associated with food insecurity, poor mental health and eating disorder. This study provides important information to help public health authorities and universities give better support to student health feeding programs during pandemics and lockdowns. Further research could help develop innovative prevention programs that would seek to promote healthy food and mental health for all times among university students.

Impact of restrictive preventive measures during the COVID-19 pandemic on mortality in Bulgaria
Penka Kostadinova1, Sergey Kostadino1, Irena Stoilova1, Stefan Kostadino1
1Department of Social Medicine and Health Management, Pleven Medical University, Pleven, Bulgaria, 2Department of General Medicine, Forensic Medicine and Deontology, Faculty of Public Health, Pleven Medical University, Bulgaria,

Introduction: Compared to other countries in Europe, Bulgaria is in first place in terms of total mortality and occupies leading positions both in terms of mortality from COVID 19 and other socially significant diseases. During the pandemic, prohibitions were repeatedly introduced to conduct general preventive examinations and examinations for periodic monitoring of the condition of persons with chronic diseases. In addition, people limited visits to their GP due to fear of contagion. The purpose of the present study is to determine the impact of the introduced restrictive measures for prevention among the population during the COVID 19 pandemic on mortality among the population in Bulgaria. Materials and methods: Official data for the period 2018-2021 from the National Statistical Institute in Bulgaria were used, which were processed with statistical Methods. Results: Total mortality increased significantly during the pandemic (compared to 2019, an increase of 28.5% in 2020 and 39.8% in 2021). One of the reasons is the death rate from COVID 19, which in Bulgaria is higher than the average values for European countries. A significant increase in deaths from diseases of the respiratory system and diseases of the circulatory system was found. The growth in mortality from malignant neoplasms, diseases of the endocrine system and mental illnesses is also impressive. During the pandemic, a lower coverage of the population with preventive examinations is reported (below 35%). Conclusions: The pandemic of COVID 19 and its consequences gave a reflection, besides as a direct cause of death among the population, and as an indirect cause of death in persons mostly with chronic diseases. Restrictions on prevention and early detection of diseases, as well as irregular monitoring of chronically ill people is an additional reason for the increased mortality from socially significant diseases.
Attitude of personnel’s of Estonian nursing homes towards vaccination against COVID-19
Ulle Parm 1
1Tartu Health Care College, Estonia

Background and Objectives: Since the beginning of COVID-19 pandemic, many studies have been conducted to assess public attitudes and readiness for vaccination against COVID-19. Less attention has been paid to nursing home workers, though they have important role in achieving immunity in a vulnerable population. The aim was to clarify the readiness of Estonian nursing home workers to be vaccinated against COVID-19 and the factors influencing their opinion.

Methods: Web-based electronic questionnaire was fulfilled online by nursing home personnel in May 2021. Descriptive statistics, t- or Mann-Whitney, and y2- or Fisher Exact tests were used. In order to measure attitudes Likert-scale (5 degrees), and to identify risk factors associated with decision to vaccinate univariate logistic regression analyses were used.

Results: 139 nursing home workers (caregivers, nurses, cleaners, board members and other specialists) participated. They were divided into pro-vaccination (87.8%), the skeptics (3.6%), anti-vaccination (8.6%) groups. Pro-vaccinations wanted to protect themselves (73.8%). Anti-vaccinators believed that there is not enough information about vaccines (75%) and vaccination is not necessary (33.3%) or even dangerous (41.7%). Vaccination was influenced by married/long-term relationship status and caregiver occupation (OR=3.01, 95% CI 1.04–8.76; OR=0.26, 95% CI 0.09–0.75, respectively). Most participants agreed that vaccination is important because it prevents severe illness (84.2%), protects others (82.7%) and limits the spread of disease (81.3%). The belonging to vacation group was positively influenced by family status (cohabitation or marriage) (OR=3.01, 95% CI 1.04–8.76) but negatively by belonging to caregiver group (OR=0.26, 95% CI 0.09–0.75).

Conclusions: Employees of Estonian nursing homes are mostly in favor of receiving COVID-19 vaccine. There were also skeptics and opponents of vaccination, which could have a negative impact on the health behavior and health of nursing home residents. Vaccine skepticism is a global problem and thus awareness and vaccination campaigns must continue.

Attitude of the Estonian-speaking population towards the COVID-19 vaccination
Anna-Liisa Tamm 1
1Tartu Health Care College, Estonia

Background and Objectives: Vaccination is a simple, safe and effective way to protect from harmful diseases, but unfortunately, vaccine resistance is on the rise worldwide. The aim of study was to clarify the attitude of Estonian-speaking population towards COVID-19 vaccination and main reasons for accepting or refusing vaccination.

Methods: The online electronic questionnaire was completed online by Estonian-speaking citizens in May 2021. Descriptive statistics, t- or Mann-Whitney, and y2- or Fisher Exact tests were used. In order to measure attitudes Likert-scale (5 degrees), and to identify risk factors associated with decision to vaccinate univariate logistic regression analyses were used.

Results: Participants (n=508; 33.5±12.3y) were divided into: pro-vaccination (78.7%), many of them had already been vaccinated with either one or two doses (36.5%, 31.5%, respectively) or were planning vaccinate soon (32%); the skeptics had not decided (12%); anti-vaccination (9.3%). The main reason why vaccination was preferred was the belief that by vaccinating we help those who for some reason cannot vaccinate themselves (81.7%) and in case of concomitant diseases COVID-19 can be extremely severe (80.9%). 6.5% of anti-vaccinators believed that their body protects itself from the disease, and 4.7% believed that vaccination should not violate the sanctity of the human body. The main reasons for vaccination resistance were insufficient research on vaccines (80.9%) and general attitude towards the necessity of vaccines (48.9%). The belonging to vaccination group was influenced by living in an urban area and student status (OR=1.96, 95% CI 1.28–3.02; OR=2.39, 95% CI 1.26–4.55, respectively). Anti-vaccination status was primarily influenced by a secondary vs higher education (OR=2.34, 95% CI 1.14–4.77, p=0.02). Skeptics and opponents of vaccination mainly believe media (24.6%); vaccinators mostly the opinion of health professionals (16%).

Conclusions: Vaccine skepticism is a global problem and thus awareness and vaccination campaigns must continue.

The impact of COVID-19 pandemic on the physical activity of the population of adult residents of Lithuania
Rokas Arlauskas 1, Rimantas Stukas 2
1Faculty of Medicine, Vilnius University, Lithuania, 2Vilnius University Faculty of Medicine, Lithuania

Background and objective: The COVID-19 pandemic has introduced changes in physical activity of various populations. The aim of this study was to assess the impact of the COVID-19 pandemic on physical activity in a representative sample of adult residents of Lithuania. Methods: The survey data was collected from October to November 2021. After the exclusion of missing data, this study included a representative sample of 1502 adult residents of Lithuania aged from 18 to 64 years old. The chi-square criterion was used to estimate the association between sociodemographic variables, COVID-19 experience and food selection criteria with change in physical activity during the pandemic.

Results: Although the majority (54.7%) of the participants of this study indicated no effect of the COVID-19 pandemic on their physical activity, 33.8% of the sample indicated the decrease in physical activity. During the pandemic, physical activity increased among 11.4% of the respondents. Decrease in physical activity was more frequent among younger respondents (28.6% vs. 29.6%), people from the largest towns of Lithuania (39.9% vs. 29.4%), single respondents (45.7% vs. 31.2%) and those who suffered from COVID-19 personally or had COVID-19 cases in their families (28.6% vs. 41.8%) (p<0.05). Physical activity increased more frequently among respondents with university education and those who selected their foods with respect to its impact on health (respectively, 14.4% vs. 5.8% and 15.6% vs. 9.6%) (p<0.05). Gender, employment status, number of family members, having children under 18 years, monthly income per family member and severeness of COVID-19 of the respondents were not associated with changes in physical activity during the pandemic (p>0.05). Conclusions: The COVID-19 pandemic has reduced the physical activity in one third of the population of adult residents of Lithuania. The decrease was observed among both – residents with higher and lower prepanademic physical activity.

Study of the continuity of tuberculosis-related care during the COVID-19 pandemic between March 2020 and February 2021 in Senegal
Mamadou Leye 1
1Medecine Preventive and Public Health, University Cheikh Anta Diop of Dakar, Dakar, Senegal

Introduction: Tuberculosis is one of the major public health problems. The COVID-19 pandemic has impacted the health system globally and nationally. Faced with this situation, it was deemed necessary to study the continuity of services related to tuberculosis in Senegal during the COVID-19 pandemic period between March 2020 and February 2021.

Methodology: A cross-sectional study for analytical purposes was conducted between March 2020 and February 2021 The study population was represented by all tuberculosis patients seen in consultation between March 2020 and February 2021 and who reside in Senegal. A multistage survey was carried out at the level of each district. Univariate and multivariate analyzes were performed using Epi Info 3.3.2 and R 3.4.4 software.

Results: The average age of respondents was 41.43 years with extremes 13 and 81 years. Possession of a television was significantly associated with the impact of COVID-19 on the continuity of tuberculosis services. Patients sensitized before Senegal recorded its first case (ORa 0.09 [0.02-0.43]) were less likely to continue their health care compared to those who received it after the first case. The request for follow-up consultation service was significantly associated with the impact of COVID-19 on the continuity of services related to tuberculosis. Patients who were in the attack phase (ORa 107.69 [5.94-1951.97]) and maintenance phase (ORa 50.06 [7.32-342.07]) were more likely to continue their health care compared to those who did not know what phase they were in.

Conclusions: The Results of this work suggest to the health authorities to reorganize the health system and to adopt a policy based on the community approach and to the populations to overcome the “fear of COVID 19”. Keywords: continuity, services, prevention, Tuberculosis, COVID 19, Senegal

Changes of influenza vaccination coverage rates due to the COVID-19 pandemic between March 2020 and February 2021

expanding free influenza vaccination program before and during the COVID-19 pandemic in Korea

Jun Hwang1, Soon-Woo Park2
1Department of Preventive Medicine, Daegu Catholic University School of Medicine, Republic of Korea

Background and Objective: As the COVID-19 pandemic prolongs, the threat of twindemic with influenza and COVID-19 remains. Therefore, this study aims to evaluate the effect of improving the influenza vaccination coverage rates of free expansion vaccination program before and during the COVID-19 pandemic.

Methods: The present study used the 2020–2021 Korea Community Health Survey (KCHS) data from Kyungpook province in Korea, which includes 23 cities/counties. We analyzed annual influenza vaccination rate, and the 2020 KCHS and 2021 KCHS Results meant the influenza vaccination rates for the 2019-2020 season and the 2020-2021 season, respectively, considering the KCHS survey period (mid-August to mid-October) and adult influenza vaccination period (mid-October or later). During the 2020–2021 season, unlike other regions, one city (Andong) of Kyungpook province introduced free vaccination program for all citizens.

Results: The adult influenza vaccination coverage rate of 2020 and 2021 KCHS increased by only 1.8%p (52.9% in 2020, 54.7% in 2021) in Kyungpook, but increased by 9.4%p (55.9% in 2020, 65.3% in 2021) in Andong. As a Results of comparison by age group in 10-year intervals, vaccination coverage rates for those in their 60s and 70s or older, who were not subject to vaccination expansion program, showed no difference or slightly decreased in both regions between the 2020 and 2021 KCHS. However, the vaccination coverage rate increased respectively by 19.0%p, 15.0%p, and 21.6%p for those in their 30s, 40s, and 50s in Andong. On the other hand, in the 20s, the rate of increase was low in both regions.

Conclusions: The expansion of the free influenza vaccine program was effective in improving the vaccination coverage rate among adults in their 30~50s, excluding those in their 20s. The temporary expansion of free vaccination programs will be efficient in preventing the twindemic between influenza, and COVID-19 or other emerging infectious diseases.

Users’ perceptions of medical services in primary health care during the COVID-19 pandemic in Fortaleza, Brazil

Louranny Costa1,2, Luciano Cavalcanti1,3,4, Leonardo Rocha2, Sarah Oliveira2, José Barreira2, Fernanda Faria1, Leila Pontes1, Ingrid Vasconcelos1, João Freitas2, Vitor Malheiro1,1, Liana Marques1, Gustavo Bezerra2, Pedro Aquino2, Lara Medeiros1, Leonardo Andrade3, Tiago Farías4
1School of Medicine, Universidade de Fortaleza, Brazil, 2Universidade Federal do Ceará, Brazil, 3Department of Conservative Dentistry, Periodontics, Faculty of Dentistry, Centre for Biomedical Research and Innovation (CIB), Brazil, 4Universidade de Fortaleza, Brazil

Introduction: Due to the COVID-19 pandemic, several countries reorganized their health systems, prioritizing emergency consultations over primary care. Objective: To evaluate adult users perceptions of medical care received between April 2020 and July 2021, in public primary health care (PHC) in Fortaleza, Northeast of Brazil. Methods: This is a cross-sectional study involving a survey and analysis of medical records (MR). Between August and November 2021, 126 participants were enrolled, invited by convenience, from 3 PHC units. We performed an ordinal logistic regression to verify the factors associated with users perceptions regarding the medical care received.

Results: 107 women (84.9%) and 19 men (15.1%) participated, with a mean age of 59.7 years; 42.9% of participants waited 30 to 60 minutes for appointments; 69% believed the pandemic interfered with that time; 78.6% believed there were not enough doctors to provide proper care. Distancing, masks, and face shields interfered with consultations, according to 16.7% of respondents. 53.2% rated the services received as “very good”. EMR data were collected from 58 participants: 49 women and 9 men. The average number of consultations in the period was 4.47. General consultations and nonspecific complaints were the most frequent ICD-10 codes in the MR, followed by respiratory symptoms and suspected or confirmed cases of COVID-19 (11.5%), and prenatal care (9.6%). The average number of times a user received medication was 9.33. Their perceptions of care were influenced by: believing there were enough doctors available to meet appointments; believing that the pandemic interfered with their waiting time; the availability of professionals for counseling; the user’s gender; and the times a user received medication (p = 0.0002). Conclusions: Clinical consultations maintained their quality according to users despite the pandemic overload and changes in health professionals work. It is possible to use these results in future crises to improve assistance.

Suffering and pleasure in health workers on the front lines of COVID-19

Patricia Baptista1, Cristiane Gallasch2, João Silva-Júnior3, Daniela Lourenção4
1School of Nursing, University of Sao Paulo, Brazil, 2Faculty of Nursing of the State of Rio de Janeiro, Brazil, 3Department of Occupational Medicine, University of Sao Paulo, Sao Paulo, Brazil, 4School of Nursing, University of Sao Paulo, Sao Paulo, Brazil

Background and objective: The COVID-19 pandemic occurs in a scenario that already reveals great concern for health workers. Added to this, in a context of constant changes and unpredictability, the risk of increased mental suffering is a worldwide finding. The present study aimed to verify indicators of suffering and pleasure in health workers in the pandemic context. Methods: Exploratory, analytical, cross-sectional study with a quantitative approach. The sample consisted of 437 health professionals invited electronically, who answered the questionnaire on sociodemographic information, occupational aspects and clinical conditions. Suffering and pleasure at work were considered as outcomes, which were analyzed with multinomial logistic regression regarding the associated independent variables.

Results: Most participants were female (71.0%), nurses (55.6%), mean age of 38.4 years, with an employment relationship (60.9%) and weekly workload of 40 hours or more (75.8%). Regarding suffering, 61.6% of participants were in mental distress, with the average score having critical levels in professional exhaustion and lack of recognition. As for pleasure at work, it is presented at a critical level, with the freedom of expression factor at a critical level. However, despite the difficulties faced in working on the front lines of COVID, health workers still feel some pleasure in their professional activities, especially due to the professional fulfillment of the tasks performed. Conclusions: Suffering at work is associated with occupational characteristics and mental exhaustion and lack of recognition among health workers in the COVID-19 setting.

Yang Han1, Roger Chung1
1The Chinese University of Hong Kong, China

Background: Social capital is dynamic; however, little is known about the association of its dynamics with health resilience in a pandemic. We examined the longitudinal association of pre-COVID-19 cognitive social capital trajectories with peri-COVID-19 depression and the moderating effect of province-level COVID-19 severity on the association in China.

Methods: We employed four-wave adult (≥ 16 years) data (follow-up n=6,228) from the biennial China Family Panel Studies between 2014 and 2020 with peri-COVID-19 depression in 2020 measured by the 8-item Center for Epidemiological Studies-Depression Scale. Pre-COVID-19 cognitive social capital from 2014 to 2018 included dichotomized (high/low) generalized trust, trust in neighbors, trust in local government officials, and reciprocity, with each of them categorized by age group in 10-year intervals. Results: Most participants were female (71.0%), nurses (55.6%), mean age of 38.4 years, with an employment relationship (60.9%) and weekly workload of 40 hours or more (75.8%). Regarding suffering, 61.6% of participants were in mental distress, with the average score having critical levels in professional exhaustion and lack of recognition. As for pleasure at work, it is presented at a critical level, with the freedom of expression factor at a critical level. However, despite the difficulties faced in working on the front lines of COVID, health workers still feel some pleasure in their professional activities, especially due to the professional fulfillment of the tasks performed. Conclusions: Suffering at work is associated with occupational characteristics and mental exhaustion and lack of recognition among health workers in the COVID-19 setting.

COVID-19 outbreak: challenges reorganizing a university hospital setting and preserving non-deferrable cares in the South Italy
Comparative profiles of anti-SARS-CoV-2 IgG in the blood and milk of Brazilian lactating women vaccinated by mRNA and other vaccine platforms

Daniele Marano1, Yasmin Amaral2, Maria Zuma, Fernanda Mazzoli, Zilton Vasconcellos3, Marina Vilain3, Fátima Monteiro, Paulo Borges, Maria Moreira1

1Oswaldo Cruz Foundation (Fiocruz), Brazil, 2Fiocruz, Rio de Janeiro, Brazil, 3Universitário Serra dos Órgãos (UNIFESO), Brazil, 4Fundação Oswaldo Cruz (Fiocruz), Brazil, 5Fiocruz, Brazil, 6Fiocruz, Rio de Janeiro, Brazil, 7Oswaldo Cruz Foundation (Fiocruz)

Background: The presence of SARS-CoV-2 IgG is directly correlated with the degree of vaccine efficacy. Recent studies have shown the presence of this antibody in the blood and milk of breastfeeding mothers vaccinated with mRNA (Pfizer). However, limited information is available in lactating women that received other vaccine platforms used in developing countries, such as the inactivated SARS-CoV-2 vaccine and the non-replicating adenovirus vaccines. Objective: To compare the amount anti-SARS-CoV-2 IgG protein in the blood and milk of lactating women vaccinated against SARS-CoV-2 based on vaccine platforms used. Methods: A cross-sectional study was carried out with 48 Brazilian lactating women, over 18 years old, contacted by the main social networks. The milk and blood samples were collected by healthcare workers previously trained in the blood collection will be carried out by professionals previously trained in the sample collection. The technicians used the method of direct collection in different vaccine platforms. Most lactating women received the second Pfizer vaccine with mRNA, 29.2% non-replicating adenovirus and 23% inactivated SARS-COV-2. The average of IgG in blood (5.39) was higher than in milk (1.19), however, limited information is available in lactating women that received other vaccine platforms used in developing countries, such as the inactivated SARS-CoV-2 vaccine and the non-replicating adenovirus vaccines. Objective: To compare the amount anti-SARS-CoV-2 IgG protein in the blood and milk of lactating women vaccinated against SARS-CoV-2 based on vaccine platforms used.

Knowledge, attitudes, and practices in adapting to COVID-19 pandemic conditions: a cross-sectional survey among the Mongolian population (The second phase follow up study)

Sarantuya Altansukh1

1National Center for Public Health, Mongolia

Background: In fact, of COVID-19 confirmed cases, Mongolia is in the top five countries in the West Pacific. A lack of practice to prevent from coronavirus infection period presents a need to improve the prevention, response, and risk communications of Mongolians and ensure the adaptability of citizens. Conducting the knowledge, attitudes, and practices towards coronavirus infection will help identify and address the population's information needs and concerns, provide relevant information, and to save lives.

Methods: The study was conducted participants from 3 remote provinces and 2 districts of Ulaanbaatar Capital city. Kazakh ethnic group in Bayan-Ulgii province, who make 5.9 percent of the total population, was selected through targeted sampling methodology to determine whether cultural and religious factors influence attitudes towards spreading COVID-19. The survey data was collected using quantitative, and qualitative methods among three specific groups (health specialists, general population, teenagers). Observations were performed on the population's handwashing situation, duration, use of soap, wearing and removing masks, frequency, and social distancing behavior of people.

Results: Positive changes made in the behavior of handwashing frequency (50.5% to 83.2%), wash hand in the correct order (21.4% to 39.1%), use soap regular (26.0% to 53.2%), wash hand duration (16.1% to 33.5%), the frequency of cleaning and disinfecting of home and the use of disinfections has been increased, the practice of wearing masks in crowded places and outdoors were increased by 6.8 percent.

Conclusions: To divide the target group into children, adolescents, adults and the elderly and implement activities aimed for them. Promote and develop training program and curriculum for all level education institution and create a supportive environment. Continue to provide essential knowledge sharing activities.

Healthcare workers and COVID-19 vaccination: a living systematic review

Mario Poz,1 Alessandra Silva,1 Luciana Castaneda,1 Raphael Chang,2 Leila Maia,3 Inês Frontera,4 Isabel Craveiro,5 Ana Oliveira,5 Paulo Ferrinho5

1Institute of Social Medicine, University of Rio de Janeiro State, Brazil 2Institute of Health Sciences, Federal University of Campina Grande, Brazil 3Institute of Tropical Medicine, University of Porto Alegre, Brazil 4Institute of Health Sciences, Federal University of Rio de Janeiro, Brazil 5Institute of Social Medicine, University of Rio de Janeiro State, Brazil

DOI: 10.18332/popmed/165294

Conclusions: To divide the target group into children, adolescents, adults and the elderly and implement activities aimed for them. Promote and develop training program and curriculum for all level education institution and create a supportive environment. Continue to provide essential knowledge sharing activities.
Background and Objective: The COVID-19 has shaken the scientific community and highlighted the lack of policies to protect and support health care workers (HCWs) in public health emergencies. The discovery of the vaccine was not enough to defeat the pandemic for several reasons, such as anti-vaccine behavior, deficit of vaccines in several countries and fragile policies for vaccine coverage worldwide. We aimed to identify HCWs’ skills and requirements for covering a target population; countries’ policies to uptake vaccination; and strategies for improving vaccination team’s performance.

Methods: Living systematic review of studies retrieved from PubMed, Embase, Scopus, Lilacs, Web of Science, WHO COVID-19 database, and Google Scholar published between January 2020 and March 2022. The PICO search tool was used for the research questions about requirements, policies and strategies for HCWs and target population vaccination. Risk of bias and Certainty of evidence were assessed by GRADE CERQual tool.

Results: A total of 4556 studies were identified in the databases. First, 193 studies were selected for retrieval. Then, 162 studies were selected for full-text reading. We identified 29 publications that met the inclusion criteria. After full texts reading, 10 studies were excluded. Data extraction was done from 19 studies. Most of the evidence was acquired from cross-sectional surveys and qualitative studies. The main findings are related to vaccine hesitancy, which is not a minor issue among the HCWs. Countries have embraced few policies for covering the target population and the HCWs worldwide.

Conclusions: The pandemic has yet to be overcome entirely. Skepticism, mistrust, and hesitancy are global issues that can jeopardize immunization coverage. Governments will need guidance to develop and advance policies for vaccine coverage, control outbreaks of new strains. We propose to continue the living systematic review method to accommodate the development of strong evidence studies to support public policies on this subject.

Prevalence of postpartum depression symptoms in developed and developing countries in the COVID-19 pandemic: a systematic review with meta-analysis

Marina Vilarim1, Fernanda Rebelo2, Janne Vieira2, Fernanda Mazzoli1, Antonio Nardi2, Daniele Marano2

1Cancer National Institute, Health Ministry, Brazil, 2Institute of Social Medicine, University of Rio de Janeiro State, Brazil, 3Cancer National Institute, Brazil, 4Global Health and Tropical Medicine, Instituto de Higiene e Medicina Tropical, Universidade Nova de Lisboa, Portugal

Background: The prevalence of postpartum depression (PPD) possibly increased during the COVID-19 pandemic due to numerous direct and indirect stressors that resulted in modifications on the social, economical, and health landscape. Objective: We aimed to carry out a systematic literature review of cross-sectional studies that assessed the prevalence of PPD symptoms in the pandemic, then meta-analyze and compare the prevalence between developed and developing countries. Methods: Studies published on PubMed, Embase, Virtual Health Library, Scopus, Web of Science, PsyCINFO and Cinahl from inception to October 2022, that reported prevalence of PPD symptoms, using Edinburgh Postnatal Depression Scale, among puerperal women aged ≥ 18 were included. Quality assessment was performed according to Joanna Briggs Institute Critical Appraisal Checklist. The metagroup command was used in the Stata statistical software to run a random effects meta-analysis. Heterogeneity was explored by subgroup analysis and meta-regression, considering human development index (HDI), age, time after childbirth, breastfeeding and parity. Results: The initial search strategy identified 691 articles. A total of 15 studies with 4788 postpartum women during the COVID-19 pandemic were included. Seven studies were conducted in developed countries and eight in developing countries. The overall prevalence of PPD symptoms was 31% (95% CI: 21.85-40.99). The pooled prevalence of PPD symptoms among women from developed countries [30.5% (95% CI: 16.95–46.02)] did not differ significantly from that in developing countries [31.5% (95% CI: 19.26–45.15)]. In the meta-regression, the proportion of breastfeeding was direct associated with the prevalence of PPD (β=0.006, p<0.04). Studies that analyzed women up to one month after childbirth had a lower prevalence of PPD compared to those that observed them up to one year after childbirth. High heterogeneity was detected across studies.

Institutional care of older people during the COVID-19 epidemic in Croatia

Branko Kolaric1

1Andrija Stampar Teaching Institute of Public Health, Croatia

Background and Objective: During 2020 in Croatia there have been two highly stressful events that could have caused professional burnout among nursing home employees: the COVID-19 epidemic and two earthquakes. After the emergence of COVID-19, the Department of Public Health Gerontology at the Andrija Stampar Teaching Institute of Public Health became the coordinator for the preparation of the Guidelines for the Prevention and Suppression of the COVID-19 Epidemic for Social Service Providers in the Social Welfare System incorporating examples of good practice.

Methods: A special team is formed consisting of two specialists in epidemiology and three specialists in public health, three nurses and one IT specialist. The team’s tasks were: implementation of official anti-epidemic measures and their coordination in nursing homes in the City of Zagreb, supervision of the implementation of the official guidelines, 24/7 standby telephone, expert consultation of family medicine doctors regarding the application of prescribed measures and vaccines and reporting on the epidemiological situation in nursing homes on a daily basis.

Results: During the peak of the epidemic in 2020/2021, special isolation departments for infected residents were organized in the nursing homes. Due to the well-defined treatment protocols and immediate assurance of the necessary hospitalizations, we had a low death rate among nursing home residents. Among 8667 infected nursing homes residents in Croatia, there have been 1132 (13%) deaths. Conclusions: Well-defined protocols and good organisation reduced the number of deaths among nursing homes residents, and later the number of infected residents through the active implementation of vaccinations in nursing homes. Based on the experience gained during the epidemic, we have designed a special two-year program „Control of the consequences of the COVID-19 epidemic and the earthquake in Zagreb in nursing homes” with the qualitative and quantitative research on professional burnout among employees which is still ongoing.

Citizen involvement in COVID-19 contact tracing with digital tools: a qualitative study to explore citizens’ perspectives and needs

Akke Meer1
1National Coordination Centre for Communicable Disease Control, Centre for Infectious Disease Control, National Institute for Public Health and the Environment, The Netherlands

Background and Objectives: Contact tracing (CT) is a key strategy for controlling outbreaks of infectious diseases, including COVID-19. The scale of the COVID-19 pandemic often made it difficult for public health professionals (PHPs) to execute CT adequately. This may be compensated by more actively involving citizens in CT tasks that are traditionally executed by PHPs (further referred to as ‘self-led’ CT). However, there is limited insight into citizens’ perspectives and needs regarding self-led CT. Therefore, we aimed to explore the perspectives and needs of Dutch citizens regarding self-led CT. We additionally explored if and how self-led CT may be facilitated with digital tools.

Methods: In November 2021, we performed an exploratory qualitative study among Dutch citizens (N=27), in which we conducted online semi-structured interviews. Questions were based on constructs of the Reasoned Action Approach and the Health Belief Model. Interviews were audio-recorded and transcribed verbatim. A thematic analysis was conducted to identify citizens’ perspectives and needs regarding participation in self-led CT.

Conclusions: Citizens’ attitude towards participating in self-led CT may depend on various factors. Their perspectives and needs should be considered for the future implementation of self-led CT in practice.

Perceptions on prevention measures for COVID-19 by users of Brazilian basic health units

Kellen Gasque1, Jonatas Conceição2,3, Fábio Amorim4, Magda Mattos4, Débora Nascimento5, Leticia Goulart6
1Regional Board of Brasilia, Oswaldo Cruz Foundation, Brasilia, Brazil, 2Regional Board of Brasilia, Brasilia, Brazil, 3Oswaldo Cruz Foundation, Brasilia, Brazil, 4Superior School of Health Sciences, Health Secretariat Federal District Government, Brasilia, Brazil, 5Federal University of Rondonopolis, Rondonopolis, Brazil, 6Fiocruz Pantanal, Oswaldo Cruz Foundation, Campo Grande, Brazil

The behavior of populations in the context of the COVID-19 pandemic is influenced by sociodemographic, health and cultural factors. This study sought to analyze the perceptions and daily practices for the prevention of COVID-19 that were adopted by users of Basic Health Units in the Midwest region of Brazil. This is a cross-sectional study. A total of 403 Primary Care Health users participated in the survey. A block-structured questionnaire covering sociodemographic issues, preventive practices for COVID-19 and sources of information about the infection was applied. A robust Poisson model was generated to determine the factors associated with the perception of avoiding crowding as very important. The most searched sources of information were newspapers and the internet (73.9%), television (65.0%) and social networks (61.8%). Mask use (82.6%), alcohol gel (65.0%) and hand washing (63.0%) were the most adopted preventive methods. The majority (91.1%) perceived social isolation as a very important preventive method against COVID-19, associated with working in an essential service, getting information on TV, considering government officials as reliable source for information and social distancing practice. In addition to the development of health education actions in their territories by the basic health professional teams, it is essential that the health professional assumes the role as a source of health information for the user, as well as develops self-autonomy and the ability to distinguish reliable sources from fake news, whether in the context of the COVID-19 pandemic or in other health situations and their social determinants.

Social skills associated with stress in university students after the return to face-to-face classes

Sol Sanchez1, Yoshio Gonzalez2, Hugo Vida1, Karime Diaz1, Jose Villegas-Dominguez1
1Universidad del Valle de Mexico, Mexico

Background: During the confinement experienced in different countries due to the COVID-19 pandemic, symptoms related to mental health were identified as
a consequence of this stage, such as stress, so it is essential to identify the factors that positively or negatively influence the to start with early identification and attention programs. General Objective: Determine the association between social skills associated with stress in university students after returning to face-to-face classes. Methodology: A cross-sectional, prospective, observational and analytical study was carried out between January and April 2022 in Veracruz-Boca del Rio, including university students of both sexes, in face-to-face classes, excluding subjects with a previous diagnosis of stress, anxiety or who do not want to participate. The main variables studied were social skills (degree of assertiveness, communication, self-esteem and decision-making) and stress level. Surveys were conducted using Google Forms, including the social skills test (a.Cronbach 0.75) and the perceived stress scale (a.Cronbach 0.84). Statistical significance was assigned with a value of p<0.05.

Results: 485 participants were included, 83.6% men and 16.4% women. Sex, age, major studied, and academic degree had values of p>0.05, while other factors (OR/CI95%) such as having an average of 6-7.9 (0.2/0.1-0.6) or 9-10 (1.8/1.1-2.9), as well as the degrees of low assertiveness (0.05/0.01-0.1), low average (0.3/0.2-0.9) or very high (2.8/1.3-6.1), low degree of communication (0.2/0.1-0.4) or high (2.4/1.2-4.8), degree of low self-esteem (0.2/0.1-0.4) or high (3.2/1.5-6.9) and degree of low (0.3/0.1-0.5) and high (2/1.3) decisions -4.5 showed values of p>0.05 for the perception of stress. Conclusions: Being a worker is positively associated with the development of stress in students, while school achievement, the development of social skills, communication, self-esteem and decision-making are both positively and negatively associated with the development of stress, according to the intensity of each of these characteristics.

The fight for the human right to health in the COVID-19 pandemic: the political participation of social movements

Denise Diniz1, Wânia Almeida2, Eliane Teixeira2, Marina Souza2
1 Instituto Unimed-Rio, Brazil, 2 Faculdade de Direito Milton Campos, Brazil, Brazil

Background and Objective: Social movements are the root of struggles for the recognition of human rights, which means that these are the fruits of historical struggles for access to material and immaterial goods that are indispensable for a life with dignity. The objective is to survey and analyze the performance of social movements in the construction and realization of the human right to health during COVID-19 pandemic. Methods: Based on a narrative review of the literature, a critical analysis was carried out on the Brazilian Sanitary Reform Movement (BSRM), the Declaration of Human Rights and the Brazilian Federal Constitution (CFB/88), and the concept of the “Right Found in the Street”, as bases for the discussion of three social movements that emerged in the pandemic.

Results: 1st The BSRM emerged in the 1970s, with social movements against the dictatorship, from the interaction between students, intellectuals, health workers and the popular classes, acting as a strong protagonist in the process that generated the CFB/88 and the Unified Health System/1990. 2nd Law can emerge on the street and legality must also emerge from formality, with the participation of civil society, targeting to achieve democratic legitimacy in decision-making. 3rd Thus, the right to health was implemented during pandemic with the participation of slum residents’ associations of Paraisópolis/São Paulo, Complexo do Alemão and Morro da Mangueira/Rio de Janeiro, highlighting the hiring of ambulances to assist symptomatic patients and the collection and distribution of food baskets, water and hygiene products. Conclusions: Social movements can be agents for building the human right to health, at any time, without disregarding other civil society sectors and the international community. It is necessary to recognize and value the micropolitics constituted in the daily life of the territories, facilitating the political participation of social movements in the right’s struggle.

**Controlling Delta in Waikato New Zealand - partnering with Maori for better outcomes**

Richard Vipond1
1 National Public Health Service Waikato, Te Whatu Ora Waikato, Hamilton, New Zealand

Background: In the Waikato region of New Zealand, the delta variant of COVID-19 disproportionately affected our most vulnerable populations - Maori, and the less socioeconomically resourced. COVID-19 presented challenges unable to be prioritised within already complex lives. Historical experiences with government services resulted in a legacy of wariness. Persistence with conventional contact tracing method would perpetuate inequities. New relationships and working pathways were vital in order to successfully control the spread of disease and protect the community. The Waikato response weaved conventional public health approaches with indigenous knowledge (Te Ao Maori). It was guided by 3 key Maori values: KAWEA AKE (looking ahead), Manaakitanga (respect and support), and Mahitahi (working as one).

Objectives: 1. Describe the COVID-19 delta outbreak in the Waikato District Health Board region between October 2021 and January 2022, 2. Describe the approach taken to manage the outbreak.

Results: The delta outbreak disproportionately affected Maori (70% of cases) and low socioeconomic communities (57% quintile 5). The partnership approach was successful in reducing the spread of COVID-19. Delta was stamped out in a number of vulnerable communities and nearly eliminated from the Waikato region. The outbreak response combined Maori approach with traditional contact tracing methods: 1. Manaaki first - respecting, enhancing and uplifting others in a way that is culturally appropriate and acceptable, 2. Whaanau centered - placing the priorities of affected families at the center of the response, 3. Mahitahi - working together with indigenous leaders through the sharing of power and collaborative decision making, 4. High trust model - shared understanding of expectations and consequences. Conclusions: The Waikato approach is an example of a successful outbreak response model that was equity-centric and committed to the practical application of Te Tiri o Waitangi principals.

**Distress and dependency during meals: the effect of COVID lockdowns on individuals with type-2 diabetes**

Márcio Araújo1, Rejane Costa1, Vitória Rebouçôs1, Vivian Veras1, Maria Serra1, Roberto Freitas1
1 Oswaldo Cruz Foundation, Brazil, 2 Cariri Regional University, Brazil, 3 University for International Integration of the Afro Brazilian Lusophony, Brazil, 4 Maranhão Federal University, Brazil

Background: Social isolation and confinement were some of the public health measures continually employed in several countries around the world throughout the COVID-19 pandemic. Such measures had a strong influence on public health management and care. Objective: This study sought to understand the influence of lockdown confinement during the COVID-19 pandemic on the eating behaviors of patients with type 2 diabetes. Methods: A study was conducted via an interpretive-qualitative approach in two primary health care centers located in Eusébio, Brazil, in 2022. We collected relevant patient health information, such as sociodemographic data, quality-of-life indicators, physical activity levels, nutritional status, and overall eating habits. We then carried out home visits to conduct in-depth interviews with 11 patients with type 2 diabetes and poor metabolic control (glycosylated hemoglobin levels > 7%). The data analysis was supported by the software Frasem, and by interpretive description approach. Results: The sample group mostly consisted of physically active, middle-aged women showing poor glycemic control, and negative experiences linked to the disease. In the patients reports, we verified the prevalence of words associated with strategies of individual diabetes control. During home visits, we uncovered 20 pieces of data related to two main recurring themes: distress and passive dependency regarding their own eating behaviors. Conclusions: It is necessary to intensify measures of health education aiming at the empowerment of diabetic individuals under confinement regarding the self-management of their eating. This is due to the fact that, in this scenario, these individuals experience feelings of distress and of lack of autonomy over the management of their meal choices and eating patterns.

Background: The concept of “Right Found in the Street”, as bases for the discussion of three social movements that emerged in the pandemic.

Methods: Based on a narrative review of the literature, a critical analysis was carried out on the Brazilian Sanitary Reform Movement (BSRM), the Declaration of Human Rights and the Brazilian Federal Constitution (CFB/88), and the concept of the “Right Found in the Street”, as bases for the discussion of three social movements that emerged in the pandemic. Results: 1st The BSRM emerged in the 1970s, with social movements against the dictatorship, from the interaction between students, intellectuals, health workers and the popular classes, acting as a strong protagonist in the process that generated the CFB/88 and the Unified Health System/1990. 2nd Law can emerge on the street and legality must also emerge from formality, with the participation of civil society, targeting to achieve democratic legitimacy in decision-making. 3rd Thus, the right to health was implemented during pandemic with the participation of slum residents’ associations of Paraisópolis/São Paulo, Complexo do Alemão and Morro da Mangueira/Rio de Janeiro, highlighting the hiring of ambulances to assist symptomatic patients and the collection and distribution of food baskets, water and hygiene products. Conclusions: Social movements can be agents for building the human right to health, at any time, without disregarding other civil society sectors and the international community. It is necessary to recognize and value the micropolitics constituted in the daily life of the territories, facilitating the political participation of social movements in the right’s struggle.
Hospital Information System administrative data to identify comorbidity and mortality among hospitalized COVID-19 patients (single center retrospective study)

Iskra Mircheva1, Martin Mirchev1, Natalya Usheva1, Tzonko Paunov2
1Medical University “Prof. Dr. Paraskov Stoyanov”, Varna, Bulgaria, 2National Hospital “Saint Marina”, Varna, Bulgaria

Background: COVID-19 is associated with hospitalization and high mortality rate. Previous studies suggested higher mortality rate in COVID-19 patients with comorbidities, however controversies among different studies about the burden of comorbidity were found. Objective: To identify what and to what extend comorbid diseases are associated with hospitalized COVID-19 patients’ mortality. Methods: A retrospective single-center study was conducted using anonymized HIS administrative data for 71330 patients in the university hospital “Saint Marina” - Varna, Bulgaria, for the period 14/06/2020-31/12/2021. Non-parametric tests and logistic regression were applied at α = .05; 95%CI.

Results: Up to seven comorbidities per patient were registered, 9036 for discharged, 4967 for deceased COVID-19 patients. Comorbidities registered for <30.1% patients were discarded. From 8319 COVID-19 patients, 1809(21.7%) died - 54.3% male; mean age 70.70(SD=11.38); 130(7.2%) had seven, 207(11.4%) had no comorbidities. Deceased comorbid patients had more comorbidities (≥23.314; p<0.01), were older (≥15.435; p<0.01) and had shorter hospital stay (≥15.749; p<0.01). Infectious/Parasitic diseases (A) were registered for 157(9.2%) patients, (157 diseases: A14.9; A04.7;A94.1); cardiovascular diseases (J) registered for 1266(70%);(2430 diseases: 111.9.20;81.1.04.580.1;J69.3.67.911.12.225.850.1); respiratory diseases (J) - registered for 617(34.1%) patients (651 diseases: J96.0;J80); renal diseases (N) - registered for 190(10.6%) patients (283 diseases: N18.8; N19.940); endocrine/metabolic diseases (E) - registered for 478(26.5%) patients (643 diseases: E11.9,E11.4,E11.7,E78.4); malignant neoplasms (C) - registered for 89(4.9%) patients (92 diseases). Patients with (A),(J),(I),(N),(E) and (C) comorbidities had higher odds of dying (ORA = 20.284; 95%CI=12.371-33.255); (ORJ = 4.08; 95%CI=3.604-4.618); (ORI = 2.752; 95%CI=2.461-3.077); (ORR = 2.866; 95%CI=2.359-3.481); (ORJ =1.539; 95%CI=1.362-1.737); (ORC =1.633; 95%CI=1.265-2.107), correspondingly. Conclusions: Death with COVID-19 was associated with sepsis, pulmonary, cardiovascular, endocrine, renal and cancer comorbidities, however with lower odds. Monitoring COVID-19 patients for comorbidities is highly recommended to prevent mortality. HIS administrative data can be used for analyses of hospital comorbidity and mortality in pandemics and disasters.

COVID-19 and mortality risk factors in a tertiary care center in central eastern Tunisia: a survival analyses

Emna Hariz1, Hela Ghali1, Sara Ghirri1, Rania Bannour1, Souhir Ayadi1, Aroua Kame1, Fatima Khayou1, Arwa Nafei1, Sofien Aidani1, Salwa Khelacha1, Mohamed Rejeb1, Asma Cheikh1, Houyem Latiri2
1Department of Prevention and Security of Care, Sahloul University Hospital, Sousse, Tunisia, 2Faculty Medicine, Faculty of Medicine of Sousse, Tunisia, 3Family Medicine, Faculty of Medicine of Sousse, Tunisia

Introduction and Objective: The novel coronavirus illness quickly swept the globe. With a high rate of patients presenting severe acute respiratory syndrome, Tunisia is one of the most affected nations but clinical factors associated with COVID-19 mortality among Tunisian hospitalised patients are rarely studied. Our study aimed to identify independent risk factors of hospital COVID-19 mortality in a tertiary care center since the start of the pandemic.

Methods: An observational prospective study was conducted among confirmed COVID-19 patients who were hospitalized in Sahlool university hospital between September 2020 and November 2022. To identify risk factors of hospital COVID-19 mortality, Kaplan Meier survival analysis and Cox Proportional Hazard regression were used.

Results: A total of 1978 patients were hospitalized in Sahlool University Hospital between September 26th 2020 and November 30th 2022. The mean age was 55.65±21.39 years [1-94]. During the study period, a total of 417 Deaths were reported, with a median survival 30+/- 3.11 days (95% CI [23.904; 36.096]). Mortality was significantly associated with: age (p<10-3), comorbidities (p<0.01), obesity (p<10-3), cardiovascular disease (p<0.015), endocrine pathologies (p<0.01), obesity (p<10-3), hospitalization in intensive care units (ICU) (p<10-3) and Oro tracheal intubation (p<10-3). At multivariable analyses, hypertension (HR 1.93; CI [1.2; 3.71]), cardiovascular disease (HR 4.11; CI [1.99; 17.09]) and being admitted in ICU (HR 31.49; CI [11.04; 72.90]), were independent associated factors with COVID-19 mortality.

Conclusions: The early identification of high-risk COVID-19 patients is mandatory.
to decrease this virus morbi-mortality. And this can only be reached by multidisciplinary interventions to solve this public health problem.

Brazil’s primary health care response to the COVID-19 pandemic
Ligia Giovanelia, Maria Mendonça, Ayline Bousquat, Luiz Facchini, Fúlvio Nedel, Geraldo Cury
1 Oswaldo Cruz Foundation (Fiocruz), Rio de Janeiro, Brazil; 2 Esps/ FiOcruZ, Brazil, 3 ESP, Brazil, 4 USP, Brazil, 5 UFPe, Brazil, 6 UFSC, Brazil, 7 UFMG, Brazil
Background: Brazil has more than 33,000 primary health care facilities (PHCFs) which could have played an important role in combating the COVID-19 pandemic. This study examines PHC performance during the pandemic in the country’s five macro-regions.

Methods: A cross-sectional study was carried out as a survey using probability sampling of PHCFs. A composite COVID PHC Index (CPI) was generated aggregating 26 variables along four axes: COVID-19 treatment, health surveillance, care continuity and social support. A CPI of 100 would represent best PHCF performance. Factor analysis revealed that the axes reflecting collective actions (health surveillance and social support) behaved similarly, in contrast with those focused on individual actions (COVID-19 care and care continuity). Differences between macro-regions in the CPI and the 4 axes were analysed. Associations between the CPIs and socioeconomic, political and health indicators were examined.

Results: 907 PHCFs participated in the survey. The highest CPI value was observed in health surveillance (70) and the lowest, in social support (59). In the dimension expressing more individual care practices (care continuity and COVID-19 care), a higher value was found among South region PHCFs than among those of the Northeast. The relationship was reversed in the collective dimension: higher values were found in the Northeast. PHCFs with the highest CPIs belong to municipalities with lower per capita income, population and number of hospital beds.

Conclusions: In the absence of national government coordination, PHC potential in the Unified Health System (SUS) was not fully realised. The two performance

Comparison, by country, of the uptake of COVID-19 vaccination by health care workers in the EU/EAA January - June 2021
Therese McGlacken, Therese McGlacken
1 Department of Public Health, Royal College of Physicians Ireland, Dublin, Ireland, 2 Royal College of Physicians Ireland, Department of Public Health, Ireland, Health Service Executive Area C, Dublin, Ireland
Health Care Workers (HCWs) are at high risk of exposure to COVID-19 when providing care to patients infected with COVID-19. This study aimed to investigate the uptake of COVID-19 vaccination among HCWs in the EU/EAA and discuss the factors which influence this uptake. The aim of this study was to compare, by country, COVID-19 vaccination uptake by HCWs from January to June 2021, to assist with policy making and prospective planning in these countries during the current pandemic and into the future. The study population included all the countries in the European Union (EU) and European Economic Area (EEA). The secondary data file was downloaded from the European Centre for Disease Prevention and Control (ECDC) website Descriptive and comparative data were analysed and presented using Excel and Chi-square test of hypothesis. The percentage of HCWs in EU/EAA countries ranged from 1.2% to 5.1% per population. From January to June 2021, the percentage of first and second dose vaccinations of HCWs ranged from 20% to 100% and from 21% to 100%, respectively. The Comirnaty–Pfizer/BioNTech vaccine (COM) was the most administered vaccine in all EU/EAA countries, followed by the Moderna mRNA-1273 vaccine (MD0) and the AstraZeneca–Vaxzevria vaccine (AZ). The Janssen–Ad26.COV 2.5 vaccine (Janss) used ranged from 0.1% to 4.8% for the one dose vaccine. In January 2021, a median of 29% of HCWs received their first dose of COVID-19 vaccination. Italy was the only country with a mandatory vaccination policy for HCWs. Vaccination uptake rates were statistically different among EU countries (p<0.05). Data such as these could be used in mathematical modelling potential future pandemics to predict vaccine uptake by selected, exposed, vulnerable sectors of the population, for whom it is relevant.

Implementation of the international health regulations during the COVID-19 pandemic, a scoping review
Daniel Saldanha Resendes, Eunice Crisóstomo, Inês Mendes Pacheco, Marcelo Godinho, Joana Miguel Carvalho
1 ACES Lisboa Central Portugal, 2 ULS Litoral Alentejano, 3 ACES Tâmega II Portugal, 4 ACES Entre Douro e Vouga I
Background and objective: The International Health Regulations (IHR) is a legal instrument that sets out to control infectious disease epidemics worldwide and that makes countries accountable for monitoring and notifying the World Health Organization (WHO) of any event that could constitute a public health emergency. The COVID-19 pandemic set an unprecedented challenge to the IHR commitments and so this scoping review set out to identify the challenges, successes and limitations of the IHR during the COVID-19 pandemic.

Methods: We conducted a scoping review following a PRISMA methodology of the following online databases and sources: PubMed and SCOPUS. Only articles mentioning both IHR and COVID-19 were eligible. Eligible articles were then read by two reviewers independently and in duplicate. A total of 15 articles between 2020 and 2022 met the criteria and were included.

Results: Most articles refer to the IHR as still a vital instrument in Public Health action especially in Health Emergency situations, but most countries faced limitations in its implementation during the COVID-19 pandemic. Reinforcing the global health security strategy, reviewing the IHR to address current challenges and strengthening the commitment of countries and states to comply with its resolutions, are key lessons mentioned.

Conclusion: The lessons learned from this scoping review should act as a warning sign that the IHR should be reviewed and updated to meet current societies’ requirements. A more effective response grounded on the IHR is needed to face upcoming and expected events of COVID-19’s magnitude and severity.

Vaccination in children under 6 years old and the impact of the covid 19 pandemic, Cartagena, Colombia
Irma Castillo Avila, Luis Alvis Estrada, Edna Gomez Bustamante
1 Universidad de Cartagena, Colombia
Background: Childhood vaccination is a widely used strategy to reduce the population impact of vaccine-preventable diseases. Some social circumstances can significantly affect the coverage and achievements of immunization programs.

Objective: Determine vaccination coverage before and after the pandemic in children under 6 years old in the Cartagena district.

Methods: A descriptive study was performed. The vaccination coverage of the biologics included in the national vaccination program was evaluated. A total of 3,829 boys and girls under 6 years old were included, using random cluster sampling. Two coverage measurements were made: one in 2019 and one in 2022. Descriptive statistics were applied to the data.

Results: The highest vaccination coverage is presented in the newborn doses (Antiy Tuberculosis (BCC) and Hepatitis B) with 99.6% for the year 2019 and 100% for the year 2022. The biologicals with the lowest coverage are the 5-year reinforcements (Antipolio and reinforcement against Measles, Rubella and Mumps), with percentages of 68.4% and 69.3% respectively. In all the biologicals, a coverage reduction of 11% on average is observed for the year 2022. The main reason for not vaccinating is the lack of time for parents and caregivers to attend consultations, mainly due to the restrictions derived from the COVID 19 pandemic.

Conclusion: Vaccination coverage depends on the availability of parents and caregivers to attend the consultations. A greater impact due to the restrictions of the COVID 19 pandemic is observed.

DOI: 10.18332/popmed/163730

Public perception and perspective towards COVID19 vaccination among students of University of Debrecen
Phuong Nguyen Thi
1 University of Debrecen, Hungary
Background: COVID19 pandemic is most remarkable cocern since early 2020. Public Health has constantly made effort to alleviate the crisis. Vaccination is one of the ultimate control methods of COVID19 that were created at incredibly rapid rates. The implication of vaccines comes with divergent opinions. To maximize the coverage, the understanding of perspectives towards the vaccination is crucial. No health promotion campaign can achieve its goals without local adjustment. The study was conducted with students in University of Debrecen to investigate local tendencies and to suggest the vital local adjustments when promoting vaccines.
Objective: The study aims to investigate the perceptions and perspectives towards COVID-19 vaccinations among students in University of Debrecen. Motivations, beliefs and concerns on taking COVID19 vaccination are the major focus to study the decision-making process and the crucial factors behind.

Methods: A cross-sectional survey was launched at the end of 2021, in the third outbreak with 386 students from University of Debrecen. The questionnaire was distributed online and in-person. The key factors are demographic features, common beliefs and concerns about vaccination. The tendencies, levels of acceptance and the potential decision-turning factors were identified.

Results: Among 386 participants, 87% believed that COVID19 vaccines are necessary. However, around 45% are concerned by being vaccinated. Information and emotion are the most important in decision making, 88% agreed that unreliable news affects their choices and 47% consider social media to be worrying for them. Side effect and controversies play a significant role in public perspective. Valid and consistent information source was confirmed to ease the unrest about vaccination.

Conclusions: The findings suggest the positive sides of vaccination situation and suggest space for improvement. Naming hesitations and misssing in trust-building, we can elaborate the interventions for certain areas, demographic groups; equip the young with health protecting skills and improve health literacy.

Repercussion of the covid-19 pandemic on academic activity in graduation in health in a private education institution

Caroline Castro1, Margareth Conceição2, Bárbara Lacerda1, Marcos Silva1, Jeanine Barbosa2, Dhershik Santos1, Jeremias Simões1, Rafael Caliari1, Rita Lima1, Maria Andrade1

1Universidade Federal do Espírito Santo, Programa de pós-graduação em saúde coletiva, Brazil, 2Universidade Federal do Espírito Santo, Universidade federal de catalão, Departamento de medicina, Brazil

Background: During the COVID-19 pandemic, quarantine and other prevention measures impacted the educational system by affecting the preparation and the quality of teaching.

Objective: To identify factors associated with the discontinuance of academic activities by students due to funding issues in the context of the pandemic.

Method: This quantitative, exploratory cross-sectional study was carried out in a private higher education institution (HEI) in the city of Vítória, Espírito Santo (ES), Brazil. Data was collected through google forms from Nov/2021 to Jan/2022. Analysis was made with SPSS Statistics version 24 and STATA version 15.1 programs.

Results: 846 students participated in the research, 52% of the students enrolled at the HEI in 2021, with an average age of 22 years, 75.3% women, 63.1% white, and 54.3% from social class A, of which 80.5% of students do not work. Results showed that 9.46% students were unable to complete academic activities due to tuition issues, of which the majority were brown/black unmarried women, without a job, enrolled in the social service program, from social class B, with an income of up to 3 minimum wages, and received financial support from a family member, aside from student grants.

Conclusion: This study contemplates the multifunctional role of women in society, as well as the difficulties they encounter. It was demonstrated that, although student grants promote social protection, they alone were not enough to prevent the cessation of academic activities. It is necessary to carry out an analysis considering the different intersections that relate to women’s experiences in the COVID-19 pandemic due to economic and political instability in Brazil, reinforcing inequalities in educational public policies for women.

COVID-19 and life expectancy in Mexico between 2019 and 2021

Guillermo Gonzalez-Perez1, Maria Vega-Lopez1

1University of Guadalajara, Mexico

Background/Objectives: Life expectancy at birth (LEB) is an important indicator of the health status of a population. Recent studies have shown the reduction of the LEB in different countries due to the COVID-19 pandemic. In this sense, this study aims to identify the impact of COVID-19 on life expectancy in Mexico in the year 2021.

Methods: Abridged life tables by sex were constructed for Mexico in 2019 and 2021. Using the Arriaga method, the years of life expectancy lost (YLEL) were estimated between 0 and 85 years due to COVID-19 and selected causes in each year. Adjusted mortality rates from these causes were calculated for the period 1999-2021 and their trend was analyzed using a “joinpoint” regression analysis.

Results: The male LEB decreased 5.2 years and the female 4.1 years between 2019 and 2021. COVID-19 was directly responsible for 4.3 YLEL in men and 2.8 in women between 2019 and 2021, but in other causes of death such as diabetes mellitus (DM), ischemic heart disease (IHD) and acute lower respiratory infections (ALRI), a substantial increase was also observed in YLEL between both years. The trend analysis reveals for all the analyzed causes an upward inflection point at the end of the period studied, with a marked statistically significant annual percentage change.

Conclusions: The COVID-19 pandemic has reduced LEB in Mexico, especially in men; These figures are higher than those found internationally. In addition to the YLEL directly due to COVID-19, the YLEL due to other causes studied also reflect the impact of the pandemic in Mexico. While the prevalence of DM and IHD in the Mexican population is high, strategies to reduce the impact of the pandemic necessarily involve achieving greater control of these diseases in patients who suffer from it and trying to reduce its prevalence.

Prejudice and discrimination faced by nursing professionals in their community during the COVID-19 pandemic

Stephania Mendes Demarchi1, Fabiane Lima Simões1, Jeremias Campos Simões2, Marcos da Silva cordeiro1, Jeanine Pacheco Moreira Barbosa3, Caroline Feitosa Dibai De Castro1, Rafael Vulpi Caliari1, Gabriela de Brito Martins1, Rita Duarte Lima1, Maria Carvalho Andrade1

1Universidade Federal do Espírito Santo, Brazil

Introduction: In the context of the pandemic, additionally to the already known effects of the disease, many suffer from prejudice and discrimination related to COVID-19, which are usually motivated by fear and uncertainty based on distorted perceptions of risk. Among others, this treatment can negatively affect health professionals.

Objective: To describe situations of prejudice and discrimination faced by nursing professionals during the COVID-19 pandemic.

Methods: Qualitative and descriptive research, for data collection interviews were conducted with a semi-structured script with 40 participants.

Results: 17 participants (42.5%) reported episodes of prejudice or discrimination in their communities. The reports are diverse and took place in different places such as banks, supermarkets, bakeries, or the home environment of family members. Such reports included: “they moved my chair away from me when I went to the bank”, “they did not want to sit next to me on the bus”, “the neighbor crossed the street when he saw me”, “I was not invited to an event with family and friends”, “feeling looks towards me when entering the establishment”, “people with expressions of fear when they see me”, “they separated the household items for me to use at my mother-in-laws house”, “they refused to enter the elevator with me,” “condominium where I live with an elevator exclusive for me”, “my relatives were afraid of my children”, “they refused to see me at the beauty salon”.

Conclusion: Considering the social panic caused by the high mortality rates, and the fact that it is a recent and unknown disease, the population has become afraid and, concerned about the contagiousness of the disease. Information distortion from reality, fake news, and wrong approaches to dealing with the pandemic can exacerbate prejudice and discrimination by part of the population.

Effects of the COVID-19 pandemic on access and delays in care for people with diabetes

Adesola Odiah1

1Central michigan university, 21 amid court, east rockaway, ny 11518, united states

Background and Objective: During COVID-19, health and coverage restrictions, increased healthcare system demands, and patient uncertainty were important barriers to uninterrupted diabetes care. Diabetes patients are solely responsible for managing their disease through on-time access to care, proper diet, glucose monitoring, and medication. The present study was designed to examine the effect of socioeconomic variables such as employment and insurance change, on patient-self-reported delays in access to medical care, difficulties obtaining medication, forcing OMG/Insulin pump (and refilling), for diabetes patients in the US, during the pandemic.

Methods: This cross-sectional study used secondary data of 2,595 U.S. diabetes patients (December 2020, thrivable survey). The analysis examined associations between insurance change and type, employment, income, and patient education, with the following outcomes: (i) delay in care, (ii) difficulties in obtaining medications, (iii) foregoing OMG/Pump, (iv) forgoing refilling OMG/
Pump. Bivariate statistics were first conducted, followed by multivariate analysis using binary logistic regression in spss. Results: Patients with recent insurance status changes were 1.5 times more likely to report delays in care, 33% more likely to experience difficulties obtaining medication, twice more likely to forego CQM/Insulin pump, and four times more likely to forego refilling CQM/Insulin pump. Those with a recent employment change were 1.5 times more likely to have delays in care and difficulties obtaining medication, while those without insurance were twice as likely to have difficulty obtaining medication. Education, unemployment, and income were also found to be associated with challenges in seeking diabetes care. Conclusion: Diabetes patients experienced challenges during the pandemic, which can be attributed, to an extent, to socioeconomic factors. Statewide policies need to be established for non-delayed access to diabetes care in times of crisis, such as during the recent pandemic.

Building on local strength: the Philippine toolkit on community-based management of COVID-19
Miguel Dorotan1, Romelei Alfonso2, Aileen Espina3, Paolo Medina4, Gabriele Domingo5, John Abadiano6, Maria Medina7
1Alliance for Improving Health Outcomes (AIHO), Philippines Society of Public Health Physicians (PSPHP), Philippines
2Alliance for Improving Health Outcomes (AIHO), Foundation for Family Medicine Educators, World Organization of Family Doctors (WONCA), Philippines
3University of the Philippines Manila College of Medicine, Philippines
4Academic Society of Social and Community Medicine (PASCOM), Inc.; AIHO, Philippines
5Zueilig Family Foundation, Philippines

Background: In the Philippines, the earliest pandemic response has been hospital-centric. With looming hospital congestion, a group of public health professionals urgently asserted that the community should be the first line of defense. Volunteers convened to contextualize evidence and practice to the Philippines' decentralized governance setting, anticipating the need for nonexistant operational guidance. Method: A Viber group allowed rapid consultation between public health convenors, technical experts, and local government implementers to determine knowledge needs and tailor-fit guidelines for COVID-19 response, guided by these principles: existing disaster response structures must be activated, primary care resources must be mobilized, and the Filipino family/household as the unit of care must be recognized. The modified Delphi method was used to refine and finalize contents. Modules have been iterated based on user feedback. Results: The Community Based Management of COVID-19 (CBMC) toolkit was consolidated in eight weeks. Its four modules contain slide decks, user manuals, and implementation checklists. The first centers on disaster Risk Reduction and Management - Health (DRRM-H) for Emerging and Reemerging Infectious Diseases (EREIDS) using disaster response strategies that local governments are already familiar with. The second contains clinical algorithms to guide primary care providers in low-resource settings. The third details the operations of a community-run isolation and treatment facility. The fourth provides a family-oriented approach to COVID-19, including for special and vulnerable groups. Overall, this ensured that the Barangay (village) Health Emergency Response Teams and the primary care system with its community-managed isolation and treatment facilities, take central roles. This strengthened local response and pulled away strain from hospitals.

Conclusion: The CBMC framework was eventually adopted and institutionalized by the Philippine government for the local government COVID-19 response. This initiative reassesses that pandemic response should empower local communities by building on their local resources and strengthening existing systems and institutions.

Investigating Nurses’ Perceptions of Organizational Resilience due to COVID-19 Pandemic
Eliza Wong1, Annie Cheung2, Zoe Tam3, Eng-Kong Yeoh4
1The Chinese University of Hong Kong, Hong Kong

Background and Objective: The challenges including healthcare materials supply shortage, inadequate manpower, patient overload etc have happened in worldwide healthcare organizations during the COVID-19 global pandemic. Organizational resilience in the healthcare setting thus is an important issue to review which enables healthcare organizations to plan, retain and recover to their normal function even in a crisis. The study aimed to explore views on organizational resilience from nurses’ perspective due to the Omicron impact in Hong Kong.

Method: A qualitative study design was adopted to understand nurses’ experience on how their organizations responded to the wave of Omicron. To capture a breadth of diverse experience of the nurses and enrich the findings, a heterogenous sampling in terms of ranks of nurses and working settings in both public and private sectors were considered for the recruitment. The interview was guided by a semi-structured discussion guide and qualitative content analysis with an inductive approach was applied. Results: A purposive sample of 22 nurses were recruited to participate in the individual interviews between March and June 2022. Most of the nurses expressed that the capability of nurses was good enough in local healthcare settings during the pandemic due to the pre-pandemic training and previous SARS experience. However, the overall nurse capacity was lower than expected because of the patient overload and staff sickness absence at the beginning of the Omicron wave. The respondents also picked “preparedness and planning” as the main factor influencing the organisation’s resilience and “Leadership practice” was followed. Conclusion: The findings indicate the key challenges that local healthcare organizations faced during the pandemic. It also provides insights for the management team to better rethink and transform their organizations for managing the effectiveness and continuity of the healthcare systems in disaster in future.

Uptake of non-mandatory bivalent COVID-19 booster vaccine among healthcare workers: results from an Italian teaching hospital
Eleonora Marziali1, Mario Nurchis2, Domenico Pascucci3, Alberto Lontano4, Giuseppe Vetrugno5, Umberto Moscatol6, Gianfranco Damiani7, Patrizia Laurenti8
1Università Cattolica del Sacro Cuore L.go F. Vito 1, 00135 Roma (RM), Italia
2Università Cattolica del Sacro Cuore, Fondazione Policlinico Universitario “A. Gemelli” IRCCS Italy
3Università Cattolica del Sacro Cuore Italy

Background and Objective: In September 2022, the bivalent Comirnaty Original/Omicron BA.4-5 vaccine was authorized for use as a booster dose for individuals aged 12 years and older. The aim of this retrospective study was to assess the acceptance of the fourth dose among healthcare workers (HCWs) of an Italian teaching hospital and to describe changes in uptake trend compared with the previous COVID-19 vaccination campaigns, considering that the fourth dose is not mandatory. Methods: Pearson's X2 test was used to test the correlation between the fourth dose vaccination rate and the previous doses vaccination rate. A linear regression model was adopted to predict fourth dose vaccination coverage. Multivariate logistic regression was performed to investigate the influence of sex, age, and occupation on vaccination uptake. Results: Overall, 8,159 employees were included in the study. Among them, 1,077 received the bivalent booster dose between September and December 2022. Compared with men, women had a lower tendency to receive vaccination, but this difference was not statistically significant. The mean age at the time of vaccination was 44.1 years, and the probability of vaccination increased significantly (p<0.001) as age increased. The logistic regression showed that being a physician is significantly (p<0.001) associated with higher uptake compared to nurses (OR 0.25, 95%CI 0.20-0.31), other HCWs (OR 0.21, 95%CI 0.16-0.27) and administrative employees (OR 0.33, 95%CI 0.25-0.42). In contrast, working in low-risk, medium-risk or high-risk operating units did not affect vaccine uptake significantly. When analyzing the uptake of previous COVID-19 vaccine doses, the expected value, according to the linear regression model, was estimated to be 30.7%, but the observed value was significantly lower (13.0%). Conclusion: To mitigate the socio-economic and health effects of COVID-19, it is critical to further promote vaccination of HCWs, given their crucial role in vulnerable settings.

Oncology and Regenerative Medicine, University of Modena and Reggio Emilia, Modena, Italy, 2Dental Department of Morphological Sciences Related to Transplant, Oncology and Regenerative Medicine, University of Modena and Reggio Emilia, Modena, Italy, 3Department of Biomedical, Metabolic and Neural Sciences, Section of Public Health, University of Modena and Reggio Emilia, Modena, Italy, 4Department of Industrial Engineering, University of Padova, Padova, Italy, 5CNR, Institute of Geosciences and Earth Resources, Padova, Italy, 6Background: Healthcare-associate infections (HCAI) are considered a major challenge worldwide, a public health risk and an economic burden. Besides hand hygiene practices, the strategies to prevent HCAI include the use of disinfectants and cleaning of high-touch surfaces which favor microbial transfer by hands. The emergence of novel pathogenic viruses and antibiotic-resistant bacteria have prompted research into developing alternative microbial materials such as plastics with long-term biocidal activity in nanocomposites. Currently, there is a large amount of literature on multifunctional nanocomposites with improved mechanical and antimicrobial properties against bacteria and fungi, whilst data against viruses are lacking. This study aims to assess the in vitro virucidal activity of three epoxy/clay nanocomposites against viruses transmitted by salivary droplets and/or through contact with contaminated objects/surfaces.

Methods: Two natural clays from Morocco were used to reinforce the epoxy resins with 1% and 5% wt, achieving the clay dispersion by milling and mechanical stirring. A third nanocomposite was obtained adding 1, 3 and 5% wt Cloisite® 15A, a commercial montmorillonite, organically modified, containing quaternary ammonium chloride.

Results: To date, only the experimental protocol has been developed. Four viruses will be tested: Human Coronavirus OC43, as a SARS-CoV-2 surrogate, Herpes Simplex Virus 1, chosen for its low environmental resistance and for its rapid in vitro growth, Human Adenovirus type 5 and Monkeypox Virus, chosen for their high environmental persistence and resistance to treatments. Tablets of each nanocomposite and epoxy resin as control will be contaminated and after defined contact time the residual virus will be recovered and quantified by end point titration.

Conclusion: Our study could lead to the development of innovative epoxy/clay nanocomposites with virucidal activity for potential use in end-products such as food packaging, medical devices or hospital furniture, opening interesting perspectives in the treatment of surfaces potentially contaminated by viruses.

Environm ental surveillance of Sars-CoV-2 in wastewater in Apulia region, Southern Italy

Francesca Apollonio, 1 Osvalda De Giglio, 2 Francesco Triggiano, 1 Giuseppe Colaferminna, 3 Raffaele Del Prete, 4 Gianvito Lanave, 5 Helena Mateos, 6 Adriana Mosca, 7 Gerardo Palazzo, 8 Antonio Parisi, 9 Valentina Terio, 10 Maria Montagna, 11 Osvalda De Giglio

1 Interdisciplinary Department of Medicine, Section of Hygiene, University of Bari Aldo Moro, Piazza G. Cesare 11, 70124 Bari, Italy, 2 Interdisciplinary Department of Medicine, Section of Hygiene, University of Bari Aldo Moro, Piazza G. Cesare 11, 70124 Bari, Italy, 3 Department of Veterinary Medicine - University of Bari Aldo Moro, Piazza G. Cesare 11, 70124 Bari, Italy, 4 Interdisciplinary Department of Medicine, Section of Public Health, Istituto Superiore di Sanità, 00161 Rome, Italy, 5 Department of Environment and Protection, Istituto Superiore di Sanità, 00161 Rome, Italy, 6 Agency for the Environmental Protection and Prevention (ARPA Puglia), Corso Trieste 27, 70126, Bari, Italy, 7 Department of Health Promotion and Animal Welfare, Apulia Region, Bari, Italy

Background and Objective: Monitoring SARS-CoV-2 in untreated wastewater can provide an early warning system for virus circulation. The Istituto Superiore di Sanità coordinates the SARI project (Environmental surveillance using wastewater in Italy) which enlists 18 Regions and two Autonomous Provinces. The activities were carried out with the financial support of the Italian Government (L. D. 25.05.2021 n.73), and the European Commission, DG ENV (Grant Agreement 060701/2021/864481/SUB/ENV/C2). The study aims to: 1) predict the number of COVID-19 cases/100,000 inhabitants in the 15 days after SARS-CoV-2 detection in wastewater 2) investigate the factors influencing the presence of the virus in wastewater.

Methods: Overall, 16 wastewater treatment plants (WWTPs) were enrolled in Apulia Region (Southern Italy), serving municipalities with 50,000-150,000 inhabitants (14 WWTPs) and >150,000 inhabitants (2 WWTPs). Sampling was carried out weekly or biweekly, respectively, by Regional Agency for Protection of Environment. The laboratory analyses were performed according to national SARI protocol. A ROC curve model was applied to predict number COVID-19 cases and a Poisson Regression model was used to investigate the factors influencing the viral presence/load in wastewater.

Results: From October 2021 to July 2022, 607 samples were analyzed, of which 592 (97.5%) tested positive for SARS-CoV-2. The statistical analyses showed that at least 11 COVID-19 cases/100,000 inhabitants served by WWTP would occur after a wastewater sample resulted positive for SARS-CoV-2. In the period January-July 2022, winter months were associated with a higher probability of virus detection. An inverse correlation was found between the SARS-CoV-2 load in wastewater and the range of atmospheric temperature and mean atmospheric pressure/sampling day.

Conclusions: The presence of SARS-CoV-2 in wastewater can be used to predict COVID-19 cases, supporting the potential of wastewater-based epidemiology. However, further studies are required because our predictive model remains limited for the complexity and uncertainties associated with the process.

Cesare 11, 70124 Bari, Italy

Background and Objective: The transmission of SARS-CoV-2 occurs through direct contact (person to person) and indirect contact by means of objects and surfaces contaminated by secretions from individuals with COVID-19 or asymptomatic carriers. In this study, we evaluated the presence of SARS-CoV-2 RNA on surfaces made of different materials located in university environments frequented by students and staff involved in academy activity during the post pandemic era.

Methods: A total of 679 surfaces samples were collected from classrooms, computer room, desks, common areas from May to November 2022 between 1.00 and 2.00 p.m. Standard sanitation of all university areas was carried out at the end of all work activities. Swab samples were subjected to Real-Time Reverse Transcription to evaluate the presence of SARS-CoV-2 RNA by amplification of ORF-1ab gene (nsp 14). Cell cultures were set up for the isolation of SARS-CoV-2 and to demonstrate virus viability.

Results: Overall, 41 (6.09%) swabs resulted positive for SARS-CoV-2 RNA with a median C1 value of 38.12 [IQR: 36.4–39.48]. All examined samples resulted negative after viral culture, since no cytopathic effect was observed. The number of positive samples was directly proportional to average number of COVID-19 cases/week (Poison regression Intercept B = 1.217; P = 0.00027; <0.0001). Statistically significant difference were found between number of positive swabs for number of students/classroom (Fisher’s exact p<0.05). In the summer-autumn the number of positive samples (7.3%) was higher than in the winter (3.3%) (P2=3.92;<p<0.05).

Conclusion: Screening of environmental samples for the presence of virus provides evidence of the number of infected people shedding the virus in the vicinity. Environmental monitoring of SARS-CoV-2 RNA could effectively support public health prevention strategies in the academic and school world. Also, when compared with clinical-testing protocols, it could streamline all procedures related to informed consent, sample collection and operational logistics.

DOI: 10.18332/popmed/164089

Antibiotic therapy in severe COVID-19 between march 2020 and july 2022 and correlations with outcome in an intensive care unit in central Italy

Giancarlo Ripabelli, 1 Vittorio Viccone, 2 Roberta De Dona, 3 Antonio D’Amico, 4 Sonja Manocchio, 5 Maria Pilla, 6 Andrea Pompei, 7 Erika Scattareggia, 8 Nicandro Sampariti, 9 Arturo Santagata, 10 Carmen Adesso, 11 Michela Di Palma
Methods: Focus groups, Interviews and Participant observations were carried out, during the COVID-19 pandemic, from the perspective of community health agents.

Objective: To analyze the daily encounters of Primary Care in the city of Vitória, ES, living triad. Clot, and Registration, by Conceição Evaristo, in the construction of narratives of self-care. Thus, this study proposes a correlation of the clinic of activity, by Yves Clots, based on Yves Clots’ clinic of activity and used Michel Foucaults theory of ethics.

Introduction: This study gives insight to work processes in health. It presents
and research institutions were interviewed, and 57.7% of whom were women. The median age was 59 years. LTPA during the period of social distancing was reported by 46.2% of the participants, however, 19.0% of those who did it in the pre-pandemic period stopped doing it. Among those engaged, 53.0% were women, half of them were married, 30.2% cared for children or the elderly, 71.3% reported meeting the recommendations to stay/work at home and 46.5% increased weight. Among the physically inactive, 45.0% were married, 70.1% complied with the recommendations to stay/work at home, 37.5% took care of children or the elderly, 50.8% gained weight and 97.6% performed housework. The profile of men is similar except that around 80.0% of them, active or inactive, were married. According to the results, the COVID-19 pandemic decreased the practice of LTPA among study participants. The inactive men and women performed more household chores, took care of children and the elderly and had an economic impact on the family, whether due to the loss of a source of income or because a member was left without a job, constituting possible barriers to the practice of LTPA. This finding could be used in the elaboration of policies aimed at promoting health by focusing on different aspects of barriers to LTPA.

Sociodemographic and clinical profile for the tests used for the diagnosis of covid-19 in the state of Rio de Janeiro, Brazil - 2020 to 2021
Gabriella Nazario1, Silvia Cardoso1, Felipe Tavares1
1Universidade Federal Fluminense Brazil, 2Secretaria de Estado de Saúde do Rio de Janeiro
Background: Testing is an important pandemic control tool for covid-19, allows the identification of vulnerable populations and regions, where strategies can be adopted both for intensification and relaxation of control actions. In Brazil, access to health services is unequal, consequently, access to tests for covid-19 may be hampered for different population profiles.
Objective: Describe the frequency of each type of diagnostic test performed for covid-19 in residents of the state of Rio de Janeiro according to sociodemographic and clinical characteristics.
Methods: Cross-sectional descriptive study with a quantitative approach, using secondary data from the esus notifica database, where suspected cases of covid-19 are reported. The study population is individuals notified to the system, residents of the state of Rio de Janeiro and who have undergone some test. The frequency distributions of the studied population were described by sex, race/color, age group, and health region of residence, health conditions and symptoms, according to the type of test performed. The research period was from 2020 to 2021, divided into 4 semesters, according to the offer of tests and change in testing criteria guided by the ministry of health.
Results: The year 2020 was the most used test was the rapid antibody test, in the first half of 2021 was rt-pcr and in the second the rapid antigen test. In relation to rt-pcr, in all periods the indigenous race/color presented the lowest percentage and the white race/color the highest. Under 20 s age have higher percentages for rapid antigen or antibody tests.
Conclusion: The temporal change of the guidelines on testing from the ministry in all periods the indigenous race/color presented the lowest percentage and the white race/color the highest. Around 80.0% of them, active or inactive, were married. According to the results, the COVID-19 pandemic decreased the practice of LTPA among study participants. The inactive men and women performed more household chores, took care of children and the elderly and had an economic impact on the family, whether due to the loss of a source of income or because a member was left without a job, constituting possible barriers to the practice of LTPA. This finding could be used in the elaboration of policies aimed at promoting health by focusing on different aspects of barriers to LTPA.

Lessons from the bolivian covid-19 vaccine mandate
Diana Zeballos Rivas1, Juan Aguilar Ticona1, Doss-Gollin Simon2, Marcigli-Morais1, Luis de Souza1
1Universidade Federal da Bahia Brazil, 2Boston Children’s Hospital United States
Background: The study analyzed the Bolivian governments implementation of the COVID-19 vaccination card, which purports to increase vaccination rates and strengthen coverage with the entire vaccination schedule in the country. We aimed to describe the measures adopted, their effectiveness and impacts on adherence to the vaccine.
Methods: We conducted an exploratory study, based on the analysis of Supreme Decrees 4640 and 4641 of 2021, and secondary data from the Bolivian Ministry of Health and Our World in Data. The 7-day moving average of COVID-19 vaccination was calculated. We also estimated the difference of the cumulative vaccination rate between December 22, 2021, and January 19, 2022, referring to the dates of enactment and suspension of the decrees.
Results: The requirement of a vaccination card to enter public and governmental spaces increased vaccination coverage by 9.6% for the first dose and 4.4% for the second dose. Resistance to the measure resulted in its postponement and, later, suspension after only 28 days of effectiveness, which was followed by a decrease in the 7-day moving average of COVID-19 vaccination. The short time span between the measures announcement and implementation left insufficient time to plan vaccine distribution and manage supply shortages. New vaccination centers were not created, and existing centers were overcrowded and often had to share their spaces with testing centers. Long queues fueled public discontent with the policy, which then was exploited by the anti-vaccine movement, responsible for spreading misinformation and contesting the measures.
Conclusion: The COVID-19 vaccination card had a positive impact on the vaccination rate, principally among the unvaccinated, however, it was not a long-term effect, because it was soon revoked. Management challenges and misinformation about the vaccines had a negative impact on adherence to the proposal and the lack of planning placed a heavy burden on the health system.

Psychosocial effects on the elderly, during the period of lockdown due to the COVID-19 pandemic, in a city in the interior of the state of São Paulo, Brazil, between 2020 and 2022
Mario Angelo Cenedesi Junior1, Silvia Vouillat2
1Cenedesi Junior University of Business and Social Sciences (UCES) Brazil, 2University of Business and Social Sciences (UCES) Brazil
Background and Objectives: The lockdown caused by the COVID-19 pandemic brought about important changes in the daily lives of Brazilians, a fact that needs to be observed especially in the elderly, a portion that is in constant population growth. This confinement can trigger several psychosocial effects, such as feelings of loneliness, sadness, anxiety, among others, so that knowing them, in the elderly population, is understanding what is going on with their Mental Health and, thus, being able to reorganize the Health Services (through strategies and protocols) to provide the necessary support to patients.
Methods: This is a basic, observational and cross-sectional study with a descriptive objective and a mixed methodology. 253 elderly people were interviewed in a city in the interior of the state of So Paulo, Brazil, in the last quarter of 2022 - health professionals and people with severe mental disabilities were excluded from the study.
Results: 38.25% of the elderly surveyed were male and 61.73% were female. In relation to thinking that, during lockdown, the ability to identify their own emotions and those of others worsened, 19.13% answered yes; as for feeling sad for not being able to share time with their loved ones, 83.61% answered yes; in relation to feeling anxiety for not being able to predict what would happen, 77.6% answered yes; when asked if they suffered from loneliness, 66.3% answered yes.
Conclusion: The present study shows that a large part of the elderly population presented sadness, anxiety and/or loneliness during lockdown due to the COVID-19 pandemic, even surpassing the values mentioned by the World Health Organization (WHO), so that Public Politics in Mental Health need to be created (or expanded) to serve this portion of the population, improving their quality of life.

Safety and efficacy beliefs on covid-19 vaccine administration: A survey experiment in the italian population
Dario Menicagli1
1IMT School Advanced Studies Lucca Via S Agostino 66 Italy
Background and objective: During the Summer of 2022, many European countries started administering the fourth dose of COVID-19 vaccines upon developing an efficacious vaccine against the newly detected variants. However, despite governmental perspectives and previous findings reporting both actual and potential high acceptance rates on first-dose vaccination, more is needed to know about the diachronic evolution of the citizens engagement and how the change in perception of vaccine safety and efficacy affects vaccination intention. This study aims to investigate Italys fourth dose COVID-19 vaccination acceptance rates and how the differential presentation of positive framed messages regarding the scientific evidence on the fourth dose safety and efficacy could influence citizen beliefs and responsiveness.
Methods: We designed a multi-scale survey to study retrospectively the evolution of the beliefs behind each decision to vaccinate in the different stages of the vaccination campaign (i.e., from the first up to the third booster dose) and individual trust in scientific and political institutions in each period of the vaccination campaign. Secondarily, we implemented different message-framed vaccine safety and efficacy treatments to evaluate how they influence individual
intention to uptake the new dose. Overall, theory-driven structural equation analysis will reveal what factors are significant predictors of the willingness to vaccinate in a balanced sample of 500 Italian participants.

Results: We show a distinct evolution of the perceived efficacy and safety during the vaccine campaign and the importance of message targeting this latter component to increase vaccination intention. Moreover, we investigate how trust in political and scientific institutions changes during a pandemic according to vaccine beliefs. Conclusion: Vaccination campaign could benefit from messages based on vaccination safety more than efficacy perception and needs to consider a dynamic evolution of these components during multiple vaccination stages and the role of trust in scientific institutions more than governmental ones.

Lessons learnt from the vaccination strategy against COVID-19 in Spain
Ana Fernandez-Dueñas1, Carmen Olmedo1, Aurora Limia1, Laura Sanchez-Cambroner1, Sonia Fernandez-Conde1, Elena Cantero2, Rocío Villa-Pizarro2

1Immunization Programme Area, General Directorate of Public Health, Ministry of Health, Spain, 2Technical Assistance TRAGSATEC to the Ministry of Health of Spain, 3Servicio de Medicina Preventiva y Salud Publica - Hospital Clínico Universitario de Valladolid, Spain

Background and objective: Vaccination policy in Spain is characterised by the decentralisation of national health system. Regional departments of health are the vaccination programmes managers and the Ministry of health, coordinates and oversees. However, a single vaccination strategy against COVID-19 was developed. The objective is to describe the lessons learned from this process and the strategy.

Methods: Structure, work and decision-making process of the working groups (WG) of the strategy were assessed: the multidisciplinary technical WG for the development of the strategy (which included the national immunization technical advisory group and experts from bioethics, sociology, pharmacovigilance, etc.), WGS on mathematical models, vaccine effectiveness and on the development of the COVID-19 registry. Additionally, results of a survey to the members of the technical WG.

Results: Recommendations from the technical WGs were not always implemented at political level. Given the uncertainty of the pandemic, the strategy was continuously revised. Having a multidisciplinary team of independent experts and other useful tools for decision-making such as mathematical models, effectiveness studies was essential.

COVID-19 vaccination registry is the first single national vaccination registry developed in Spain. It has boosted regional information systems and enabled a real-time monitoring of the vaccination strategy implementation. Vaccination data from all residents was brought together in a homogeneous and standardized way. A lack of technical information suitable to the needs of the population was evident. WGS on real-time monitoring of the vaccination strategy implementation. Vaccination data developed in Spain. It has boosted regional information systems and enabled a decision-making process.

Mathematical models and effectiveness studies are valuable tools to revise and improve vaccination policies. High quality information on vaccination implementation programmes is essential to monitor them. Strengthening information systems in public health is critical, notably their flexibility and interoperability. It is necessary to incorporate providing technical communication to the population as an essential element in vaccination strategies.

Genomic surveillance of sars-cov-2 in tunisia : January 2021–December 2022
Mouna Safer1, Wassal Kalai1, Arwa Neffati1, Aicha Hchaichi1, Sonia Dhaouadi1, Hajer Letai1, Fatma Youssef1, Emma Mziou1, Souha Bougatf1, Leila Bouaid1, Saouda Benyouche1, Nissaf Alaya1, Ilem Boubia1, Henda Triki1, Hella Karray4, Tunisia MASTOUR1

1Observatory of New and Emerging Diseases Tunisia Tunis, 2Charles Nicolle Hospital, Tunis Tunisia, 3Pasteur Institute, Tunis Tunisia, 4Habib Bourguiba Hospital Sfax TUNISIA, 5Fattouma Bourguiba Hospital Monastir Tunisia

Background and objective: Since emergent Variant Of Concern (VOC) has threatened public health and has impacted vaccination effectiveness, genomic surveillance of these variants was becoming a crucial approach allowing to monitor the evolution of SARS-CoV-2 variants and to guide COVID-19 pandemic response.

The objective of this study was to describe the genomic epidemiology from January 2021 to December 2022.

Methods: Sequences were performed on nasopharyngeal specimens With CT less than 25 tested in all Tunisian laboratories of clinical virology. The sample selection strategy was conducted in accordance with the Tunisian sequencing strategy of SARS-CoV-2 based on two approaches: First, on a weekly randomly stratified sample by governorate and secondly on a targeted sampling focusing on specific subsets: imported cases, vaccinated cases, reinfections, severe cases...

SARS-CoV-2 genome sequencing methods applied during this study were: whole-genome sequencing(wgs), partial s gene sequencing and variant-specific real-time rt-pcr tests. clinical virology laboratories involved were: carles nicolle hospital, tunisi Pasteur institute, habib bourguiba hospital sfax and fatouma bourguiba hospital, monastir.

Results: During this study a total of 5999 nasopharyngeal samples have been sent to laboratories of clinical virology. Using the three sequencing methods a total of 4937(82.3%) lineages were assigned and 4105(83.15%) were classified as VOC: 1442 Omicron(35.2%); 1418 Delta(34,6%);1230 Alpha(30%);7 Beta(0.2%); 1 Alpha and 1 coinfection Delta omicron.

Periods of predominance of VOC were identified as following : Alpha variant was predominant from ISO week3/2021 to ISO week 25/2021; Delta variant from ISO week 26/2021 to ISO week 50/2021 and Omicron from ISO week 1/2022.

Conclusion: This study was the first Tunisian national analysis of main lineages of SARS-CoV-2 circulating during two years. This Epidemiological genomic surveillance of SARS CoV 2 have contributed to implement preventive measures in a timely manner.

Ethical justifications for the need for pandemic preparedness from sars to SARS-CoV-2: a scoping review
Rocio Villa-Pizarro1, Miguel Ángel Royo Bordónada2, Fernando José García López2, Marife Muñoz Moreno3, Maria Pilar Amzúa Ibáñez2, Natalia Madueño Moreno2, Henda Karray1, Ilhem Boutiba1, Hela Karray2, Clara Gómez3, Miguel Ángel Royo Bordónada2, Fernando José García López2, Marife Muñoz Moreno3, Natalia Madueño Moreno2, Naoual Triki3

1Servicio de Medicina Preventiva y Salud Pública - Hospital Clínico Universitario de Valladolid Spain, 2Eescuela Nacional de Sanidad (Instituto de Salud Carlos III), 3Centro Nacional de Epidemiología, Instituto de Salud Carlos III Spain, 4Unidad de Investigación Biomédica (ibc), Hospital Clínico Universitario de Valladolid, Spain, 5Hospital Clínico Universitario Natalia, Instituto de Psiquiatría y Salud Mental, Hospital Gregorio Marañón Spain

The objective of this overview review is to describe the ethical justifications for choosing pandemic preparedness proposed in the period between 2004 and 2020.

Methods: Any type of literature published between 2004 and 2019 in whose title or abstract the ethical justification for pandemic preparedness is described as the main topic was included. The sources of information searched were PubMed and Cochrane. The literature available in full text was examined for eligibility. Finally, data (curation) was extracted.

Results: From: Initial identification of 120 articles, 13 were finally included for analysis. That is, although some texts deal with the ethical obligation to be prepared for a pandemic, these are scarce and rarely develop this ethical justification beyond how this preparation should be fulfilled. Ethical guidance is even presented in an instrumental manner (as a way to improve citizen collaboration), without going into the discernment (principles, assumptions...) that underpins these moral proposals.

Conclusion: The disparity between the insufficiencies of the last 15 years before the SARS-CoV-2 pandemic and the response capacity and preparedness that were available at the beginning of the crisis is an area for improvement in risk communication. Moreover further reflection on the ethical justifications could help authorities and society as a whole to focus their efforts, during this inter-pandemic period, on preparing for future pandemics. A need to involve the population in preparedness and to make decisions in a transparent manner was shown.

The impact of the COVID-19 pandemic on mental health in South Korea
Eun-Whan Gyeonggi1

117th WORLD CONGRESS ON PUBLIC HEALTH
Could humanity build a new planetary governance system able to tackle pandemics and other existential threats? a thought experiment

Alejandro Jadad1, Francesca Zanni2, Iveta Nagyova3, Jean-Marie Okwo-Bele4, Jeff Smith5, Luis De Souza6, Maria Sáenz Madrigal7, Costa Gualtieri (Walter)8

1Centre for Digital Therapeutics (Toronto, Canada), Canada, 2University of Bologna, Italy, 3Department of Social and Behavioural Medicine, Faculty of Medicine, PJ Safarik University, Kosice, Slovak Republic, 4World Federation of Public Health Associations (WFPHA), Independent, Switzerland, 5Australian Centre for Climate and Environmental Law, NA, Australia, 6World Federation of Public Health Associations (WFPHA), Federal University of Bahia (Brazil), Brazil, 7Health Equity Network of the Americas (HENA), 8Ricardi, Università Cattolica del Sacro Cuore, Italy

Thought experiments are mental exercises in which human imagination is used to put a hypothesis or idea to the test without actually conducting an experiment or research project. From February to November 2022, we sought to answer the following question: “If we had the power to add just one resource to what was available the day COVID-19 was declared a pandemic, so that we could change its course for the better, which resource would we choose?”

Soon, we concluded that the key missing piece was a species-wide, representative, accountable and empowered governance system. In light of this, the one imaginary resource we chose to add was a Planetary Health Protection Council (PHPC). This would be a body that would convene leaders from the government and the corporate, academic and civil society sectors with the goal of developing trustworthy measures that would allow humans to interrupt the spread of a pandemic, or curb other existential threats.

Given that the success of the PHPC would depend on being perceived as trustworthy by the general public, it could be complemented with two independent related structures, which could be spearheaded and coordinated by the public health community: A platform to facilitate equitable, transparent and inclusive participation by representative samples of the world’s population, and a system of in-person and virtual tools designed to encourage community engagement around controversial issues during the pandemic, from villages to the entire globe.

During the workshop, participants will have the opportunity to explore: The feasibility of a new planetary governance system able to tackle pandemics and other existential threats. The optimal role of the public health community to prepare the world for the next pandemic or for other existential threats.

Workshop participants will be invited to join the ongoing reflections around the proposed governance system, and to identify the optimal contributions of the public health community to prepare the world for the next pandemic or for other existential threats.

Key Questions

What is legal preparedness for PHEs? What legal challenges and barriers have been recognized during the COVID-19 pandemic and other public health emergencies? How can the law enhance countries’ preparedness to prevent, detect and respond to PHEs? What is the process by which countries can assess and improve their legal preparedness? What capacities are needed, and which tools are available, to enhance legal preparedness at country level?

Pandemic Preparedness and Response in the post-COVID-19 era: Governance and PHSMs

Pandemic Preparedness and Response in the post-COVID-19 era: Governance and PHSMs
Yanping Zhang1, Chao Ma2, Yi Cai3, Zijian Feng1, Xiaofeng Liang4
1China CDC, Division of Infectious Diseases, China, 2Evidence-Based Vaccine Policy Research Office, Chinese Center for Disease Control and Prevention, China, 3School of Public Health, Wuhan University, China, 4Chinese Preventive Medicine Association;Asia-Pacific Regional Liaison Office, WFPHA; China Association for Science and Technology UN Consultative Committee on Life Science and Human Health (CCLL); China, 5Chinese Preventive Medicine Association; Disease Control and Prevention Institute of Jinan University; China Association for Science and Technology UN Consultative Committee on Life Science and Human Health (CCLL); WFPHA, China

In this workshop we will review the experiences and lessons learnt in the fight against COVID-19 in China for the purpose of better preparing for and responding to future pandemics, from the following perspectives:

- Taking a whole-of-government and a whole-of-society approach for the governance of COVID-19 pandemic is a key of success in the early phase of rapid containment.
- Immediately after the outbreak is reported, the Chinese government established a multi-sectoral joint response mechanism, consisting of 32 ministries, under the overall leadership of State Council. The national office for joint response mechanism oversees the epidemic situation and response actions, and over 4 million of community workers from 600,000 neighborhood committees in urban/ rural areas were all mobilized for the implementation of public health and social measures (PHSMs) and the provision of logistic services during lockdown. Those approaches above have served as the fundamental basis for the successful elimination of COVID-19 outbreaks for a long period in China.
- The technical tools including massive testing, contact tracing using digital tools, and lockdown are key prerequisites for ‘Zero-COVID’ policy in China. Mass testing is necessary to rapidly screen the infected persons and put them under isolation so as to prevent further transmission. China has established sufficient PCR testing capacity. Digital tools and apps using big data technique are the enablers for timely epidemiological investigation and contact tracing to identify potential sources of infection and close contacts for quarantine, which attributed to the close collaboration between the public health sector, information technology sector, and the public security sector. Strict lockdown of high-risk areas is a useful tool to ensure the cut-off of the transmission at community level, while the basic services and logistic support are challenging and needs to be well arranged.
- The status and challenges of mass vaccination program in China. China was the first country to launch the COVID-19 vaccination campaign and has made positive progress in the fight against the COVID-19, with a complete vaccination rate of over 90% for the entire population. Details of COVID-19 mass vaccination campaign and practical challenges will be introduced in this workshop.

Specific aims/objectives and component parts

To provide an overview on Chinas collaborative governance mechanism and cross-sectoral cooperation approaches in response to COVID-19 pandemic;

To demonstrate how technology plays a key role in mass testing, contact tracing, and lockdown through the experiences sharing;

To share the practices how China pushed forward with the mass vaccination program and implemented public health and social measures by engaging and integrating community resources.

Key questions that the dialogue will address

1. What is the structure and mechanism of the WGA collaborative governance in China? What is the key of success in the early phase of rapid containment?
2. How the use of technology enables China’s dynamic Zero-COVID policy? What challenges have been encountered in the implementation and how have they been effectively addressed?
3. What are the challenges of COVID-19 vaccination in China and how we address those challenges in the preparedness for next pandemic?

Global coordinated surveillance of human pathogens for public health responses to new, emerging, and re-emerging epidemics

Eric Arts1, Elena Pariani2, Miguel Quinones-Mateu3, Christopher DeGroot1
1Western University 1151 Richmond St., London, ON, Canada, N6A 3K7 Canada, 2Department of Biomedical Sciences for Health, University of Milan, Italy, 3University of Otago, Dunedin, New Zealand, 4University of Milan Department of Biomedical Sciences for Health Via Carlo Pascal, 36 - 20133, Milan, Italy

Background and key objectives

Early in the pandemic, researchers in Lombardy, Italy pioneered the measure of SARS-CoV-2 load in wastewater (WW) as a strong correlate of SARS-CoV-2 case loads within the Lombardy region/population, a WW surveillance program that continued to present day. Starting in late 2020, the province of Ontario in Canada also established a comprehensive program to monitor SARS-CoV-2 in WW representing a population of 11 million (of 14 million in Ontario), similar in population size to Lombardy but across a sampled area the size of Italy. Ontario added next generation sequencing to the WW program to identify and monitor of the spread of specific SARS-CoV-2 variants of concern. During the pandemic, public health units in both Italy and Canada relied on individual case testing to determine SARS-CoV-2 load and variant type but this all changed in Ontario with the Omicron wave. In January 2022, to save costs, Ontario cancelled nearly all individual, PCR-based SARS-CoV-2 testing and switched to population-based monitoring of estimated SARS-CoV-2 case loads from the WW surveillance data. However, despite immediate data availability, estimated SARS-CoV-2 case loads from WW was slowly adopted by public health for SARS-CoV-2 prevention
initiatives. For this workshop the first key objective is to determine how to remove barriers in using these alternative surveillance tools by Public Health professionals to respond to regional epidemics. As the pandemic progressed around the world, more countries established SARS-CoV-2 WW surveillance programs. However, there is little coordination between Public Health agencies around the world or by the World Health Organization (WHO) to share WW surveillance data which would inform recommendations for prevention and strategic distribution of vaccines in specific regions. Furthermore, the current WW surveillance is heavily reliant on well-maintained wastewater systems, often absent in low-income settings. Starting in June 2021, an international consortium piloted a WW surveillance program in Medellin–Columbia, Caracas–Venezuela, Ibadan–Nigeria, Kampala–Uganda, and Suva–Fiji using WW from open drainage systems in slum districts. An interdisciplinary team of health geographers, virologists, epidemiologists, and engineers are developing tools to monitor the load and type of pathogens in these low-income settings. For the second objective we will explore the feasibility, effectiveness, and cost to establish a global, coordinated WW surveillance program to monitor for new and re-emerging pandemics to help public health reduce or prevent the next global pandemic. The third objective will involve a discussion of pros and cons of using individual case testing compared to using WW and environmental sampling for pathogen surveillance AGENDA Workshop will involve an open discussion to provide valuable insights into a working document to present as a future program to the WHO.

**Interventions to fight against COVID-19 in different countries: Challenges and lessons learned**
Henrique Barros¹, Thais Aranha-Rossi², James Macinko¹, Arnaud Simeon³, Ines Dourado⁴
¹University of Porto University of Porto Portugal, ²State University of Bahia, Brazil, ³Université Lumière Lyon 2 Université Lumière Lyon 2 France, ⁴Federal University of Bahia Federal University of Bahia Brazil

**Brief Outline Of The Overall Workshop**
This workshop proposition aims to address interventions to fight COVID-19 focusing on Primary Health Care (PHC) services and surveillance strategies in countries with different responses as a possibility to systematize learning for future pandemics. Non-governmental responses will also be discussed. Portuguese response to COVID-19 is considered successful by the adoption of different surveillance strategies, and multiple actions in its health system. In the United States and Brazil, countries with different health systems, high numbers of cases and deaths were observed due to COVID-19. In coping with these scenarios, we highlight the importance of strengthening health systems, expanding testing, and surveillance actions, integrating the healthcare network, and wide vaccination coverage.

**Specific Objectives And Component Parts**
The specific objectives of this workshop are: (1) To present interventions to fight against COVID-19 focusing on primary care services and surveillance strategies in countries with different responses as a possibility to systematize learning for future pandemics, and (2) To discuss the role of Primary Health Care in the COVID-19 pandemic. This workshop will address pandemic response interventions, especially actions in primary care, expansion of testing, and surveillance strategies.

The main pillars on which the Portuguese response and the lessons learned were structured will be presented. Intervention in France will be also discussed. The role of primary care in the response to COVID-19 will be presented as a contribution to thinking about future scenarios in different countries. A research intervention that aimed to expand testing, isolation, quarantine, and telemonitoring (TQT-COVID-19) in primary care units in two Brazilian capitals will also be systematized. From these experiences, we seek to bring contributions to understanding the different answers and thinking about coping with future problems.

The **Key Questions That The Workshop Will Address**
* What are the main components of interventions and/or responses to fight against the COVID-19 pandemic?
* What is the role of Primary Health Care in the COVID-19 pandemic?
* What are the main lessons for future pandemics?

**Simulation exercises to enhance public health pandemic/epidemic preparedness**
Emanuela Frisicale¹, Maria Dentel¹, Francesco Maraglino², Anna Palamara²
¹Italian Ministry of Health General directorate of health prevention, Ministry of Health Italy, ²National Institute of Health, National Center for Global Health, Italy, ³Italian Ministry of Health Head of office Prevention of communicable diseases and international prophylaxis, general directorate of health prevention Italy, ⁴National Institute of Health Director, infectious disease department, National Institute of Health Italy

The COVID-19 pandemic revealed weaknesses in healthcare systems globally, above all in the detection, preparedness and response to biological threats such as emerging pathogens. The pandemic was not completely unexpected, considering for example how in 2018 WHO included “Pathogen X” among the list of pathogens which could threaten global health security and have a pandemic potential. In a simulation exercise (SIMEX) there are three principle phases: * A PRE-EXERCISE PHASE dedicated to planning, logistics, implementation of exercise materials and recruitment of participants; * AN EXERCISE IMPLEMENTATION PHASE, which includes the preparation of the facilitators, the beginning of the exercise, its conduct, the “hot” debriefing with the participants and the closure of the exercise itself; and finally * A POST-EXERCISE PHASE dedicated to the collection of results, the debriefing with the facilitators, the preparation of a report and evaluation of the exercise and the administrative reporting. This workshop will present pandemic and pandemic preparedness from an international perspective through the experience of two international experts of the European Centre for Disease Prevention and Control and the example of pandemic simulations carried out currently as part of the National strategic and operational plan for preparedness and response to an influenza pandemic (PanFlu) 2021-2023, in Italy. The Congress takes place in a time of change in the global health security governance context with the revision of the International Health Regulations, the discussions around the Pandemic Treaty and, in the European Union, with the issue of the recent regulation EU 2022/2371 of the European Parliament and of the Council on serious cross-border threats to health. In addition, at the time in which the workshop will take place, the European Centre for Disease Prevention and Control will have a newly expanded mandate and Italy will have performed and analysed one of two national simulation exercises on a single scenario that will take place during 2023 to test the implementation of above-mentioned plan. The changing pandemic preparedness context, with specific reference to simulation exercises and their role in supporting effective and resilient health care systems during epidemics and pandemics, will thus also be discussed.

**Specific aims/objectives and component parts**
The workshop aims at promoting discussion among experts about the role and impact of simulation exercises for pandemic preparedness. The specific objectives are to share experiences in SIMEX implementation, discuss how to build national capacity in this field and deepen knowledge on the potential development of SIMEXes taking into account COVID-19 pandemic lessons’ learnt. The workshop will take place at a time in which the results of the first Italian SIMEX will be available, and Ministry of Health and the National Health Institute could be able to contribute to the debate also sharing preliminary results.

The **key questions that the workshop will address**
* The role of simulation exercises within the emerging global health governance landscape * Are States aware about the potential of SIMEXes in improving preparedness and readiness to emergencies? * Can SIMEX be effective in helping during an emergency? * How could SIMEX evolve in light of the COVID-19 pandemic legacy?

**From national to international health policy making:** Lessons learned from ASPHER’s covid-19 task force
Alison McCullum¹, Nadav Davidovitch², John Middleton¹, Nadav Davidovitch²
¹ASPHER United Kingdom, ²Ben-Gurion University, Israel, ³BOU and ASPHER Israel

* brief outline * ASPHER, (Association of Public Health Schools in the WHO European Region), convened a COVID-19 Task Force (TF) in early 2020. TF has involved over 60 experts, 30 member schools, more than 20 countries across four continents, supported by young professionals (YPs). The COVID-19 TF became a unique expert forum for mutual support, sharing, reviewing, and presenting evidence on epidemiological, technical, societal, and political dimensions of the COVID-19 pandemic across Europe. Working with European and national health authorities and non-governmental organisations (NGOs), it prompted and supported the coordination of policy responses across WHO European Region.

* Drawing on members’ collective knowledge and expertise, the TF produced a significant body of work on different public health aspects of the pandemic and gaps in responses. Since its inception, the TF has produced more than 30 peer-reviewed publications, regular position statements, reports on topics from personal to planetary protection including: face masks, testing, tracking, vaccination, health inequalities, safe schools, advocacy for wider social protection and global
Evaluation methods applied to digital health interventions: What is being done beyond randomised controlled trials? A scoping review

Robert Hrynyszyn1,2, Christina Friediger1, Christiane Stock1,2, Stefanie Maria Helmer1

1Institute of Health and Nursing Science, Charité-Universitätsmedizin Berlin, corporate member of Freie Universität Berlin and Humboldt-Universität zu Berlin, Berlin, Germany, 2Unit for Health Promotion Research, University of Southern Denmark, Esbjerg, Denmark, 3Human and Health Sciences, University of Bremen, Bremen, Germany, 4Leibniz ScienceCampus Digital Public Health Bremen, Bremen, Germany

Background and Objective: Digital health interventions (DHIs) can deliver health interventions with lower barriers to a wide audience and support behaviour change. Despite the potential of DHIs, evaluating their effectiveness is challenging. DHIs are often designed as complex interventions, and established evaluation methods, e.g., randomised controlled trials (RCT), have limited applicability for evaluating complex interventions. In this context, alternative evaluation methods are often discussed. Therefore, a scoping review was conducted to provide an overview of existing evaluation method of DHIs beyond RCTs.

Methods: The Cochrane Central Register of Controlled Trials, MEDLINE, Web of Science, and EMBASE were screened in May 2021 to identify relevant publications. Studies were included that were (1) applying alternative evaluation Methods, (2) testing and reporting effects of interventions, and (3) dealing with DHIs. Inclusion was not restricted to any specific population or to specific contexts in which studies were conducted.

Results: Eight studies were identified, which included four alternative assessment designs. The most used evaluation design for DHIs was factorial designs (n=5), followed by stepped wedge designs (n=1), sequential multiple assignment randomised trials (SMARTs) (n=1), and micro randomised trials (MRTs) (n=1). Some of these methodological adaptations are interventions (e.g., SMART or MRTs) and the evaluation of specific components of interventions (e.g., factorial designs).

Conclusions: Alternative study designs are appropriate for addressing some specific needs in the evaluation of DHIs. Alternative study designs might be beneficial in overcoming the current evaluation challenges in DHIs. However, it remains unclear how to establish these alternative evaluation designs in research practice and how to deal with the limitations of the designs.

Marketing in the metaverse, noncommunicable diseases and human rights

André Constantin1, Maia Daniel1

1O'Neill Institute for National and Global Health Law, Georgetown University, Washington, United States, 2Center of Technology and Society (CETYS), Universidad de San Andrés, Argentina

The metaverse will change the world in many ways. Essentially creating virtual spaces owned by private companies where individuals, corporations, and even governments can interact with minimal oversight. Although the Web 2.0 had already offered a brand-new way of interacting with others, the interactions that the metaverse’s immersive technologies enable will bring about a new worldview and multiple challenges. The metaverse will definitely offer numerous benefits for users—such as organizing virtual field trips for students or getting a telemedicine consultation with a doctor in any part of the world. However, the use of these technologies could also entail potential serious risks for the right to health and health-related rights. In this study we examine the legal and policy implications of marketing and advertising by unhealthy commodities companies (tobacco, alcohol, ultraprocessed foods/beverages) in the metaverse and what it means for people's health. In particular, we aim to answer questions such as: what is or should be the role of public health authorities in the metaverse? Are current health-related legal standards applicable in the metaverse? Do we need specific norms to protect the right to health? What are the anticipated health and human rights risks that a poorly regulated metaverse—or poorly enforced laws and regulations in this space—can facilitate?

DOI: 10.18332/popmed/164849

The effectiveness of telemedicine interventions, delivered exclusively during the postnatal period, on postpartum depression in mothers without history or existing mental disorders: a systematic review and meta-analysis

Nivine Hanachi1, Nanne Vries2, Hadia Radwan1, Nour Bissani3

1Department of Health Promotion, Maastricht University, The Netherlands, 2Department of Health Promotion, Maastricht University, Netherlands, 3Department of Clinical Nutrition and Dietetics, College of Health Sciences, University of Sharjah, Sharjah, United Arab Emirates, 4Research Institute of Medical and Health Sciences (RIMHS), University of Sharjah, Sharjah, United Arab Emirates, 5Department of Nutrition and Food Science, Faculty of Agricultural and Food Sciences, American University of Beirut, Beirut, Lebanon

Background and Objective: Postpartum depression, one of the most common forms of depression, is highly prevalent worldwide among women during childbirth. Despite available treatments for postpartum depression, numerous barriers hinder women to access care including time, financial constraints, and childcare concerns. Telemedicine interventions are suggested to be feasible to prevent and improve postpartum depression. The objective is to examine the effectiveness of telemedicine interventions delivered exclusively during the postnatal period, on postpartum depression symptomatology in women with no history of mental disorders. Design: A systematic review and meta-analysis of randomized controlled trials.

Methods: PubMed, Web of Science, Cochrane Library, and ProQuest Dissertations and Theses databases were used to identify relevant randomized controlled trials, until 7 January 2020. Studies were quality assessed using the Cochrane Library Risk of Bias Tool. The Results of postpartum depression scores were pooled using a random-effects model. Intervention completion rate and participants’ satisfaction were reported in a narrative form, as secondary outcomes.

Results: Ten trials including a total of 2366 participants, contributed data to the review. Seven studies were included in the quantitative synthesis. Women who received technology-based interventions, regardless of the type (web-based versus telephone-based), had a statistically significant improvement in postpartum depression (mean difference: -1.8, 95% CI: -2.68 to -0.93, P < .001). The completion rate was 80% in the intervention groups compared to 76% in the control groups. Three studies reporting participants’ satisfaction revealed that the participants were highly satisfied with the technology-based interventions.

Conclusions: Overall, telemedicine interventions appear to be promising in preventing and improving postpartum depression. Further larger-scale high-quality research is required to establish an evidence-based telemedicine approach, in terms of structure, content, and providers. Future economic evaluation is also vital to evaluate the long-term use of telemedicine in improving postpartum depression.
The ethics of point of care devices and the need for AI policy frameworks in resources limited settings

Mimmie Watts1, Ismaila Ima1, Tesfay Gebrehiwet1, Maha Gmira1, Wendy Crooks2, Ian Robins1

1Policy Committee World Federation of Public Health Associations (WFWHA), Institute of Health and Wellbeing, Federation University Australia, Victoria, Australia; 2University of Energy and Natural Resources, Sunyani, Ghana.

Access to quality healthcare is a fundamental human right and one of the Sustainable Development Goals (SDGs), as adopted by the United Nations in 2015. Thus, so is the maintenance of high ethical standards in providing healthcare. An important requirement for healthcare practitioners is the practice of the concept of avoiding harm while doing good. Advances in technology, global industrialization, and more recently Artificial Intelligence (AI) have undeniably led to significant improvements and advances in healthcare delivery, including the introduction of Point-Of-Care Testing (POCT) devices that can instantly provide data about measures of a patient's health. Unfortunately, these advances have inadvertently affected the ethical standards in the field and there are calls for appropriate structures to ensure that all healthcare beneficiaries, especially the vulnerable ones in society continue to enjoy high ethical standards expected in receiving healthcare. This article drawing on the TAM and UTAUT theories, provides comprehensive analysis on the need to develop policy and ethical framework for AI technologies in healthcare. We believe that this has great potential to accelerate scientific discovery in medicine and to improve health care services. Keywords: e-health, ethical policy, artificial intelligence, healthcare records, vulnerable groups, minority rights, mobile technologies, health equity

Factors affecting successful post-discharge engagement of emergency department patients with opioid use history who received telehealth recovery coaching services

Dennis Watson1, Peter Phalen1, Spencer Medcalf1, Sarah Messmer1, Alan McGuire1

1Chestnut Health Systems, Chicago, United States; 2University of Maryland School of Medicine, Baltimore, United States; 3Indiana University Health, Indianapolis, United States; 4University of Illinois at Chicago, Chicago, United States; 5Indiana University-Purdue University Indianapolis, Indianapolis, United States

Background and Objectives: In recent years, emergency departments across the United States have implemented peer recovery coach (PRC) services to support patients who use opioids. The majority of such interventions discussed in the literature follow an in-person modality where PRCs engage patients directly at the emergency department bedside. However, telehealth services that connect PRCs with emergency department patients in real-time using secure communications technology are becoming more popular, and even less is known about the effectiveness of such programs as related to services and clinical outcomes. The current study sought to assess factors associated with successful post-discharge follow-up of patients with a history of opioid use who received PRC telehealth services while in the emergency department. Methods: Data come from records of 917 patients who engaged a telehealth PRC one or more times. Multilevel regression models were used to assess the degree to which variables predicted successful post-discharge follow-up by a PRC. Results: Twenty-three percent of enrolled patients were successfully followed-up with at least once. Significant predictors of successful follow-up included patient employment at baseline (Incidence Rate Ratio [IRR]: 2.8, CI: 2.05-3.9), living in a rural area (IRR: 1.8, CI: 1.04-3.1), PRC provision of referrals (IRR: 1.7, CI: 1.2-2.1), number of emergency department presentations in previous 365 days (IRR: 0.9, CI: 0.98-0.99), and duration of the initial PRC telehealth interaction (IRR: 0.87, CI: 0.85-0.88). Conclusions: Understanding successful follow-up associated with telehealth engagement is of importance to the developing PRC profession, considering relationship development is one of their key functions. The results have potential utility for planning and implementing peer telehealth services in EDs and other locations, which is needed considering the expansion for peer telehealth services is likely to continue.

CORēHealth: operating center of telemedicine for chronic conditions and clinical networks

Giovanni Gorgoni1, Pasquale Notarangelo2, Vito Petrarolo3

1Regional Agency for Health and Social Care of Apulia, Italy; 2ARESS Puglia, Regional Agency for Health and Social Care of Apulia, Italy; 3Regional Agency for Health and Social Care of Apulia (ARESS Puglia), Italy

Background and Objectives: The diagnosis and continuous care of chronic conditions such as HIV present potential teachable moments for delivering smoking prevention and cessation interventions for patients. During our study, we designed and pre-tested a prototype of a smartphone application (app), Decision-T, specifically designed to assist physicians and non-physicians when providing personalized smoking prevention and cessation services to their patients. Methods: We developed the Decision-T app based on the transtheoretical algorithm for smoking prevention and cessation following the 5 As model. Our study used a mixed-methods approach among 18 HIV care providers recruited from the Houston Metropolitan Area for pre-testing the app. Each participant took part in three mock sessions using the Decision-T app. The average time spent by the provider at each mock session was measured. We also measured accuracy and quality comparing the smoking prevention and cessation treatment offered by the HIV care provider using the app to the treatment approach chosen by a tobacco specialist who designed the case. The system usability scale (SUS) was used to assess usability quantitatively. Transcripts of individual interviews with study participants were analyzed to assess usability qualitatively. STATA 17/SE and NVivo Version 12 were used for quantitative and qualitative analysis, respectively. Results: The average time for completing each mock session was 5 minutes 17 seconds. The participants achieved an overall average accuracy of 88.89%. The average SUS score achieved was 87.5 (±10.26). A total of five major themes (i.e., the apps contents are beneficial and straightforward, apps design is easy to understand, apps user experience is uncomplicated, apps tech is intuitive, app needs improvements) emerged after analyzing the qualitative interviews. Conclusions: The Decision-T app has the potential to increase HIV care providers engagement in offering smoking prevention and cessation behavioral support and pharmacotherapy recommendations to their patients briefly and accurately.

The ethics of point of care devices and the need for AI policy frameworks in resources limited settings

Mimmie Watts1, Ismaila Ima1, Tesfay Gebrehiwet1, Maha Gmira1, Wendy Crooks2, Ian Robins1

1Policy Committee World Federation of Public Health Associations (WFWHA), Institute of Health and Wellbeing, Federation University Australia, Victoria, Australia; 2University of Energy and Natural Resources, Sunyani, Ghana.

Access to quality healthcare is a fundamental human right and one of the Sustainable Development Goals (SDGs), as adopted by the United Nations in 2015. Thus, so is the maintenance of high ethical standards in providing healthcare. An important requirement for healthcare practitioners is the practice of the concept of avoiding harm while doing good. Advances in technology, global industrialization, and more recently Artificial Intelligence (AI) have undeniably led to significant improvements and advances in healthcare delivery, including the introduction of Point-Of-Care Testing (POCT) devices that can instantly provide data about measures of a patient’s health. Unfortunately, these advances have inadvertently affected the ethical standards in the field and there are calls for appropriate structures to ensure that all healthcare beneficiaries, especially the vulnerable ones in society continue to enjoy high ethical standards expected in receiving healthcare. This article drawing on the TAM and UTAUT theories, provides comprehensive analysis on the need to develop policy and ethical framework for AI technologies in healthcare. We believe that this has great potential to accelerate scientific discovery in medicine and to improve health care services. Keywords: e-health, ethical policy, artificial intelligence, healthcare records, vulnerable groups, minority rights, mobile technologies, health equity

Factors affecting successful post-discharge engagement of emergency department patients with opioid use history who received telehealth recovery coaching services

Dennis Watson1, Peter Phalen1, Spencer Medcalf1, Sarah Messmer1, Alan McGuire1

1Chestnut Health Systems, Chicago, United States; 2University of Maryland School of Medicine, Baltimore, United States; 3Indiana University Health, Indianapolis, United States; 4University of Illinois at Chicago, Chicago, United States; 5Indiana University-Purdue University Indianapolis, Indianapolis, United States

Background and Objectives: In recent years, emergency departments across the United States have implemented peer recovery coach (PRC) services to support patients who use opioids. The majority of such interventions discussed in the literature follow an in-person modality where PRCs engage patients directly at the emergency department bedside. However, telehealth services that connect PRCs with emergency department patients in real-time using secure communications technology are becoming more popular, and even less is known about the effectiveness of such programs as related to services and clinical outcomes. The current study sought to assess factors associated with successful post-discharge follow-up of patients with a history of opioid use who received PRC telehealth services while in the emergency department. Methods: Data come from records of 917 patients who engaged a telehealth PRC one or more times. Multilevel regression models were used to assess the degree to which variables predicted successful post-discharge follow-up by a PRC. Results: Twenty-three percent of enrolled patients were successfully followed-up with at least once. Significant predictors of successful follow-up included patient employment at baseline (Incidence Rate Ratio [IRR]: 2.8, CI: 2.05-3.9), living in a rural area (IRR: 1.8, CI: 1.04-3.1), PRC provision of referrals (IRR: 1.7, CI: 1.2-2.1), number of emergency department presentations in previous 365 days (IRR: 0.9, CI: 0.98-0.99), and duration of the initial PRC telehealth interaction (IRR: 0.87, CI: 0.85-0.88). Conclusions: Understanding successful follow-up associated with telehealth engagement is of importance to the developing PRC profession, considering relationship development is one of their key functions. The results have potential utility for planning and implementing peer telehealth services in EDs and other locations, which is needed considering the expansion for peer telehealth services is likely to continue.

Association between e-health literacy and vaccine hesitancy among non-health college students at King Faisal University
Abdulrahman1, Mohammed Abadi1, Edric Estrella1, Mohammed Hability1, Mujtaba Salman1, Hashem Suwaj1
1King Faisal University, Saudi Arabia

Background and Objectives: Vaccine hesitancy has been rated among the top 10 global Public Health threats by the World Health Organization (WHO). Causes of vaccine hesitancy are heterogeneous and the media environment can negatively influence vaccination acceptance and contribute to vaccine hesitancy. The purpose of this study was to determine the association between eHealth literacy and vaccine hesitancy towards flu and HPV among non-health college students at King Faisal University.

Methods: This analytical cross-sectional study obtained data from 876 non-health undergraduates at King Faisal University selected through two-stage cluster sampling procedure. Two validated instruments, particularly, the eHealth Literacy Scale (eHEALS) and the Adult Vaccine hesitancy Scale were used. Statistical analysis was done using JASP. Logistic regression was performed to determine the association between the student’s level of eHealth literacy and vaccine hesitancy towards flu and HPV.

Results: Half of the students had high eHEALTH literacy level. The estimated proportion of students who displayed hesitancy towards the HPV and flu vaccine was 52.85% (95%CI:49.49%-56.20%) with the statement “I am concerned about serious adverse effects of vaccines” (89% CI: 87.00%-91.00%) as the most prevalent reason for vaccine hesitancy. Students with high eHealth literacy were roughly three times more likely to be not vaccine hesitant (p < .001) compared to those with low eHealth literacy. Conclusions: The present data confirms that eHealth literacy was significantly associated with vaccine hesitancy which necessitates the university to take initiatives to further enhance the eHealth literacy levels of the non-health students by utilizing the electronic platforms to share credible health information. The Ministry of Health should also enhance their social media presence in order to spread reliable health information, specifically regarding vaccines and their safety.

Culturally safe eHealth: what is ‘best practice’ and who determines it?
Georgina Chelberg1, Ray Mahoney2, Charankarthi Musuwadi2, Kaley Butten1
1Commonwealth Scientific and Industrial Research Organisation, Australia, 2Commonwealth Scientific and Industrial Research Organisation, Herston, Australia

Background/Objective: Evidence for the relevance, effectiveness, and socio-cultural benefits of eHealth interventions with First Nations peoples is growing. In Australia, a research program is preparing a best practice framework (BPF) for eHealth with Aboriginal and Torres Strait Islander people [1]. The 7 phases aim to establish the themes and characteristics of culturally safe eHealth, as voiced by Aboriginal and Torres Strait Islander people.

Methods: A systematic literature review and scoping review were conducted (Phases 1 and (ii) what guidelines or best practice evidence should inform eHealth interventions with Aboriginal and Torres Strait Islander people. PROSPERO and Open Science Framework protocols were registered. Search strategies incorporated variations of ‘eHealth’, ‘Aboriginal and Torres Strait Islander health’, ‘guidelines, ethics’. Database searches included WebScience, Scopus, Cochrane, Embase, CINAHL, PubMed, PsycINFO, plus grey literature. Screening, data extraction and quality assessments were conducted by 3 authors, with narrative analysis to generate themes (Phase 3). Modified Delphi processes will confirm final themes and principles of the BPF (Phases 4-6). Delphi participants will include stakeholders of eHealth feasibility trials, subject matter experts, and community-controlled partners with expertise in Aboriginal and Torres Strait Islander health.

Results: The BPF scientific protocol was published in June 2022 [1]. Phases 1 & 2 commenced November 2022 with findings on-track for release in early 2023. In December 2022, qualitative data collection was completed for several eHealth feasibility trials with Aboriginal and Torres Strait Islander communities. Key findings from stakeholders will contribute to subsequent Delphi processes scheduled for May 2023. Dissemination of the foundational BPF is expected December 2023 (Phase 7). This presentation will highlight key findings from completed research phases.

Conclusions: The BPF will contribute to rigorous eHealth innovations that promote genuine co-design, ensure cultural safety and clinical effectiveness for Aboriginal and Torres Strait Islander people. [1]doi:10.2196/34904

The effect of WhatsApp group-based digital health interventions on increasing anemia knowledge in college female students
Andi Silawan1, Suriah Suriah1, Nurhaedar Jafar1, Intan Areni1, Muh Zamaa1, Nurliefi Nurleli1, Basri Basri1, Rezky Yusuf1
1Hasanuddin University Indonesia, Indonesia, 2Sekolah Tinggi Ilmu Kesehatan Makassar, Indonesia, 3Universitas Muslim Indonesia, Indonesia

Background: The prevalence of adolescent female anemia and reproductive age remains alarming. By 2025 globally, it is predicted that there will be an increase in prevalence by more than double by 31.2%. Data on the prevalence of Indonesian adolescents aged 15-24 years has increased, namely in 2013 by 18.4%, an increase of 26.8% in 2018, and this shows that Indonesia is a country with a worsening anemia rate that is difficult to reach the Global nutrition target (anemia) in 2025, namely 14.3%. This study Aims to determine the effect of group WhatsApp-based digital health interventions on improving anemia knowledge in female college students.

Methods: The type of research is pre-experimental, using a one-group posttest-posttest approach without a control group. The study sample was 36 female students, using the Purposive sampling technique.

Results: The studies results using the paired t-test showed an influence of group WhatsApp-based digital health interventions on the increase in anemia knowledge in female students p = 0.012 < 0.05.

Conclusions: This study concludes that there is an influence of WhatsApp group-based digital intervention on increasing anemia knowledge among female college students, so this group WhatsApp-based digital health interventions method can be applied as one of the promotion strategies in the delivery of health education about anemia among women of productive age.

How can we build public trust in personal data use in health systems? Evidence-based guidance

Felix Gille1, Sarah Smith2, Nicholas Mays3
1University of Zurich, Switzerland, 2The London School of Hygiene & Tropical Medicine (LSHTM), United Kingdom, 3London School of Hygiene & Tropical Medicine (LSHTM), United Kingdom

Objective: Public trust in health systems is pivotal for their effective and efficient functioning. In particular, public trust is essential for personal data use, as demonstrated in debates in many countries, for example, about whether data from COVID-19 contact tracing apps should be pooled or remain on individuals’ smartphones. Low levels of public trust pose a risk not only to health system legitimacy but can also hurt population health. Methods: Synthesising our previous qualitative and theoretical research in the English National Health Service which enabled us to conceptualise the nature of public trust in health systems, we present guiding principles designed to rebuild public trust, if lost, and to maintain high levels of public trust in personal data use within the health system, if not. Results: To build public trust, health system actors need to not rush trust building; engage with the public; keep the public safe; offer autonomy to the public; plan for diverse trust relationships; recognise that trust is shaped by both emotion and rational thought; represent the public interest; and work towards realising a net benefit for the health system and the public. Conclusions: Beyond policymakers and government officials, the guiding principles address a wide range of actors that operate in greater conformity with the guiding principles perform better.

How to measure digital public health system maturity on a national level: an international interdisciplinary Delphi study

Laura Maas1,2
1Research Center on Inequality and Social Policy (Socium), University of Bremen, Bremen, Germany, 2Leibniz ScienceCampus Digital Public Health Bremen, Bremen, Germany

Background and Objective: The COVID-19 pandemic showed how crucial digital public health (DiPH) interventions are for continuous treatment and system sustainability. Several studies highlighted how the digital system transformation might improve access to and quality of healthcare services. However, there is no consensus on how to best assess the national readiness for the digitalization of such systems. Therefore, this Delphi study aimed to collect indicators to measure the maturity of DiPH systems nationally.

Methods: The three-stage international and interdisciplinary Delphi study included 82 participants. During the first round, participants were invited to propose indicators to measure maturity among the technological and legal requirements of DiPH tools, the willingness of the general public to use them, and the degree of application of DiPH tools to the national healthcare system. The suggestions were qualitatively assessed and presented for ranking on a 4-point Likert scale during the second round. Experts were also able to rephrase or add indicators. In the third round, experts could only rank indicators.

Results: 106 indicators to measure the maturity of DiPH systems were included. Of these, 33 fall under the legal and 30 under the technological requirements. 27 assess the social level and 16 the degree of application. All dimensions can be clustered further into 3-4 sub-groups each. The qualitative analysis pointed to the importance of data protection regulations, affordable access to smartphones and the internet, interoperability between interventions, financial incentives, user motivation and literacy, and whether interventions were implemented as local pilots or national system services.

Conclusions: The study identified indicators for interdisciplinary assessing DiPH system maturity. While this Delphi can’t answer how best to integrate these indicators into national health system evaluation procedures, this approach is an essential first step towards an index to measure the maturity of DiPH systems.

Adjusting to digital change: learnings from five hospitals using mHealth for gestational diabetes management

Kaley Buxton1, Marien Vanniel1
1Department of Cardiological, Thoracic and Vascular Sciences, and Public Health, University of Padova, Italy, 2Department of Diagnostics and Public Health, University of Padova, Italy, 3Department of Diagnostics and Public Health, Section of Hygiene, University of Verona, Italy

Background and Objective: Regular physical exercise lowers the risk of all-cause mortality and of various chronic diseases. Sedentary lifestyles are very common in all age groups, including college students, so there is no guarantee of sufficient levels of physical activity at this age are at high risk of persisting in this behavior for the rest of their adult lives. New technologies, such as smartphones and social media, have been used successfully as health promotion tools in college populations. The purpose of this study was to conduct a systematic review of studies examining the effectiveness of interventions that used modern technologies to promote physical activity in college students, and to propose a protocol for such interventions based on the evidence emerging from the review. Methods: A systematic review was conducted on the PubMed and SCOPUS databases, considering studies published from 2012 to 2022 that aimed to assess the effectiveness of interventions to promote physical activities for college students using modern technologies. For a total of 19 articles selected, an evidence table was drawn up, and the quality of the studies was assessed using the PRISMA checklist.

Results: The interventions differed enormously in design, the strategies implemented and the types of outcome measure considered. Fifteen (79%) of the 19 studies reviewed demonstrated an improvement in participants’ physical activity levels, while three studies (16%) found no such improvement, and a worsening of the baseline activity levels was reported in one study (5%). Conclusions: Interventions to improve college students’ physical activity levels with the aid of modern technology tend to be effective. Many factors can influence the effectiveness of such interventions, however. For example, a gender-related difference emerged in students’ participation in the studies reviewed, and the interventions proved more effective if they were accompanied by the creation of social groups.

How to measure digital public health system maturity on a national level: an international interdisciplinary Delphi study

Adjusting to digital change: learnings from five hospitals using mHealth for gestational diabetes management

Kaley Buxton1, Marien Vanniel1
1Department of Cardiological, Thoracic and Vascular Sciences, and Public Health, University of Padova, Italy, 2Department of Diagnostics and Public Health, University of Padova, Italy, 3Department of Diagnostics and Public Health, Section of Hygiene, University of Verona, Italy
Background and Objective: Mobile health (mHealth) platforms are becoming increasingly common as health services try to meet the growing demand for quality care in managing chronic health conditions. Conditions such as gestational diabetes which require consistent record-keeping and monitoring lend themselves to digital solutions, yet the implementation of these technologies remains challenging. The objective of this study was to examine the change management experiences of stakeholders utilising the MoTHER platform which consists of a patient-facing App and a web-based clinician dashboard, to support the management of gestational diabetes across five Australian hospitals.

Methods: A mixed-methods approach has been used to understand stakeholder experiences implementing MoTHER. Clinicians, project staff including engineers across five Australian hospitals where the platform has been used with 5000+ patients since June 2020 are sharing their views in interviews and contributing via a survey based on the Unified Theory of Acceptance and Use of Technology (UTAUT). Additionally, communications and pain points raised with project staff across study sites are being thematically analysed to understand common and potentially overlooked implementation challenges.

Results: Preliminary findings (final results expected by conference date) suggest that the introduction of mHealth has had multi-level implications, particularly in the health service eco-system, affecting care-coordination, staffing, allocation of resources, billing, and potentially other service models (with clinical outcomes reported to be affected).

Conclusions: Although the COVID-19 pandemic has given innovation a nudge, mHealth is not a brand-new option for health service support. Research suggests there has been a lack of appropriate change management principles within health systems which has delayed adoption. Initial takeaways from this study suggest there is room for more structured frameworks to support technology transitions, particularly for clinicians and services. This study will provide important learnings which can inform future digital health integration, supporting the change management process and long-term sustainability.

Exploiting digital social diffusion: problematic dissemination of prescription drug news in Latin America

Matthew Flynn1, Andrés Lombana-Bermúdez2

1 Georgia Southern University, United States, 2 Pontificia Universidad Javeriana, Colombia

Background and Objective: Due to public health concerns, most countries of the world ban companies from directly advertising medicines to the public. However, the rise of new digital media allows for the dissemination of information that does not promote the rational use of prescription drugs. The objective of this study is to evaluate reports on medicines and analyze their diffusion on social media platforms.

Methods: This study searched for the top 19 drugs sold in 2018 using Media Cloud, an engine that organizes digital media on the Internet and places them in a database, published in Brazil, Argentina, Mexico, Chile, Peru, and Colombia. Three coders decided on the following criteria: Source of information (news media, op-ed, university, company, government, NGO); Propaganda (Yes/No/Maybe); Content (new treatment, abuse, regulation, price, industry, other); Tone (neutral, laudatory, critical); and Adverse Reactions (ADRs) mentioned (Yes/No).

Results: A total of 424 stories mentioning the top 19 brands (329 in Spanish, 95 in Portuguese) were collected. A subgroup of 213 stories was shared on Facebook (141 in SP, 72 in PT), of which 35 stories had more than 100 FB shares. The count of articles coded as laudatory, critical, and neutral are 75, 91, and 47, respectively, and a majority (N=155) not mentioning ADRs. For stories shared more than 100 times on FB, 19 were coded as laudatory compared to critical respectively, and a majority (N=155) not mentioning ADRs. For stories shared more than 100 times on FB, 19 were coded as laudatory compared to critical respectively, and a majority (N=155) not mentioning ADRs.

Conclusions: Prescription drug news with laudatory frames as well as content that fails to mention potential side effects appears to disseminate more on social media.

Data sharing barriers and enablers for healthcare Artificial Intelligence (AI) in Low- and Middle-income countries

Capucine Barcellona1, Aprajita Kushk1, Nikita Manday1, Si Tan2, Jasper Tromp3

1 Saw Swee Hock School of Public Health, National University of Singapore, Singapore, 2 National University of Singapore

Background: Health systems in low- and middle-income countries (LMICs) can greatly benefit from AI interventions, including electronic decision support tools and predictive analytics. Unfortunately, challenges to data sharing pose a significant obstacle to the development and use of AI in healthcare. Objective: This systematic review identified barriers to and enablers for data sharing related to AI in healthcare in LMICs. Methods: A systematic literature search was performed using PubMed, SCOPUS, Embase, Web of Science and ACM (Association for Computing Machinery) for articles describing barriers to and enablers for data sharing for AI in healthcare in LMICs. Qualitative data extraction and thematic analysis was conducted on selected studies. Barriers and enablers were classified according to a framework formulated by merging two existing framework (Panhuis 2014 and Sun and Medaglia 2019), comprising eight categories: 1) Technical, 2) Motivational, 3) Economic, 4) Political, Legal and Policy, 5) Ethical, 6) Social, 7) Organisational and Managerial and 8) Data-related. Results: The systematic search identified 2471 records, of which 22 met the eligibility criteria. The studies were from 13 countries, with the majority from Africa (12 studies, 55%) and Asia (6 studies, 27%). The most important barriers were technical (e.g. lack of hospital infrastructure) and data-related (e.g. lack of interoperability standards). Significant enablers for data sharing included political and regulatory enablers (e.g. government support, clear policies and guidelines on data sharing) and technical enablers (e.g. shifting from paper-based to electronic data collection).

Conclusions: This systematic review identified various barriers and enablers relevant to LMICs. These results can inform context-specific recommendations to promote local AI development in resource-limited settings. Recommendations and best practices arising from this review can also indicate ways to mitigate common data sharing barriers for transitioning economies and health systems.

Machine learning prediction of suicidal ideation among college students during the COVID-19 pandemic

Mélissa Macalli1, Marie Navarro1, Océane Pic1, Nathalie Texier2, Stéphane Schück3, Christophe Tzourio1

1 University of Bordeaux, France, 2Kappa Santé, France

Background and Objective: College students are particularly vulnerable to mental health problems, including suicidal ideation. The COVID-19 pandemic, and the
restrictive measures imposed to limit the spread of the virus, such as lockdown or university closures, have increased the vulnerability of college students to mental health problems. In this particular epidemic context, our objectives were to (1) develop a predictive model of suicidal ideation among college students with a machine learning model; and (2) identify the most predictive factors.

Methods: We used random forest models to predict suicidal ideation among 346 French college students involved in the French CONFINS longitudinal cohort. We created models for predicting suicidal ideation at follow-up, based on 128 potential predictors reported at baseline that reflected socio-demographics, health, lifestyle habits, familial characteristics, and COVID-19-related characteristics.

Results: The most important predictors identified were depressive symptoms, self-reported mood, and anxiety symptoms. The predictive models showed moderately good mean values for the area under the receiver operating characteristic curve (0.74), sensitivity (0.69), specificity (0.74), and negative predictive value (0.89). To a lesser degree, the level of stress before the COVID-19 pandemic, optimism about the quality of life after lockdown, and health literacy contributed to the suicidal ideation prediction. In a subsample of students that did not report suicidal ideation at baseline, the main predictors were quite similar.

Conclusions: Few factors were required for predicting the SI. The strongest predictors were related to the college student’s mental health, and they were not specific to the pandemic. These findings may facilitate the development of a routine screening tool for the early identification of students at risk.

Exploring maternal mortality in Southern Ethiopia: a qualitative study

Niguse Kares1, Mary Codd2, Takele Tadesse3, Abenet Desalegn1
1School of Public health, Wolaita Sodo University, Wolaita Sodo, Ethiopia,
2School of Public health, Physiotherapy and Sport Science, University College Dublin, Ireland,
3School of Public health, Wolaita Sodo University, Sodo, Ethiopia,
4School of Medicine, Wolaita Sodo University, Wolaita Sodo, Ethiopia

Background: Maternal mortality in Ethiopia is the fifth highest in the world, estimated to be 401/100000 population. Even though Ethiopia has been applying strategies to reduce maternal mortality such as Basic (BEmOC) and Comprehensive Emergency Obstetric Care (CEmOC), upgrading health facilities, training health officers and midwives, providing institutions with essential equipment, and regular monitoring and supervision, maternal mortality is still unacceptably high. The objective of this study is to explore factors associated with maternal deaths in the Wolaita Zone, Southern Ethiopia.

Methods: The study used a grounded theory method with theoretical sampling. Four focus group Discussions (FGD) with 24 health care providers at four hospitals, and in-depth interviews with 10 family members of deceased mothers in Wolaita Zone who were identified from hospital records and from maternal death response officers and health extension workers in the district were carried out. All interviews and focused Group Discussion (FGD) were recorded, transcribed, and analysed using NVivo software with constant comparison analysis.

Results: Grounded data from FGD and in-depth interviews revealed factors very likely associated with and contributing to the high maternal death from health care providers and deceased family perspectives. The Findings evolved as important were heavy bleeding, uterine rupture, delay in decisions to seek care, delay in getting to hospitals, and delay in receiving adequate health care.

Conclusions: To reduce maternal mortality to Sustainable Development Goal (SDG) 2030 level, maternal complications found in this study along with others should be given critical emphasis from service users, health care providers and government.

Data quality assessment of mHealth systems: strengths, potential limitations and opportunities for improvement; Case of Yendanafe system in Neno District, Malawi

Othmaneolumba1, Woldemichael Kudambo1, Fabien Munyanze2, Rex Wong3, Chiyembekeza Kachimanga4, Karim Benali5
1University of Global Health Equity, Rwanda, 2University of Global Health Equity, Malawi, 3Partners in Health Malawi, Rwanda, 4University of Global Health Equity, United States, 5Partners in Health Malawi, Malawi, 6Havard University, Algeria

Background: Good quality data enables proper decision making in healthcare settings leading to better planning, higher management efficiency and improved patient outcomes. The Yendanafe data system in Malawi was designed to promote comprehensive patient care and improve public health services through an evidence-based approach. This study assessed the quality of the Yendanafe data system.

Methods: All available data in the Yendanafe data system for the year 2021 were analyzed in their data completeness, timeliness, accuracy, and consistency by measuring against the who recommended standards. A quantitative survey was conducted on a random sample of community health workers at six participating sites to identify end-user perspectives on the system and potential sources of variability.

Results: The median completion rate was 100%, significantly higher than the who recommended standard of 90% (p=0.043). The overall timeliness of the Yendanafe system was 87.4%, significantly higher than the who recommended score of 80% (p=0.001). The overall average accuracy rate was 48.8%, significantly below the who recommended accuracy rate of 95% (p=0.001). The overall consistency was 98.77%. The strength of the system included having a language that is easy to understand (86%), having enough time to synchronize data into database (99%) and the ability to make edits in case information is wrongly filled (88%). However, some respondents found the phone were not user-friendly (86%), the system operated slowly (75%) and limited previous experience in collecting data via phone (85%).

Conclusions: The Yendanafe system is an innovative and powerful tool that has the potential to revolutionize data collection and use to contribute positively to the improvement of the healthcare system in Malawi. Future studies to validate the accuracy of the Yendanafe system and to assess the accuracy of EMR data systems are needed. More technical support was needed and the design of the system could be improved.

DOI: 10.18332/popmed/165432

Medical artificial intelligence readiness of medical students in Turkey

Seyda Sungur1, Didem Oktar2, Selma Metintas1, Muhammed Onsu2, Mediha Bal1
1Department of Public Health, Faculty of Medicine, Eskisehir Osmangazi University, Eskisehir, Turkey

Background and Objectives: Medical artificial intelligence readiness (MAIR) is the state of readiness of the health care provider in the knowledge, skills and attitude to use health care-Artificial intelligence (AI) applications in its mix with their own professional knowledge. The study aimed to measure the MAIR level of medical students and related variables amalgam with own professional knowledge and related variables. Methods: This cross-sectional study was conducted on 108,876 medical students in Turkey in the 2022 spring semester. In the questionnaire, sociodemographic characteristics, participants thoughts on AI and AI usage areas were questioned. MAIR was measured with the MAIR Scale for medical students (MAIRS-MS). MAIRS-MS was found to be a valid and reliable (Cronbach’s alpha 0.87) for evaluating and monitoring medical students’ on AI technologies and applications. The questionnaire was administered on digital platforms with online Google forms.

Results: The study group consisted of 2407 students, 55.6% of whom were female. The scores obtained from the scale ranged 22-110, with a median of 67. Of 60.4% students scored above the average. Among the areas where AI is used in health services, the most known was medical imaging with 59.3%, and the least known was early response planning and needs analysis for disasters with 17.9%. MAIR level was higher in those who had heard of AI before, studied AI, knew the use of AI in medicine, reported more than three areas of AI in medicine (p<0.001). Of 70.0% students thought that AI should be included in their curriculum. The students stated that AI is safe in medicine (47.8%), can be used in their professional business work (44.3%), but it might be abused (43.4%). Conclusions: The AI readiness level of future physicians is moderate. More educational programs for the applications of AI in medicine are recommended for medical students.

DOI: 10.18332/popmed/165464

Patient satisfaction on the utilization of Video Observed Therapy (VOT) at the Vicente Sotto Memorial Medical Center (VSMMC), Cebu City, Programmatic Management of Drug Resistant Tuberculosis Satellite Treatment Center (PMDT STC) during the COVID-19 pandemic

Anro Begontes1, Grace Melchor1, Alfredo Lim1, Vince Araneta1
1Vicente Sotto Memorial Medical Center, Cebu City, Philippines

Introduction: The face-to-face directly observed treatment (DOT) of multi drug resistant tuberculosis (MDRTB) was constrained by the implementation
of community lockdowns and travel restrictions to contain the Severe Acute Respiratory Syndrome Coronavirus-2 (SARS-CoV-2). The pandemic resulted in disruptions of the usual operations in almost all sectors of the Philippines. The development of a new strategy like video telephony technology in healthcare have raised the remote video-observed treatment (VOT) as an alternative approach to DOT for monitoring. The utilization of this new strategy in our present setting in Cebu City, Philippines has to be explored yet.

Objective: To assess and determine the patient's satisfaction on the utilization of VOT among MDR Tuberculosis patients in the time of COVID 19 pandemic at the PMDT – VSMMC from May 2022 to July 2022.

Methods: A purposive sampling method was utilized involving the enrolled patients at PMDT STC. The patient satisfaction with VOT was measured using survey questionnaires from the study of Sekandi et al., (2020).

Design: The study design used in this research were both descriptive and analytical cross-sectional study during the COVID-19 pandemic within the time period of May 2022 to July 2022.

Results: Among the 45 respondents, 95.6 % were satisfied with the mode of therapy and 4.4 % were not. Most of the patients, 55.6%, recommend the VOT in the management of MDRTB. The Fisher's Exact Test showed that there were no significant associations existing among the different demographic parameters.

Conclusions: Video Observed therapy is an acceptable method of monitoring among patients receiving MDRTB treatment in VSMMC, wherein the respondents of the study were satisfied with this mode of therapy and recommends its use. This innovative mode of treatment can be used in a pandemic period wherein lockdowns or travel restrictions interfere with DOT.

Popul. Med. 2023;5(Supplement):A578
DOI: 10.18332/popmed/165465

Italy’s journey throughout the pandemic: sentiments and attitudes in 2 million tweets
Andry Melnyk1, Andrea Agostini2, Mario Nurchis2, Gerardo Altamura1, Chiara Cadeddu1, Fidelia Cascini2, Walter Ricciardi1
1Department of Life Sciences and Public Health, Università Cattolica del Sacro Cuore, Roma, Italy, 2ETH Zurich, Switzerland

Background and Objective: Artificial Intelligence (AI) and Machine Learning (ML) techniques offer an opportunity for profound analysis of public attitudes, sentiments, and key discussion topics from a diverse range of sources, including social media data. Among social media platforms, Twitter offers a unique and potentially powerful data source due to its ease of access, real-time nature and support for academic endeavors. The analysis of tweets allows identification of dominant themes, topics, and changing trends pertaining to the pandemic, lockdowns and vaccinations. This might fundamentally improve public health programs, policies and vaccine rollout strategies both locally and nationally.

Methods: Twitter API v2 for academic purposes was used to extract Italian language tweets using a keyword set. Daily twitter volume and 2000 sample tweets per day were obtained from February 21st, 2020, to December 1st, 2022. A hybrid algorithm combining a rules-based approach and machine learning, specifically tuned for Italian, classified tweets according to sentiment (positive or negative) and topics (topic modelling). Weighing daily twitter volume, a Regression Discontinuity Design was used to identify changes in attitudes around a spectrum of relevant national events (e.g., pandemic, policies, COVID Certificate).

Results: A total of 287 patients were included (115 pediatrics, 124 diabetology/endocrinology, and Pediatrics were included in the study. A 40-items survey was administered by trained researchers to the patients who were waiting for the visits. Characteristics of the visits ("first visit" or "follow-up visit", use of medical devices) were also retrieved. Specific criteria were defined to select the visits that could be potentially delivered in telmedicine.

Analyses: A cross-sectional study was conducted in outpatient facilities located in Piedmont, Italy. Patients referred to Neurology, Diabetology/Endocrinology, and Pediatrics were included in the study. A 40-items survey was administered by trained researchers to the patients who were waiting for the visits. The median number of visits per patient was 9.3 (IQR 6.0-12.0). The most common visits were for diabetes (n=11) and neurological disorders (n=10). The most common device used was a glucose meter (n=22), followed by a blood pressure monitor (n=9) and a pulse oximeter (n=7).

Conclusions: Telemedicine is a useful tool to deliver care to patients who have difficulties to reach healthcare facilities. During the recent COVID-19 pandemic period, the use of telmedicine increased exponentially. However, the use of this tool could be further incremented. The aim of this study was to analyze the prevalence of specialist outpatient visits currently delivered in presence that can be delivered via telmedicine, and the potential predictors of the willingness of the patients to use this tool.

Methods: A cross-sectional study was conducted in outpatient facilities located in Piedmont, Italy. Patients referred to Neurology, Diabetology/Endocrinology, and Pediatrics were included in the study. A 40-items survey was administered by trained researchers to the patients who were waiting for the visits. Characteristics of the visits (“first visit” or “follow-up visit”, use of medical devices) were also retrieved. Specific criteria were defined to select the visits that could be potentially delivered in telmedicine.

Results: A total of 287 patients were included (115 pediatrics, 124 diabetology/endocrinology, 48 neurology). The percentage of specialist outpatient visits that could be provided via telmedicine was 2.6% for pediatric visits and 5.2% for other specialties. When considering deliverable in telmedicine also the visits in which medical devices were used, the percentages reached 38.7% overall. In 51.9% of cases, the assisted person declared the willingness to do the visit via telmedicine. Potential predictors of this willingness were the educational level and the age of the person.

Conclusions: Patients demonstrated the willingness to use telmedicine for specialist outpatient visits. However, to date it is difficult to increase the number of visits that can be provided remotely. There is the need of investments in new technologies, and to raise awareness among the most hesitant categories of persons about the use of this service.

Popul. Med. 2023;5(Supplement):A581

Mobile-assisted medication adherence support intervention among tuberculosis patients: a parallel group randomized control trial
Zekariyas Sahile1, Anthony Maeder2, Lua Perimal-Lewis2, Paul Arbon2
1Flinders University Ambo University, Department of Public Health Ethiopia, 2Flinders University Australia

Background: There is conflicting evidence regarding the efficacy of SMS texts to promote TB medication adherence. Thus, we developed a mobile-assisted medication adherence support (Ma-MAS) intervention using the medical research council (MRC) framework based in a local context targeting audience needs and the effectiveness of this intervention evaluated in a sample of TB patients in Addis Ababa, Ethiopia.

Methods: A parallel group randomized control trial design was used to evaluate the effectiveness of Ma-MAS intervention. In total, 186 adult TB patients (93 per group) were randomly assigned 1:1 to one of the two groups. Participants in the Ma-MAS group received daily SMS texts and weekly phone calls regarding their daily medication intake and reminders to attend clinic visits for 8 weeks. Participants in the control group did not receive SMS texts or phone calls but received the same routine standard care as the Ma-MAS group. The primary outcome was the proportion of adherence measured by urine test for isoniazid (INH) metabolites at the end of the 4th and 8th week of follow-up period. Analysis of a multivariable binomial generalized linear model was employed to evaluate the effect of Ma-MAS at P value< 0.05.

Results: Ma-MAS significantly improved adherence to TB medications by 15.25% (95% CI: 5.38, 25.12; P value=0.0065) after 8 weeks of intervention compared to the standard care alone in the control group. At the end of 8 weeks follow-up period, the predicted probability of adherence to TB medication in the Ma-MAS group was 86% (95% CI: 81, 93), and in the control group was 70% (95% CI: 61, 79). Ma-MAS also improved adherence to TB medication by 15.30% (95% CI: 6.68, 23.90; P value=0.0022) after 4 weeks of intervention compared with the control group.

Conclusion: Ma-MAS intervention based on information-motivation-behavioural skills model and behavioural change techniques is useful to improve adherence to TB medication.

The Italian national artificial intelligence platform to enhance health experience and outcomes
Domenico Mantoan1, Elettra Carin1, Alice Borghini1, Simone Furfaro1, Roberta Costi1, Domenico Mantoan1
1National Agency for Regional Health Services (AGENAS), Via Piemonte 60, 00187 Rome, Italy

Background and Objective: In this study we intend to build a model to evaluate the attitude of Italian doctors towards AI applications in medicine and evaluate the factors that predispose them to be more favourable to its use. Methods: A 27-item questionnaire was distributed from September 1 and October 15 2022 to physicians from different healthcare facilities and with different background, using snowball technique. Statistical analysis: First, the descriptive statistics (mean, standard deviation) were computed. A confirmatory factor analysis was performed to reduce the items on the Aptitude for AI scale and the reliability was evaluated through the Cronbach's alpha index. To predict the new variable, a multiple linear regression was performed. Finally, to classify the units into groups, a hierarchical and then, a non-hierarchical cluster were performed. For all tests the significance level considered was p<0.05. Analyses were conducted with Stata v16 software.

Results: Globally 500 physicians fully responded; 54% men, mean age 50.53 years (SD +/-15.54). 38% of whom with more than 20 years of professional experience. The factor of AI explained 83% of the original variability and Cronbach’s alpha was 0.81. The variables statistically significant in the regression model were Telemedicine, Clinical decision support system, Training and education of physician, Multi professional teams, Partnership, AI systems final supervision and Equity, with R2=0.6761. The subdivision in clusters was associated only with the type of use (X22 = 41.9499; p<0.001) and not with gender (X22 = 1.1471; p’= 0.284); area of competence (X22 = 7.0801; p’= 0.528) and professional experience (X22 = 5.7251; p’= 0.221). Conclusions: PAITA is the first study with a large number of Italian doctors’ attitudes toward AI and its results might represent a starting point for monitoring doctors’ trust and issues regarding AI in the medical field in order to entail several future interventions.
in health is undeniable, still there are many issues that concern the users such as privacy, the complex and opaque relationships between analysis performed by AI and clinical output, efficacy and effectiveness of AI tools. The aim of this study is to analyse the impact of the introduction of a national AI platform for primary care. Methods: A before-and-after study will be performed by AGENAS to analyse the efficiency and effectiveness of the AI platform over a time span of 12 months of implementation. Objective of General Practitioners (GPs) working in the community health houses using the AI platform will be selected and indicators will be analysed at baseline, 6 and 12 months. A survey to analyse satisfaction of patients and GPs will be carried out. Results: The national AI platform is funded with 40 million euros by NextGenerationEU plan and a call is ongoing to commit its realization. The first release of the AI platform will be implemented by 2024. The overall number of GPs in Italy is 39.270, the sample will involve a significant number of them, at least 1 doctor per urban zone (as defined by Istat) per region. The indicators measured will be about the utilization of the platform, changes in diagnosis and therapy. The questionnaire will survey the satisfaction of both patients and GPs using the platform. Conclusion: The implementation of the AI platform is expected to enhance access to health services for patients, and accuracy and timeliness of diagnosis and therapy for professionals as well as enhance the experience of care and reduce the administrative burden on professionals. Digitalisation and AI can produce massive changes in health and can lead to a new era in health delivery.

Moral health resources assessment using Mobile Application Rating Scale (MARS)

Hyewon Lee1, Hyewon Lee1, Oral Health Workgroup, WFPHA2, 1World Federation of Public Health, Seoul National University School of Dentistry and Dental Research Institute, Korea, Republic Of, 2World Federation of Public Health, Switzerland

This presentation aims to showcase how the World Federation of Public Health Association’s (WFPHA) oral health workgroup identified assessment tools and a set of questionnaires to evaluate moral health and web-based resources that promote oral health literacy and training in oral health. The presentation will showcase how the oral health workgroup from 13 different countries identified moral health and web-based resources and evaluated them using mars and other questions. The presentation will also discuss the dissemination of such resources, which align with the first two priority goals of the WHO’s implementation guide on mobile technologies for oral health. In 2021, the WHO published a guideline on moral health focused on promoting oral health, training health workers, detecting oral health conditions, collecting data and disseminating such resources, which align with the first two priority goals of the WHO’s implementation guide on mobile technologies for oral health.

Support to responsive parenting through m-health

Svetlana Mladenovic Jankovic1, Dusanka Matijevic2, Gordana Tamburkovski2, Aleksandra Andric1, Marija Markovic2, Nezamje Stefanovic2, Andjelka Grujicic2, Nevenka Kovacevic2, Inga Mijakovic1, Jelena Vasojevic2, Aleksandra Vuckovic3, Vladimir Glisovic4, Svetlana Mlitenovic1
1Institute of Public Health of Belgrade, Serbia

Background: Mobile applications on child health and development are available resource for improvement of parental capacities and promotion of positive family environment. Mob app “Bebbo” is comprehensive interactive guide for parents and offers different functionalities as daily reads, monitoring child development, reminder for preventive checkups and immunization, advices for stimulation child development. The application was created based on the prototype of the application “Hello Baby - Your companion in parenthood” developed by UNICEF in Serbia and the Institute for Public Health with the Nordeus. The UNICEF regional office for Europe and Central Asia enabled the application to be improved and to cross the borders of Serbia and start living under the new, international name “Bebbo” in as many as 11 countries and territories, in 19 language variants. The objective of this paper is to represent utilization of mobile application. Method: Retrospective analysis of data on mob app utilization in Serbia between Oct 2021 and Nov 2022. Data were available through mob app statistics. Results: More than 39000 users downloaded mob app from Play store and App store. Most of them are parents, mainly mothers of newborns and infants. Articles that raised most of the attention of users were about child development, nutrition and breastfeeding, health and wellbeing, immunization, play and learning, responsive parenting, safety and protection. Most popular games were about stimulation of motor development, language and communication, and socio-emotional development. Most of users was interested in monitoring of child milestones, and less in measuring of child growth. Functionalities on child checkups and immunization has been also utilized. Conclusion: The mobile application “Bebbo” was used by parents for various contents of importance for childrens health. Aspect of child development was most prominent through articles and functionalities most used. Data on mobile app utilization is important tool for further content management.

Health care risk assessment of the effectiveness and efficiency of COVID-19 remote patient telemonitoring

Chiara Parretti1, Micaela La Regina2, Paul Barach3, Riccardo Tartaglia1
1Department of Science Engineering, Marconi University, Rome, Via Plinio 44 00192 Rome, Italy, 2Healthcare Agency S La Spezia, Via Fazio, 30 La Spezia, Italy, 3Jefferson College of Population Health, United States

Background and Objective: The COVID-19 pandemic accelerated the spread of telemedicine (TM). The WHO stresses the importance of developing digital solutions with the goals of making care more effective, safe, and of better quality. While market forces are eager to drive innovation, problems with usability and intraoperability remain. We analyzed two TM applications in different Italian facilities. The objective was to highlight key gap areas of criticality, and to develop a proactive implementation model to guide implementation of future effective telemedicine services.

Methods: We analyzed the inherent risks of TM using robust mixed methods, including failure mode and effects analysis (FMEA), a prospective, team-based risk management methodology structured to identify high-risk process system vulnerabilities and failures before they occur. We report on a remote patient monitoring (RPM) program in which 200 COVID-19 patients were followed remotely to evaluate the effectiveness in treating and monitoring patients in home settings. Results: We demonstrated that a telemedicine device reduced the number of hospitalizations and costs significantly. Assessment based on FMEA offers important insights and considerations for evaluating the future implementation of RPM and the direction of TM. Telemedicine solutions are technically feasible, easy for staff to use, achieving high adherence rates, but rigorous evaluation of devices and platforms is needed to clarify their value and guide optimal adoption strategies.

Conclusions: Telemedicine saved lives and improved decision making during the pandemic, helped prevent the collapse of the health care system, and had a positive impact on continuity of care, quality of life, and self-care. Integration of electronic medical records and telemedicine devices represents a compelling innovative solution that could greatly improve quality of care and lower the error rates. Rigorous and ongoing evaluation of devices and platforms is essential to clarifying their value and guiding national decisions and adoption programs.
position. We also want to establish if blockchain technology will provide a more secure mechanism for protecting patient records and payments. Methods: Examined 34 global research and professional writings published between 2008 to 2022 to assess the future and recognize the potential of cryptocurrency and blockchain technology. Reports were analyzed using qualitative research methods. Results: Dozens of medical cryptocurrencies/digital coins are already available to purchase and spend. Using cryptocurrency will provide a more secure decentralized payment platform that does not use third-party financial intermediaries. Adopting blockchain technology is a safe component of protecting payments and patient records. It uses cryptography that makes data modifications virtually impossible once recorded; it promotes fidelity, transparency, and security. Data can only be altered if you alter all subsequent blocks, which requires a consensus of the network majority. Blockchain technology also protects against ransomware attacks on healthcare providers and facilities. United Healthcare Group, Anthem, and Aetna are a part of a group to test blockchain technology. 55% of U.S. Executives plan on investing 1M USD in blockchain technology. Companies are creating EMR systems powered by technology to be prepared for adoption. Conclusion: The evidence indicates an upcoming disruption in how we finance our office visits, co-pays, co-insurance, procedures, hospital stays, and prescriptions. It also suggests that cryptocurrency and blockchain technology in healthcare will become more mainstream within the next ten years. With common sense governmental regulation and the stabilization of the crypto market, cryptocurrency can augment the financial position of a hospital or private practice if appropriately managed.

Fluoride-related misinformation analysis on Twitter: Infodemiology study

Mathew Lotto\(^1\), Zakir Irfhana\(^2\), Jasleen Kaur\(^1\), Zahid Butt\(^1\), Thiago Cruvinel\(^1\), Plinio Morita\(^1\)

\(^1\)School of Public Health Sciences, University of Waterloo, Waterloo, ON, Canada, \(^2\)School of Public Health Sciences, University of Waterloo, Waterloo, ON, Canada, India

Background & Objectives: The presence of misinformation on social media significantly harms communities since accessing trustworthy information is a ground principle for people to achieve better health-related outcomes. In this context, antimicrobial use is broadly shared on social media, deceiving people about fluoride's relevance and safety. Considering the potential negative implications of online fluoride falsehoods, the present study aimed to analyze fluoride-related misinformation on Twitter.

Methods: First, 23,436 tweets were collected using the Twitter Application Programming Interface (API) from the keyword “fluoride-free” between May 2016 and May 2022. After data preprocessing, Latent Dirichlet Allocation (LDA) topic modeling techniques were applied with retain 21,169 tweets to determine the salient topics linked to the falsehood. Finally, time series decomposition methods were applied to define fluoride misinformation trends and seasonality over time using pandas, NumPy, and statsmodels.tsa seasonal libraries in Python 3.

Results: From a coherence score of 0.542, a total of 3 different salient topics emerged from the LDA topic modeling analysis. As a result, fluoride-related misinformation was mainly associated with the people's perception of a healthy lifestyle (topic 1), followed by the consumption of natural and organic oral care products (topic 2), and recommendations of fluoride-free products and measures (topic 3). Notably, all topics displayed a decreasing trend between 2016-2019 and an increasing trend from 2020 onwards. Moreover, they presented a seasonal pattern of searches with peaks mainly at the beginning and middle of each year. Conclusion: Fluoride misinformation was primarily related to personal concerns about a healthier lifestyle. The recent increasing trends of falsehoods have likely contributed to the popularization of fluoride-free products and the suspension of fluoridated water community programs. Hence, user-centered digital health strategies are required to control the spread and consumption of fluoride misinformation on social media.

Can the apple watch ECG app be successfully used for measuring stress?

Pedro Velimovský\(^1\), Paulo Alencar\(^2\), Mathew Lotto\(^1\), Scott Leatherdale\(^1\), Donald Cowan\(^1\), Plinio Morita\(^1\)

\(^1\)University of Waterloo, 162 McGarry Dr, Canada

Background and Objective: Stress is a major public health issue correlated with severe health conditions, including depression, obesity, and cardiovascular diseases. Public health efforts typically are designed regarding the self-perceived stress of people. Interestingly, new advances in smart technology can support stress quantification, complementing traditional measurement methods. Hence, this study aimed to examine the evidence of stress among the Canadian population using the Apple Watch ECG app.

Methods: Forty-one participants were invited to use an iPhone 7 and an Apple Watch 7 for 2 weeks to measure self-perceived stress and ECG metrics six times per day. The iPhone contained an app that collected ECG from Apple Watch and allowed participants to self-report stress through a questionnaire composed of the Depression, Anxiety, and Stress Scale (DASS-21) and a Likert-based scale question about self-perceived stress level. Both scales were dichotomized into non-stress and stress concerning a cut-off score of 14 points for DASS-21 and 2 points for the single item. Statistical analysis was performed using the Statistical Package for Social Sciences (v. 28.0). First, Heart Rate Variability (HRV) data were extracted from the ECG. Next, the data normality and homogeneity were determined using the Kolmogorov-Smirnov and Levene tests. Then, Mann-Whitney was used to compare HRV variables with self-perceived stress. For all analyses, P<.05 was considered significant.

Results: Several features were statistically significant, including the standard deviation of NN intervals (SDNN), the root mean square of successive differences (RMSSD), the heart's acceleration (AC) and deceleration (DC), and several high-frequency features. Conclusion: Features widely used in HRV analysis (SDNN, RMSSD) proved statistically significant when measuring stress. In addition, AC and DC are relatively new indicators and lack research with a focus on stress, suggesting new avenues of research. Ultimately, the results support using the Apple Watch ECG to study stress.

Background and Objective: Telemedicine is a powerful tool for managing patients affected by COVID-19 patients. Our study aims to evaluate the use, barriers and facilitators of the “Lazio ADVICE” telemedicine platform according to General Practitioners (GPs) and Family Paediatricians (FPs) of the LHA Roma 1 to contrast the pandemic. This could be useful for the wider implementation of telemedicine in primary healthcare.

Methods: We performed an interview-based survey composed of questions investigating the demographic information of GPs/FPs, the knowledge of the COVID-19 patients.

Results: We interviewed 214 physicians (21.75% of the total population): 89 (41.59%) users and 125 (58.41%) non-user. Older age and working in District 1, 14 and 15 (vs. District 13) significantly reduced the probability of using the platform by the physician.

Among the users, 19 (21.35%) used the platform every day or even several times a day, 40 (44.34%) several times a week but less than one access per day, 30 (33.71%) several times a month. Most of them (92.26%) consider the platform useful. Suggested improvements: integration between physician’s applications (86.26%), presence of data regarding COVID-19 diagnosis and contact tracing (69.6%), facilitating access and usability (52.81%). Difficulties: poor integration (86.26%), presence of data regarding COVID-19 diagnosis and contact tracing (69.6%), facilitating access and usability (52.81%).

Conclusion: The COVID-19 pandemic has accelerated the implementation of
telemedicine services. Telemedicine for monitoring patients has potential but certainly, to be competitive it must offer something different or additional than telephone consultation.

Digital divide older adults’ approach to digital health: an integrative review
Elisabetta Corvo1, Walter De Caro1
1Canterbury Christ Church University, United Kingdom, 1CNAI Italian Nurses Association, Italy

Introduction: There is a growing use of in primary and secondary care facilities of digital health in terms of receiving exam results, repeating prescriptions, health promotion, and disease prevention. There is a general agreement in the literature that this approach is cost-efficient and time efficient for National Health Systems, specific health facilities, and, more generally, for individuals’ health. Due to the demographic change in Europe, there is a high number of older people. The introduction of technology to improve health promotion and health care provided to citizens must be balanced by a sufficient level of participation and use of the technology itself by all citizens, especially by those who potentially have the most need (older adults).

Methods: This integrative review aims to identify the state of the arts across Europe regarding access, use, and confidence in using digital health technology by older people (65+). Three central databases have been interrogated: Pubmed, Cinahl, and EMBASE in the last 5 years. Inclusion criteria were research carried out in English, focused on older people above the age of 65.

Results: The results displayed a frustration perceived by older people in using these tools of which they recognize the usefulness but at the same time need to have perfect mastery. Results show a general difficulty for older people to access hospital portals, due to a need for digital and health literacy and a general lack of confidence about privacy and security in disclosing their data on the internet.

Conclusion: If, on the one hand, these technologies have demonstrated value in the management of some illnesses and in facilitating the patient-health system relationship, these mustn’t become a barrier to adequate access to care which is a social determinant of health. A process of education and support for older people should be implemented.

DOI: 10.18332/popmed/163878

A systematic review of conversational artificial intelligence for smoking cessation
Hollie Bendotti1, Henry Marshall2, Sheleigh Lawler1, Coral Gartner1, David Ireland3
1The University of Queensland, Thoracic Research Centre, Faculty of Medicine, Australia, 2The Prince Charles Hospital, Queensland Health, 3The University of Queensland, School of Public Health, Faculty of Medicine, Australia

Background: Conversational artificial intelligence (AI) (chatbots, dialogue systems and virtual agents) is an emerging tool for tobacco smoking cessation which has the potential to emulate personalised human support and increase engagement. We aimed to determine the effect of conversational AI interventions with or without standard smoking cessation interventions on smoking cessation outcomes among adults who smoke, compared to no intervention, placebo intervention or an active comparator.

Methods: A comprehensive search of six databases was completed in June 2022. Eligible studies included randomised controlled trials (RCTs) published since 2005. The primary outcome was sustained tobacco abstinence, self-reported and/or biochemically validated, at least 6 months. Secondary outcomes included point-prevalence abstinence, sustained abstinence of less than 6 months. Data extraction of cessation outcomes and risk of bias assessments was completed independently by two authors.

Results: Five RCTs met inclusion criteria (n=58,796) from 819 studies; all differing in setting, methodology, intervention, participants and endpoints. Conversational AI interventions included chatbots embedded in multi- and single component smartphone apps (n=3), a social media-based (n=1) chatbot, and an internet-based avatar (n=1). Random effects meta-analysis found participants in the conversational AI enhanced intervention were significantly more likely to quit smoking at the end of the trial compared to control group participants (RR = 1.61, 95% CI (1.21, 2.13), p < .001). High heterogeneity was found between studies (Q(4) = 53.84, p<.001), as well as high overall risk of bias. Loss to follow-up was generally high.

Conclusion: There is limited but promising evidence on the effectiveness of conversational AI interventions for smoking cessation. While all studies found benefit from conversational AI interventions, substantial heterogeneity means the results should be interpreted with caution. Given the rapid evolution and potential of AI interventions, further well-designed RCTs are warranted in this promising area.

Evaluation of data management systems for COVID-19 vaccine roll-out in Australian health systems: a public health perspective
Bret Gutierrez1, 2
1The University of Melbourne, Melbourne School of Population and Global Health, E. Rodriguez Sr., Ave., Quezon City, Philippines

Vaccination is one of the greatest breakthroughs in public health and remains one of the best weapons against infectious diseases. Health Information Systems (HISs) are cloud-based, population-focused and confidential public health platforms that aid the COVID-19 vaccination programme at Northern Health Australia. They established their own HIS on vaccination while CVMS was being developed. This paper uses the RE-AIM (Reach, Effectiveness, Adoption, Implementation and Maintenance) framework, based on continued involvement in the implementation of two immunisation information systems: COVID-19 Vaccination Management System (CVMS) and the in-house Northern Health System (NHS). Through engagement with various stakeholders, the author established analytical frameworks, a logic model and HIS documentary analysis from a public health perspective with an emphasis on three major HIS utility parameters. The key findings are (1) vaccination information systems promote vaccine equity among populations, (2) information systems promote improved decision-making of clinicians and government, which strengthens the health system and (3) vaccination information systems evaluate the safety and effectiveness of vaccines. Despite the challenges, the two immunisation HIS are instrumental in improving vaccination-related activities from managing and consolidating data in the booking system, AIR data compliance and adverse events reporting, are used to guide policymakers and further support public health emergency decision-making. The ideal system would centralise data exchange, submission and analysis across the whole state, provide easy accessibility to the public, and promote coordination between stakeholders for continuous improvement. However, it is worth noting that balancing requirements while setting up these large systems may imply a longer development time.

Digitize to reach and track: An retrospective analysis of digitalized immunization data for children under one year in Bangladesh from Pre-COVID and during-COVID era
Avijit Saha1, Mahbub Latif1, Md. Hossen2, Zahid Hasan3, Malabika Sarker1
1BRAC James P Grant School of Public Health, BRAC University, 6th Floor, Medona Tower, 28 Mohakhali Commercial Area, Bir Uttom A K Khandaar Road, Dhaka-1213, Bangladesh, 2Institute of Statistical Research and Training (ISRT), 3EPI & Surveillance, EPI, DGHS, MoHFW, Bangladesh, 4UNICEF Bangladesh, United Nations Children’s Fund, UNICEF House, Plot # E-30, Syed Mahbub Morshed Avenue, Sher-E-Bangla Nagar, Agargaon, Dhaka-1207, Bangladesh

Objective: We analyzed the digitalized e-Tracker data intending to calculate vaccination coverages, dose timeliness, and dropout rates for children under one year of age from Pre-COVID and during-COVID era

Introduction: With an impressive track record in expanding childhood immunization and an inclination to adopt digitalization in healthcare service delivery, Expanded Program on Immunization (EPI) Bangladesh piloted the e-Tracker intervention in Moulavibazar district and Dhaka South City Corporation (Zone-5) from 2019 till the end of 2021.

Method: With help from Health Management Information System (HMIS) and UNICEF Bangladesh, we retrieved e-Tracker data for infants born between January 1, 2019, and December 31, 2021. Childhood vaccination coverage and dropout rates were determined using a Traditional approach traditionally used by WHO and a Conditional technique with a modified denominator. Using a multivariate logistic regression model, we examined the relationship between vaccination rates and birth cohorts, mother education, and location.

Result: The conditional estimation yielded a lower full vaccination coverage...
Changing dimensions in immunization: Implementation research on the E-tracker intervention for improving vaccination of children in Dhaka and Moulivibazar, Bangladesh
Humayra Anwar1, Saima Mehjabeen2, Ajivit Saha3, Md. Hossen4, Md. Islam Fuad5, Zahid Hasan6, Malabika Sarker1
1BRAC James P Grant School of Public Health, BRAC University, 6th Floor, Medona Tower, 28 Mohakhali Commercial Area, Bir Uttom A K Khandakar Road, Bangladesh, 2EPI Bangladesh, Directorate General of Health Services, 3COOPERATION PAYS ANG MERS DE DEVELOPPEMENT COPE NGO, Nyololo, Tanzania, 4EPI Bangladesh, Directorate General of Health Services, 5UNICEF Bangladesh Background: Achievement in the national Expanded Programme on Immunization (EPI) is globally recognized as an example in Low- and Middle-Income Countries (LMICs). However, the 2019 Coverage Evaluation Survey (CES) shows that 84% of children are fully vaccinated nationally. Digital solutions like mobile phone help reduce vaccination program challenges. Therefore, Bangladesh has been implementing a pilot intervention of individual electronic tracking (e-tracking) of children in Moulvibazar District and Dhaka South City Corporation and planning to scale it up. Objective: The current implementation research was conducted to understand the implementation process, success, and challenges of the e-Tracker system in Bangladesh and obtain lessons learned and scaling-up recommendations. Methods: The study followed the embedded mixed-method design, including both beneficiaries and implementers. This study occurred in selected areas of Moulivibazar District and Zone-5 of Dhaka South City Corporation and lasted from 1st April to 30th June 2021. A secondary analysis of existing vaccination coverage data of both the e-Tracker and the paper-based system was performed. Data were analyzed using Re-AIM Implementation Framework. Results: According to the implementors, they get individual accurate coverage data, minimize dropouts, avoid mistakes, monitor, and recognize invalid doses from a single device. The caregivers receive SMS reminders of the child’s vaccination date, yet many reported not receiving the SMS regularly. The frontline workers initially struggled to use the device. The e-tracker system creates additional load and requires regular troubleshooting and will require regular internet support and technical staff, especially from the government. Conclusion: This study found that the e-Tracker can produce accurate real-time data and identify dropouts; however, we need technology friendly manpower, feasible technology, the uninterrupted internet, and logistics support with a sustainable maintenance mechanism to implement and scale up this technology-dependent intervention successfully.

Mortality and Adverse Health Outcomes Associated with Telehealth: Systematic Review and Meta-Analysis
Fidelia Cascini1, Paul Barach2, Walter Ricciardi3
1Università Cattolica del S. Cuore, Italy, 2Thomas Jefferson University, United States Background: The COVID-19 pandemic’s contagion has forced healthcare to use telehealth. Evidence shows significant risks of telehealth use and potential issues that could compromise patient safety and decrease quality of care. This study aims to systematically review telehealth interventions assessed by randomized controlled trials (RCTs) and their effects. Methods: We searched for randomized controlled trials of interventions to patients that received any type of telehealth tool as an intervention and compared it with a control group that also reported outcomes. We searched for PRISMA guideline English-language studies published until March 2021 in multiple databases including PubMed, Embase, and Scopus. Studies were categorized according to methodological quality, sample size, intervention characteristics, outcome, statistical significance, and direction of effects. A meta-analysis of sufficiently homogenous studies was conducted after quality assessment and data extraction. Results: Of the 5,144 articles identified, 78 were included in the review. 8 were chosen to perform 2 separate meta-analyses (n=4 for each). The first assessed mortality rate in heart failure patients, showing the pooled relative risk of mortality to be 0.60 (95% CI, 0.0999-3.5478), p<0.42. The second assessed mortality in patients with cardiac implants: the pooled relative risk of mortality was 0.65 (95% CI, 0.4389-0.9541), p=0.028. Pooled qualitative assessment of the remaining studies was performed, producing two groups: telerehabilitation and miscellaneous studies. Conclusions: The results suggest that monitoring patients using telehealth techniques is associated with 40% lower mortality risk among patients suffering from heart failure or cardiac implants, compared to those who received traditional care methods. Telerehabilitation was observed to be comparable with the conventional rehab methods. Telehealth applications that manage chronic disease resulted in lower or comparable mortality rates and hospitalization/re-admission rates. Cognitive behavioral and online psychotherapy show promise as alternative to conventional methods. Telehealth should be considered a safe alternative to traditional medical procedures.

Implementation of the PANDA mHealth system for providing a positive pregnancy experience in Tanzania
Susanna Campani1, Stefania Paduano1, Athanase Lilungulu2, Theresia Masoi2, Anna Maltesi3, Federica Stornelli4, Giovanna Stancaneli4, Maria Rweyemamu5, Lucia Borsari6, Anne Benski7, Alex Ernest8, Iypana Mwapagatwa9, Paola Borella10
1Department of Biomedical, Metabolic and Neural Sciences, Section of Public Health, University of Modena and Reggio Emilia, Modena, Italy, 2Department of Obstetrics and Gynecology, University of Dodoma, Tanzania, 3Cooperazione Paesi Emergenti, COPE NGO, Nyololo, Tanzania, 4Terre innovative Healthcare s.r.l., Catania, Italy, 5Department of Public Health, AUSL Modena, Modena, Italy, 6Service d’obstétrique - Département de la femme, de l’enfant et de l’adolescent - Hôpitaux Universitaires de Genève, Genève, Suisse, 7Takemi Program in International Health, Harvard T.H. Chan School of Public Health, Boston, USA, 8Swaziland Background and Objective: Antenatal care (ANC) is an essential component of women's reproductive health. Many women face difficulties in attending high-quality ANC visits for a positive pregnancy experience in low/lower-middle countries, such as Tanzania. Information and Computer Technologies (ICTs) are part of the core solutions for bridging the coverage and quality gap in health care. In the Pregnancy And Newborn Diagnosis Assessment (PANDA) system is a mHealth system that incorporates WHO recommendations for ANC. This study aimed to assessing the effectiveness of PANDA system in provision of high-quality ANC in Mufindi district, Tanzania. Methods: A cluster-based non-randomized interventional trial were performed from June 2019 to September 2020 to compare the quality of ANC visits by using PANDA system in the intervention site with standard visits conducted in the control site. We enrolled pregnant women attending at analogous health facilities in both sites. The indicators used to assess the ANC quality were: performed measurements and screening tests (syphilis, HIV, malaria, hemoglobin, glucose, height/weight, blood pressure, temperature, fetal movement, fundal height, urine dip stick), and prophylaxis provided for malaria, anemia and intestinal worms. Data Analysis was done using SAS version 9.4. Results: A total of 597 pregnant women at the implementation site and 398 at the control site were enrolled. Most of them were in the age group 25-34 years (44.9%) and 15-24 (42.3%). The majority (60.6%) had more than one pregnancy. In the implementation area a significant higher coverage of performed screening tests and provided prophylaxis was recorded compared to the control area except for malaria prophylaxis. The provision of mebendazole and iron/folic acid was significantly higher in the intervention site. Conclusion: PANDA system has been shown effective in providing ANC according to WHO recommendations for a positive pregnancy experience. We recommend the mHealth solution for bridging the quality gap in low/lower-middle income countries.
Feasibility of telemedicine in anaesthetic preoperative evaluation: the organisational management experience of a teaching hospital in Italy

Martino Godoy1, Daria Bucci1, Manuel Stocchi1, Giorgio Marra2, Federico Esposti1, Carlo Signorelli1

1Università Cattolica del Sacro Cuore, Italy, 2Amsterdam University Medical Center, Netherlands

Background and objectives: Personalized medicine is defined as a medical model that aims to provide tailored prevention and treatment to individuals, potentially impacting healthcare systems worldwide. Nonetheless, it requires healthy citizens to share their health data to assess their health status correctly. With this survey, we investigate the attitudes of citizens in different EU countries towards personalized medicine and data sharing.

Methods: Through the YouGov platform, we distributed an online 30-question survey to citizens from 9 EU countries (Italy, the Netherlands, France, Germany, Spain, Hungary, Romania, and Poland). Inclusion criteria were 18 years of age or above, citizenship in an EU country, and living in an EU country. Participants not satisfying any of these criteria were excluded.

Participation was voluntary and unpaid. The survey was divided into four sections: Knowledge and opinions on personalized medicine and genetic tests, Data use and sharing, Personalized medicine governance, and Citizens’ needs. The performed statistical analysis is descriptive and comparative, including univariate tests (T-Test, Mann-Whitney test, chi-squared test). The STATA 16 software is used to perform statistical significance; a significance threshold was set at < 0.05.

Results: 6500 citizens from 8 EU countries participated: 1000 from Italy, 1000 from Germany, 1000 from France, 1000 from Spain, 1000 from the Netherlands, 500 from Hungary, 500 from Romania, and 500 from Poland. Participants were spread evenly among the age range 18-99. Detailed statistical analysis is still ongoing, but preliminary results show attitudes to be more favorable in younger generations. In contrast, older people are generally more hesitant to share data for health purposes.

Conclusion: Personalized medicine can potentially change the classical medical paradigm of diagnosis-treatment towards a prevention-oriented system. Notably, an approach that considers people's opinions is needed. Our work addresses this issue in detail with a multi-country approach.

Identification and classification of tobacco-promoting social media content at scale using deep learning: a mixed-methods study

Hüseyin Küçükali1,2, Mehmet Sarper Erdoğan1

1Department of Public Health, Istanbul University - Cerrahpasa, Istanbul, Turkey, 2Centre for Public Health, Queen's University Belfast, Belfast, United Kingdom

Background and Aim: Marketing activities of the tobacco industry on social media as an escape area have become salient in recent years. Whether its commercially motivated or not, exposure to tobacco-promoting content on social media is shown to influence subsequent tobacco use. Artificial intelligence technologies may help tackle this problem where existing policies and tools are insufficient for timely primary prevention. This study aims to develop an artificial intelligence powered tool that can automatically identify and classify tobacco-promoting content on social media.

Methods: This study is designed as a sequential mixed-methods study where qualitative analysis preceded quantitative one. A probabilistic sample (n=5000) from tobacco-related tweets that are published on Twitter in October 2020 (n=177,684) is selected. Four major tobacco-promotion mechanisms were identified deductively: tobacco promotion, price promotion, health promotion, and regulating prescriptions of psychotropic drugs.

Results: Tobacco promotion in social media content was predicted with a recall of up to 87.8% and precision of up to 81.1%. The mean number of tobacco-promoting tweets per day was 2360.1 ± 599.4 and they constituted 39.8% of all tobacco-related tweets. Tobacco promotion was more frequent among tweets that are original, mentioned by another user, published at the night, and from a mobile device.

Conclusion: We developed an “infoveillance” tool that makes it possible to monitor tobacco-promoting social media content near real time. This tool may strengthen tobacco control policies and create new opportunities for health promotion practice.

Popul. Med. 2023;5(Supplement):A603
DOI: 10.18332/popmed/164106

A Scoping Review of the Existing Telemedicine Applications in India: Learnings for the Future

Vanita Singh1, Vanita Singh2

1Management Development Institute, Gurgaon, India

Background: Countries, including India, were quick to adopt telemedicine for delivering primary care in response to the widespread disruptions in routine healthcare delivery due to COVID-19 pandemic. This expeditious adoption was critical and the challenges faced during this exigency could guide the design and delivery of future telemedicine applications for primary care delivery.

Methods: With an aim to identify challenges in delivering primary care via telemedicine technology in Indian context a scoping review was conducted using popular medical database (PUBMED) and largest database of peer-reviewed literature (SCOPUS). Drawing from the systems approach in healthcare delivery, the review findings challenges are summarized at four levels, patient, provider, healthcare organizations, and, policy.

Results: Out of the 247 search results, 13 articles met our inclusion criteria. This review highlighted that telemedicine facilitated continuity of care during COVID-19 but not without challenges. Low levels of education and computer literacy along with language barrier posed challenges at patient level. Providers were challenged due to limited skills in using systems, and had concerns related to efficiency and effectiveness of remote consultations, legal liabilities, and unethical behavior of patients. The healthcare delivery system faced challenges in ensuring an integrated care as there was lack of integration with diagnostics, pharmacies, and other departments. The current policy landscape falls short in addressing data privacy and security concerns, unethical behavior by patient, or provider, and regulating prescriptions of psychotropic drugs.

Conclusion: Telemedicine has the potential to improve primary healthcare delivery and address health system challenges even beyond COVID-19. The reviewed telemedicine applications in India mirrors the existing fragmented healthcare delivery system. There is a need to acknowledge and factor-in the interconnectedness of health system elements and organize health system elements
Fostering exchange of genomic data between European countries for clinical and research purposes: the genomic data infrastructure (gdi) project

Stefania Boccia1, Flavia Beccia1, Giovanna Calabro2, Roberta Pasturino3, Giovanni Comandé4, Domenico Covelli5, Marco Morelli6, Graziano Pesole7, Giovanni Tononi8, Francesco Causio9, Sara Farina9, Luigi Russo2, Andry Melnyk2, Serena Scollen9

1Università Cattolica del Sacro Cuore Firenze, 2Scuola Superiore S. Anna Pisa Italy, 3Uniper Italia, 4Elixir United Kingdom, 5Scuola Superiore S. Anna Pisa Italy, 6Istituto Gianna Gaslini IRCCS Italy, 7Elixir United Kingdom, 8IRCCS S. Matteo Pavia Italy, 9Università Cattolica del Sacro Cuore Firenze

Background and Objectives: The genomic data infrastructure (GDI) is a common and integrated framework designed to facilitate the exchange of genomic, clinical, and associated data between adhering countries and organizations for clinical and research purposes. GDI is an OEG (One Genomics Europe Group) initiative aiming to foster the exchange of genomic data between European countries for clinical and research purposes. This paper describes the project's activity since its launch in November 2022.

Methods: The GDI project was launched in November 2022 to start the scale-up and sustainability phase of the 1+MG initiative. It includes 44 partners from 20 countries, divided into 8 Work Packages across three pillars (Long-term sustainability, 1+MG infrastructure, and Application and innovation solution).

Results: Over 4 years, the GDI project will establish a federated data infrastructure across Europe for genomic and clinical data. It will also design and implement a communication strategy to inform citizens and policymakers and ensure their trust.

Conclusion: The GDI project will provide data access and governance to genomic and clinical data across adhering countries, integrating them and making them available for clinicians and researchers safely and sustainably.

Improving the effectiveness of telemedicine in rural communities: reflecting on client and provider experience of esanjeevani jharkhand

Aditya Naskar1, Shilpa Bhatte1, Neha Verma1, Amit Parab1, Rajeev Kumar1, Shivshankar Kumar1, Ashok Tigga1, Praveer Mahto1, Sanjay Kumar1, Shyamal Santra1, Lalit Pathak2

1Intelehealth India, 2Transforming Rural India Foundation India

Background: Recently, the government of Jharkhand has adopted a web-based comprehensive telemedicine platform – named esanjeevani– to provide specialist care for consultations in rural areas. Under this program, rural health and wellness centers (HWCS) are upgraded to enable teleconsultations by connecting patients to remote doctors through audio or video calls.

Objective: To identify processes and enablers of improving outcomes of telemedicine services under esanjeevani with patient-reported outcomes, acceptability of telemedicine among providers and clients, and their perceptions on service delivery.

Methods: A mixed method approach was used combining cross-sectional surveys and qualitative interviews with clients and providers. 500 clients and 119 health providers across five districts were surveyed, and in-depth qualitative interviews were conducted with 10 health providers and 20 clients.

The analysis is guided by the implementation research framework suggested by the medical research council to identify processes and facilitators integral to shaping outcomes.

Findings: The findings indicate that esanjeevani is perceived as an affordable and easily accessible health service delivery platform – with clients emphasizing a reduction in health expenditure and improved provider availability. Overall, we estimate that telemedicine saved 21.59 km in distance traveled and INR 941.51 per health visit. Community health officers and frontline workers were identified as the primary drivers of the intervention. Providers also reported a high level of acceptability in terms of perceived usefulness and ease of use and highlighted the need for continued capacity building and behavior change to increase the adoption of the platform.

Conclusion: The esanjeevani program has been effective in providing affordable quality specialist consultation to patients in rural communities, especially women.
However, there are a few challenges such as the need for improvement in reducing over-referrals, creating community demand, capacity building of the telemedicine workforce, and challenges related to deficits in digital infrastructure in rural contexts.

DOI: 10.18332/popmed/164255

An exploration of mothers’ and fathers’ perspectives on a mhealth application to support parents in the first 1,000 days of life
Laura Brunelli1, Sofia Bussolaro1, Raffaella Dobrina2, Chiara Vita1, Elena Mazzolini1, Giuseppe Verardi1, Maura Degrassi3, Maria Piazza4, Andrea Cassone5, Anja Starc6, Giuseppe Ricci4, Sara Zanchiello1, Tamara Stampalija7, Department of Medical, Surgical and Health Sciences, University of Trieste, Trieste, Italy, 1Healthcare Professions Department, Institute for Maternal and Child Health - IRCCS “Burlo Garofolo” - Trieste, Italy, 2Area Science Park, Trieste, Italy, 3Department of Medical, Surgical and Health Sciences, University of Trieste, Trieste, Italy, Obstetrics and Gynecology Clinic, Institute for Maternal and Child Health - IRCCS “Burlo Garofolo” - Trieste, Italy

Background and objective: The first 1,000 days of life play a crucial role in the child's health and development. However, existing mHealth solutions often provide unreliable information about this critical period, without considering the real needs of parents and, worse still, usually neglecting fathers. We explored the information needs of both parents for a hypothetical mobile application to support the first 1,000 days.

Methods: Between May and August 2022, we enrolled new and expectant parents attending an Institute for Maternal and Child Health in north-eastern Italy in a cross-sectional study. We administered a 39-item questionnaire on a 5-point Likert scale (0-not important at all; 4-absolutely essential) to assess the importance of a set of content about pregnancy and postpartum provided by the proposed application. Based on mean scores (M±SD), items with ratings greater than or equal to 3.5 were identified as top ranked items related to priority content.

Results: Priorities differed between mothers (n=94) and fathers (n=69). Five of the six top ranked items for fathers were related to “pregnancy”, including general information about pregnancy (3.7±0.6), information about possible infections (3.6±0.7), examinations to be performed (3.5±0.7), and delivery (3.5±0.7). Conversely, six of the nine top ranked items for mothers fell into the “postpartum” domain, including information about neonatal complications and warning signs (3.7±0.9), tips for the postpartum recovery process (3.5±0.8) and newborn care (3.5±0.7), information on breastfeeding practices (3.5±0.9), neonatal screening procedures (3.5±0.8), and risk prevention measures related to the newborn (3.5±1.1).

Conclusion: Overall, the fact that fathers focus on pregnancy might indicate that they are more “unprepared” for this phase compared to mothers who are ready to face the postpartum period. Valuing the different perspectives of mothers and fathers is essential to develop mHealth solutions that promote gender-equitable family empowerment to deftly navigate the first 1,000 days of life.

DOI: 10.18332/popmed/164255

Improving vaccination distribution on the “last mile” or in complex challenging situations
Coll MacDouglall-Hunter1, Uwe Wimna2, 1Hunter Global Tracking Ltd, 2Out Task AG

Background and objective: Cold chain logistics still frequently stops at the final distribution centre before embarking on the tough ‘last mile/low-income settings’; more rudimentary transport takes over (human, donkey, bicycle, drone, SUV). Recent WHO/UNICEF and independent reports sounded alarms as June 2022 data show global vaccination coverage continued to decline in 2021: 25 million infants missing out on lifesaving vaccines, due in part to supply-chain unavailability/disruptions that damaged at least 25% of vaccines (some cases up to 80% potency loss, the largest sustained decline in childhood vaccinations in approximately 30 years). In places of complex challenges around delivery (infrastructure, climate, floods, civil/ military conflicts, ...), the objective is to progressively improve vaccine distribution – hence vaccine potency and overall impact by introducing innovative but inexpensive technologies, to reduce waste, inefficient deliveries, theft, fraud.

Methods: 2 simultaneous on-going levels:
*equip any carrier fleet, current and future, for position tracking and content status monitoring with basic robust IoT labels/tracking systems, avoiding manual data capturing, providing transparency of current ‘invisible’ units.
*introduce an active, rugged, compressor-based, self-refrigerating/autonomous, IoT-smart Cold Box/vaccine carrier, powered by solar and battery, with IoT components/sensors; currently under development; PoC pending WHO Certification.

* Trials/evaluation of transport ‘last mile’ by Health Authorities, vaccination programmes.

Results:
* massive increase of live data enabling analysis of deficiencies, hence remedies;
* reverse sample logistics becomes possible;
* overall vaccine potency increases dramatically;
* paradigm shift from random short-term to long-term controllable mobile cooling units.

Conclusion: implementation of both aspects - upgrade of ‘invisible’ vaccine carriers and introduction of active, smart, carriers will significantly extend ‘last mile’ or ‘broad use’ vaccine logistics efficiency, facilitating coverage of Public Health Authorities’ vaccination campaigns in countries with issues.

The overcome of public health research data management chaos: exploratory study on research infrastructure implementation
Mélanie R. Maia1,2, Marta Pina, Mariana Pyrotecn, Luís V. Lapão1,2, 1UNIDEMI, Department of Mechanical and Industrial Engineering, NOVA School of Science and Technology, Universidade NOVA de Lisboa, Caparica, Portugal, 2Laboratório Associado de Sistemas Inteligentes, LASI, Guimarães, Portugal, 3Comprehensive Health Research Center, NOVA Medical School, NOVA University of Lisbon, Lisboa, Portugal

Background and objective: Digital healthcare research infrastructures integrate data, global health, people, processes, and technology. Public health decision-makers face problems of access to data and the current debate focuses on ethical and data protection issues, looking for systems’ interoperability constraints. The aim of this study is to understand the process of digital healthcare research infrastructures.

Methods: The study is a literature review on digital healthcare infrastructures integrating data supplemented with two use cases of public health research implementation focusing on data management and protection processes at different scales (centralized-national and distributed-federated).

Results: The use cases presented are different in scales and nature, having multiple levels of constraints in the research infrastructure pipeline
1. National, Portugal: literature identifies the bottleneck at the implementation and interoperability levels, for research systems. Review on national data protection emphasizes official deliberations, since the European general data protection regulation (GDPR) launch, focusing on health databases protection, the need of improving communication among institutions and professionals, and less bureaucratic processes for local implementation of health information systems. 2. Europe (EU) member states: review on EU official decisions on the adequate protection of personal data in the context of international research data flows, points to the need of FAIR processes and share of data. The bottleneck seems to be at national health security level, where policy dialogue is of major importance and national affairs need to be protected. Sharing data can be vulnerable, therefore, is controlled, sometimes not reflecting the process.

Conclusion: Jurisprudence, official and unofficial institutional documents, and peer review research publications give an important documental subtract for this research. First-hand experience will contribute to the reveal and validation of main constraints and possible solutions for the research problem. A roadmap for health research data protection implementation, in Portugal following the EU context is being set-up.

Popul. Med. 2023;5(Supplement):A611

Tooth detection and numbering in panoramic radiographs using an artificial intelligence approach
Aneesa Ayoub1, Venkatesh Vaddadi2, Phaneendra Yalavarty2, Chandrasekhar Janakiram1, 1Amrita School of Dentistry, Kochi Amrita Vishwa VidyaPeetham, Kochi Amrita School of Dentistry, Amrita Institute of Medical Science Campus, Ponrakkara P.O-682041 India, 2Indian Institute of Science, Bangalore

Introduction: Panoramic radiography is an imaging method for displaying maxillary and mandibular teeth together with their supporting structures. Artificial intelligence (AI) system was used to detect and number teeth on panoramic radiographs.
Methods: A data set of 600 randomly chosen panoramic radiographs of adults was used to train the system. The teeth numbering module classifies detected teeth images according to the FDI notation. It utilizes the classical VGG-16 CNN for the spatial arrangement of teeth.

Results: The total numbers of true positive, false positive, and false negative results were recorded and consequently, the estimated sensitivity, precision, and F-measure were 0.9652, and 0.9006, respectively.

Conclusions: The deep convolutional neural network system was successful in detecting and numbering teeth. Clinicians can use AI systems to detect and number teeth on panoramic radiographs, cephalometric landmark detection, teeth structures segmentation and teeth classification for dental recording.

Implementing a Pregnant Women And Birth Registry in Karachi, Pakistan to provide digital identity to newborns and administer birth dose vaccinations
Vijay Dharna1, Mubarak Shah2, Nida Aslam3, Danya Siddiqi4, Subhash Chandir5
1IRD Pakistan Pakistan, 2IRD Global Canada, 3IRD Global United Kingdom, 4IRD Global United States

Background and objective: Despite concerted efforts to achieve universal and equitable immunization coverage, many children are still missed since they have no formal record of existence, making it difficult to track these 'invisible' children. We developed an electronic pregnant women and birth registry (eir) module that enrolls pregnant women and newborns visiting birthing facilities into a centralized database connected to the provincial electronic immunization registry (zindagi mehfooz; zm eir) in sindh province, pakistan.

Methods: We implemented the eir module at 15 birthing facilities in 8 ‘super high-risk union councils’ (shrucs) in karachi, based on the prevalence and circulation of poliovirus and low routine immunization coverage. Pregnant women and their newborns were enrolled into the eir at the birthing facility through assigning them a unique qr-code based identifier that linked them to the provincial eir. We evaluated the impact of the eir on birth dose immunization coverage and timeliness among enrolled newborns.

Results: Between november 10, 2020, and december 31, 2021, we enrolled 33,335 pregnant women and 99.5% (17,942/18,021) of the children born at the birthing facilities. 88% (15,712/17,945) of the newborns were administered the birth dose of the polio vaccine at the facility, of which 99% (15,666/15,712) were vaccinated within 24-hours of birth. We observed that coverage rate for birth dose polio vaccine (93%) was higher among children enrolled in the eir through pwbr compared to those enrolled through other modalities (immunization centers, outreach, etc.) (43%). Timeliness of subsequent vaccines was also higher for children enrolled through pwbr compared to those enrolled through other modalities.

Conclusion: A birth registry module integrated in existing imc health systems can effectively provide newborns with a digital identity and link them to the health system for effectively tracking their immunization status till completion.

Designing and developing a telehealth services implementation model for tribal areas in nashik district, maharashtra
Vibha Bhirud1, Dhanshree Apsinghekar2, Shipa Bhatte3, Priyanka Vichare4, Yogesh Lahinge1
1Intelehealth India

Introduction: Telemedicine canvas was developed to be used as a template to design and develop telehealth interventions in a given geographical or cultural context. Villages in the tribal area of nashik district, maharashtra in india, have little to no access to primary health care services. The areas are poorly connected to the main city of nashik and at times completely cut off during the monsoon season. Telemedicine will enable the villages to access good quality primary healthcare without the need to travel long distances.

Aim: To design and develop telehealth services for tribal communities materials and methods: a community needs assessment was conducted to identify the scope of work, context, challenges, and opportunities through in-depth interviews with community members, health workers, and local health providers. The implementation team, doctors, and internal evaluation team conducted a workshop to map priorities, opinions, and perceptions using the telemedicine canvas. The workshop was followed by a baseline survey to gather data for socio-demographic, gestational, wash, health access, and expenditure data from the community.

Findings: The community needs assessment helped focus the discussions during the workshop and helped define the goals and scope of work of the program. Discussions guided by the telemedicine canvas helped develop a theory of change, requirements for the software application, and baseline survey. The
Creating a clinical decision-making algorithm in order to build a
on health knowledge repository to help support and improve the
public health surveillance system

Plácida Maholela1, Osvaldo Frederico2, Ioncêncio Chongo1, Júlio Rafael1
1Instituto Nacional de Saúde (Mozambican National Health Institute)
2Mozambique, 3Inlamea Instituto Nacional de Saúde (Mozambican National Health Institute), 4Instituto Nacional de Saúde (Mozambican National Health Institute) Mozambique Mpoki Mwabuki Sokoine University

Recording and reporting diseases within the community is still a high burden and in a country such as Mozambique, with low capacity for risk management of emerging and re-emerging diseases especially in remote areas, early detection or capture has been considered crucial. Using mobile devices to capture disease cases has enhanced timely reporting and prompt response of disease events, particularly those cases that do not report to the health facilities, preventing the health surveillance system from being able to assemble and include the information in their database for future decision-making purposes. Nevertheless, these same captured events can be used as a tool to promote early detection of cases, through the prediction of likely disease conditions based on the signs and symptoms reported, thus contributing for the reduction of disease spread and the occurrence of pandemics and at the same time promoting and enhancing local capacity for case management.

Health technicians from health facilities will be traced and asked to participate in a questionnaire-based interview, where data on their experience with clinical manifestations of emerging and re-emerging disease, as well as endemic disease cases will be compiled. This data will then be compared to a preset clinical manifestation scores map, which will then be weighed and associated with a cases location namely dengue fever, human and animal rabies, measles, hand-foot-mouth disease (HFMD), and tuberculosis. The locations of reported cases are mapped to display the numbers of active cases around any selected search point. Hence, public will be able to see the number of active cases for each disease reported from their point of search.

Methods: Verified reports of each diseases were analyze and geocoded by Malaysian health authority. Mapping of the geocoded data from each infectious disease cases location have been used to create a database. The number of infectious disease cases shown does not include the name, address, latitude, or longitude or any means of disclosing the patients’ exact coordinates. The duration of active cases varies from one disease to another while the distance depends on the type of infectious disease. It ranges from a radius of 200 metres for dengue cases and up to a radius of 5 km for hand-foot-and-mouth disease.

Conclusion: This feature is mainly to create awareness among the public regarding the risk of infectious diseases that may exist around their area. High-risk individuals (children, elderly, immunocompromised) can avoid from going into areas with high number of active cases. The community can arrange for cleaning campaign and conveying the information via social circle (e.g. WhatsApp group, Telegram channel, Facebook) especially during gatherings. This approach advocates the shift from a disease-oriented model to a person-centred wellness approach. The health authority and society work together in more effective ways of communicating about the virus, and how public able to keep themselves safe. This initiative indirectly empowering the public with health information towards putting a stop to an outbreak and improves population health.

Infectious disease tracker-mysejahtera mobile apps
Husni Hadi1
1Ministry Of Health Malaysia

Background and objective: Infectious disease tracker is a feature in MySejahtera mobile health apps that provides real time number of active infectious disease cases location namely dengue fever, human and animal rabies, measles, hand-foot-mouth disease (HFMD), and tuberculosis. The locations of reported cases are mapped to display the numbers of active cases around any selected search point. Hence, public will be able to see the number of active cases for each disease reported from their point of search.

Methods: Verified reports of each diseases were analyze and geocoded by Malaysian health authority. Mapping of the geocoded data from each infectious disease cases location have been used to create a database. The number of infectious disease cases shown does not include the name, address, latitude, or longitude or any means of disclosing the patients’ exact coordinates. The duration of active cases varies from one disease to another while the distance depends on the type of infectious disease. It ranges from a radius of 200 metres for dengue cases and up to a radius of 5 km for hand-foot-and-mouth disease.

Conclusion: This feature is mainly to create awareness among the public regarding the risk of infectious diseases that may exist around their area. High-risk individuals (children, elderly, immunocompromised) can avoid from going into areas with high number of active cases. The community can arrange for cleaning campaign and conveying the information via social circle (e.g. WhatsApp group, Telegram channel, Facebook) especially during gatherings. This approach advocates the shift from a disease-oriented model to a person-centred wellness approach. The health authority and society work together in more effective ways of communicating about the virus, and how public able to keep themselves safe. This initiative indirectly empowering the public with health information towards putting a stop to an outbreak and improves population health.
Telehealth as a tool to optimize the pre-hospital pathway: An extreme case study in southern Italy

Anna Gagliardi1, Francesca Troiano2, Carmela Pulcro3, Giuseppe Furia4, Patrizia Chicherini5, Maddalena Quintili6
1University of Foggia Department of Economics Via Romolo Caggese, 1, 71121 Foggia FG Italy, 2Local Health Authority Roma 1, 3Local Health Authority Roma 1 Risk Management Area Borgo Santo Spirito, 30019 Roma RM Italy, 4Local Health Authority Roma 1 Hospital Management Area Borgo Santo Spirito, 30019 Roma RM Italy, 5Local Health Authority Roma 1, 6Local Health Authority Roma 1 Risk Management Area Borgo Santo Spirito, 3 00193 Roma RM Italy

Background and Objective: The COVID-19 pandemic has had a significant impact on health systems around the world. In particular, the suspension of scheduled surgical activities, guaranteeing only urgent surgeries, has inevitably lengthened the waiting time for treatment of patients with a diagnosis other than COVID-19, resulting in inefficient management of the operating rooms. This study aims to describe the advantages of telehealth services for managing patient operations and care. METHODS This study, focusing on a dataset including 166 major surgery interventions from the data warehouse of the "Casa Sollievo della Sofferenza Research Hospital" (Italy) from January 2021 to November 2022, examined, in particular, the Pre-hospital Pathway. The research, analyzing the leading Key Performance Indicators and comparing them between the two years of investigation (2021 in the absence and 2022 in the presence of the telehealth service), highlighted potential changes in organizational and operational dynamics. RESULTS The main results indicate a better efficiency of the Time Management of the operating room. The data show a significant reduction "of the index of re-planning of surgical operations" from 16.27% in 2021 to 7.5% in 2022. In addition, the number of surgeries performed in the operating room has been optimized from 71.4% in 2021 to 90% in 2022. CONCLUSION Introducing the telehealth service in the Pre-hospital Pathway is a valuable tool to spread the culture of Change Management within the health organization. Enhanced operations management and improved patient experience are the tangible results of this study.

The use of social media-communities by diabetes patients - a scoping review

Hocke-Bolte Zora1
1University of Education Schwäbisch Gmünd Germany

Background and objective: There are over 420 million people with diabetes worldwide. The World Health Organization (WHO) estimates that the number of diabetes-related deaths will double by 2030. Living with diabetes requires the ability to seek and apply health information. The aim of the scoping review is to find out what evidence is available for social media usage by diabetes patients and whether it is being used to search for health information or to obtain emotional support.

Methods: A scoping review was conducted to report relevant literature published prior to 2022. Attention was paid to the emphasis of digital health literacy, emotional support and variations within the different studies.

Results: There are a lot of new methodological approaches, which are published frequently as pioneering work. Emotional support often plays a more important role in the use of social media than seeking health information, but in-depth understanding and explanatory patterns are lacking.

Conclusion: Future studies should investigate what explanatory patterns can be used to understand social media use by diabetes patients. Those would allow improved targeted health promotion and prevention measures.

Telemedicine and chronic patient: perceived effectiveness of asthmatic children’s caregivers

Elisabetta Ceretti1, Caterina Antonelli1, Cristina Quecchia1, Valeria Grettet1, Raffaele Badolato2
1University of Brescia Department of Medical and Surgical Specialties, Radiological Sciences and Public Health, University of Brescia Italy, 2University of Padova Master Degree Course in Health Assistance, University of Padova Italy, 3ASST Spedali Civili, Brescia Paediatric Allergology Clinic, Child Hospital, ASST Spedali Civili, Brescia, Italy, 4University of Brescia Department of Clinical and Experimental Sciences, University of Brescia Italy

Introduction: The outbreak of the Coronavirus pandemic and the restrictions imposed to limit Sars-CoV-2 circulation have prompted the use of telemedicine as an alternative method of assistance, especially for chronic patients. The aim of the study was to evaluate the perceived effectiveness of introducing telemedicine into a diagnostic therapeutic-educational pathway (DTEP) of asthmatic children treated at the “Io e l’Asma” Centre of the Children Hospital, ASST Spedali Civili in Brescia, Italy.

Methods: From July to September 2022, a questionnaire was administered to a sample of caregivers of asthmatic children who made at least one telemedicine visit in the period between March 2020 and September 2022. The 28-questions questionnaire was divided into three macro-areas concerning subject personal data, number and type of visits and perception about the visits, respectively.

Results: We collected 108 questionnaires. Most of the subjects were parents, female and Italian, and participated in more than one telemedicine visits: 58% of the subjects were satisfied of the organization of the telemedicine visits, stating they were willing to continue them even after the pandemic had ended. Furthermore, 75% of subjects experienced empathy with the doctor despite the distance, in contrast with the belief about telemedicine which claims that the absence of direct contact between doctor and patient negatively affects the conduction of the visit.

Conclusions: Telemedicine at the Io e l’Asma Centre was introduced for necessity in 2020, during the pandemic; but, its sudden introduction did not allow the planning of a gradual integration strategy between traditional and telemedicine visits, and better preparation and training of patients and practitioners. However, the results of the study showed that the caregivers of asthmatic children appreciated use of telemedicine for assistance of asthma which could integrate the traditional approach for treating the disease.

Methodological approaches based on machine learning in the use of big data in public health: a systematic review

Giuseppe Migliara1, Antonio Sciuti1, Maria De Biasiis1, Valentina De Nicolò1, Daniela Mercuri1, Valentina Baccolini1, Carolina Marzuzzo1, Paolo Villani1, Corrado Vito1
1Sapienza University of Rome Department of Public Health and Infectious Diseases Piazzale Aldo Moro 5, 00168, Rome Italy

Background and objective: Since the past few years, there has been a growing interest for the use of massive amounts of data - i.e., the Big Data - in medical research, for their potential role in changing the approach to personal care, medical care and public health. However, part of the difficulties in introducing Big Data in Public Health is constituted by the problem of abandoning the classical statistical methodology in favour of the methodologies mainly based on machine learning (ML). We performed a systematic review to investigate the ML methodologies used in studies of interest for public health, with particular attention to their development and validation.

Methods: The research was performed in PubMed, Scopus, and Web of Science databases. Studies investigating risk prediction reporting use of ML methodologies in public health fields of interest were included. The following data were extracted: study design, target population, data source, type of machine learning algorithm used, study objective, methodological approaches used in the development of the ML algorithms.

Results: The search retrieved 26340 records. 26 studies were included. 15 studies used Random Forest models, while the use of other types of models was more sporadic. The risk of overfitting of the models developed in the 24 studies that used supervised algorithms, based on tuning methods, internal validation methods and external validation methods, was found to be high in 6 studies, low in 15 studies and minimal in 3 studies.

Conclusions: Almost a third of the studies used approaches inadequate for the tuning, training, and validation of machine learning algorithms. Only three studies applied appropriate external validation techniques. These methodologies will have to be carefully guided, both in the standardization of their development, and in the assessment of their effectiveness, to ensure that their potential can bring real benefits to the entire population.

Exploring data visualizations as a tool to make ai more accessible for qualitative researchers in the healthcare field

Luka Mazza1, Luka Mazza1, Jim Wallace1, Plinio Morita1
1University of Padova Master Degree Course in Health Assistance, University of Padova Italy, 2ASST Spedali Civili, Brescia Paediatric Allergology Clinic, Child Hospital, ASST Spedali Civili, Brescia, Italy, 3University of Brescia Department of Clinical and Experimental Sciences, University of Brescia Italy
Background and objective: Qualitative data analysis allows healthcare researchers to understand lived-experiences of patients and practitioners. However, it requires time and effort, which is not always available. A potential way to assist is to use artificial intelligence as a tool to help researchers with data exploration. However, many qualitative researchers do not have programming skills to use AI and are reluctant to lose their sense of agency and serendipity when conducting research. As a potential way to bridge this gap, we explored the use of data visualizations to foster researcher agency and make AI more accessible.

Methods: We used Design Science Research to develop a series of prototypes. First qualitative semi-structured interviews were conducted with 5 qualitative researchers to gauge how they interacted with their data and what they expected of data visualization for working with AI. The interviews were guided by the concept of agency and how it can be fostered through media interaction. Then, the results were compiled into guidelines for the development of 4 datavis prototypes, each focusing on fostering agency through a different channel.

Results: Researchers reported needing freedom to move within a visualization the most. High levels of tactile interactivity increased the trust in the AI and made participants feel like they were working as a partnership. Additionally, freedom to co-create the visualization instead of being presented with a finished product was cited as satisfying. Both males and females preferred personal ownership of the data and trust in AI. Overall, data visualizations seem to show promise in making AI more accessible for people with no programming experience.

DOI: 10.18332/popmed/164352

**Impact of digital health interventions for adolescents with type 1 diabetes mellitus on health literacy: a systematic review**
Aurélia Naef

1. MHH, Germany

This systematic review provides an overview on the impact of digital health interventions for adolescents with type 1 diabetes on health literacy and derive recommendations for further research.

Background: Evidence shows that living with diabetes mellitus type 1 (T1DM) in adolescent age is particularly challenging and difficult to manage. A high level of health literacy is important to prevent and avoid debilitating complications. Despite the increasing prevalence and incidence of T1DM and the large use of digital health interventions, little is known about the association between this use and health literacy.

Methods: Electronic searches were performed in five databases: PubMed, The Cochrane Library, EMBASE (via Ovid), Web of Science and PsycINFO from 2011 to 2021. In addition, grey literature searches were conducted. Relevant studies that have been missed by electronic and hand-searching strategies were searched in the reference lists of all included studies. The review followed PRISMA guidelines. Two researchers screened abstracts for inclusion eligibility and applied the inclusion and exclusion criteria to the relevant full-text articles. Quality was assessed.

Results: Out of 981 studies, 22 were included in the final review. Most primary studies included in this review were judged as moderate overall risk of bias or with some concerns and most of the secondary studies as critically low quality reviews. Our findings suggest that the interplay of health care providers (HCP) and patients through social media helps the management of the disease. This corroborates Bröder et al. (2017) dimension of 'communication and interactions' in their concept of health literacy.

Conclusions: For adolescents with T1DM, social media may be a specific and beneficial intervention for an improved communication and interaction with their HCP. Further research should investigate what specific form of social media suits best for such adolescents.

**Popul. Med. 2023;5(Supplement):A626**

**A pilot randomized trial for smoking cessation app in Arabic language: a study protocol**
Ola Soudah, Alameen Alsabbah, Mo'men Dalalal'al'n, Carmen Svanès

1. Faculty of Medicine, Yarmouk University, Jordan, 2. Faculty of Medicine, The University of Bergen, Norway

Tobacco consumption in the middle-east region is very high. Many smoking cessation apps show to be effective in reducing smoking rates. To date, smoking cessation apps in Arabic mostly are translated from English. No study tested the apps efficacy of the Arabic version in our region. Moreover, the cultural context is not addressed. The purpose of this study is to develop a smoking cessation app in Arabic (iEndSmokin, ﬁffffffff fffffff) and to examine its efficacy. The app will be based on clinically proven behavioral therapy as Cognitive-Behavioral Therapy (CBT) and Acceptance Commitment Therapy (ACT). In this pilot randomized clinical trial, smokers will be randomized and allocated in a 1:1 ratio to app intervention or to the control group. Participants in the control arm will attend educational and motivational sessions. The intervention will last for 6 months and participants will be followed for 12 months. The primary outcome is a 30-point prevalence of smoking abstinence and normal saliva cotinine level at the end of the study. A 50% reduction in the smoking rate will be the secondary outcome. Long-term abstinence will be measured after 12 months. The sample size will be around 200 smokers who are willing to quit. Recruitment will be between April 2023 to May 2023 or until the process is completed. The study will start from June 2023 to December 2023 with 4 follow-up points: 1) baseline, 2) 3 months, 3) 6 months, and 4) 12 months. Data will be analyzed based on intention-to-treat. Our main hypothesis, the iEndSmokin app will be an effective, accessible, and feasible smoking cessation app targeting all Arabic speaking countries. All ethical approval will be obtained from Yarmouk University Institutional Review Board (IRB) prior to app development and recruitment. The study results will be disseminated via peer-reviewed publication.

**Study on effectiveness of online learning among medical students of BPKihs during COVID-19**
Laxmi Subedi

1. School of Public Health and Community Medicine, Koirala Institute of Health Sciences, Nepal

Background and objectives: Responses to the COVID-19 pandemic in medical education have varied from country to country, from closures of medical schools to online learning approaches to abiding by country-specific measures such as social distancing. The sudden transition from on-campus learning to exclusively online learning is challenging for both faculty and students and has required a lot of preparation in a short time. This study focuses on assessing the effectiveness of online teaching among medical students of BPKIHs during COVID-19.

Methods: A cross sectional study was done among the 100 undergraduate medical students of BPKIHs. Convenient sampling method was used to select study participant. Almost equal number of students from each batch were selected randomly. Mixed method was used for the study. Stratified random selection was done in equal proportion of 1:1. Self-Administered, Semi-structured questionnaire among the Medical students was administered using Google form and open-ended questionnaire was used for qualitative study.

Results: In our online survey 62.0% of the students agreed that the sessions were up to their expectation, 48.0% reported that session/course were well structured, for 55.0% the relevant questions asked motivated learning during online sessions. The pace of the sessions was very fast for 62.0% of the students, 65.0% of the students wanted more visual aids, 41.0% of respondents said voice quality was not good during the session, 59.0% of the students reported online classes were interactive whereas 83.0% of students missed direct, in-person interaction. Adequate Visual aids, good communication and time management skills, good internet strength and quizning during the sessions were suggestions for improvement of online teaching.

Conclusions: According to our Findings most of the students found online sessions effective however improvement in technical issues (audio visual aid, internet connection etc.) would make the online session more effective.

**Please mind the gap between guidelines & behavior change: a systematic review and a consideration on effectiveness in healthcare**
Nicola Bellè, Stefano Gandolfi

1. Laboratorio MoS, Management e Sanità, Sant’Anna School of Advanced Studies, Pisa, Italy, 2. Sant’Anna School of Advanced Studies, Pisa, Italy

Background and Objectives: This study is a systematic review, following the PRISMA Methodology, to explore and take stock of extant scholarship on the relationship between practice guidelines and behavior change in the context of healthcare provision. Methods: Scopus and Web of Science were researched according to our PICO(T) Keywords. The initial search yielded 624 Results, which were then reevaluated based on inclusion criteria to remove duplicates, items besides research articles,
and items outside the scope of the review. A total of 67 articles were analyzed in depth.

Results: The 67 studies in our final sample come from 25 countries, with the UK, Australia, Canada, and the US being the most represented. In terms of populations of interest, about 45% of the studies in our sample specifically focus on medical doctors, and some 37% generically target healthcare workers. Prescription is the most frequently investigated behavior, followed by hand hygiene. Guidelines significantly influence behavior in the intended direction in less than half of the studies. Results are mixed in more than one-fifth of the cases and significant but contrary to expectations in 18% of reviewed articles. In terms of research design, most studies are based on quantitative methodologies, followed by qualitative work, literature reviews, and theoretical contributions. Conclusions: The study speaks to academics and healthcare professionals alike, aiming to improve the effectiveness of guidelines as a tool for positively changing behavior in the healthcare context. It provides an exhaustive mapping of the relationship between guidelines and behavioral changes in health professionals, including the factors that mediate or moderate this relationship and the methodologies adopted in this research area.

Preventing public health crises: an expert system using Big Data and AI in combating the spread of health misinformation

Jasleen Kaur1, Irthana Hussain1, Matheus Lotto1, Zahid Butt1, Plinio Morita1
1University of Waterloo, Canada

Background and Objective: Health misinformation disseminated on social media has detrimentally affected the general population’s attitudes toward public health measures, leading to costly and harmful public health crises around the world. Currently, public health officials cannot mitigate these health misinformation trends due to a lack of a comprehensive expert system capable of collecting and analyzing large amounts of social media data. The objective of this study is to design and develop a big data pipeline and ecosystem for the identification and analysis of health misinformation on social media named the Misinformation Analysis System (MAS).

Methods: Python, the Twitter V2 API, and the Elastic Stack are the main technologies used in developing the MAS system. The MAS system extracts social media data from the Twitter V2 API using its Data Extraction Framework and applies automatic health misinformation analysis using a pre-trained Latent Dirichlet Allocation (LDA) Topic Model, Sentiment Analyzer, and Information Disorder Identification machine learning model. The analyzed data is then visualized through dashboards and analytics after being loaded into the Elastic Cloud deployment.

Results: The system is performing efficiently and accurately. Independent investigators have successfully utilized the system to extract significant insights for a fluoride-related health misinformation use case, spanning a period of 6 years, from 2015 to 2021. The system is currently being used for a vaccine hesitancy use case, spanning a period of 15 years, from 2007 to 2022, and a heat-related illnesses use case (2011 to 2022), respectively.

Conclusions: The novel MAS expert system has the potential to help public health officials globally to detect and analyze misleading health information. Moreover, this system can grow to integrate social media data from multiple sources into dashboards for a multiplatform analysis and to support social media data written in non-Western languages.

Use of telehealth resources in primary care and its association with facing the COVID-19 pandemic in Minas Gerais, Brazil

Alaneir Santos1, Liliana Dramos1, Delba Santos2, Raphael Aguiar1, Solange Godoy3, Maria Senna3, Mariana Freitas3, Elís Borde2, Rosângela Perillo4, Rogelli Peixoto2, Rafaela Pinto2, Antônio Matta-Machado1, Venezuela Oliveira5
1Faculty of Medicine, Universidade Federal de Minas Gerais, Brazil, 2Universidade Federal dos Vales do Jequitinhonha e Mucuri, Brazil, 3Nursing School, Universidade Federal de Minas Gerais, Brazil, 4Faculty of Dentistry, Universidade Federal de Minas Gerais, Brazil, 5Universidade Federal de Minas Gerais - Faculty of Medicine, Brazil

Background and Objective: Use of telehealth resources increased dramatically during the COVID-19 pandemic. This study set out to examine associations between the level of incorporation of telehealth resources and the level of Primary Health Care structuring to deal with the COVID-19 pandemic in the State of Minas Gerais, Brazil. Methods: A cross-sectional study carried out at the end of 2020, with a sample of 260 Primary Health Care working in the State of Minas Gerais, Brazil. Two variables were created - Level of the Primary Health Care structuring to deal with the COVID-19 pandemic and Level of telehealth structuring, involving: Telehealth-based training targeting the community, Telehealth-based medication strategies, number of computers and electronic devices, consultations and monitoring of COVID-19 patients using Telehealth resources, Information and Communication Tecnologies - and Telehealth-based monitoring of chronic patients, internet availability and teleactivities. Associations between variables were examined using the Tukey’s test for multiple comparisons and the Spearman correlation. Variables associated with socioeconomic dimensions and healthcare were also analyzed.

Results: Levels of telehealth structuring in Primary Health Care ranged from poor (43%) to regular (40%) in most cases. Most Primary Health Care teams had regular (56%) or good (37%) levels of Primary Health Care structuring to deal with the pandemic. Telehealth use and COVID-19 tackling ability were significantly correlated (p<0.050). The higher the level of telehealth use, the better the ability to deal with COVID-19 (0.45; p<0.001). No correlations with human development index, number of hospital beds and percentage of health insurance plans were detected. Primary Health Care was structured to tackle the pandemic. However, there is a lot to be done before telehealth resources are effectively incorporated into Primary Health Care. Conclusions: Whenever incorporated, telehealth resources contributed a more robust primary care structuring to deal the COVID-19 pandemic.

Mental health topics in social media during the COVID-19 pandemic - a literature review

Virve Pekurinen1, Tia Koivu1, Pirjo Lindfors2, Katja Joronen2
1University of Turku, Finland, 2Tampere University, Finland

Background and Objective: The COVID-19 pandemic has increased psychological distress and the use of social media, especially in young people. The continual use of social media can undermine people’s mental well-being. However, social media can provide peer support by enabling people to share their mental health experiences. Still, little is known about mental health communication on social media during the pandemic. The aim of this review is to describe the existing research related to mental health communication on social media during the COVID-19 pandemic.

Methods: The peer-reviewed literature was reviewed using the search terms, such as social media, mental health, and COVID-19. The databases used were APA PsychINFO, CINAHL, Pubmed, and Web of Science. A manual search was also
conducted. Studies were excluded if the study population consisted of the elderly or social-/healthcare professionals, or if the mental health conversations were related to specific health problems or specific peer-support groups and networks. The search resulted in 1970 references, of which 19 studies were selected.

Results: The studies (N=19) were conducted in North America (63%), in Asia (32%), and in Australia (5%). Machine learning was used in the majority of the studies. The studies examined communication on Twitter (58%), Reddit (26%), Sina Weibo (11), and YouTube (5%). The communicated mental health topics included depression, suicidal thoughts, anxiety, fatigue, poor sleep quality, stress, and feelings of loneliness and fear. Peer support and advice were also communicated. Conclusions: Mental health topics are communicated via social media, suggesting that social media platforms are a useful method to identify ongoing prevalent, and even potentially emerging, mental health topics. The existing research focuses mainly on Twitter; therefore, research is needed on other commonly used social media platforms among adolescents, such as YouTube. Research regarding users’ experiences with peer support on social media is also needed.

DOI: 10.18332/popmed/165447

Use of social media associated with health promotion: a new reality in Dentistry
Bárbara Fernandes1, Caroline Santos2, Cláudia Coscarelli1, Juliana Araujo1, Marcus Bezer1, Oliveira Gonçalves3
1Serviço Social do Comércio - Rio de Janeiro (SESSC-RJ), Brazil, 2Serviço Social do Comércio, Rio de Janeiro, Brazil, 3Serviço Social do Comércio (SESC-RJ), Rio de Janeiro, Brazil

Health education, whether face-to-face or using digital tools, acts as an interdisciplinary process of knowledge construction. The Serviço Social do Comércio – Rio de Janeiro (Social Service of Commerce - Rio de Janeiro) (SESC-RJ) has health prevention as its premise, valuing educational activities throughout the client care from the general medical condition. With the COVID-19 pandemic, social media stood out as a tool to maintain these activities. This study intends to carry out a research on the dissemination of health promotion information by Sesc RJ Dentistry, through the Instagram profiles @sescsocio and @sescauntaluziar in publications in the format of reels, and to evaluate the importance of this practice even after the return of face-to-face activities. A metric evaluation regarding the number of posts in the format of reels and their views was performed from May 2021 to October 2022; in addition to a survey regarding the monthly average of face-to-face attendances in health education promoted by dental clinic of Sesc Santa Luzia in 2019 and 2022. All these data were extracted from the Sesc statistical system, which are accounted for in the month following production, based on Public Domain information and available in aggregate form, without individual identification. Sesc RJ has an amount of 78 publications and a monthly average of 45623 views. And the number of publications regarding Sesc Santa Luzia is 68 and S138, respectively. The monthly average of face-to-face dental appointment at Sesc Santa Luzia in 2019 was 2557 while from March to October 2022, the number of patients was 2563. According to the results obtained, it was ascertain that the alternative of expanding knowledge in health through the technological approach was successful and that it should be maintained even after the end of social isolation. Thus, social media reinforced health education in the dissemination of knowledge.

DOI: 10.18332/popmed/165622

The "Octopus" project: a digital health model for suppling glaucoma care in Italy
Carmina Carnevale1, Francesco Oddone2, Angela Mastromatteo1
1IRCCS Fondazione G.B. Bietti Italy

Background: The current guidelines for glaucoma management suggest that patients perform a mean of three eye examinations per year associated with functional/structural exams. However, most of the primary territorial centers (ASL) are not equipped with the instruments for glaucoma diagnosis/follow-up. Therefore, these tests are carried out exclusively at the secondary specialized referral centers leading to a progressive overcrowding of the structure, incurring in waiting times and difficulties in ensuring an adequate continuity of care for glaucoma patients.

Methods: we analyzed the current territorial and hospital outpatient activity in order to find critical areas, specific problems and needs. The project will embrace two phases: definition of the network and digital platform and creation of a “point of care (POC)” physically located within the ASL and managed by the secondary referral center. The POC will be equipped with all the instruments required for the complete follow-up of the stable glaucoma patients.

Results: The digital platform provides a strong connection between the healthcare infrastructures both on the administrative, technical and clinical level allowing to share clinical patients’ data including the exams’ results. The actors involved will provide, through the platform, all the clinical patients’ data necessary to send stable patients from the secondary referral center to the POC or to send cases that require para-surgical/surgical management or specialist evaluation from the ASL to the secondary referral center. The visit or further diagnostic tests will be scheduled online, through a shared agenda, with a significant reduction of the waiting list allowing to schedule the periodic follow-up based on the individual risk level.

Conclusions: The integrated digital network could improve the patient management, the effectiveness and efficiency of the healthcare system ensuring the continuity of care for the management of chronic-degenerative disease.

DOI: 10.18332/popmed/163673

The evaluation of the use of digital media as a tool in oral health education strategy at the odontosec mobile unit
Katia Andrade1, Claudia Pereira2, Katia Andrade1, Claudia Pereira2, Julia Mayer3, Rafaela Souza4, Tais Feres4
1SESC - Social Service of Commerce in Rio de Janeiro, Health Management, 261 Conde de Bonfim, Tijuca, apt 802, Rio de Janeiro, RJ 20520-051, Brazil, 2Department of Health Management, Social Service of Commerce in Rio de Janeiro, Niterói, Brazil, 3SESC - Social Service of Commerce in Rio de Janeiro, Health Management, 104 Benjamin Constant, APT802, Glória, RJ 20241150, Brazil, 4SESC - Social Service of Commerce in Rio de Janeiro, Health Management, 55 Av jornalista Alberto Francisco Torres, Icaraí apt 708-1, RJ 22430-000, Brazil, 5SESC - Social Service of Commerce in Rio de Janeiro

Introduction: Inserted in a broad concept of health, the promotion of oral health transcends the technical dimension of dental practice. Therefore, the need and efforts through Oral Health Education increase, with the purpose of enlightening the population about oral diseases and encouraging changes in general habits. During the COVID-19 pandemic, face-to-face activities were restricted, so digital media (YouTube, facebook and Instagram) emerged as an alternative for sharing content, aiming to promote health, prevent disease and continue the dissemination of knowledge, provide people with simple and low-cost alternatives for their well-being and better quality of life.

Aim: Quantitative evaluation of the use of digital media as a tool in the Oral Health Education strategy by the dental team of the Mobile Unit OdontoSesc, which belongs to the Social Service of Commerce in Rio de Janeiro.

Methodology: A quantitative exploratory study, based on an institutional database system (Planning and Execution System - SPE), which presents the number of views collected in posts on digital media, from January to December 2022. The posts were weekly or fortnightly, with content related to the main complaints and demands previously observed with face-to-face consultations. The contents were produced in short forms (videos and reels).

Results: The content shared on digital media had a reach of 71683 views/year, which represented an additional 66% in face-to-face educational activities.

Conclusion: The success presented by the new implementation strategy in the activity restriction period led the tool to be used, concomitantly, with face-to-face health education actions, aiming at a greater population reach and dissemination of knowledge, to foster utonomy and collaborate for a better quality of life for the population.

Dashboard as a public transparency tool for management and planning data in Brazilian healthcare system
Marília Coser Mansur1, Cristina Hamester1, Georgena Riff2, Nathalia Derengowski3, Wania Ferreira3, Davylín dos Anjos3, Tania Barbosa3, Ligia Braun3
1Ministry of Health - Brazil

Background and Objective: Brazil has a public unified healthcare system named sistema Unico de Saúde (SUS). Healthcare management, financing and delivery are responsibilities of the three levels of government, the union, states, and municipalities. For monitoring and control, managers must fill in data in several planning tools, such as the current manager planning system called Digius Gestor Modulo Planejamento (DGMP), in order to guarantee transparency about the status of the health planning and management mandatory documents. Those documents might go under further evaluation by the health council, which is the collegiate that acts in the formulation of strategies and as a society control
of health policies implementation in the corresponding government level. The objective of our project is to present the newly developed dashboard as a tool offering public transparency and enabling comparative analyses of sus planning instruments status.

Methods: A team of ministry of health professionals developed the dashboard between July 2021 and June 2022, in weekly meetings under constant cooperation and collective effort, using microsoft power BI as supporting technology.

Results: Maps, graphs and tables illustrate the situation of sus planning and management instruments in the dashboard, providing a public, friendly interface that is easily available. This technological innovation makes it possible to display the status of sus planning instruments in government levels and health regions. Furthermore, the application of a spatial clipping frame provides the basis to elaborate technical reports and qualitative analyses of those instruments.

Dashboard available at website: https://liisaude.com.br/paineldgmp/. Conclusion: The dashboard innovates by providing transparency of Brazilian unified health system planning data, thus supporting government decision making and social control policies.

**Patient Experience of Using Telehealth Services during COVID-19 in Dubai Health Authority: A cross sectional Electronic Survey**

**Wafa Alnakhi**1, Wafa Alnakhi 1 , Amal Al Balushi 2 , Hamid Hussain 1 , Gamal Blanca Rellosa 1 , Alethea De Guzman 1 , Ma. de Pedro 1 , Cecilou Bilbao 1 , Wafa Alnakhi 1 , Amal Al Balushi 2 , Hamid Hussain 1 , Gamal Blanca Rellosa 1 , Alethea De Guzman 1 , Ma. de Pedro 1 , Cecilou Bilbao 1 , Implementers’ Lens DOI: 10.18332/popmed/163836

**Philippines’s Family Planning Health Information System: From the Implementers’ Lens**

Blanca Rellosa1, Alethea De Guzman1, Ma. de Pedro1, Ceciliub Bilbao1, Honeylyn Todavía1

1RTI, Philippines

Background: Availability of quality and timely data is crucial to effective health program management. In the case of the Philippines’s national health information system, Field Health Services Information System (FHSIS), anecdotes abound on challenges to its implementation. However, there’s been no purposive documentation of its nature from the users’ perspective.

Methods: To build data on this, the study conducted interviews, partnered with records review, with select public health facilities, provincial and city health offices, and regional and national Department of Health (DOH). Topics discussed focused on Family Planning (FP) since availability of quality FP data is paramount to addressing increasing unmet need for FP and teenage pregnancies and for appropriate resource allocation given the upcoming devolution of procurement of select FP logistics to Local Government Units (LGUs).

Results: Results showed that despite the spread COVID-19 put on the limited health workforce, compliance to recording and reporting processes were maintained although problems on timeliness were aggravated. Integration of hospital reports to FHSIS is a challenge due primarily to absence of standard consolidation tools and reporting guidelines. This is also why extent of issues on accuracy and reliability of hospital reports cannot be fully determined. Difference in perception per reporting unit on where integration should happen was also observed. Lack of standard electronic FP FHSIS tools that facilitates consolidation and validation led to the development of excel-based tools with varying set-up depending on an area’s data needs. Despite availability of e-tools, some continue to use paper-based tools due to unavailability of equipment, limited skill, or error in the e-tool itself.

Conclusion: Overall, despite these challenges, short-term solutions to address these has been implemented by the users themselves. However, long-term resolution would depend largely on support and direction from the national DOH.

**Education in type 1 diabetes mellitus through virtual method and its influence on metabolic control - a pilot study**

Roberto Freire de Freitas1, Sandhara Ribeiro Rodrigues2, Marcio Araújo3

1Oswaldo Cruz Foundation Brazil, 2Oswaldo Cruz Foundation Rua Conselheiro Da Silva 708 Brazil

Background: Diabetes education groups exist to support self-care and can take place in many ways, including through technologies. Barriers associated with participating in face-to-face groups can be overcome with the use of digital health interventions and it is perceived that there is a knowledge breach in relation to studies that address this issue with intervention methodologies.

Objective: To develop a virtual type 1 diabetes education program lasting 12 weeks; to measure self-care and quality of life before and after the intervention and, to evaluate the effectiveness of the virtual program in the metabolic control.

Method: This is a methodological study, based on a diabetes education protocol in virtual format. This protocol consisting in sending educational messages through a WhatsApp group. Before and after the intervention, clinical and laboratory data on glycemic control were collected, and the Diabetes Quality of Life Measurement Questionnaire (DQLMQ-Brazil) and part of the Diabetes Self-Care Questionnaire (DSCQ) were applied.

Results: The educational material was based on the recommendations of the American Association of Diabetes Educators, and consisted of texts, images, infographics and links. The pilot project was executed with 6 people, with an average age of 31 and average time since diagnosis of 14.6 years. There was an improvement in the quality of life score and an increase in the weekly frequency of following up on healthy eating, fruit and vegetable consumption, capillary blood glucose measurement and clinical examination of the feet. There was no statistical significance in the analyzed variables.

Conclusion: It is concluded that the diabetes education tool built is practical to implement and has increased access capacity, and can be used by various professionals and health institutions.

**Enabling digital health access for the vulnerable and marginalized population in India**

Simran Singh1, Sana Thapa2

1Swasti health catalyst 23, 3rd Floor, Raghavendra Nilaya, 1st Main Road, ACESS Layout, Ashwathnagar, near Rishi’s Paratha Plaza Sanjay Nagar, Bengaluru, Karnataka 560094 India, 2Swasti health catalyst

Background and objective: The vulnerable population and marginalized communities are prone to receive undignified care, lack of timely care and unresponsiveness from the health systems. The health inequities in low-resourced settings lead to a lack of access to healthcare services and lack of reliable health information. The telecare program was implemented to examine the feasibility and acceptability of using community led telemedicine models to solve for health inequalities and health illiteracy in vulnerable communities such as LGBTQ population and slum
dwellers where digital illiteracy and digital divide is significant.

Methods: The program was carried out from Jul'21-Dec'22 in 9 different locations across 6 Indian states. Communities belonged to LGBTQIA, indigenous communities, migrant workers, slum dwellers and rural population. A team of community health workers were recruited for last mile health access. They advocated and facilitated the program on-ground. Qualified nurses, doctors, counselors, welfare officers and triage agents were connected digitally through a health-tech platform.

Results: Program reached over 82,000 individuals. 2,075 medical cases were treated and 508 health information calls were facilitated. There was a positive uptake of the community-lead telemedicine services among the members. Presence of community health workers on-ground earned trust among the members, changing their health seeking behavior and solved for digital illiteracy and digital divide which were the pivotal factors for failure of telemedicine models. The cost of delivering one quality medical case was estimated at inr 96, similar quality consultations are priced over inr 400 in tier 2 cities.

Conclusion: Telecare addresses health inequities and substantially bridges the access gap in low-resource and discriminated communities by providing personalized health information and building resilient healthy communities. The program demonstrated a new model of care that provides dignified and quality care to unheard voices and is scalable, adaptable and agile to other vulnerable health populations.

How to evaluate health and medical apps in public health - what are alternatives to randomized controlled trials?

Laura Maas1, 1, Felix Holtz1, 2, Robert Hrynsychyn1, 2
1 SOCIUM Research Center on Inequality and Social Policy, University of Bremen, Bremen, Germany, 2 DiGiHealth Institute, Neu-Ulm University of Applied Sciences, Neu-Ulm, Germany

Abstract: While randomized controlled trials (RCTs) are considered the gold standard for evaluating causal relationships between tools and resulting health outcomes, they might not be suitable for the digital environment. Software (such as apps) is characterized by its evolving process at a rapid pace. This does not work well with the average 5.5 years duration of an RCT with a strict study protocol. Additionally, such extensive research is expensive and nearly impossible to finance for health technology start-ups. This workshop will argue that RCTs have limitations when evaluating health or medical apps. We will introduce the participants briefly to the three core principles (3 talks, 5 minutes each) before discussing possible alternatives. To start, Laura Maas will present the differences between health and medical apps and why differentiation is crucial when discussing their evidence. Building on this, Felix Holtz will display the regulation of medical apps in Germany as DiGA and why Germany decided to use RCTs as the primary evaluation method. Lastly, Robert Hrynsychyn will explain why RCTs have limitations in evaluating health and medical apps and what alternatives exist. Once the participants gain insights into the problem, we will divide the audience into smaller groups to collect and prioritize the challenges for assessing health and medical apps during the development, evaluation, and implementation phases. The groups will then formulate solutions and assessment designs based on this discussion. Finally, the group’s Results will be presented to the audience and discussed with the whole group. We will use the Results from the workshop for a white paper on alternative methods for assessing and evaluating health and medical apps to make the Results public to interested researchers and policy-makers outside this conference.

Workshop Objectives: The workshop’s objective is to discuss the challenges of applying methods to digital health tools that weren’t designed to evaluate the digital environment. Together with the participants, we aim to find alternatives for RCTs as the new gold standard for assessing digital public health interventions.
Learning from digital public health interventions in practice: challenges we embraced
Laura Maaß1, Felix Hoff2,3, Stefan Buttigieg4, Ihoghosa Iyamu2, Chen-Chia Pan3,4
1SOCiUM Research Center on Inequality and Socia Policy, University of Bremen, Bremen, Germany, 2Leibniz ScienceCampus Digital Public Health Bremen, Bremen, Germany, 3University of Munich, Munich, Germany, 4DIGIHealth Institute, Neu-Ulm University of Applied Sciences, Neu-Ulm, Germany. 9School of Population and Public Health, University of British Columbia, Vancouver, Canada.

Workshop key questions: What public health challenges arise in using, evaluating, and regulating health and medical apps? How can those challenges be addressed to create a higher impact on healthcare systems?

DOI: 10.18332/popmed/165233

Workshop Objectives: The workshop will address obstacles and their solutions during planning, implementing, and evaluating DPH interventions in various settings. Workshop key questions: How can we best prepare the public health workforce for the digital environment and the challenges for DPH projects? How can we best leverage resources to develop and maintain evidence-based DiPH workforce for the digital environment and the challenges for DiPH projects? How can we best prepare the public health workforce for the digital environment and the challenges for DiPH projects? How can we best leverage resources to develop and maintain evidence-based DiPH interventions to improve the populations health (e.g., health promotion, health management, or implementation science). Since health and public health are becoming increasingly digitalized, this adds new and essential disciplines to develop and improve evidence-based digital technologies and innovations (e.g., human-computer interaction, computer science, or engineering). Having various disciplines collaborating can offer new opportunities but also create new challenges if there is no mutual understanding of digital public health. Therefore, this skill-building workshop Aims to foster awareness of interdisciplinary approaches in public health research and practice. Two presentations will set the workshops frame and foster mutual understanding of the key terms: Interdisciplinarity and (digital) public health. Given its interdisciplinary field, public health scientists often claim to facilitate health-related interdisciplinary research and practice. However, little is known regarding whether it is merely a descriptive term or whether normative expectations are also associated with it. We emphasize that a mutual understanding of the term enables successful interdisciplinary research and practice. Therefore, the first presentation by Merle Frey will give an overview of the concept of interdisciplinarity Building on the terms clarification, the talk will draw on the practical challenges of interdisciplinary research and practice examples for promoting such competencies. During the second talk, Laura Maaß will describe traditional public health core functions and how they relate to other disciplines in the social, natural, and environmental sciences and humanities. Further, the talk will highlight how the extension to digital public health influenced the so-called system of sub-disciplines that form public health. We will illustrate the challenges and opportunities that arise from this complex view of (digital) public health and how to approach them accordingly. Building on knowledge gained in the first presentation, participants will hear about the need to combine discipline-related knowledge to tackle public health issues and achieve the goal of population health promotion. The participants will be invited to discuss the challenges and opportunities of interdisciplinary collaborations in three small groups after the introductory talks. The groups will focus on the challenges and opportunities of interdisciplinary collaborations during a mobile mental health apps development, evaluation, or implementation. For this, they will receive support from experts in law, ethics, public health, health promotion, epidemiology, sociology, psychology, and human-computer interaction. Afterward, the groups will present their Results in plenary and discuss how to best approach interdisciplinary practice and research and what they deem crucial requirements.

Workshop Objectives: Our workshops primary objective is to raise awareness regarding the opportunities for interdisciplinarity in (digital) public health. The second goal is to sensitize participants to a mindset characterized by empathy and curiosity toward other disciplines.

Workshop key questions: How can one efficiently incorporate other disciplines through interdisciplinary approaches in (digital) public health projects? How can different disciplines communicate more effectively?

DOI: 10.18332/popmed/165268

Human-centered design approaches to develop digital tools to enhance Indigenous health
Emma Patu1, Cristina Ore2, Alec Calac3, Timothy Mackey1
1World Federation of Public Health Associations (WFPHA), New Zealand, 2University of Washington, United States, 3University of California San Diego, United States. 3University of California San Diego, San Diego, United States. 4Institute of Public Health and Nursing Sciences (IPP), University of Bremen, Bremen, Germany, 5Institute for Public Health Research and Epidemiology - BIPS GmbH, Bremen, Germany.

Workshop key questions: How can we best prepare the public health workforce for the digital environment and the challenges for DPH projects? How can we best leverage resources to develop and maintain evidence-based DPH interventions that promote health equity? How can we effectively communicate our research Results to policy-makers for a national public health impact?

DOI: 10.18332/popmed/165264

How to achieve effective interdisciplinarity in digital public health
practice
Laura Maaß1, Merle Frey2, Núria Pedrós Barnils3,4, Chen-Chia Pan3,4
1SOCiUM Research Center on Inequality and Socia Policy, University of Bremen, Bremen, Germany, 2Leibniz ScienceCampus Digital Public Health Bremen, Bremen, Germany, 3Institute for Information, Health Care, and Medical Law (IGMR), University of Bremen, Bremen, Germany, 4Institute for Public Health and Nursing Sciences (IPP), University of Bremen, Bremen, Germany, 5Institute for Prevention Research and Epidemiology - BIPS GmbH, Bremen, Germany.

Their interdisciplinary nature characterizes health, especially public health: Some involved disciplines address an individuals health or set the framework for health practices (e.g., law, medicine, psychology, ethics, or sociology). Others measure health outcomes on a population level (e.g., epidemiology) or develop interventions to improve the populations health (e.g., health promotion, health management, or implementation science). Since health and public health are becoming increasingly digitalized, this adds new and essential disciplines to develop and improve evidence-based digital technologies and innovations (e.g., human-computer interaction, computer science, or engineering). Having various disciplines collaborating can offer new opportunities but also create new challenges if there is no mutual understanding of digital public health. Therefore, this skill-building workshop Aims to foster awareness of interdisciplinary approaches in public health research and practice. Two presentations will set the workshops frame and foster mutual understanding of the key terms: Interdisciplinarity and (digital) public health. Given its interdisciplinary field, public health scientists often claim to facilitate health-related interdisciplinary research and practice. However, little is known regarding whether it is merely a descriptive term or whether normative expectations are also associated with it. We emphasize that a mutual understanding of the term enables successful interdisciplinary research and practice. Therefore, the first presentation by Merle Frey will give an overview of the concept of interdisciplinarity Building on the terms clarification, the talk will draw on the practical challenges of interdisciplinary research and practice examples for promoting such competencies. During the second talk, Laura Maaß will describe traditional public health core functions and how they relate to other disciplines in the social, natural, and environmental sciences and humanities. Further, the talk will highlight how the extension to digital public health influenced the so-called system of sub-disciplines that form public health. We will illustrate the challenges and opportunities that arise from this complex view of (digital) public health and how to approach them accordingly. Building on knowledge gained in the first presentation, participants will hear about the need to combine discipline-related knowledge to tackle public health issues and achieve the goal of population health promotion. The participants will be invited to discuss the challenges and opportunities of interdisciplinary collaborations in three small groups after the introductory talks. For this, they will receive support from experts in law, ethics, public health, health promotion, epidemiology, sociology, psychology, and human-computer interaction. Afterward, the groups will present their Results in plenary and discuss how to best approach interdisciplinary practice and research and what they deem crucial requirements.

Workshop Objectives: Our workshops primary objective is to raise awareness regarding the opportunities for interdisciplinarity in (digital) public health. The second goal is to sensitize participants to a mindset characterized by empathy and curiosity toward other disciplines. Workshop key questions: How can one efficiently incorporate other disciplines through interdisciplinary approaches in (digital) public health projects? How can different disciplines communicate more effectively?
that will be co-presented by working group chairs. After the introduction to the workshop, participants will be guided through a short co-ideation and co-design session around specific Indigenous health challenges that can benefit from digital health approaches. Delegates will be provided information on different resources, software, and tools that can be used for rapid prototyping of digital health solutions and can actively participate in the workshop by helping to formulate solutions for specific Indigenous health challenges. Finally, participants will have the opportunity to present their thoughts, solution ideas, and possible prototypes to all workshop attendees and have them evaluated by workshop chairs and speakers. Using this approach, we hope to generate innovative ideas that address unique and under-reserved areas in global health, health equity, and Indigenous health while also building capacity by enabling participants to continue to explore digital health solutions in their own communities.

Specific Aims/Objectives: 1. Describe how human-centered approaches in digital health design and innovation can help enhance health equity and Indigenous health objectives. 2. Identify different human-centered design resources, tools, software, and methods for purposes of rapid prototyping of solutions. 3. Provide participants the opportunity to co-design digital health tools and present them for expert and group feedback. Key questions workshop will address: The key questions that will be addressed in this workshop include: (1) what type of digital health tools and human-centered design approaches have been used to address health equity?; (2) how do we ensure that the next generation of digital tools are designed purposefully for the needs of distinct communities, including specifically Indigenous peoples?; and (3) how do we incorporate concepts such as Indigenous Data Sovereignty into digital health design and commercialization in a sustainable manner.

Dealing with infodemic and health mis/dis-information: new public health organizations’ proposals
Ruediger Krech1, Fidelia Cascini2, Iveta Nagyova3, Melissa Sweet4
1World Health Organization, Switzerland, 2Universita Cattolica S. Cuore, Italy, 3Pavol Jozef Safarik University, Slovak Republic, 4Croakey Health Media, Australia
In the last years and mostly during the pandemic, the proliferation of digital channels and news sources including social media has caused an overabundance of information referred to as an infodemic. It involves misinformation (information which is essentially wrong or untrue), and disinformation (information that is created to be misleading or harming). These are harmful as it can undermine compliance with public health measures, and effective mobilisation for the health risks prevention and the management of emergencies contributing to people polarisation on dangerous behaviours and social divisions. The complex problem of health mis/dis-information would require coordinated actions of all concerned stakeholders as citizens, governments, and information platforms, under the expected leadership of Public Health Organizations cooperating at a global level. A joint statement from September 2020 by the WHO, UN agencies and the International Federation of Red Cross calls for action on the infodemic by national governments and social media organisations.[1] [1] The UN describes multiple tools are designed purposefully for the needs of distinct communities, including specifically Indigenous peoples?; and (3) how do we incorporate concepts such as Indigenous Data Sovereignty into digital health design and commercialization in a sustainable manner.

Addressing the Infodemic from a Health Information Equity Lens
Timothy K. Mackey1, Elena Petelos2, Tina Purnat3, Iveta Nagyova4, Dimitra Uziki5
1Global Health Program, Department of Anthropology, University of California, San Diego, United States, 2Department of Health Services Research Care and Public Health, Research Institute Maastricht University, Maastricht, The Netherlands, 3Department of Epidemic and Pandemic Preparedness and Prevention, World Health Organization, Geneva, Switzerland, 4Institute for Collective Health, European Public Health Association, Slovak Republic, 5European Healthcare Fraud and Corruption Network, Greece
Outline of overall workshop: The focus of this workshop is to increase capacity and knowledge of delegates by providing them with the evidence, resources, tools, and support to combat health Infodemics through the lens of health information equity. The workshop is a collaboration between the WFPHA Global Health Equity and Digital Technology, the Health Technology Assessment Section of the European Public Health Association, and the World Health Organization. We will start with a short introduction into key concepts, i.e., the infodemic, misinformation, disinformation, evidence generation and health knowledge dissemination, digital health literacy, health information equity, and then transition to a discussion of specific case studies illustrating how misinformation impacts underrepresented global communities and populations in low-and middle-income countries. After the Introduction, participants will be guided through key strategies on how to improve health information accessibility, identify specific misinformation-induced health inequalities that may target certain groups, and explore different approaches to retrieve and appraise evidence. These strategies will be used to formulate and develop effective and timely messaging and communication approaches to debunk or correct misinformation, as it occurs, in online and physical spaces alike. Delegates will be specifically provided with information on different resources, training, and community-outreach developed by the WHO, and will be given the opportunity to ideate on how to tailor these tools to interventions in their own communities. The workshop will close with a collaborative exercise among all participants to crowd-source ideas around definitions, shared objectives, priorities, unique measurements, and activities needed to specifically address the Infodemic from a health information equity lens. Using this approach, we hope to generate needed dialogue among the global health community about the need to infuse health equity into conversations about misinformation, improve access to evidence and tools to strengthen shared goals of improving information equity and management of infodemics, and contribute ideas that can improve adherence to public health measures and confidence and trust in science.

Specific Aims/Objectives: 1. Describe how addressing health information equity is critical to combating health misinformation, 2. Identify and improve access to evidence, resources, tools, and strategies to ensure community resilience against the infodemic while also strengthening trust in science, 3. Generate shared objectives, priorities, and activities needed to specifically address the infodemic from a health information equity approach. Key questions workshop will address: The key questions that will be addressed in this workshop include: (1) how do challenges associated with the Infodemic originate from fundamental issues related to health information equity?; (2) what are some key strategies needed to concurrently address health information equity and to combat health misinformation and what is the role emerging and exponential technologies can play in these?; and (3) what do WFPHA delegates think are the key priorities in advancing this area of study and engagement to enhance health information equity and community reliance against Infodemics?

Digital Public Health Governance - navigating complex structures
Sarah Forberger1,2, Merle Frey1,2, Stefan Buttigieg2, Laura Maas2,3
1Leibniz Institut for Prevention Research and Epidemiology - BIPS GmbH, Germany, 2University of Innsbruck, Austria, 3University of Maastricht, Netherlands

214
Bremen, Germany, 1Leibniz ScienceCampus Digital Public Health Bremen, Bremen, Germany, 2Institute for Information, Health and Medical Law (IGMR), University, of Bremen, Bremen, Germany, 3Ministry of Health Malta, Valletta, Malta, 4SOCIUM Research Center on Inequality and Socia Policy, University of Bremen, Bremen, Germany

The COVID-19 pandemic is among society’s most severe crises this century. The rapid transmission speed has forced countries to adapt their national healthcare systems at an unprecedented rate, with digital health playing a crucial role in universal health coverage. However, to develop its full potential, appropriate governance structures should go along with mechanisms for egalitarian, sustainable, and high-quality systems and data to tap into their full potential for population health. Therefore, this workshop addresses the following objectives: Navigation complex structures – how could digital public health governance look? Digital public health encompasses, e.g., disease surveillance systems, electronic medical records, and social health insurance payment processes. An overview of the complex building blocks of the system and the coordination of stakeholders and policies to develop, implement, and maintain a well-functioning and comprehensive health system is needed. The workshop will show how complex the system is and what it entails and discuss the role of transparency, accountability, participation, and integrity in building such a system. Nothing without data – creating robust and scalable data pipelines and platforms: Developing robust and scalable “infrastructures” requires backing robust data platforms designed to empower automated reporting and, better yet, feeding analytics. Moving away from existing standard tools for static analysis, e.g., Microsoft Excel, to well-designed data pipelines and platforms requires basic understanding and advanced planning. This session will outline the available technology, a basic methodology that goes into understanding your current data sources, data pipeline planning, implementation techniques supported by a data strategy and understanding what an ideal data science team looks like. No data without proper informed consent – data protection in the digital age. Digital health systems and data pipelines are inseparably associated with data. Health data processing can serve public interests and benefit individuals and society significantly. Contrarily, data protection aims to protect personal data and is often identified as one of the main culprits for innovation. Undoubtedly, the philosophy of Open Data contradicts the basic principles of data protection – especially when the pandemic unveils a structural data problem in several countries. Nevertheless, the European Data Protection Law is not as insufficient as thought. Although the solution is often reduced to the so-called informed consent, the law is more flexible as perceived in practice. The session sheds light on new solutions and challenges, showing that harmonising data flow and data protection is not a mission impossible. Helping countries to learn - comparing digital public health systems: COVID-19 worked as a catalyst for further develop digital tools to support healthcare systems. Benchmarking strategies are crucial to save resources and progress faster during the transition. This talk will present the Digital Public Health Maturity Index, a tool to assess ones digital (public) healthcare system and compare it with another country. The index encompasses the technological and legal requirements, the society's attitude towards using the applications, and the degree of implementation. The index displays the results as a score, allowing for country comparisons and thus encouraging improving their public health system and digital public health.

Precision medicine as the future of public health
Budi Sadikin1, Jorge Guzman2, Kausik Ray3, Mega Febrianora4
1Institute for Collective Health, Ministry of Health of the Republic of Indonesia, Indonesia, 2Cleveland Clinic Abu Dhabi, United Arab Emirates, 3Imperial College London, United Kingdom, 4Indonesian Heart Association, Indonesia

Background: Precision (or personalized) medicine is defined as the application of emerging technologies to better manage patients’ health and to target therapies to achieve the best outcomes in the management of a patient’s disease or predisposition to disease. Used properly, precision medicine should both improve patient outcomes and deliver benefits to the health service - including reducing the cost of ineffective treatment and multiple tests. To bring precision medicine to reality, we need to understanding the relevant regulatory issues within precision medicine, exploring opportunities that could further improve patient safety and outcomes, identifying issues for the state to monitor, and putting forward recommendations that would continue to support innovation. How we move from our current healthcare system to a precision medicine system is the challenge we face. We can chase how others in the world develop and implement precision medicine, primarily as a race to be first in biomedical and genomic discovery, or we can lead the world in demonstrating how precision medicine should be responsibly and sustainably delivered. Given the tools and increased insight into health and disease, precision medicine offers tremendous opportunity to help address many of the barriers and challenges in patient’s management. Precision medicine offers the ability to understand and reduce individual risk for developing various health concerns. This can support better decision-making about where to focus prevention efforts. It is well recognized that behavior change is an important aspect of many treatment plans, and also one of the most difficult. Through increased data and real time feedback, there is the potential to support more individualized behavior change that is more suited to the individual rather than a generic education program. Additionally, rather than the trial and error of therapies that are often experienced, precision medicine approaches, based on biological drivers, should be able to provide earlier diagnosis, preventing months or years of provider visits and tests, and can lead to earlier treatment and prevention of complications. Not only is there a potential to provide an earlier diagnosis, there is great potential to predict, based on use of large data sets, which intervention is most likely to achieve the desired outcomes with the fewest side effects. This has the potential to save treatment costs as well as reduce suffering and complications. The workshop session will bring comprehensive perspectives from government, hospital leader, and clinician to apply the precision medicine from theory to in practice. Workshop participants will identify how to implement precision medicine as what best fit to their field of expertise.

**Insights into challenges of health interventions going digital - a perspective from human-computer interaction, law and sociology**
Núria Pedróds Barnils1,2, Chen-Chia Pan1,3, Anke V. Reinschluessel1,4, Merle Freye1,3, Saskia Muellmann1,3
1Leibniz ScienceCampus Digital Public Health Bremen, Bremen, Germany, 2Institute for Public Health and Nursing Research, University of Bremen, Bremen, Germany, 3Leibniz Institute for Prevention Research and Epidemiology - BIPS, Bremen, Germany, 4Digital Media Lab, TUI, University of Bremen, Bremen, Germany

Brief outline of the overall workshop: In recent years, digital technologies aiming to promote and enhance the health status of individuals and communities have emerged. Given the novelty of this junction, the traditional approaches to health interventions no longer suit the development and evaluation of digital public health interventions. With the rise of technology, public health professionals need input from related disciplines (e.g., computer science, law, sociology) to ensure the quality and impact of digital public health interventions. To support the transition to digital public health, the Leibniz ScienceCampus Digital Public Health (LSC DiPh) developed a comprehensive framework that is informed by interdisciplinary research. In the workshop, we will present how it can be used to develop and evaluate digital public health interventions, thereby highlighting the importance of the aspects that originate from related disciplines.

Specific Objectives and Component Parts: The presented workshop aims to 1) introduce the newly developed LSC DiPh Interventions Framework; 2) shed light on potential challenges public health practitioners might face when developing and evaluating digital public health interventions; 3) provide insights on how to address these challenges from an interdisciplinary perspective; and 4) demonstrate how to apply the framework on specific case studies through an interactive group activity. Key questions that the workshop will address: 1. What are the common blind spots public health professionals encounter in developing and assessing digital public health interventions? 2. Why are Human-Computer Interaction, Law and Sociology essential in developing and assessing digital public health interventions? 3. How can the LSC DiPh Interventions Framework help overcome the common blind spots public health professionals encounter in developing and assessing digital public health interventions? 4. Which specific challenges arise when applying the LSC DiPh Interventions Framework on digital public health interventions?

**Key considerations in digital population health interventions**
Robyn Whittaker1, Jude McCool1, Chris Paton2, Lorien Abroms2, Dale Bramley1, Rosie Dobson1
1Te Whatu Ora Wait mata, New Zealand, 2University of Auckland, Auckland, New Zealand, 3University of Auckland, New Zealand, 4University of Otago, New Zealand, 5George Washington University, United States, 6Te Whatu Ora, New Zealand

Digital health technologies (DHTs) have become an integral part of global public health initiatives from encouraging and monitoring vaccine uptake to...
supporting self-management of long-term conditions. As these technologies have matured, significant challenges have become apparent that threaten to undermine global efforts to ensure public health interventions that use DHTs are equitable and effective. Top-down large-scale deployments of DHTs designed by and for high-income contexts risk wasting efforts and resources if rejected by the local communities who are expected to use them. Regulations, standards, and guidelines developed to support evidence-based healthcare have not yet been updated to include DHTs resulting in a largely unregulated market - a problem particularly acute in low-income settings. Our international team has diverse global experience at designing, evaluating and implementing DHTs for public health and population health benefits. It is not often that we get the opportunity to come together and discuss using these tools from a public health perspective. The purpose of this workshop is to describe and discuss current trends and future considerations for designing equitable and effective digital technologies for population health. Each presenter will provide a case study of how they have used DHTs for public health programmes in Aotearoa NZ, Pacific Islands, UK, USA, Kenya, Vietnam, Israel, and India. They will outline the current evidence base in their areas of expertise and share learnings from implementing programmes in a diverse range of contexts. The workshop will focus on how DHTs can be designed to improve health equity, particularly for indigenous populations such as New Zealand Māori, and how different contexts and countries should influence how technologies should be designed and implemented. We will address the challenge of designing equitable DHTs and low-income settings with monolithic applications and how governments and international regulators are moving to meet the challenge of ensuring DHTs such as wearable sensors and AI-based diagnostics are evidence-based, effective and safe. Our overall theme is that although DHTs may provide value through enhanced capacity and the ability to meet increasing consumer demand for real-time, accessible, convenient, and choice-driven health care, there remain challenges with the implementation of DHTs with respect to equity, scalability and sustainability. We also question whether DHTs that are in ownership, equity and safety are likely to be upheld with models of social and health entrepreneurship. We will then have a live Q&A time with our panel. There will be time for open group discussion, and we would also hope to gain further insights from participants in the workshop. Objectives: To share learnings and broaden our collaborative understanding of the challenges of designing and implementing digital health technologies for population health benefits in different contexts. In particular, we are interested in further developing the focus on equity via DHTs.

Key Questions: What have we learned about designing DHTs for equity? What are models of integration of DHTs in health systems? What are the next steps for research in this area?

**Exploring the Use of Digital Health Innovations to Improve Health Equity: An International Perspective**
Timothy Mackey1, Marcelo Fornazin2, Marcelo Fornazin3
1University of California San Diego, Global Health Policy and Data Institute, 9500 Gilman Drive, MC: 0505, La Jolla, CA 92037, United States, 2National School of Public Health, Oswaldo Cruz Foundation, Brazil, Yara, Abowelwaffa, Health 2.0 Egypt, Egypt, 3Oswaldo Cruz Foundation, National School of Public Health, Av. Leopoldo Buhóes, 1480, Room 319, Brazil

Digital health innovations are dramatically impacting practices, services, and national health systems. Digital health can potentially expand access to health services, but it can also bring risks to users. This session will therefore discuss the multisectoral understanding of the digital health ecosystem, considering equity as a tenet of modern health systems and a crucial design consideration that needs to be contextualized to local, community, and regional health needs. The workshop’s focus is to increase delegates’ capacity and knowledge in leveraging different digital tools to enhance health equity while also exploring how they align with Sustainable Health Equity goals of the SDGs and local community needs. The workshop will also offer the opportunity to dialogue with the audience about their perspectives and experiences, providing opportunities for connections that can formulate a shared research agenda on digital health innovations and health equity that can be used for capacity building in different communities.

After a brief introduction, the workshop will have three moments: (i) provocations through previously elaborated questions from a group of speakers from diverse regional representation (Latin America, the United States, and the Middle East), (ii) questions and answers from the audience to promote shared dialogue and priority setting, and (iii) final considerations of a preliminary action plan for digital health and health equity. At first, each panelist will focus on answering a leading question without prejudice to dialogue with previous presentations. In the second moment, questions will be collected from the audience to be answered in one or two blocks with each speaker and with active collaboration and problem exploration with the audience. Finally, the speakers will weave their final considerations with provocations of future agendas on the subject, including alignment with governance, policy, and the SDGs, and seek consensus from participants using digital learning tools, e.g., online polls. Using this approach, we will work for generate innovative ideas that address unique and underserved areas in global health, health equity, and digital health while also building capacity by enabling participants to continue exploring digital health solutions in their communities.

**Specific Aims/Objectives:** Describe how digital health system design and digital health tools can enhance health equity and potential risks - Identify different approaches to evaluate technology appropriateness using an equity lens - Provide participants the opportunity to discuss digital health innovation potential benefits in different contexts. In particular, we are interested in further developing the focus on equity via DHTs.

**100 million Brazilian cohort and the cidacs birth cohort: Record linkage national data resources**
Enny Cruz1, Julia Pescarini2, Aline Rocha3, Andrea Ferreira3, Mauricio Barreto1, Enny Cruz1, Mauricio Barreto1
1London School of Hygiene and Tropical Medicine CIDACS keppel st United Kingdom, 2London School of Hygiene and Tropical Medicine, United Kingdom, 3CIDACS, Brazil

Brief Outline Of Overall Workshop
In this workshop, we will present the process of creating two cohorts from the linkage of routinely collected health and social data from a middle-income country. We will explain the methodology and linkage strategies to develop the 100 Million Brazilian Cohort and the Cedars Birth cohort, their characteristics and some applications of their use. SPECIFIC AIMS/OBJECTIVES AND COMPONENT PARTS: We aim to present the two Brazilian data resources developed at the Center of Data and Knowledge Integration for Health (Centro de Integração de Dados e Conhecimentos para Saúde, CIDACS/Fiocruz) using linked administrative dataset.

* In the first part of the workshop, we will describe operational protocols for the acquisition, management, and linkage of large-scale, nationwide, administratively collected electronic health and social records in Brazil.

* Then we will describe the 100 Million Brazilian Cohort (N=131,697,800 low-income individuals, 2001-2018), which was initially developed to investigate the social determinants and the impact of social policies on the health of the low-income population across the whole of Brazil who apply for social benefits through the Unified Registry of Social Beneficiaries (Cadastro Único). The dynamic cohort links (i) individual-level health records, including information on birth, death, notifiable infectious diseases (e.g., dengue, Zika, chikungunya, leprosy, and tuberculosis) and their treatments, ICD-10-coded hospital admissions from both communicable and non-communicable conditions (e.g., mental health, cardiovascular disease, and cancer), and deaths coded with specific causes, (ii) community-level (e.g., local deprivation), household-level (e.g., housing quality), and individual-level (e.g., educational attainment) socioeconomic data, and (iii) intervention-related data on social policies (e.g., the Bolsa Família conditional cash transfer, social housing programme Minha Casa Minha Vida, and the improvement of access to water, the Cisternas (Wells) programs). After describing this resource, we will present the main findings of published studies.

* The second data resource that we will present is the CIDACS Birth Cohort (N=28,631,594 liveborn children and mothers, 2001-2018), which was initially developed to investigate the impact of prenatal and early life events on health-related outcomes for infants, children, adolescents, and pregnant persons in the context of social inequalities. The dynamic cohort links (i) birth records, including information on antenatal care and perinatal outcomes from the Information System of Live Births (SINASC, Sistema de Informação sobre Nascidos Vivos) with (ii) socioeconomic and (iii) health outcome-related data from the 100 Million Brazilian Cohort. This dataset has been used to produce important scientific knowledge, and a study findings will be presented.

The Key Questions That The Workshop Will Address
By the end of this workshop, the participants will be able to understand the strengths and weaknesses of these cohorts, as well as discuss the importance
of these and other routinely linked data resources to knowledge generation and informed policymaking. We will also discuss the future perspectives involving the use of routinely collected data for research.

Analysis of reasons for rejection of biological specimens at national health laboratory service - Dr George Mukhari Tertiary Laboratory

Scelo Khumalo1

1Sefako Magatho Health Sciences University, South Africa

Background and objectives: Clinical laboratories play an enormous role in appropriate and reliable medical decision making, given that a large proportion (70-80%) of diagnoses are based on laboratory tests. To ensure reliability of patient results and avoid reporting of erroneous Results, quality indicators detecting laboratory errors are required. "Laboratory error" is defined as any defect in the testing process, with a reported frequency of 0.012-0.6%. Total testing process in the laboratory comprises of three phases: the pre-analytical phase, analytical and post-analytical phase. This study aimed to identify reasons for rejection of biological specimens at Dr George Mukhari tertiary laboratory. Objectives was to identify and classify the causes of biological specimen rejection, to identify areas where improvement is necessary, as well as to advise on preventative strategies.

Methods: This was a retrospective study conducted in the department of Chemical Pathology at Dr George Mukhari Academic Hospital, Pretoria, South Africa. Data regarding specimen rejection were extracted from the laboratory information system from January to December 2019.

Results: From a total of 2463572 specimens received during the study period, 81687 were rejected, Resulting in a rejection rate of 3.3%. The rejection rate per laboratory was as follows: chemistry, 54%, haematology, 25%, virology, 13%, microbiology, 8%, and cytology, 0.15%. The main reasons for rejection were old specimens, wrong specimens, and haemolysis, accounting for 30%, 15% and 15% respectively. Community health centres showed the highest number of rejected specimens (30%), with the least (2%) from the paediatric outpatients department.

Conclusions: Sample integrity was found to be the major reason for samples being rejected; this included old samples, haemolysed samples, followed by incorrect samples and insufficient samples received by the laboratory. The highest number of rejected samples was from the community health centres, suggesting a need for improvement in specimen handling and transportation from these sites.

Modern doctoral program in public health and social science in Georgian universities

Natia Skhvitaridze1, Tamar Lobjanidze1, Mariam Lobjanidze2, Nino Chkhidzade3

1National Center for Disease Control and Public Health, The University of Georgia, Georgia, 2School of Health Sciences, The University of Georgia, Georgia, 3School of Health Sciences, University of Georgia, Georgia, 4Faculty of Medicine, Tbilisi State University, Georgia

Main challenge for academic programs is to respond to the needs of the healthcare sector faced during pandemic. Social determinantsconstitute about 50% of known risk factors and behavior strongly influence a burden of disease. To improve population health and to mitigation potential threats it is necessary to know health risks that are shifted from social and behavioral spheres. Modern models of public health study are more social driven and meets demand of healthcare system to improve response to potential threats. These lead academic programs to change teaching approach, include multidisciplinary and intersectoral collaboration and tackle social determinants of health. Thus, project "Doctoral Programmes in Public Health and Social Science" (DPPHSS) was initiated in the frame of Erasmus+ programme. Georgian High Education Institutions (HEIs) were participant of this project. The aim was to create modern doctoral program in public health and social science to prepare workforce equipped with knowledge and skills of the proper understanding of social component. It was initiated a cross-sectional, quantitative survey. The study was conducted among stakeholders: faculty, respective doctoral and master students, in total 60. Data were taken in one shot measurement during the dissemination event of the DPPHSS in 2021, using questionnaire. According Results several courses, most important for the public health doctoral programme are Social and behavioral aspects of public health (35%), Health promotion (35%), and Advanced epidemiology and statistics (30%), 75% of respondents advice to upgrade PhD programme according to the current pandemic needs to avoid health services disruption. Hence, in late 2021 was created modern doctoral programmes in public health and social science at the Georgian HEIs (The University of Georgia, Tbilisi State University). Consequently, integration of social science in the public health programme contributed to better health care and social services provision and mitigate negative impact of pandemic.

Strengthening ethics in Ebola research: a toolbox developed with and for limited literacy adults in Ebola-affected countries

Elyse Nowe1

1Western University, Canada

Introduction: Clinical research in West Africa routinely enrolls adults with a low level of literacy, and with no previous research experience. Such research expanded substantially in Ebola-affected countries, following the 2013-2016 Ebola outbreak (Sierra Leone, Liberia, Guinea). The purpose of this study was to develop for and with potential participants with low levels of education, means and tools to support their informed consent (or refusal) to engage in clinical research. Methodology: The study involved intersectoral, multi-country collaboration, notably with Ebola survivor associations and National Research Ethics Committees, to plan, develop and pilot an open access toolkit to support ethical clinical research in public health emergencies. A pilot test of the toolbox was done in Guinea using local languages (Susu and Dioula).

Results: Participatory design of the toolbox Resulted in more audio-visual materials than initially intended, and successful piloting of the toolbox in collaboration with the Ebola Survivors Association of Guinea (May 2021). Pilot workshop participants, including women and men, and individuals aged 18 to over 70 years of age, appreciated having the opportunity to reflect collectively on benefits and risks of participating in EVD research. The use of recognizably African cultural dynamics and values in visually engaging video and poster tools was effective in instigating animated Discussion and building trust in research, but requires a facilitator guide to support effective use.

Conclusions: This toolbox will be important to disseminate among health researchers, anthropologists, members of Associations of Ebola survivors and communicators, researchers, ethics board members, civil society leaders who wish to support potential participants to better understand, discuss, prepare for, and manage their participation in clinical research projects with a particular focus on EVD-affected countries. Skilled facilitation of workshops using the tools as a point of departure for discussions is recommended.

Educational achievement of children with selected major congenital anomalies and associated factors: a Finnish registry-study

Zahra Roustaei1, Anna Heino1, Sonja Kiuru-Kuhlefelt1, Joan Morris3, Svetlana Glinianaia1, Ester Garne4, Loane1, Judith Rankin5, Mika Gissler1,6,7

1Department of Health Sciences, Faculty of Medicine, University of Helsinki, Helsinki, Finland, 2Department of Knowledge Brokers, National Institute for Health and Welfare (THL), Helsinki, Finland, 3Department of Knowledge Brokers, THL Finnish Institute for Health and Welfare, Helsinki, Finland, 4Population Health Research Institute, St George's, University of London, London, United Kingdom, 5Population Health Sciences Institute, Newcastle University, Newcastle upon Tyne, United Kingdom, 6Paediatric Department, Hospital Lillebaelt, Kolding, Denmark, 7Faculty of Life and Health Sciences, Ulster University, Coleraine, United Kingdom, 8Population Health Sciences Institute, Newcastle University, Newcastle, United Kingdom, 9Academic Primary Health Care Centre, Region Stockholm, Stockholm, Sweden, 10Department of Molecular Medicine and Surgery, Karolinska Institute, Stockholm, Sweden

Background and Objectives: There are few population-based studies on the academic achievement of children with specific congenital anomalies. In this study, we aimed to evaluate the academic achievements of children born with major congenital anomalies compared to children without major congenital anomalies and whether educational achievements are associated with sociodemographic factors.

Methods: We performed a population-based study including 401544 children in Finland, graduates of the compulsory school who applied to secondary education. We used health data from the Finnish Register of Congenital Malformations for children born from 1995 to 2002 who had a recorded major congenital anomaly linked with education data from the Finnish Ministry of Education and Culture. We used a generalised linear regression to compare the mean grade differences of children with major congenital anomalies and ‘All anomalies’ subgroup, included children with major congenital anomalies, chromosomal syndromes, and multiple
Inter Professional Education (IPE) and team-based practice in Africa: the missing link
Godwin Ajia

Background and Objectives: Interprofessional education (IPE) is a unique model of educating students for careers in the health sector, where collaboration and teamwork are critical skills required to maximally address the health needs of society. However, it seems that the words, "collaboration" and "teamwork" in the IPE concept are often preferentially applied, to suggest collaboration and teamwork with mostly professionals within the clinical/institutional setting and does not usually include other "professionals" associated with the health system. This paper highlights the need to broaden and diversify the operational definition and application of IPE to emphasize collaboration and teamwork with extra-professionals, super-professionals and the supra-professional to optimally and holistically address the health needs of the community to ensure universal health coverage.

Methods: This is a conceptual paper.

Results: The health system is bigger than the healthcare subsystem. Therefore, interprofessional education should not only be about the professionals in the field of medicine or nursing or medical laboratory science but also other professionals involved in "addressing the priority health concerns of the community, region, and/or nation they have a mandate to serve." Collaboration and teamwork with extra-professionals, super-professionals and the supra-professional are key to addressing human health needs at both the institutional, clinical and community levels.

Conclusions: There is a missing link in the definition and operationalization of the concept of interprofessional education. The health sector is complex, diverse and encompasses other professionals, thus, requiring health professionals to work together with other stakeholders (particularly communities and policy makers) to effectively and efficiently provide need-based health to Africans. There is the need to broaden and diversify the operational definition and application of interprofessional education of students to emphasize collaboration and teamwork with extra-professionals, super-professionals and the supra-professional to optimally and holistically address the health needs of the community and to ensure universal health coverage.

DOI: 10.18332/pompop/164924

Training of health professionals to implement the overweight and obesity reduction policy
Sheila Lindner1, Dalvan Campos2, Deise Warling4, Carolina Henn4, Elza Coelho1

1Universidade Federal de Santa Catarina (UDESC), Brazil, 2Universidade do Estado de Santa Catarina (UDESC), Brazil

Excess weight reflects a relevant public health problem in Brazil. Between 2003 and 2019, the proportion of overweight adults rose from 43.3% to 61.7%, with the prevalence of obesity rising from 12.2% to 26.8% (BRASIL, 2019). Primary Care has confirmed that administrators require basic, entry-level training at the level of a Bachelor’s degree to be able to fulfill their duties. Nearly 83% of the experts confirmed ‘REC administrator’ as the appropriate title for this profession.

Conclusions: A capacity development framework was designed focusing on the following aspects: training, standard operating procedures, infrastructural upgrades, administrative systems, harmonising procedures, and improving information sharing in order to better capacitate administrators. Research ethics administrators need to be capacitated in various ways, comparable to the training received by committee members who review studies so that they are better placed to operate in and respond to the rapidly developing world of global health, research, and research ethics review.

DOI: 10.18332/pompop/164966

A capacity development framework for research ethics committee administrators
Mutshidzi Mulundo1, Joyce Tseka-Gwegweni4, Perpetual Chikobvu1

1University of the Free State, South Africa

Background and Objectives: Little research has been done on research ethics committee administrators’ capacity development, leading to a lack of uniform requirements for this role, and few training opportunities. The role may be related to administration, but it is integral to the smooth running of research ethics committees that oversee global health and scientific research studies. This study proposed and validated a capacity development framework for research ethics administrators in South Africa using a Delphi survey on ethics experts to reach a consensus.

Methods: The Delphi method was applied among research ethics experts from South Africa and abroad through an anonymous online questionnaire.

Results: In total, 23 experts were approached to participate in the study, with 12 and 13 experts responding and participating in the two Delphi Survey rounds, respectively. The results of the second round showed that 67% of the experts confirmed that administrators require basic, entry-level training at the level of a Bachelor’s degree to be able to fulfill their duties. Nearly 83% of the experts confirmed ‘REC administrator’ as the appropriate title for this profession.

Serious game: educational technology for nurses of Primary Health Care
Lucimare Ferraz1, Paola Silva2

1Santa Catarina State University (UDESC), Brazil, 2Universidade do Estado de Santa Catarina (UDESC), Brazil

Background and Objectives: Educational games are technologies that seek to ensure the engagement and involvement of their players, in a teaching-learning process through the game in a differentiated and dynamic way. The objective of this study was to develop a serious game on the prevention of neonatal mortality, as an educational technology for Primary Health Care nurses. Methods: Methodological research, developed in two stages: 1 - search, selection and definition of game content; 2 - development of the serious game, in the stages: Concept, Pre-production or Planning, Prototype, Production, Alpha, Beta and Gold Phase. Results: the content of the game are real cases of neonatal death, classified as preventable, and which have already been investigated by the Municipal Committee for the Prevention of Maternal, Child and Fetal Mortality. For the selection of cases, an e-Delphi consensus panel was developed, with five members of the committee, who after analysis answered a Likert Scale: 0 - nothing relevant, I don’t see the need to include; 1 - slightly relevant, but can be included; 2 - relevant, this could be it; 3 - very relevant, it would be very good to include; 4 - essential, must be included). The three cases selected to compose the content of the game

Popul. Med. 2023;5(Supplement):A662
DOI: 10.18332/pompop/165032

17th WORLD CONGRESS ON PUBLIC HEALTH

218
were: newborn affected by maternal hypertensive disorders, newborn affected by maternal infection in the genital tract and newborn affected by isthmic-cervical incompetence. Thus, in the serious game, the player creates his Avatar (a nurse), who is faced with the cases, being instigated to choose the best conduct of care for the pregnant woman. Considerations: we believe that it is necessary to innovate in teaching strategies, through attractive and interactive processes, based on how active learning, reverberating in a qualification of the Primary Health Care professional for adequate prenatal care.

Assessment of knowledge gaps about ionizing radiation among public health specialists in Lithuania
Donatas Austys¹, Karolina Scieliochienė¹, Rūta Arlauskienė¹, Rimantas Stukas²
¹Department of Public Health, Institute of Health Sciences, Faculty of Medicine, Vilnius University, ²Department of Public Health, Institute of Health Sciences, Faculty of Medicine, Vilnius University, Vilnius, Lithuania

Background and Objective: Ionizing radiation is widely used in various areas of human life. Despite its benefits, it is an important risk factor to health. Taking into account the recent nuclear threats in Europe, the aim of this study was to assess the knowledge of Lithuanian public health specialists about ionizing radiation.

Methods: This study included 300 public health specialists working in municipal public health offices of Lithuania. In 2020, an anonymous survey was conducted. Levels of knowledge about ionizing radiation were calculated. Respondents who could answer less than 5 questions of 13 correctly were assigned to “insufficient knowledge” group. Distribution of the respondents by the level of knowledge about ionizing radiation and sociodemographic groups was assessed.

Results: The level of knowledge about ionizing radiation was insufficient among the 94.0% of the respondents. Distribution of the respondents by the level of knowledge was similar among the respondents with different gender, age, type of place of residence, marital status, level of education, income (p>0.05). There were no respondents who could correctly indicate the most effective personal protection measures against penetrating ionizing radiation, internal exposure to ionizing radiation, there were no respondents who could correctly indicate medical procedures which cause the highest doses of ionizing radiation, also what happenings are accounted as nuclear and radiation accidents and incidents. Most of the respondents stated that they lacked information about radiation induced by various medical procedures, protective equipment, actions that have to be proceeded in case of accidents, accident prevention and consequences elimination plan, and information spreading in case of an accident.

Conclusions: 9 out of 10 public health professionals have an insufficient level of knowledge about ionizing radiation. This emphasizes the possible threat to the public health which should be assessed across the Europe.

Keywords: ionizing radiation, public health, knowledge, awareness

Implementing Health-Promoting Schools - Focus on ergonomics: are we verifying the effectiveness of awareness educational programs? A pilot study on the experience with middle-school children
Sara Pani¹, Fabrizio Gaccetta², Federica Cadoni³, Andrea Salda³, Arianna Lioni³, Paolo Contu³
¹Department of Medical Sciences and Public Health, University of Cagliari, Monserrato, Italy, ²Bachelor Program in Health Care, University of Cagliari, Cagliari, Italy, ³Department of Medical Sciences and Public Health, Specialization School for Hygiene and Preventive Medicine, University of Cagliari, AOI Cagliari, Italy, 4Department of Medical Sciences and Public Health, University of Cagliari, Italy

Background and Objective: Ergonomics programs addressed to children and school-community fit the Health Promoting Schools (HPS) framework. Beyond the integration of ergonomics in curricula, important aspects regard the evaluation of the appropriateness and effectiveness of the programs. A correct evaluation of effectiveness is crucial to guide resource allocation, an essential step to implement and sustain the HPS approach. With the present pilot study, we aimed to evaluate the effectiveness of the program proposed to a sample of school children in the metropolitan area of Cagliari. Methods: The awareness educational program was designed along the lines of the National Institute of Work Accident Insurance (Italy) scheme and proposed to 260 middle-school children. The program is divided into three phases: i) assessment of students’ background, ii) displaying of the training modules, iii) evaluation of conceptual understanding. For this purpose, we used pre- and post-intervention questionnaires.

Results: The results show a substantial improvement in the percentage of correct responses in the post-intervention, confirmed by the chi-square test, for questions regarding general concepts about ergonomics, backpack weight, and handling. On the other hand, some questions show a pre- and post-intervention continuity in terms of percentage of correct answers. We can divide them into two categories: a) questions to which the students already answered well (basic rules of polite postures); b) questions to which students often answered incorrectly, both before and after the intervention (illustrations; sequences). Conclusions: Effectiveness evaluation led us to a necessary re-evaluation of topics, form, and clearness of the questions posed, as well as of the teaching style. Adapting the program to the educational, environmental, and cultural context seems to be crucial for maximizing effectiveness. This pilot study demonstrates that the cultural gap relating to health and safety at school might be reduced with dedicated and tailored programs for school children and community.

Exploring doctors’ trade-offs between management, research, and clinical training in the medical curriculum: a discrete choice experiment in southern Africa
Jacqueline Wolaarda¹, Astrid Turner¹, Mandy Ryan²
¹School of Health Systems and Public Health, University of Pretoria, South Africa, ²Health Economics Research Unit, University of Aberdeen, United Kingdom

Background and Objective: Public health requires doctors to fulfill roles that extend beyond that of a clinician. There is consensus that management and research training in medical curricula will reinforce evidence-based practices. The study aimed to establish how much clinical activity training time doctors in southern Africa would give up for time spent on research and management training, as well as possible teaching methods. Methods: A discrete choice experiment (DCE) was used. Five attributes were included: i) management content; ii) research content; iii) teaching method iv) placement; and v) clinical training hours in a week. Respondents were presented with 10 choice tasks generated from a D-efficient design. A resistance to change-beliefs scale assessed respondents’ preference for tradition or change. Demographic information was collected to assess observed preference heterogeneity. Analysis of the DCE data was based on the Random Utility Maximization framework using variants of the multinomial logit model. Willingness to Give Up Time (WTGUT) was estimated for all attributes i.e., how many hours respondents would be willing to give up from the current 40 hours clinical training to be used for management and/or research training instead. The online pilot DCE survey was sent to 50 medical doctors in September 2022. Results: Parameter estimates suggested face validity in terms of direction of preference. Relative to no management training, respondents preferred all other levels of content. There was a preference for students to learn how to use, not do, research. Relative to face-to-face teaching at the beginning of the curriculum, respondents preferred the hybrid method throughout all years. However, WTGUT estimates lacked face validity and respondents did not distinguish between clinical training levels.

Conclusions: Pilot study findings suggest the clinical training levels did not push individuals to their maximum. Revised levels will have to be included in the main study in 2023.

The discrepancy of premortem clinical and post-mortem autopsy of lung pathologies in under-five deaths and the reasons of discrepancy among cases included in CHAMPS research, a case series study
Haleluya Leulseged¹, Nega Assefa², Merga Dherezza², Addissu Alemu³
¹Haramaya University, Ethiopia, ²Haramaya University, Harar City, Ethiopia, ³Haramaya University, Harar city, Ethiopia, ⁴Haramaya University, Harar, Ethiopia

Background: In Ethiopia, modern medicine was started in 1886 G.C and health professionals have been treating patients using different diagnostics algorithms but there is a limited practice of examining post-mortem autopsy results and thinking back on the certainty of the diagnosis made for the patients before death. Conducting diagnostic discrepancy studies is important to understand the gap that exists in the clinical diagnosis and modify the diagnostic algorithms to give better and appropriate treatment.

Methods: In this research, a formal, non-consecutive clinical case series study of under-five deaths included in the autopsy study between October 2019 and April 2022 was conducted. The premortem clinical diagnosis and post-mortem
pathological diagnosis of the lung was compared for each case, and 02 physicians evaluated the results separately for concordance and discordance of diagnosis. McNemar test was used to see if there is a statistically significant difference between the postmortem clinical diagnosis and post-mortem pathologic diagnosis of each case. P-value < 0.05 was considered statistically significant. Cohen's kappa was also calculated to see the inter-rater variability. The reason for concordance and discordance in diagnosis was analyzed case by case for all under-five deaths included in this research by 02 separate senior physicians.

Results: The magnitude of diagnostic discrepancy was 34% (95% CI: 20%-47%) and Cohen’s kappa Results was: 0.079. Reasons contributing to diagnostics discrepancy were: Case analysis problem (knowledge gap or compression problem) in 35.5%, Problem in consultation and teamwork in 35.5%, Documentation problem in 10%, Unavailability of diagnostic investigations in 8%, Communication gap between health facilities in 6%, Access to health facility in 3% and Work culture in 1%.

Conclusions: The magnitude of misdiagnosis of cases is very high, and interventions should be implemented on the most common causes of diagnostics discrepancy to yield a better diagnosis of diseases by clinicians.

The terrible “C word”: Dismantling coloniality and hegemonic structures in health education
Danielle Fernandes 1
1University of Ghent, Belgium

Background: There is increasing recognition of hegemonic structures in global (public) health, from its colonial legacy to contemporary decision-making and governance. Power structures are often perpetuated through health education that instills Eurocentric perspectives and methodologies. While public health academics have long called for the decolonization of health education, there is limited evidence of such initiatives in European higher education institutions. With this gap in mind, a student-led project was launched within the University of Ghent to examine and address hegemonic structures in health education. The aims of the project were to (I) co-develop recommendations to dismantle power structures within the university, and (II) assess the implementation of these recommendations. Methods: An exploratory study was conducted consisting of a series of interviews and workshops with students and staff of the University of Ghent’s Medical Faculty from February - August 2022. A co-creation approach was used to co-develop a set of actionable recommendations. These recommendations were tested, and a qualitative inquiry was conducted to explore the perspectives of students and staff regarding the acceptability and feasibility of these initiatives.

Results: The project highlighted three focal areas for change: (I) diversification of teaching staff, (II) decolonisation of curriculum, and (III) North-South equity. A set of targeted policy recommendations were formulated, with a select few being tested, such as digital learning to include foreign guest lecturers, sensitisation courses, buddy programmes for North-South knowledge exchange, and sensitisation for students going abroad. Implementation barriers and facilitators were highlighted, including the importance of student engagement and the need for systemic changes.

Conclusions: This project effectively moves the decoloniality discourse in academia from rhetoric to action. The findings can inform efforts to train a new generation of health professionals that are better equipped to address power dynamics and achieve equity in public health.

Movement from knowledge-based to competency-based MPH curriculum in the United States
Laura King 1
1Council on Education for Public Health

Background and Objective: In 2016, the Council on Education for Public Health (CEPH), the accrediting body for schools and program of public health in the United States and worldwide, adopted a competency-based approach as the foundation for the MPH curriculum, replacing a disciplinary-based, five core knowledge area (i.e., biostatistics, epidemiology, health services administration, social/behavioral sciences, and environmental health) approach. Prior to 2016, accreditation criteria required students to “complete sufficient coursework to attain depth and breadth in the five core areas of public health knowledge.” In practice, all programs addressed this expectation by requiring at least one distinct class in each of the five knowledge areas. These five classes comprised the “core curriculum.” The 2016 accreditation criteria define a set of 12 foundational learning objectives and 22 foundational competencies for the MPH, with no specific references to core areas or disciplines. This presentation will focus on the evolution of the core curriculum completed by all MPH students five years after these changes were adopted.

Methods: Accreditation self-evaluation documents, appendices, and university websites accessed between March and May 2020 were reviewed and curricula were coded as A) Retained five core course structure, B) Added/changed courses, or C) Integrated courses.

Results: Results indicate that only 10% of programs have retained the pre-2016 model of curriculum, and 11% of programs have pursued complete integration of the core curriculum. Nearly 80% have modified the core curriculum by retaining some discipline-specific classes and adding new non-discipline specific core classes. The most frequently added classes are those in program planning, implementation, and evaluation; research methods; and general Introduction to public health. The median number of required classes went from five in 2016 to seven in 2021.

Conclusions: A discipline-based curricular approach is not the preferred method in a competency-based learning model.

Development of innovative strategies to evaluate teaching-learning processes in public health
Edlaine Villela 1, Regiane Paula 1
1São Paulo State Health Department, Brazil

Background and Objective: Education and communication in health surveillance have been taught in a very conceptual way in postgraduate programs, without reflection on health practice and return to society. The objective is to transform the way of evaluating a postgraduate course, allowing the use of technological resources to innovate in the area of public health and disseminate the materials prepared to health professionals and the community in general. Methods: The elaboration of the audiovisual material was carried out by 27 students in 2021 from the Postgraduate Program in Sciences of the Disease Control Coordination/ So Paulo State Health Department to approach content of public health during the discipline of Education and Communication in Health Surveillance. As a way of applying active Methodology in the evaluation process, the elaboration of audiovisual materials was proposed. The theme was chosen by students, covering concepts and fundamentals of health education and communication.

Results: The group addressed the themes: Patient safety; COVID-19 in schools; Vaccination; One health; and HIV prevention, due to the relevance of the theme and its applicability in the practice of health surveillance. Therefore, it is extremely important to understand the subject in the work routine, aiming at improving health services. The produced videos were based on different methods, popular on YouTube. Audiovisual recordings were presented in the classroom along with an explanatory report of the activities carried out. In addition, the materials produced were posted on the YouTube channel of the Coordination of Disease Control, which allow the dissemination the of knowledge in public health. Conclusions: The use of digital technologies facilitated the learning process and effective communication. It provided innovative views on the same subject, presenting specific contents in a didactic way. The partnership between innovation and creativity made possible to assimilate the application of health surveillance content.

Student experiences and perceptions of content and learning processes during the fully online Postgraduate Diploma in Public Health
Tiaan Eksteen 1, Sean Patrick 1, Liz Wolvaardt 1
1University of Pretoria, South Africa

Objectives: Describe enrolled students’ experiences regarding learning about public health online and perceptions about content and the learning process. Study design: A descriptive cross-sectional design. Methods: A 52-item closed-ended online questionnaire was sent to Postgraduate Diploma in Public Health (PDiDipPH) students enrolled from May 2020 to March 2021 (N=775), and who had completed at least two modules. Mean Student Experience Scores (SES) and an Overall Student Experience Score (OSES) were calculated. Logistic regression was used to determine associations between demographic variables and SES for each variable.

Results: The response rate was 31% with majority (74%) being female aged 35-40 years. Most (97%) respondents agreed that modules provide multiple activities to enhance learning. Similarly, 92% agreed that multiple assessment strategies and innovative technology actively engages them in the learning processes. The 31–34-year age group was more likely to have a lower SES for opportunities for
interaction and communication compared to the 20–30-year age group (OR 0.26, 95%CI 0.07-0.90, p=0.028). Respondents aged 31-34 years were more likely to have a lower SES on regular feedback regarding their performance throughout the modules compared to those aged 20-30 year (OR 0.32, 95%CI 0.11-0.88, p=0.028). Respondents agreed that their overall experiences of the PGdIPH were positive, OSES=37.66 (SD=3.70).

Conclusions: Results shows that the online PGdIPH provides multiple activities to strengthen student learning and that multiple assessment strategies engages students in learning processes. The overall experience of the programme is positive; however, strategies of feedback for learning and feedback of learning need further study.

New competences in MBA for healthcare programs on the example of digitization
Piotr Szykiewicz1, Janusz Strużyna2
1Collegium Prometricum - The Business School for Healthcare, Poland, 2University of Economics in Katowice, Poland

Relevance: Digital competences significantly affect the ability to use the opportunities offered by digitization [Topol, 2019]. The implementation of integrated care [Goodwin, 2016]. The efficiency of using digital means of communication turned out to be particularly important during the pandemic (Clement et al., 2021). Context and Aims: Competencies can be defined as characteristic employees attributes, that helpful for understanding the current and future performance, attitudes and behaviours of employees [Grant and Baden-Fuller, 2018]. Digital competences are the attributes of the employee that allow the use of digital devices and software in a manner consistent with their capabilities, but subordinated to the users needs. Digital competences of employees are shaped in two ways. The first concerns the competence to operate digital devices for the needs of everyday life. The second way of increasing the digital competences level Results from employee improvement processes as part of professional requirements. The overlapping of digital life and professional competences is a fact and has positive and negative consequences.

Findings: Researchers analyzing digital competences have distinguished many possible ways to indicate their comprehensiveness and complexity. In the development of the tool for assessing digital competences of medical workers, an appropriately adapted model indicated in the work of Laar [Laar 2018] was used. The next stage of work on the development of digital competences of medical workers should be the development of appropriate training programs. Innovative Contribution to Policy, Practice and/or Research: The current state of knowledge shows that digital competences are not a simple sum of their components. Both the importance and complexity of the phenomenon of digital competences mean that they should find their place in the MBA in Healthcare curriculum.

Field epidemiology training program in West African Portuguese speaking countries: building capacity while strengthening health systems for health surveillance and outbreak response
Mohsin Sidat1, Inês Gonçalves2, Isabel Araújo3, António Delgado4, Maria Mendonça5, Paulo Ferrihno6,7
1Faculty of Medicine, University Eduardo Mondlane, Mozambique, 2Instituto de Higiene e Medicina Tropical, Universidade Nova de Lisboa, Portugal, 3Universidade de Cabo Verde, Cape Verde, 4Instituto Nacional de Saúde Pública, Cape Verde, 5Instituto de Higiene e Medicina Tropical, Portugal, 6Universidade Nova de Lisboa, Portugal

Introduction: In 2020, the European and Developing Countries Clinical Trials Partnership and Africa CDC announced funds for Training of epidemiologists in sub-Saharan Africa. In response, a consortium was established which included African and European Universities, National Institutes of Public Health and Research Centers. This consortium proposed a project to implement a Masters in Field Epidemiology offered via blended-learning platforms by the University of Cape Verde. Thus, this presentation is to share experiences of a first ever in the world offer a blended-learning advanced field epidemiology training, integrated into the National Field Epidemiology Training Program (FETP) coordinated by the National Institute of Public Health of Cape Verde.

Methods: The overall project will be described as well as processes in developing the curriculum and its accreditation at different levels (including Higher Education Accreditation Authorities in Cape Verde), students’ recruitment strategies, establishment of International Steering Committee among others. The field training sites accreditation, processes to identifying teachers and tutors among other key aspects of advanced FETP delivery will be presented.

Results: A total of 55 candidatures were received and 15 were selected (6 from Cape Verde, 6 from Guinea-Bissau and 3 from São Tomé and Príncipe). Through a consultative process and field visits, tutors were identified for each student in the country of origin. Field training sites to enhance experiences and capacity of trainees in health surveillance and outbreak response were chosen. The expected outputs from field training were defined.

Conclusions: The practical training in the countries of origin complemented with theoretical training offered online will allow better retention of the trained cadres in their countries of origin and contribute for health system strengthening. The program will contribute with learning and teaching materials in Portuguese and enhance a cohort of Portuguese speaking African epidemiologists.

Measuring student engagement in a fully online programme in public health
Jacqueline Wolvaardt1, Mari Wyk2
1School of Health Systems and Public Health, University of Pretoria, South Africa, 2South Africa, 3University of Pretoria, Pretoria, South Africa

Background and Objective: The maximum period of study for a Master of Public Health degree at our university is two years (part-time). The majority of students works full time and the compulsory attendance of modules usually far exceeds the number of leave weeks that our students routinely have. The entry requirement is broad and does not require a previous degree in public health. The decision was therefore made to include all the foundational modules in a fully online postgraduate diploma in Public Health and make this programme an entry requirement for the Master programme. One concern was whether fully employed mature students would engage in online learning.

Methods: A document review was done of the all offerings of the first module in the curriculum in 2022. The number of academic discussion posts (excluding group submissions), academic emergency posts and social posts were calculated as a percentage of enrolments. Similarly, the completion of the three possible achievement badges was calculated. A Welcome Badge was for all those who introduced themselves; A Corona Badge was awarded to those who achieved at least 50% for in-video assessments, and a Calculus Badge was for those who achieved 75% for statistics-related quizzes.

Results: A total of 970 students were enrolled in one of the six modules that met the inclusion criteria. The engagement rate in academic discussions was 2 115% (or a total of 20 522 posts). The engagement rate of students who posted in the Emergency Room (a discussion board to post problems and receive help) was 250%. There was less engagement in the social space/coffee chat room (110%). The success rate for one or more of the three possible badges was 71% (average). Conclusions: A fully-online programme in public health that is designed (and rewarded) online engagement can ensure student engagement.

Students learn better when we design public health curricula using systems thinking principles

Simon Reid1, Nicholas Osborne2, Sheleigh Lawler3, Angela Willemansen4, Karen Shelley5

1School of Public Health, The University of Queensland, Queensland, Australia, 2School of Public Health, The University of Queensland, Queensland, Australia, 3School of Public Health, University of Queensland, Queensland, Australia, 4School of Public Health, The University of Queensland, Herston Road, Queensland, Australia, 5School of Public Health, The University of Queensland, Queensland, Australia

Background and Objective: The complexity and uncertainty of the COVID-19 pandemic highlights the need to change training of public health professionals in higher education by shifting from siloed specialisations to interdisciplinary collaboration. At the end of 2020 and 2021, public health professionals collaboratively designed and delivered, a week-long intensive course—Public Health in Pandemics. The aim of this research study was to understand whether the use of systems thinking in the design and delivery of the course enabled students to grasp the interdisciplinary nature of contemporary health promotion and public health practice.

Methods: Two focus group interviews (n = 5 and 3/47) and a course opinion survey (n = 11/47) were utilised to gather information from students regarding experiences and perceptions of course design and delivery, and to determine if students felt better able to understand the complex nature of pandemics and pandemic responses.

Results: Students provided positive feedback on the course and believed that the course design and delivery assisted in understanding the complex nature of health problems and the ways in which health promotion and public health practitioners need to work across sectors with diverse disciplines for pandemic responses.

Conclusions: The use of an integrated interdisciplinary approach to course design and delivery enabled students used systems thinking to understand the complexity in preparing for and responding to a pandemic. This approach may have utility in preparing an agile, iterative and adaptive health promotion and public health workforce more capable of facing the challenges and complexity in public health.

Investigating the international immigration tendency of intern doctors in Türkiye and related factors

Berna Sert1, Ahmet Uzun2, Süleyman Konuş3, Coşkun Bakar4, Gamze Can1,2

1Public Health Department, Faculty of Medicine, Kanakalle Onsekiz Mart University, Türkiye, 2Kanakalle Yenice State Hospital, Türkiye

Background and Objective: In the last decade, immigrating to developed countries has been a popular topic among young doctors in Türkiye. In the beginning of 2022, the Discussions about doctors’ immigration were in the focus of national media. However, there was a clear lack of scientific data. This study aimed to investigate the tendencies of intern doctors towards international immigration, and to determine the factors that may induce a desire to immigrate.

Methods: 206 intern doctors that were reached through social media, participated in the study by filling the online form between March 1 - 21, 2022. The form included questions about descriptive features, Attitude Towards Brain Drain Scale(ATBDS) and the Beck Hopelessness Scale(BHS).

Results: 82.0% of participants were exposed to verbal violence while working, 6.3% were exposed to both verbal and physical violence. 85.9% wanted to work abroad, 74.5% of these participants made this decision during their clinical training. 64.6% of the participants were planning to take board exams abroad. Most of the participants wanted to take board exams of United Kingdom (64.6%), followed by United States (37.6%), Germany (15.8%) and Canada (12.78%). The mean of BHS scores was found to be 9,130(D=4.31). ATBDS scores were found to be higher in the intern doctors who have been exposed to physical violence, who have a history of being abroad, who are currently taking or have plans to take a foreign language course, who want to work abroad, who have plans to take foreign residency exams and who do not plan to take residency entrance exam in Türkiye (p<0.05).

Recommendations: Brain drain tendencies may indicate an increase in the need of general practitioners and specialists. New researches should examine the push and pull factors that lead young doctors to migrate, and guide policymakers to solve the push factors.

Changes in cultural competency among emergency department staff in a large urban hospital following the implementation of an Indigenous Cultural Safety education program

Chenoa Cassidy-Matthews1,2, Leslie Bonshor2, Andreas Pilarinos1,2, Sandra Fox3, Lori Quinn4, Kristzina Vasarhelyi1,2, Brittany Bingham1,2

1University of British Columbia, Canada, 2Vancouver Coastal Health, Canada, 3Vancouver Coastal Health Authority, Canada, Simon Fraser University, Canada, 4Centre for Gender and Sexual Health Equity, Canada

Introduction: Anti-Indigenous racism within healthcare has been well-documented globally. In response, there have been calls for the expansion of Indigenous cultural safety (ICS) education to all healthcare staff. Given limited evidence on the impacts of ICS education within acute healthcare settings, this study sought to evaluate changes in Emergency Department (ED) staff’s understanding and application of ICS within their health care practice. Methods: Employing a one-group, pre- and post-test study design, the Cultural Capability Measurement Tool (CCMT), and other standalone questions on cultural competence, were administered to ED staff at a large urban hospital in Vancouver, Canada both before and after the completion of a new, introductory, and in-person ICS education program. Paired t-tests examined changes in CCMT scores, and Wilcoxon rank sign test was used to assess changes in standalone questions.

Results: A total 66 ED staff complete a pre- and post-test survey. Statistically significant improvements were seen in three of four of the domains of the CCMT, including in respect (p=0.015), communication (p<0.001), and safety and quality (p=0.005), though no statistically significant improvements were observed in the reflection and advocacy domain (p=0.189). Similarly, statistically significant improvements were observed across other measures of cultural competency in relation to general knowledge, workplace applications of ICS, and how to meaningfully engage with Indigenous patients (all p<0.05). Conclusions: Findings indicate that expanding ICS education in healthcare is critical to reducing anti-Indigenous racism and improving Indigenous Peoples’ trust in the healthcare system. This may include providing regular, routine ICS education opportunities for healthcare staff and incorporating ICS teachings into medical education curriculum. Future research comparing changes in cultural competency between an intervention and control group of healthcare staff is recommended and would be valuable, as well as research into Indigenous Peoples’ experiences before and after the implementation of a healthcare-specific ICS education program.

Perceptions towards an e-learning approach Public Health students at a South African University

Kavitha Naicker1

1University of Pretoria, South Africa

Background and Objective: Technological advancements have been making its way into many aspects of our homes and livelihood. And our educational system is no exception to this technological advancement, since its Introduction into the system in the 1990’s. This is in addition to meeting the demands of globalisation and the need for information accessibility and technological advancements. However, these advancements have shown to be not well received and perceived by students. And therefore, the objective of the current study is to determine the perceptions and experiences of e-learning amongst Postgraduate Public Health students in South Africa in order to optimise learning strategies whilst improving the learning environment for studying to be more enjoyable. This in turn would Results in a two-way benefit, in that more students would uptake e-learning studies, whilst higher educational institutions would run successful programs. The need for this study was highlighted by several research findings that suggest that there
are several perceptions of students towards e-learning that needs investigation. Methods: The sample will consist of two cohorts from the Postgraduate Diploma in Public Health at a South African University. All students in these cohorts will be provided with a link that provides information on the study, in addition to the Perceptions towards an e-learning approach Questionnaire.

Results and Conclusions: Preliminary results indicate that students in general experience e-learning as positive. They are a bit lost in the beginning, but eventually find their way in the learning journey. They struggle with time-management, workload management, balancing work, family and study life. They complain about instructions, and they procrastinate. Since data will still need to be collected, analysis might confirm, deny or add to these findings.

Piloting the Informed Health Choices resources in Barcelona primary schools: a mixed method study
Laura Jofra¹, Laura Jofra¹, Esther Martínez², Pablo Alonso-Coello³, Sarah Rosenbaum⁴, Laura García⁵
¹Hospital de la Santa Creu i Sant Pau, Spain, ²Centro Cochrane Iberoamericano, Instituto de Investigacion Biomédica Sant Pau (IIB-Sant Pau), Spain, ³Centre for Informed Health Choices, Norwegian Institute of Public Health, Norway

Introduction: The main Objective of the Informed Health Choices (IHC) project is to teach people to assess treatment claims and make informed health choices. For this purpose, the IHC learning resources were developed for primary school children. The aim of this study is to explore students’ and teachers’ experiences when using the IHC resources in Barcelona (Spain) primary schools.

Methods: We conducted a mixed method study for piloting the IHC resources in Barcelona (Spain) primary schools. The intervention included a workshop with teachers and family members, and nine lessons with the students. We collected data using multiple approaches, including ad hoc questionnaires, non-participatory observations, and semi-structured interviews. We performed quantitative and qualitative thematic analyses to explore understandability, desirability, suitability, usefulness, and facilitators and barriers for using the IHC resources.

Results: Two schools with a total of 143 students in 4th and 5th grade (9 to 11-year-olds) and six teachers participated in the study. One school competed all the lessons and followed the suggested IHC teaching plan. The other school did not complete all the lessons and changed the teaching plan substantially. Overall, students and teachers understood, were interested, and were able to apply the content of the lessons. During the lessons, students used the IHC resources (mainly the textbook), but teachers used them in a variable way. Teachers adapted the IHC resources to promote increased student participation and used Information and Communications Technologies to support their teaching. We observed more facilitators than barriers to teach the lessons. Teachers suggested some ideas to improve the lessons based on the activities they developed and implemented.

Conclusions: It is feasible to use the IHC resources in Barcelona primary schools. However, the IHC resources should be adapted for this setting to increase students’ participation in classroom.

How do young women perceive and shape the culture of postsecondary education in rural Canada?
Alexa Ferdinands¹, Dana Wagner¹, Maria Mayan¹
¹University of Alberta, Canada

Background and Objective: Postsecondary educational attainment, one of the most compelling social determinants of health, is lower (45%) than the national average (65%) for women in Drayton Valley, a rural oil and gas town in Canada. Traditional gender roles are entrenched in Drayton Valley, including social norms surrounding education. Men are encouraged to enter well-paid oil field work straight from high school, making it possible to have one-income-earner families. However, undertaking postsecondary education can also lead to the continuous introduction of new technologies which will affect economic stability, and consequently, residents' physical, mental, and social health. In response to these challenges, one such town, Drayton Valley, introduced a tuition assistance program (up to $5000 CAD per resident) in 2019 to reduce financial barriers to select postsecondary education and training programs. While the program offers opportunities to train in fields independent of oil and gas, it may also retain residents and attract new people to the town. In partnership with the Town of Drayton Valley, along with evidence that education is one of the most important determinants of health, we aimed to examine the facilitators of and barriers to developing, implementing, and sustaining this program.

Methods: This qualitative study was underpinned by principles of community-based participatory research. Between August 2021 and June 2022, we conducted 11 interviews with stakeholders (elected officials, local administration, postsecondary institution representatives) and participated in 5 group stakeholder consultations, facilitated by a community economic development consultant. Interview transcripts and fieldnotes were analyzed using qualitative content analysis.

Results: We developed five categories which speak to the facilitators and barriers of developing, implementing, and sustaining Drayton Valley's tuition assistance program: 1) lack of a unified vision and goals; 2) unique context of postsecondary education and training in Drayton Valley; 3) innovative champions of education; 4) stakeholder collaborations and multisectoral partnerships; and 5) establishing community buy-in. In this presentation, we will summarize recommendations for capitalizing on facilitators and addressing barriers as the town moves forward with this program.

Conclusions: This study contributes to the limited knowledge on tuition assistance programs in Canada. Findings may have implications for other rural communities interested in using tuition assistance programs as innovative tools for promoting health equity.

Developing a framework for collaborative education and training of the next generation of global health professionals: experiences and challenges
Iman Hakim¹, Gabriella Valdez², Roxanna Apaez³
¹Mel and Enid Zuckerman College of Public Health, University of Arizona, Tucson, United States, ²Mel and Enid Zuckerman College of Public Health, University of Arizona, Tucson, United States

Background and Objectives: There is a tremendous need for a global health workforce that is competent to deal with emerging global health issues. Global health education and training provide unique collaborative opportunities to address the global burden of disease by training the next generation of global health experts. The Mel and Enid Zuckerman College of Public Health (MEZCOPH) at the University of Arizona is an example of an institution that has recently invested in global health infrastructure and academic programs. MEZCOPH established the Global Health Institute (GHI) to provide innovative and transformative public health education, scholarship, research, advocacy, and leadership training for health care professionals worldwide.

Methods: The rapidly evolving convergence of the physical, digital and biological fields is reshaping and transforming higher education. This Fourth Industrial Revolution will lead to the continuous introduction of new technologies which will mandate new and innovative ways of experiential learning. The new and emerging
digital media technologies provide feasible and cost-effective alternatives to traditional classroom instruction.

Results: The GHI implemented an innovative approach to internationalization by establishing a worldwide network of global partners and/or micro-campuses to deliver collaborative educational and training programs including unique dual degree programs overseas to local students and different summer and global immersion programs. These programs rely on the full collaboration between GHI and its worldwide partners. I will discuss our micro-campus experience and other GHI ongoing programs with our network of global partners. I will highlight the successes, challenges, and lessons learned.

Conclusions: Collaborations in global health education and training, while tremendously advantageous, can be demanding and challenging.

DOI: 10.18332/popmed/165526

Are students and teachers of Slovak medical university motivated for physical activity?

Katarina Dostalova1, Eva Palugova1, Peter Simko1, Sona Wimmerova1, Eva Horvathova1, Stefania Moricova1

1Slovak Medical University, Bratislava, Slovak Republic

The importance of physical activity (PA) for the human body is very well known. The physical inactivity significantly contributes to the development of chronic diseases and premature mortality. The Slovak Medical University (SMU) in Bratislava is a higher education institution keeping the tradition of education of health care workers in specialised studies and continuous lifelong education in Slovakia. It is assumed that students and teachers of SMU with mission to educate for prevention and a healthy lifestyle, follow the principles of a healthy lifestyle in their personal lives. According to WHO adults aged 18–64 years should do at least 150–300 minutes of moderate-intensity aerobic PA.

Methods: We analyzed and compared the physical activity of teachers and students of SMU. The group consisted of 101 teachers and 242 students. Data collection was performed through an anonymous electronic questionnaire.

Results: 44 teachers (43.56%) and 60 students (24.79%) engage in PA for more than 150 minutes per week. We analyzed the motivation of respondents to PA. 144 respondents are motivated to perform PA by friends (18.81% of teachers and 51.65% of students). 137 respondents chose the family as the main motivation (66.34% of teachers and 28.93% of students). Social networks, the internet, television and advertising motivate only 3 students (1.24%).

Conclusions: It is astonishing that only a quarter of SMU students meet the WHO recommendations for PA. It is a challenge for SMU teachers to pass on to their students’ knowledge about a healthy lifestyle not only in theoretical form, but also their personal experiences from everyday life. We explain the low share of motivation through social networks and the internet to PA and, on the contrary, motivation mainly by close people (family in teachers and friends in students) in the current pandemic situation, when personal contact becomes highly valued.

DOI: 10.18332/popmed/165567

Defining the elements of a regional accreditation system for academic institutions of public health in Africa: methodological processes

Neo Ledibane1, Liz Wolvaardt1, Kuku Yoi2

1School of Health Systems and Public Health, Faculty of Health Sciences, University of Pretoria, Pretoria, South Africa

Background: Health systems in Africa require an overhaul to align with the universal health coverage (UHC) mandate and a parallel review of public health training and development of the health workforce is warranted. One of the integral components that inform the relevance of public health education in the setting of UHC is the capacities of the academic institutions of public health. The aims of the study are to define the elements that comprise the public health education capacity within academic institutions and to develop an accreditation system for the African region.

Methods: Study design: quantitative analytical cross-sectional design with a qualitative component. Study setting: ASPHA (Association of Schools of Public Health in Africa)-affiliated academic institutions of public health at Anglophone, Lusophone, Francophone countries in Africa. Study population: Heads/Deans of Departments/Schools of Public Health. Phase 1: A secure, electronic self-administered questionnaire measuring the institutional baseline characteristics (academics’ demographic, curriculum and institution characteristics) underwent five iterations, was piloted and translated into French and Portuguese. The survey launched in November 2022. Quantitative data analysis will be performed using STATA version 17; thematic analysis will be applied to the qualitative data using the ATLAS.ti software.

Results: The preliminary Results will be presented at the conference. These results will form the basis of the elements of a Delphi panel in Phase 2 of the study. The planned outcome of Phase 2 is a self- and peer-assessment tool that can be tested (in Phase 3) as a first step towards accreditation. Conclusions: The study findings are envisaged to inform the development of an accreditation system for the association so that the academic institutions of public health can align their workforce training and development to the changing health and health system needs of Africa.

DOI: 10.18332/popmed/165595

Current problems in nursing and midwifery research in Bulgaria (2020-2022)

Milena Saleva1, Gena Grancharova1, Silviya Yankulovska1, Nakreta Draganova2

1Faculty of Public Health, Medical University of Pleven, Pleven, Bulgaria, 2Bulgarian Public Health Association, Bulgaria

Background and Objectives: The research in nursing and midwifery in developed countries has a long tradition and is very well positioned. In Bulgaria, this activity is promoted during the last decades with the introduction of Bachelor degree in basic training of nurses and midwives and Master degree for educators and managerial positions in health care. We aimed to reveal the main problems hindering the development of research in Bulgarian nursing and midwifery.

Methods: A total of 1097 anonymous self-administered questionnaires (with closed, semi-closed and open questions) were distributed among practicing nurses and midwives in 8 hospitals and educators and fourth-year students in 6 higher schools. The response rate was 78.9%; higher for students (85.2%), followed by 79.3% for practitioners and 77.2% for educators. Data processing was performed by SPSS v.24 using descriptive statistics and comparative analysis. The accepted level of significance was p<0.05.

Results: All the respondents pointed out the lack of time due to insufficient staffing. The situation was exacerbated by COVID-19 pandemic. Lack of motivation and underestimation of the efforts by the employers was the second factor for 36.6% of practitioners and ranked as third by 57.5% of educators and 58.9% of students (P<0.01). The lack of funding was indicated by 30.4% of practitioners and 28.3% of students. Insufficient knowledge and skills for conducting research were recognised as other important problems together with poor command in foreign language and lack of standardized documentation in healthcare practice. Good computer skills and knowledge were not among the main problems. Conclusions: When studying the current situation of research, it is important to look for the problems that hinder its development. The results of our study serve as important signals for concrete actions to be taken to overcome the problems and to encourage research among nurses and midwives.

DOI: 10.18332/popmed/165624

Implementation of a comprehensive approach to health promotion at the school and community levels: preliminary findings from the Alliance for Health project

Axelle Girond1, Marine Gontin2, Caroline Simar3, Véronique Denois5, Julie Pirionom1, Julien Masson1, Didier Jourdan4, Franck Chauvin4

1University Jean Monnet Saint-Etienne, France, 2University Jean Monnet Saint-Etienne, Saint-Priest-en-Jarez, France, 3University Clermont-Auvergne, UR4281 ACTé, Chamalières, France, 4University Jean Monnet Saint-Etienne, Saint-Priest-en-Jarez, France, 5University Claude Bernard Lyon 1, UR 4129 P2S, University Jean Monnet Saint-Etienne, France

Background and Objective: Supporting children in developing health skills goes, according to research, through a comprehensive approach to health promotion. The Alliance for health project aims to enact and assess the impact of a comprehensive approach to health promotion at the school and community levels. This intersectoral project involves regional education authorities, regional public health agency, local policy makers, researchers, and local health promotion operators.

Methods: This project involved 48 French primary schools and 47 associated municipalities in the AURA region randomly selected. From September 2019 to June 2022, the intervention was implemented. Primary school teachers were provided training, support, and resources to develop a health-promoting environment in school according to the Health-Promoting Schools framework. Meanwhile, school deputies and territorial agents involved in extracurricular activities were provided training, support, and resources in the same aim. Intersectoral working sessions were promoted. To analyze implementation outcomes, semi-structured interviews
The necessity of research skills training for nurses and midwives in Bulgaria

Milena Saleva 1, 2, Silviya Aleksandrova-Yankulovska 1, Makreta Draganova 1, 2, Gene Gancheva 1
1 Medical University of Pleven, Pleven, Bulgaria, 2 Bulgarian Association of Public Health, Pleven, Bulgaria

Background and Objective: The recommendations of international organizations require to start training for research in health care from the basic training. In Bulgaria, the Ordinance on the Unified State Requirements for the acquisition of Bachelor degree in Nursing and Midwifery and Master degree in Management of Health Care (2006) do not include mandatory disciplines for acquiring specific knowledge and skills for research. The aim of the study was to find out how nurses and midwives evaluate their research preparation and their basic needs.

Methods: Within a more complex study on research in nursing and midwifery, practitioners in 8 hospitals, educators and fourth-year students in 6 universities were surveyed through an anonymous self-administered questionnaire. Out of a total of 1,097 distributed questionnaires, 78.9% responded, with the highest rate among students (85.2%), followed by practitioners (79.3%) and educators (77.2%).

Data processing was performed by SPSS v24 using descriptive statistics and comparative analysis. The accepted level of significance was p<0.05.

Results: Statistically significant differences were found in all three groups regarding their self-assessment of confidence to undertake specific research activities (p<0.05). The proportion of practitioners who definitely do not feel prepared for research was 38.9%. Among the trainees, there was a slight predominance of those who feel confident (57.8%). The highest proportion of confidence in their preparation for research was among educators (62.0%) for which research is an obligatory element of their position. In all three groups, the largest proportion of persons supported the opinion that the acquisition of basic competencies for research should start in basic education and should be upgraded during the Bachelor and Master programs in the specialty “Health Care Management”. Conclusions: There is a necessity to introduce research training into basic nursing and midwifery education, justified by regulatory requirements and their poor assessment of research skills.

Health care professionals’ knowledge on chronic noncancer pain in pediatric age

Paula Oliveira 1, Clara Abadesso 1, Humberto Machado 1, José Romão 1
1 Public Health Unit of Porto Occidental, Portugal, 2 Pediatric Department, Prof. Dr Fernando Fonseca Hospital, Portugal

were conducted in Spring 2022. Results: This qualitative study included 11 district pediatrical advisors, 10 school principals, 9 school deputies, 2 extracurricular agents, 1 person in charge of after-school programs and 1 health promotion project manager. Schools’ perspective. Identified facilitators were a constant and available referral, institutional support and dedicated time, clear aim and issues from the beginning, community support, multi-school training sessions, contextualized support. Barriers were COVID-pandemic, lack of community support, lack of time. Community perspective. Identified facilitators were health promotion perceived legitimacy, collective motivation, regular and effective working sessions. Barriers were perceived methodological incompetence, administrative burden, lack of time.

Conclusions: Collective work dynamics, practices’ exchanges, health promotion professional identity are essential implementation components. Lack of time is perceived as a structural barrier. Communities pointed out perceived legitimacy and competences as corner-stones of their engagement.

Pre-service teachers’ experiences with students impacted by trauma in the school setting

Ella Carton 1, 3, Karen Martin 1, Alex Woolard 4, Kate Fitzgerald 2
1 Telethon Kids Institute, Australia, 2 The University of Western Australia, Australia, 3 The University of Tasmania, Australia, 4 Telethon Kids Institut, The University of Western Australia, Australia

Background: Experiencing trauma can adversely impact a child’s education and their lifelong social, physical and mental health. Trauma is poorly understood by those working within the education sector. Teachers play a pivotal role in recognising and helping when children display trauma-related behaviours, but risk re-traumatising children if not adequately trained. Pre-service teachers (PSTs) have limited exposure and experience in responding to the different needs experienced by children impacted by trauma. This research explored PST education and training about trauma and its impact, and their knowledge and experience in supporting children whilst on practicums.

Methods: Phenomenological analysis of in-depth interviews with 15 undergraduate PSTs attending three Western Australian universities explored their knowledge and experiences in working with children impacted by trauma. Results: Themes emerging from the data included; PSTs’ teaching preparedness, experiences and emotions on practicums, support during and after practicums and recommendations. Participants received almost no education or training about how to support children impacted by trauma, felt underprepared, lacked support from schools and their university, and noted issues with inadequate trauma-informed practices in some classrooms. A prominent finding resonating with all participants was the importance of gaining an understanding about trauma to better equip PSTs with the knowledge and confidence to support children.

Conclusions: This research suggests PSTs may not be receiving sufficient training at university about how to support children impacted by trauma and feel underprepared on practicums. Results highlight the importance of teacher education and training in preparing future teachers about supporting children impacted by trauma. The results demonstrate the necessity for conceptual changes around university education and support for PSTs in classrooms. These results are relevant internationally for education sectors in ensuring adequate training of our future teachers, universities in their teaching courses and for schools in how best to support their practicum and school students.

One Health, Multiple backgrounds

Giorgia Solda 1, Giorgia Soldà 1, Angela Capodici 1, Marco Montalti 1, Aurelia Salussolosa 3, Zeno Valerio 1, Giuys Fauci 3, Francesca Scognamiglio 3
1 University of Bologna, Italy, 2 University of Bologna, Italy

Background and Objective: One Health (OH) is considered to be a trans-disciplinary topic. In 2010, Fao, Woah, and who recognized that to address health risks, strong partnerships among players with different perspectives are required. However, in Italy, oh is only taught in a few university courses and is excluded from medicine and surgery. In October 2021, as first-year Public Health (PH) residents of the university of bologna, we decided to organize a winter school on oh open to medical residents, veterinarians, nurses, and biologists’ students.

Methods: The course lasted 4 dedicated to human, environmental, and
animal health. It was recognized from the beginning the core importance of having an interprofessional environment, both for the lecturers and the trainees. In particular, morning activities were led by experts of multiple backgrounds, such as PH, veterinary, chemistry, geography, agriculture, statistics, environmental engineering, health economics, psychiatry, endocrinology, and microbiology, while the afternoons by the PH residents who integrated the morning topics with soft skills such as leadership and advocacy.

Results: Frontal lessons covered different fields of expertise, and known and neglected problems and highlighted the gap between real-world issues and the academic division of knowledge. The involvement of PH residents was instrumental in implementing a peer-to-peer learning approach, involving participants in debates and encouraging them to express ideas and insights on specific issues to view them in a multi-disciplinary framework.

Conclusions: Every participant was asked to fill out an evaluation form at the end of each day. Soft-skills training sessions were widely appreciated and participants acknowledged the course’s added value of facilitating the intersection between different fields of knowledge. Traditional educational approaches often underestimate the importance of a transdisciplinary approach, even though it appears fundamental in order to effectively assess real-world problems, and professionals are deeply aware of this gap in their education.

DOI: 10.18332/popmed/165705

Study on the satisfaction of medical students with distance learning during the period of COVID-19 restrictions for the perspective of the Karaganda Medical University, Kazakhstan

Zhaniya Dauletaliyeva1, Karina Nukeshayeva1
‘Karaganda Medical University, Kazakhstan

Background and Objectives: The current situation associated with the pandemic has led to transitional distance learning methods in higher education. The aim of the study is to observe the attitude of students towards distance learning at a medical university and to identify the problems they face.

Methods: The design of the study is cross-sectional. An electronic questionnaire was assigned, and 1238 students were interviewed. The study was conducted after replacing traditional face-to-face education.

Results: 38.2% of students have perfectly adapted to distance learning. At the same time, 3.1% adapted to online learning poorly. 67.1% of respondents report that they were absolutely comfortable learning online, and only 6.6% of respondents report that it was very difficult. 40.5% of respondents believe that their workload has increased during the period of delayed learning, and slightly fewer respondents report that the workload has not changed. The majority of students rate the work of the teaching staff during distance learning as “excellent”, however, still, 3% of students rate the work of the teacher as “bad”. The main requirements that students have faced during the long period of study are the technical conditions, the poor performance of the Internet in the regions where the students are located during the distance learning period. In general, 48.1% of students are completely satisfied with the learning process during distance learning, while 4.6% of students are completely satisfied. It is noted that students of lower grades have an increased frequency of increased values of the training load during long-term training (p-value <0.001).

Conclusions: Much attention is paid to solving the problem of digital literacy among the teaching staff and students, as well as increasing the availability of digital technologies for all students, regardless of their distance from the university.

Popul. Med. 2023;5(Supplement):A692
DOI: 10.18332/popmed/163567

Virtual, augmented, immersive reality and metaverse in the medical students training: a systematic review

Alice Mannocci1, Gholamalishahi Shima2, Vanessa Barletta2, Maria Manai1, Federica Battisti3, Giuseppe La Torre4
1 Universitas Mercatorum, Faculty of economics, Piazza Mattei 10, 00186 Rome, Italy. 2 Apia University of Rome, Italy. 3 Department of Public Health and Infectious Diseases, Italy. 4 University of Padua, Department of Information Engineering, Italy

Background and Objective: In the last decades, several educational strategies have been identified to improve the skills of students and promote deep learning. The use of virtual reality (VR), immersive (IR) or augmented reality (AR) and metaverse (MV) technologies can be engaging and interactive learning resources and easily updated in line with the learning needs. While digital education is increasingly used in teaching, it is not very clear how effective. To address this gap a systematic review has been conducted to investigate the academic performance, satisfaction, and acceptability of this digital education in university students of medicine.

Methods: The review was conducted according to the guidelines of the Preferred Reporting Items for Systematic Reviews and Meta-Analyses. The following databases were searched from their earliest records until October 30th, 2022: PubMed, Scopus (Elsevier), and Web of Science. The following search string was selected: (metaverse OR “immersive reality” OR “virtual reality” OR “augmented reality”) AND (“Medical Students” OR “Medical Training” OR Triability OR Teaching) AND University AND (satisfaction OR Acceptance OR Performance). Only studies focused on undergraduate students of medicine/dentistry/degree courses in the health professions were considered. Only experimental studies were included.

Results: Actually, the systematic review is in progress. The preliminary results of the search through the scientific literature identified 372 citations. 32 studies were selected: 4 full texts are not available, 17 RCT, 10 quasi-experimental trials, and 1 quasi-randomized trial. Considering only the studies that measured academic performance (N=26), 13 of them indicated significantly superior performance with the equipment for VR or analog technologies trained students.

Conclusion: VR simulation was at least as effective as traditional learning methods in training medical students while providing benefits regarding user satisfaction. VR is useful for learning both simple and complex clinical skills, according to these findings.

Popul. Med. 2023;5(Supplement):A693
DOI: 10.18332/popmed/163739

Climate crisis and planetary health in Italian medical schools’ curricula: a scoping review

Doris Zjalc1, Gaia Lombardi1, Giulia Congedo1, Doris Zjalc2, Alessio Perilli1, Mattia Di Russo1, Chiara Cadeddu1
1 Unisttività Cattolica del Sacro Cuore, Italian Institute for Planetary Health, Italy

Background and Objective: Italy is considered a hotspot for climate change in the Mediterranean region and people living in it are already affected by environmental modifications. Medical doctors have a key role in tackling with the consequences of this threat by providing direct care and correct education, preparing the population, helping in adaptation process, and advocating for public health policies. To achieve this aim, medical doctors need solid knowledge about the interconnection between human health and climate crisis, which is a cornerstone of Planetary Health. The aim of this study is to analyse whether Italian medicine schools’ curricula incorporate Planetary Health and climate change topics.

Methods: A review of all medicine degree courses in Italy was conducted in December 2022 on academic websites of each course founded on the Universities. it” institutional portal. In each programme, we searched for the Italian terms for “climate change”, “environmental change”, “planetary health”, “one health” and we synthesized the results in a database, which was used to set out the Italian situation with descriptive statistics.

Results: Forty-eight medical schools and eighty-three degree courses have been included. Preliminary data show that only 4 schools out of 48 (8.3%) offer elective courses on the subject and in 13 courses out of 83 (10.8%) there is a teaching course that includes Planetary Health topics in the programme.

Conclusion: This review shows that Italian future medical doctors are receiving an insufficient education in their degree courses on climate crisis and environmental matters, which comprise 25% of the global burden of disease. Medical doctors need to be aware of global environmental changes and to be actively involved in population health protection and support for policymaking. Planetary Health Educational framework shows the way to reach this goal, developing knowledge and skills to face the problem.

Impact of an infection prevention and control intervention on the management of a mdro outbreak in a medical department

Matteo Rigon1, Chiara Dalle Carbonare2, Sofia Zanovello3, Davide Brodesco3, Maria Zanor2, Francesco De Siena1, Vinicio Manfín1, Mario Rassu1, Sara Mondino1, Romina Cazzaro1
1 University of Padua, Dept. of Cardiac, Thoracic, Vascular Sciences and Public Health, Italy. 2 AULSS B Berica, Hospital Direction, Italy. 3 AULSS B Berica, Infectious Disease Department, Italy. 4 AULSS B Berica, Microbiology and Virology Department, Italy

Background and Objective: In November 2021 there was a steady increase of Multidrug-Resistant Microorganisms (MDRO) colonized patients in a medical department of san bortolo hospital (Vicenza, Italy). 6 Vancomycin-Resistant Enterococcus (VRE), 1 pseudomonas aeruginosa MDR. MDRO active surveillance
with rectal swabs was already performed to patients at admission and every 7 days (patients with known MDRO excluded). Therefore, targeted interventions were planned.

Methods: The implementation of an infection Prevention and Control (IPC) intervention was planned by the Infection Control Team (ICT) in order to analyze, contain and manage the phenomenon. Measures implemented by ICT with staff was included in hand hygiene observation session, onsite training meetings with healthcare staff, environmental screening by performing swabs in colonized patients’ rooms, analysis and revision of sanitizing protocols for electro-medical equipment and flusher disinfectors.

Results: The 3 inspections carried on revealed some critical issues, in particular: poor hand hygiene adherence, double gloves use, unclear dirty/clean pathways, incorrect Personal Protective Equipment (PPE) removal sequence, presence of too much equipment in isolation rooms. Environmental swabs showed vre contamination on 1 bedside, 1 monitor, and 1 colonized patient garrison. The 3 onsite training meetings allowed the engagement of staff with focus on: proper hand hygiene, principles of antibiotic resistance, standard and contact precautions, proper use of PPE.

Conclusions: The IPC intervention allowed an improvement in the equipment arrangement in colonized patients rooms, a review of sanitization protocols and an improvement in PPE use procedures; staff engagement led to an increase in responsibility and knowledge, allowing the cluster to be contained and resolved within a month.

School based HIV education affecting girls in selected countries in Sub Saharan Africa
Ivainesu Musa1
1Thammasat University, Thailand

Introduction: There is a high level of hiv amongst adolescent girls and young women in sub saharan africa and this has affected progress towards achieving the 90-90-90 targets. The current strategies aren sufficient to make the goals; there is a need to revamp at different levels and one of these levels is education. The objectives of this were to review and describe school-based HIV education programmes involving girls. As well as to categorize and synthesize the key features of school-based programs, how they address known barriers to participation and how they incorporate important principles and guidelines.

Methods: This paper applied a documentary research design involving an analysis of school-based hiv intervention programs that affect girls in Kenya, South Africa and Zimbabwe as a representative subset of sub Saharan Africa. An analysis of school-based HIV intervention programs affecting girls. It included data sources such as peer reviewed articles, as well as articles from authoritative sources. The analysis included both qualitative and quantitative data. The documentary review analyzed all evidence from collected data that included the information needed to identify lessons learned, best practices and program performance.

Results: Findings revealed systemic barriers to safe participation. It exhibited the issues pertaining access to quality hiv education. Social norms and moral expectations based on culture and religion remained significant barriers to girls education.

Conclusion: One of the ways to achieve the 90-90-90 targets as well as the sustainable development goals, is through education strategies. The findings in this study revealed the importance and impact school-based HIV education can have in assisting girls. In order for health promotion to be enabled, collaboration is key. There is also a need for a multi-sectoral approach to achieve the set targets and reduce prevalence of HIV/AIDS among agyw.

Competencies of family practice for providing integrated care for people living with HIV
Gabriel Velloso1, Gisela Cardoso2, Valéria Romano3

Background and Objective: Since the decentralization of Human Immunodeficiency Virus (HIV) treatment to Primary Healthcare, Family Practice has a growing role in providing integrated care for people living with HIV. While having medical residency as its gold-standard for graduate education, the specialty has been structuring its curriculum with competency-based education, but there are still fragilities in the curriculum in being capable of providing integrated care for people living with HIV. Based on Philippe Perrenoud’s Theory of Competencies, this study proposes the analysis of competencies of Family Practice for providing integrated care for people living with HIV through the perception of graduates from Family Practice Residency Programs in Rio de Janeiro.

Methods: For this purpose, the focal group technique was used, through which was collected the data, complemented by documental analysis.

Results: Based on Perrenoud’s concept of competence, 38 competencies were identified, from which 11 were considered transversal, 10 were knowledge, 11 were practices and 6 were attitudes. The concept and application of each of these competencies were then discussed, prioritizing most neglected topics such as recognition of social markers of difference, clinical communication, medical privacy and community interventions. As a result of this study, a table was organized to present Family Practice’s competencies in integrated care for people living with HIV, to be shared with education institutions related to the specialty.

Conclusion: This study is expected to support instruction of future family doctors, in order to orient the specialty to a wider view, to challenge the hegemonic paradigms and to truly oppose serophobia.

Mental health and citizenship: understanding and fighting prejudice through education
Alexandre Maia1, Pedro Zamprogno2, Daury Fabriz3, Tammy Motta4
1FDV - Faculdade de Direito de Vitória, Rua Sergipe, 247, 202, CEP: 29101-400, ES: Espírito Santo, Brazil, 2CRP - Conselho Regional de Psicologia ES, Brazil

Background and Objective: This project aims to promote understanding, social tolerance, and mental health, as provided for in the Universal Declaration of Human Rights, articulating the fundamental right to mental health with the principles of education, as set out in the Federal Constitution and in Brazilian’s Law of Guidelines and Bases of National Education (LDB). It seeks to combat prejudice and misinformation historically observed in relation to therapeutic processes, often considered as “things of unbalanced people”. Such prejudice generates two problems that need to be fought: first, the lack of access to therapies capable of improving the quality of life of individuals; secondly, to ensure respect for those seeking treatment.

Methods: Recognition of the complexity of the problem requires an integration of fields of study, a search that goes beyond restricted research in the field of Medicine, Psychology or Law. The methodology is rhetoric, seeking convince through reasonable discourse, based on ethical and legal principles. The proposal consists in two steps: The first stage is the elaboration of a class plan and expository video, guided by professionals in the fields of psychology, medicine, law and pedagogy. It can be incorporated into the high school curriculum of any school in the national territory, as it is in accordance with the precepts of the Constitution and the Brazilian's Law of Guidelines and Bases of Education (LDB). The second stage is aimed at researching interaction with students, using active methodologies as a basis.

Results: Both a lesson plan and the class were produced, and are available for presentation and integration into schools.

Conclusion: It is concluded that the material produced, according to ethical and legal sources, is effective as a way of producing greater acceptance and understanding necessary for the reality of mental health. Substantive citizenship demands education as a formative element.

Are trained family planning service providers competent? analyzing the results of diagnostic workshops to improve capacity building in family planning
Jaime Bonifacio Jr, Rosário Benabaye1
1RTI International, USAID ReachHealth, Pasig City, Philippines, Philippines, 2RTI International

Background and Objective: Family planning (FP) service provider’s competence is critical to delivering quality FP counselling and services. Hence, the necessity of continuous trainings that capacitate FP providers until they become proficient in FP service provision. However, in many parts of the Philippines, most capacity building activities end with the training itself. USAID ReachHealth found in 2019 that only 302 of 1,969 FP-trained primary care providers in 12 cities and provinces
in the Philippines have undergone a post-training evaluation. To address this gap, local governments conducted diagnostic workshops (DW) to efficiently assess, evaluate, certify, and mentor FP providers.

Methods: The DW for FP gathers 15 to 25 nurses and midwives to undergo knowledge assessment through written tests, and skills assessment through objective structured clinical examination. It allows program managers and trainers to identify providers' weaknesses and address them purposefully. USAID ReachHealth analyzed the results of DWs from 2018 to 2022 to identify the concepts and skills that must be emphasized or reinforced during trainings and succeeding coaching activities, and inform the strengthening of FP capacity building interventions.

Results: Twenty-one workshops attended by 371 participants were reviewed. Fifty-three percent were found competent and endorsed for certification while 47% either had to be coached or retrained. While most of the evaluated providers had strong interpersonal skills, they needed coaching in addressing missed contraceptive pills and providing information on lactational amenorrhea method, among others. These aspects also need to be reinforced in basic FP courses offered by the Philippine Department of Health.

Conclusion: Not all trained providers are competent in FP services. Hence, continuous capacity building, including mentoring that specifically targets their weaknesses, is necessary. The DW is an effective and efficient way to assess the knowledge and skills of providers. It is also a viable approach to strengthening FP capacity building interventions.

Midwives’ self-efficacy during the COVID-19 pandemic
Elena Capitani1, Agnese Casucci1, Lucia Alaimo2, Nicola Nante3
1University of Siena, Italy, 2University of Siena, Italy, 3University of Siena, Italy, Degree Course in Obstetrics, University of Siena, Italy

Background and Objective: Self-reflection skills enable us to analyse experiences and reflect on our thought processes, generating new capacities for action. The study aims to investigate the extent to which Italian midwives are able to use self-efficacy in the professional and working environment during the covid-19 pandemic.

Methods: A cross-sectional study was conducted on a sample of midwives enrolled through an online questionnaire from July to October 2022. The questionnaire consists of socio-demographic data and work experience data. It was used as a psychometric instrument, “Scale of perceived self-efficacy in the management of complex problems” (Farnese ML, 2007) with four dimensions investigated (emotional maturity, finality to action, relational fluency, context analysis) and scored from 6 to 30. Statistical analysis was performed by STATA 17.

Results: The sample consists of 835 midwives. The following mean dimensions were obtained “emotional maturity” 18.1 (CI:17.8-18.3), “finalization of action” 20.5 (CI: 20.2-20.7), “relational fluidity” 20.8 (CI: 20.5-21.1), “context analysis” 20.7 (CI: 20.4-21.0). Those who are slightly/not at all satisfied with their professional fulfillment are more likely to have a low emotional maturity score (OR:2.1,C.I:1.4-3.3). Those who are fairly/very satisfied with their professional fulfillment are more likely to score highly on action finalisation (OR:1.45, C.I:1.1-2.0). Those who feel that the covid-19 pandemic has greatly affected their emotional experience are less likely to have a high score on emotional maturity. (OR:0.6,C.I: 0.4-0.9). Those who believe that the covid-19 pandemic had little influence on their emotional experience are more likely to have a high emotional maturity score (OR:1.6,C.I:1.2-2.5).

Conclusion: Our study shows that personal fulfillment in the care setting strongly influences the perception of midwives self-efficacy and that the covid-19 pandemic has left an indelible scar on healthcare professionals by conditioning their perception of their self-efficacy.

Association of study- and health behavior-related factors with university students’ health and health literacy - A monocenter cross-sectional study in Germany
Alexandra Löwe1, Martin Lange2, Andrea Schaller3
1IST University of Applied Sciences, Department of Health and Fitness, Erkrath Straße 220 a-c, 40233 Düsseldorf, Germany, 2IST University of Applied Sciences, 3German Sport University Cologne, Working Group Physical Activity-Related Prevention Research, Institute of Movement Therapy and Movement-oriented Prevention and Rehabilitation, Am Sportpark Münstersdorf 6, 50953 Köln, Germany

Background and Objective: University students (US) face challenging times characterized by home detachment, identity exploration, academic demands, and additional stressors due to the current global situation that can negatively impact health. Health behaviors (HB) and health literacy (HL) are important resources for maintaining health. The objectives are to evaluate the current health status (HS), HB, and HL of US and to identify study-related and health behavior-related factors associated with HS and HL.

Methods: A cross-sectional study was conducted at a University of Applied Sciences in Germany. Data were collected online between November 2020 and March 2022, using validated instruments to assess HS, HB and HL. HS, HB and HL were presented by descriptive statistics. Multiple linear regression analysis were performed to evaluate the associations between HS, HL, study-related and behavioral factors.

Results: N= 550 participants (67.7%) were included. HS was positive, stress levels were high, sleep scores, physical activity, and HL were low. A high HS (p = <.004, adjusted R²: .254; F: 34) was associated with male gender (b = .124, p = .031), higher life satisfaction (b = .050, p =.001), better sleep (b = .044, p =<.001) and nutrition (b = .016, p =.005). HL (p = .022, adjusted R²: .076; F: .08) was positively associated with the target graduation ‘master’ (b = .082, p = .051), better sleep (b = -.132, p = .004), healthy nutrition (b = .094, p =.031), lower alcohol intake (b = -.099, p =.017) and higher life satisfaction (b = .108, p = .022).

Conclusion: Students perceive themselves as healthy but exhibit critical HB and low HL, revealing potential for health-promoting interventions. Universities can draw on existing resources to implement the measures efficiently.

Using virtual reality in a blended learning course of clinical reasoning competency in primary care: a case study in Central Vietnam
Quynh-Anh Le Ho Th1, Quang-Tuan Duong2, Minh Huyhn Van1, Chi Le Van3, Quoc-Huy Nguyen Vu1, Minh Tam Nguyen, Quang-Tuan Duong4, Truong-An Ho Duc1, Len-Len Che Thi, Viet Cuc2, Martin Valcke5

Indian experience of tetanus - a study from South India
Dr V S
1 AFH India

Introduction: Tetanus is an old world disease where 2 centuries ago people had realised the link between wound leading to muscle spasm and fatality. Even today there are many cases fatalities of tetanus being reported from different parts of the country even after viability of a Tetanus toxoid and Immunoglobulin injections. One of this very few recent studies done in India on Tetanus, As there is very less data available on Tetanus so we are trying to share our experience on Tetanus, so it will help the physicians to get a better understanding.

Methodology: This a retrospective study done collecting patients detail from 2017-2019, detailed case sheet review was done and the patients clinical presentation and prognosis was noted in predesigned format. Exclusion criteria – All diagnosed case of tetanus, Exclusion criteria – patient already received treatment from local hospital. The patients details were kept confidential during all times.

Results: The total of 58 cases -35 males and 23 females, The average duration of hospital stay was 15 days. The most common occupation were farmers (bare foot workers). The site of injury was foot in 65% cases followed by injuries to the fingers or the hand in 30% and 5% cases due to injury while tooth picking with pin, splinter removal using pins. Clinical symptoms - Trismus ”Lock jaw”(41), Difficulty in walking(2), limb pain/ stiffness(17), back muscle pain/stiffness(12), Dysphagia(7),72% autonomic dysfunction. Opiosthonous position and Riscus sardonicus developed after 7-8 days of infection. 20% cases were vaccinated still developed diseases. 18% mortality was noted most cases were unvaccinated cases.

Conclusion: Tetanus is preventable diseases; If TT vaccination and immunoglobin are administered on time. In all primary health care levels cold chain should be maintained for vaccines. The patients should be made sensitized about the consequence of the diseases process.

What training and competencies are required for public health practitioners to support the digital transformation of public health? A rapid review
Ihogosa Iyamu, Geoffrey McKee
1 School of Health Information Science, University of Victoria, BC, Canada

Methods: Following the World Health Organization’s (2017) guidelines for rapid reviews, we searched OVID Medline, OVID Embase, ERIC, and Web of Science for peer-reviewed articles using search terms related to public health, digital health, and training and practice competencies. We also searched Google scholar, public health agency and public health training associations’ websites. We included articles proffering training and practice competencies recommendations for DTs amongst population and public health practitioners, published in English between January 2010 and December 2022. We excluded articles exploring a solely medical perspective.

Results: Our search returned 1695 titles and abstracts. Screening will occur in two phases. First, we are reviewing titles and abstract based on above inclusion and exclusion criteria, before repeating the process with full texts. We will extract recommendations for training and practice competencies, and disciplinary perspectives and educational approaches required to facilitate identified recommendations.

Conclusion: This review is a first step in efforts to fill human resource capacity gaps related to DTs. Considering this review synthesizes training and practice competency recommendations worldwide, we will further conduct environmental scans and focus groups with Canadian public health practitioners and researchers to identify recommendations that can be integrated in the Canadian context.

Tobacco as a threat to the environment: an experimental awareness campaign targeted at youth
Martina Antinozzi1, Nicola Calveccevchia2, Maria Assunta Donato3, Caterina Ferrari1, Giulia Gatti1, Giisy La Fauci1, Francesco Mondera1, Raffaella Sibilio1, Maria Sofia Cattaruzza4
1 Sapienza University of Rome Department of Public Health and Infectious Diseases Piazzale Aldo Moro, 5, 00185, Rome, Italy, 2University of Genoa, 3University of Bologna Unit of Hygiene, Department of Biomedical and Neuromotor Sciences Italy, 4University of Genoa Department of Health Sciences Italy

Background: we wrote short informative articles on each one. Meanwhile, we developed two different 7-question surveys to be answered: before reading the ebook (t0) to analyze baseline knowledge and after reading it (t1), to assess possible improvements.

Results: The campaign is still ongoing. At the moment 579 people read the ebook in 7 different countries (EU and US area). We collected 163 answers for t0 and 149 for t1. Respondents are university students with a mean age of 29.8 (DS±1.62), 73.6% are females, 69.9% come from central Italy. Only 4% already hold a university degree and 92.6% are studying in the healthcare sector. At t0, the mean of correct answers was 2, whereas at t1 it became 4, with a median value of 5 correct out of 7 total.

Conclusion: This ebook is just a first step in digital scien2ific dissemination on tobacco control. As a pilot project, it underlines the importance of content sharing and brainstorming in digital science communication and paves the path to a new concept of health promotion in the digital era.
Training, qualification and title of health professional specialists in Brazil
Cristiana Carvalho1, Cristina Carvalho2, Ana de Assis Chagas1, Ana de Sousa van Stralen3, Samuel da Silva4, Fabiana Pimenta1, Valéria Goulart1, Leda de Oliveira1, Sabado Girardi1
1Pontifical Catholic University of Minas Gerais (PUC-MINAS) and Federal University of Minas Gerais (UFMG) Brazil, 2Pontifical Catholic University (PUC-MINAS) and Federal University of Minas Gerais (UFMG) Brazil, 3Federal University of Minas Gerais, 4Federal University of Minas Gerais Brazil.
Background and objective: The growing demand for health professional qualifications and new skills for the job market has expanded the requirements and possibilities for specialist training. In this scenario, different postgraduate education modalities have emerged. This study aimed to raise the different formative, normative, and potential arrangements for specialist training for health professionals in Brazil.
Methods: We carried out documentary research in which we consulted the legislation referring to the training and qualification of health professional specialists, including norms of regulatory councils of the following professions: dentistry, medicine, nursing, pharmacy, physiotherapy, and psychology.
Results: In Brazil there are different modalities of postgraduate training, including specialization courses, residencies, masters, and doctorate degrees. These modalities are different in workload, pedagogical requirements, and credentials, which may or may not be recognized by the regulatory bodies of each profession. Title and professional registration show significant differences, without any standardization regarding the recognition of specialists, which vary from completing residency programs to proving work experience and title examination. However, professionals can freely exercise any specialty, regardless of registration by the regulatory body. There is also a significant difference in the number of specialties recognized by the respective regulatory bodies. Ranging from 13 for psychology, 55 for medicine, to 142 for nurses, defined independently of the actual need for health services.
Conclusions: In Brazil, training for specialists includes different modalities, but most health professionals practice their specialty regardless of having a course and/or specialist title recognized by their regulatory body. Health activities require adequate training of professionals with a high degree of qualification and a profile suited to meet the health needs of the population. However, the different postgraduate modalities available and the requirements of the regulatory bodies are not always in tune with each other in order to meet society's demands and train qualified professionals.

Lessons from India: outcomes of an overseas field trip for public health students
Ranjit Khutan1, Bhawna Solanki2, Himanshu Mittal3, Ranjit Khutan1
1University of Wolverhampton United Kingdom, 2University of Wolverhampton, United Kingdom, 3Stride Education, India
Background and objective: Working in partnership with education and health organisations in India, this field trip aimed to enhance public health students' knowledge and experiences of working with diverse communities.
Methods: Focussing on public health needs, students could reflect and relate these to their own needs and experiences. This experiential learning programme provided students with an opportunity to compare and contrast how public health practitioners addressed health needs in India and explore the impact of policy and funding on practice.
Results: Five groups of around 20 students have been on the field trip since 2014. Students learned about government-initiated public health approaches as well as those coordinated and delivered by NGOs and local populations. The outcomes were assessed through reflective accounts, video diaries and interviews. These highlighted that they were able to appreciate how culture influenced health beliefs and public health practice; they were also able to understand the role the government, NGOs, faith organisations and the collective efforts of society to protect and promote health. This experience enhanced students' understanding of public health and gave them experiences and insights into practice that could not have been gained from reading alone.
Conclusions: The COVID-19 pandemic has reminded us that public health education needs to be global and not bound by national or geographical boundaries, so we are maintaining connections with our partners in India to support learning for public health students in both countries. We are providing a virtual experience through the reflective accounts that were gathered on the field trips and through online discussions with practitioners and public health students in India.

Education A powerful tool for combating health effects of climate change
Laurent Chambaud1, John Middleton2, Tara Chen3, Rana Orhan4, Robert Otto5
1Association of Schools of Public Health in the European Region France, 2Association of Schools of Public Health in the European Region United Kingdom, 3Association of Schools of Public Health in the European Region Belgium, 4Association of Schools of Public Health in the European Region Netherlands, 5Association of Schools of Public Health in the European Region Belgium
Background and Objectives: There are calls for urgent climate action to combat climate change, usually focused on mitigation such as renewable energy sources, protection of coastal wetlands, and agroforestry measures. However, we often ignore one of the most important tools for climate action: education. ASPHER aims to foster learning and knowledge about the relationship between health and climate change, by training not only the future health workforce but also stakeholders to develop effective climate change responses and engage in a societal transformation for a healthier future.
Methods: ASPHER conducted an online survey to look at the implementation of climate education and climate action taken by public health institutions to provide a baseline assessment. This supported the development of ASPHER's climate-Health implementation strategy for action through partnership-building for collective impact.
Results: The survey results found a lack of a systematic approach and ad hoc actions by public health academic institutions. ASPHER has embodied the findings to deliver actions in practice by leveraging the EU Health Policy Platform; developing a joint climate-health education statement, and hereby receiving institutional support at various levels. This has triggered the formal development of a working group of ASPHER members to synthesize climate-health education activities to support knowledge-sharing and lessons learned across institutions adopting climate-health education to its curricula.
Conclusions: Supporting the call for climate-health education at the workforce and trainee level can catalyze long term transformation as it fosters behavioural change in traditional operations and roles. Climate-health education is more than ensuring environmental literacy but supporting the role of public health and health professionals of the most effective ways to act on climate change and to build a climate resilient health system.

Training in health promotion for nurses
Manon Duay1, Nathalie Déchanetz2
1HES-SO University of Applied Sciences and Arts Western Switzerland Rte des Arsenaux 16a, 1700 Fribourg, Switzerland HES-SO University of Applied Sciences of Western Switzerland / School Nursing Fribourg Rte des Arsenaux 16a, 1700 Fribourg Switzerland, 2University of Applied Sciences of Western Switzerland (HES-SO), Fribourg, Switzerland HES-SO University of Applied Sciences of Western Switzerland / School Nursing Fribourg Route des Arsenaux 6a, 1700 Fribourg Switzerland
Background and objective: Nurses have an important role to play as health promoters (Donaghy et al., 2022), however the concept of health promotion is not always well understood. In nursing practice, it is sometimes reduced to prevention, pitting health against disease, or focusing on individual determinants of health without considering socio-environmental determinants, or sometimes focusing on a health education approach where the professional already knows what is good for others.
The objective of the presentation will be to illustrate a health promotion training
course for public health professionals (PHPs) using a participative approach, considering the determinants of health as a whole and identifying opportunities for health promotion practice through community immersion.

Methods: Creation of a teaching method during an undergraduate degree of Science in Nursing at HES-SO University of Applied Sciences and Arts Western Switzerland, by a socio-constructivist approach that aims to do a community assignment with a population concerned by a health challenge. This 12-day course over 3 weeks seeks to enhance group empowerment and participation of stakeholders based on a salutogenic approach.

Results: In this course, students are divided into groups of 4-5 and are invited to carry out a health promotion project, with a population/community. This project-based approach enables the development of their health promotion posture, which is based on the principles of empowerment, health determinants perspective and community participation, with a view to transferring it to more conventional fields of practice (hospital, home care, ...). To encourage their success, a partnership is established with actors in extra-hospital settings (schools, neighbourhoods, communities).

Conclusion: The presented course on health promotion gives the opportunity to improve community engagement and to improve partnerships between actors in the health system.

Framing public health education to meet the needs of professionals for war and peacebuilding

Colette Cunningham1, Lisa Wand Schneider2
1 School of Public Health, University College Cork ASPHER Western Gateway Building 4.31, University College Cork. Ireland, 2Bielefeld University

Background and Objectives: Public health plays a crucial role in restoring, protecting, and promoting health of affected populations in times of war and armed conflict. Even though health effects of war are well explored, the development of competencies to address the public health impact has received little attention in public health curricula. Evidence shows that displacement of people and medical staff and attacks on healthcare facilities is on the increase in wars putting the provision of healthcare under pressure. Therefore, public health professionals need to adapt to new ways of working in times of war and peacebuilding.

Methods: To strengthen War and Peacebuilding specific competencies, we suggest building upon the WHO-ASPERHER Competency multi-dimensional Framework. It provides an already established framework for Schools of Public Health and additional public health organizations and, at the same time, can be extended to understand and prevent the political, economic, social, and cultural determinants of war.

Findings

We explore and highlight linkage points for adapting public health curricula and defining competencies specific to war and peacebuilding in public health in the respective Framework categories. For example, international frameworks on war, peacebuilding, and healthcare as well as potential ethical dilemmas need to be addressed in law policies and ethics competencies. As for leadership and systems thinking, public health emergency management and risk communication in times of war need to be addressed.

Conclusions: To equip the public health workforce for times of war and peacebuilding, training resources and curricula need to catch up. Our proposed adapted competency framework could help as a first step with that adaptation and highlights synergistic effects with related fields such as outbreak control, disaster management and humanitarian work.

DOI: 10.18332/popmed/164329

Community-based strategy for peer education on sexual and reproductive rights in the community of Basurú, municipality of Istmina, Chocó, Colombia, 2021-2022

Jhon Patiño Rueda1, Jovana Cañas1, Honoria Rengifo1
1Research Line on Health Systems, Childhood, Gender, Interculturality and Tropical Diseases, School of Public Health, Medical Education and Medical Professionalism, School of Medicine, Universidad de los Andes, Bogotá DC, Colombia

Background and Objectives: The Afro-Colombian community of Basurú is in the department of Chocó, Colombia. Several reports show that the Sexual and Reproductive Health (SRH) situation of women in this department is not the best. Knowledge of Sexual and Reproductive Rights (SRHR) has been associated with increased SRHR. Peer Training Strategies (PTS) have been shown to be effective in improving SRHR knowledge. The objective of this study was to implement a community-based PTS on SRHR of Basurú, Municipality of Istmina, Chocó, Colombia, 2021-2022.

Methods: A study with qualitative methodology and Participatory Action Research design was conducted. We co-worked with the women of the Basurú community. Three phases of work were carried out: research, education and design, and action. In the research phase, the work methodology was contextualized, adjusted, adapted, and planned. Community leaders were identified and SRH work topics were prioritized. In phase two, the PTS was designed through various design cycles and iconographic and thematic validation with community. A Before/After evaluation was conducted to assess the increase in knowledge given the PTS through linear regression.

Results: Five workshops, with a participation between 4 and 40 women, were held to co-construct a flip chart based on 14 topics. For each topic, introductory questions, a definition, recommendations, and questions for discussion were developed. These topics were organized along three thematic lines: cross-cutting topics, sexual rights, and reproductive rights. A facilitators guide was created with didactic and playful activities for each practice. The pilot was carried out with a group of 36 women from Istmina. It was shown that the strategy improved knowledge about DSDR by 1.85 correct answers (p=0.001).

Conclusion: The PTS co-constructed in the Basurú community could be used in other similar contexts to train in SRHR as it proved to improve knowledge on this topic.

Is public health education and training adequately responding (or not) to emerging priorities?

Christina Severinsen1, Geri Seeley1, Leanne Coombe1, Priscilla Robinson1
1Massey University New Zealand, 2World Federation of Public Health Associations George Washington University United States, 3World Federation of Public Health Associations La Trobe University United Kingdom

Background: Work by the World Federation of Public Health Associations’ Professional Education and Training (WFPHAPET) working group has identified several areas of the current public health environment in which practitioners need to have a basic understanding to prepare them for the future of the field but are not necessarily included in public health competency sets or curriculums. The emerging and important public health issues identified were OneHealth, Systems Thinking, Public Health Ethics, and Disaster and Emergency Health.

Methods: A panel was organized and moderated by John Middleton (Association of Schools of Public Health in European Region), with Laura Khan (OneHealth), Carol Stewart (Disaster and Emergency Health), Helen de Pinto (Systems Thinking), Michael Moore (Political Engagement), and Jim Thomas (Public Health Ethics) invited to discuss challenges in integrating these specialties into public health education, training, and practice.

Results: Common threads across the discussion included:

* The current pace of change seen in these areas of public health
* Nimble ways of identifying emerging problems
* Imaginative ways of teaching
* The need for sophisticated communication systems
* Understanding current political imperatives and political realities
* Training ‘public health practitioners who understand political thinking’

Conclusion: To enable better capacity in public health workforce means updating course materials and finding ways to integrate new materials without losing core content. Opportunities exist for a range of imaginative and nimble teaching strategies to adapt current and future training materials, including short courses; case-based approaches; and the integration of emergent public health topics. As teachers we must be mindful of the need to teach enough of everything versus a lot of nothing, losing the ability to teach specialist topics in any depth. The SARS-CoV-2 pandemic brought us a unique experience to reflect on how we teach, and learn new teaching techniques, and not spend time teaching material which is easily available online.

Changes in the food consumption of university students during the years 1992–2019

Jana Babjaková1, Zuzana Štefaníková1, Katarína Vargová1, Ivana Kachutová1, Lenka Matejaková1, Martin Samohyľ1, Katarína Hirosova1, Jana Jurkovicová1, Lubica Argalasova2
1Institute of Hygiene, Faculty of Medicine, Comenius University in Bratislava, Slovakia, 2Institute of Hygiene, Faculty of Medicine, Comenius University in Bratislava, Slovakia

Results: The students consumption of fats, potatoes, legumes, sugar, and especially fruit decreased. On the contrary, the consumption of meat, meat products, poultry, eggs, vegetable fats and vegetables increased, as did the consumption of milk and dairy products and pasta among women. Fish and grain products consumption remained mostly unchanged. In comparison to women, men consume more meat, milk, dairy products, fish, eggs, cereals, potatoes, and legumes. Women consume more fruit and fruit products. The consumption of total fats, vegetables and sugar is approximately the same for both genders.

Conclusions: Among students, we observe similar trends as in the general Slovak population, with significant intersexual differences. The consumption of meat is quantitatively sufficient, but the structure is unbalanced, the consumption of milk, dairy products and especially fish is insufficient, the consumption of poultry, cheese and eggs is excessive. The consumption of potatoes, vegetables and particularly fruits is critically low, even though the structure has improved. The nutritional consumption of students was not in accordance with the RDAs and intervention is needed. This work was supported in part by the grant KEGA 015UK-4/2022.

Using popular education in health during the COVID-19 pandemic with women who suffered violence: an experience report

Bárbara Miranda1, Ana Ferreira1, Andressa Souza1, Alice Andrade1, Carol Luiz1
1State University of Campinas - UNICAMP, Brazil

This research reports the experience of Paulo ferries itinerary, carried out in cultural circles, in Campinas/Brazil with women who suffered violence. During the new coronavirus (COVID-19) pandemic, the number of cases of domestic violence increased and the access to support services for victims, in particular in health, social assistance and public security sectors reduced. Popular health education becomes a powerful strategy in the sense of promoting actions and proposals for educational practices. Therefore, it is a priority to design and create specialized intervention programs to prevent and reduce complications that arise from violence exposure. Objectives: to report the experience of hosting culture circles through research into implementation of care for people exposed to violence, by group interfaces, from the faculty of medical sciences at Unicamp, Brazil. Method: two cycles of groups composed of 8 meetings were carried out from June to December 2021, inspired by the Freirean perspective, with women over 18 years old exposed to violence, living in the city of Campinas, Brazil. A qualitative description of the preliminary results of the intervention performed will be presented.

Results: the impact, implications and scope of violence in the participants lives was revealed in the identification of the themes: chaunvinism, racism, future, dreams, being a woman, resilience, women's health, social inequality, trust issues, rights and justice, fear and self-image. The participants showed an interest in perpetuating the circle of culture among the women of the community. Conclusions: popular health education favored the exchange and reflection on what was experienced, and it was also understood in its collective dimension. The culture circle proved to be a potential tool for the empowerment of participants, based on the democratic sharing of knowledge and experiences about violence, becoming an emancipatory space for continuous learning, freedom, resistance and affective constructions.

The use of social media to facilitate student-led initiatives in
undergraduate medical education

Leonard Lim1
1College of Medicine, University of the Philippines, Manila, Philippines

Introduction: Despite the shift to online learning brought about by the covid-19 pandemic, existing studies on social media (some) use in medical education have primarily focused on educator-led initiatives. Our study thus described student-led initiatives and elicited perceptions of undergraduate medical students towards such initiatives.

Methodology: An online survey was sent out to first- and second-year undergraduate medical students from the university of the Philippines Manila college of medicine. Descriptive statistics were calculated, while qualitative data from open-ended questions were grouped into prominent themes. Results of the 258 participants of the survey, 228 (88.4%) recommended the continued use of some. The most popular some platforms for different tasks were as follows: discord for studying together (71.3%) and for conducting peer tutoring sessions (33.3%); Facebook messenger for reading reminders (55.4%); telegram for reading announcements related to academics (88.4%) and administrative requirements (72.9%), and for accessing material provided by classmates (60.1%) and professors (52.3%). The high uptake of some is due to the several advantages cited, such as accessibility and cost-efficiency. Some disadvantages were cited, such as their capacity to serve as distractions and sources of social media fatigue.

Conclusions: Some platforms were useful for student-led initiatives, and their use should be continued and explored further. Students use of a particular some platform was dependent on their needs and the platforms features. By analyzing the perceptions of students, medical schools will be able to better integrate these initiatives into medical curricula.

Training of health management students in Workplace health promotion

Stela Georgieva1, Mariela Kamburova1, Dima Tsonova1
1Medical University, Pleven, Bulgaria

Background: Training in health management requires analytical thinking of students, proactiveness and practical skills. Health managers are responsible for strict organization and best Results of the health institutions’ work. Creating safe and healthy working environment for the staff is also their priority task. Concept of Workplace Health Promotion (WHP) has been discussed as an innovative and effective approach in caring for health of working population. These facts justify the inclusion of an optimal discipline “WHP” in the curriculum of the masters degree “Public Health and Health Management”, in Medical University – Pleven, Bulgaria. The objectives of this paper is to analyse the exam success rate, students’ interest to the subject and their opinion to the usefulness of the acquired knowledge and skills.

Materials and Methods: Data were collected by document review of the educational documentation and interviewing students about their motivation to study this subject.

Results: Although in the curriculum the subject is optional but not obligatory, students appreciate its importance and show a great interest in it. They want to extend specific knowledge on Holistic workability model and to develop competencies of health promotion practitioners. The relative share of students who choose to study this subject increases each academic year form 30% in 2017 to 72% in 2021. Training outcomes are also improving from very good (4.62) to excellent (5.50) for both theoretical and practical part of the exam. More than 90% of students assess the acquired knowledge as very useful and applicable in their future professional work, and appreciate that the accent is on practice rather than theory.

Conclusions: Education and training in WHP helps students to acquire competencies for their future professional performance. The wide applicability of health promotion concept and positive experience of the training make the subject relevant to the curriculum of other specialties too.

Educational video to guide parents and caregivers of children using a clean intermittent bladder catheter

Lorita Pagliuca1, Antonia Sampaio1, Marília Lima1, Cristiana Reboças1
1Federal University of Ceará, Brazil

Background and Objective: Neurogenic lower urinary tract dysfunction has a considerable impact on the quality of life and daily activities of individuals and their families. Intermittent Urethral Catheterization (IUC) is the most used therapy in these cases. Aimed to evaluate the effectiveness of the educational video “Intermittent Urethral Catheterization in children: How to do it?” in the performance of UIC by parents and caregivers of children with neurogenic bladder.

Methods: Quasi-experimental study, from June to October 2021, at Pediatric Hospital in Fortaleza, Brazil. The sample consisted of 30 mothers who were starting or in continuous use of the UIC, divided into two groups: Intervention Group (IG) and Comparison Group (CG). After signing the informed consent, the sociodemographic and clinical form and the King’s Health Questionnaire (KHQ) was applied to both groups, as well as the pre-test, which consists of 10 questions about the content of the educational video. CG received routine guidelines from the outpatient clinic and the IG, in addition to the service guidelines, received information through the educational video.

Results: Sample composed mostly of women who were married or in a stable union (83%), did not work (86.6%), income of up to R$1100.00 (67%), lived in the countryside (80%), p value 0.017. After the intervention, post-test detected a significant difference between the values of the groups, p = 0.013, where the intervention group had higher scores of correct answers with an average of 9.67 of the 10 questions. Regarding the KHQ, in the Emotions domain, the IG participants declared level 3, meaning emotional state moderately affected by the children problem, with a standard deviation of 0.93. Conclusions: Intervention with an educational video is effective and contributes to family guidance, in addition to facilitating the understanding, visualization and execution of the procedure by parents/caregivers of children with this disorder.

Postgraduate Education in Health: A Case Report from Cabo Verde

Isabel Araujo1, António Delgado2, Deisa Semedo3, Celeste Fortes4, Francisca Monteiro5, Elen Castanheira5, Paulo Ferrinho6
1Faculty of Science and Technology, Universidade de Cabo Verde, Cape Verde, 2Faculty of Science and Technology, Universidade de Cabo Verde, Ilha de Santiago, Cape Verde, 3Faculty of Science and Technology, Universidade de Cabo Verde, Palmarejo, Cape Verde, 4Faculty of Social Sciences, Humanities and Arts, Universidade de Cabo Verde, Cape Verde, 5Faculty of Medicine, Universidade Estadual Paulista Júlio de Mesquita, Botucatu, Brazil, 6Institute of Hygiene and Tropical Medicine, Universidade NOVA de Lisboa, Lisboa, Portugal

Background and Objective: Cabo Verde is a small island country in West Africa, composed of 10 Islands, 9 of which are inhabited and with about 500 thousand residents. The first Public University was established in 2006, based on the pillars of training, research, and extension, to provide qualified professionals and knowledge that support good health practices and promote the health of the population. In 2009 the first post-graduate course in health was implemented - Master of Public Health aligned with the objectives of the United Nations, with the National Strategic Plan for Human Resources in Health, to expand scientific research and provide the country with a Public University with quality, qualified and internationally recognized masters and doctors. The partnership with universities from Brazil and Portugal has contributed to this process.

Methods: Case report based on the experience of the teachers involved, annual academic reports and consultation of other relevant documents.

Results: From 2010 to the present date, the Uni-CV has started 3 class of masters courses in Public Health, with a total of 84 entrants. Of these 21 (25%) have completed the course, 25 (30%) are in dissertation preparation phase, 18 (21%) are in the 1st academic year, and 20 (24%) have abandoned the program. COVID-19 pandemic. The study aims to analyze the relations between the health literacy (HL) scales and the levels of digital competencies. Both are required for competent DHL.

Methods: A web-based questionnaire based on the COVID-19 HL Survey was distributed among students at the Faculty of Mathematics and Informatics (FMI) at Sofia University St. Kliment Ohridski, with the approval of its ethics committee. Data was evaluated using cross-referencing of a digital competence framework - DigComp 2.2 and a health literacy framework - Health Literacy Questionnaire (HLQ). Qualitative and quantitative analyses were provided. Results: The answers of 221 students (13 % of 1690 asked) were received. All participated voluntarily and anonymously. Searching and filtering information are reported as the easiest tasks: easy (40 % and 31%) and very easy (52 % and 39%). Evaluation of information, based on criteria of how much information is verified, up to date, and coming from official sources is posed as very important (79%, 78%, and 69%). These results correspond to the Advanced proficiency level of "Browsing, searching and filtering data, information and digital content", and "Evaluating data, information and digital content" DigComp 2.2 competence areas and upper level of HLQ areas "Ability to find good health information" and "Appraisal of health information". Conclusions: DHL is a cross-disciplinary effort. Its evaluation requires using advanced multidimensional tools. A combination of DigComp 2.2 and HLQ was applied for the evaluation of computing students' DHL. The study reveals the prevalence of digital skills level of digital skills is essential for the acquisition and use of valuable health information, which is a prerequisite for well-being. Fostering digital skills should be an integral part of complex HL education.

Factors associated with knowledge for the prescription of exercise in patients with cardiovascular risk in health personnel at the first level of care
Luis Luis1, Sol Sanchez2, Carlos Texson3, Iant Reyes3, Carolina Pérez3, Josue Villegas-Dominguez1
1Universidad Veracruzana, Mexico, 2Mexico
Background: Chronic diseases are considered a public health problem, especially those that facilitate cardiovascular diseases such as overweight, high blood pressure and alterations in glucose and lipid metabolism. Physical exercise is essential for the prevention of complications and the reduction of care costs for health institutions. Objective: To analyze the factors that are associated with the degree of knowledge of first level care personnel about the prescription of physical exercise in patients with cardiovascular risk. Methods: An observational, cross-sectional and prospective study was carried out applying the “Knowledge about Prescription of Physical Exercise” test, validated in Spanish by Ortín et al., which has a maximum of 100 points in each item and a global score, obtained from averaging the evaluation of knowledge about exercise, its prescription in general, prescription in dyslipidemia, diabetes mellitus and arterial hypertension. Primary care doctors and nurses from Veracruz, Mexico were included. The variables age, sex, profession, perception of their knowledge, number of patients to whom they indicate exercise, training on the subject and institution where they worked were studied. Results: 170 participants were included, 67 % doctors, 92.9% indicate exercise to their patients and 22.9% do not have specific training to do so. The global knowledge score of the participants was 43.9(±14.1). Being a doctor showed a difference (p<0.05) compared to nursing in the level of knowledge for the prescription of exercise in patients with hypertension (42.1±22.6 vs 34.3±19.9), diabetes (75.4±24.3 vs 58.9±29.1) and in global knowledge (46.2±13.9 vs 39.5±13.7), the rest of the factors did not show statistically significant values (p>0.05). Conclusions: The level of knowledge of the first level care personnel is below half of the score, except for diabetes, for which training is required for the prescription of exercise, since these personnel are a fundamental part of the prevention process. of cardiovascular diseases.

Barriers to breast self-examination among Tunisian women
Imen Bannour1, Rania Bannour2, Badra Bannour2
1Farhat Hached Sousse, Tunisia
Introduction: Breast cancer remains the most frequent female cancer in Tunisia. The prevalence rate of breast cancer has shown a peak in recent years and represents 20-25% of malignant tumors in women with an incidence in 2017 estimated at 50.17/100000 cases with a female mortality significantly high with 14.04 deaths per 100000 women per year. Breast cancer can be diagnosable at early stage using inexpensive, accessible, and easy screening programs. Usually culture, beliefs, and opinions of women affect adoption of screening techniques. Objective: This study aims to investigate barriers to breast self-examination (BSE) among Tunisian women.

Materials and Methods: A cross-sectional descriptive study was performed among women consulting the Reproductive Health Center of Sousse spread over a period of 2 months (February, March 2018). Data was collected using self-administered questionnaires.

Results: The mean age of the participants was 34 years with extremes ranging from 18 to 64 years. 47% of surveyed women have already performed BSE at least once during the last year. The main barriers found were lack of awareness about the importance of breast examination (p < 0.03), lack of knowledge about BSE techniques (p < 0.001), and lack of training by personnel of healthcare centers (p = 0.016). The score of the practice of women surveyed was average; mostly, women have intermediate results for the technique of self-examination breast. No woman had a score of 15/15. Conclusions: A better education of the practice of self-examination is essential in order to improve the screening program for breast cancer. The role of the gynecologist, general practitioner or midwife is therefore essential in education and training.

Keywords: breast self-examination, Tunisia, barriers
National Network in Family Health (PROFSAÚDE), one of the programs created in the last decade for professional qualification for the Health Unic System. Studying the modality and bringing evidence that uniquely configures the MP in the training proposals contribute to the programs fulfilling the purpose for which the model was called to exercise: professional qualification. This work aimed to analyze the norms and guidelines that regulate the professional master’s degree identifying the need to give identity to this modality; contextualize the background to the creation of PROFSAÚDE and present its organizational and academic management characteristics; analyze PROFSAÚDE from the perspective of the identity requirements of the MP. It was a descriptive-exploratory study with a qualitative-quantitative approach, developed in two phases: the first focused on PM, as a stricto sensu modality, and the second phase with a specific focus on PROFSAÚDE. In this study, unique characteristics were identified in this type of course, requirements such as a curricular structure consistent with the purpose of the course, pertinent methodological strategies applied to the professional field, faculty with a profile for the professional area, and final products oriented to solving problems were identified as essential for MP proposals. It is evident in the findings that articulating teaching and application in the field of professional activity is a motto for MP. The study brought evidence that makes PROFSAÚDE a proposal that supports the MPs identity.

Integrating health sector reform strategies in developing the national training manual for community health volunteers in the Philippines

Alberto Ong1, Eunice Mallari1, Jervey Vergara1

1Culion Foundation, Mother Ignacia Avenue, Paligsahan, Quezon City, Metro Manila, Philippines

Community health volunteers (CHVs) in the Philippines, known as barangay health workers (BHWs), are important part of health system in ensuring that the health programs and services are accessible to all Filipinos. Therefore, it is important to ensure that their knowledge and skills are not only updated but also aligned with the Philippine national health sector reform strategies. This project, supported by World Health Organization Philippines, aimed to update the 2014 BHW Reference Manual, integrating different training initiatives and policies concerning them. Consultations were done with different bureau directors of the health ministry to solicit guidance on the policies that must be considered in the development of the training manual. Recent manual of procedures of different health programs and policy issuances were reviewed to identify tasks expected from BHWs. Key informant interviews, including BHWs in select urban and rural areas, were interviewed to determine the actual tasks expected from BHWs. Training manuals from different reputable institutions were also gathered and reviewed. An initial draft was developed, and disseminated to different health ministry program managers for comments. The second draft, translated into local language, with accompanying facilitators guide was pilot tested by 20 BHWs in two urban and two rural areas for 10 days. The national policies on BHW roles (as indicated in a legislation), competency training standard, national reorientation on health promotion, and integration of health services were incorporated in the BHW training manual. The amount of content per topic was determined by the prescribed number of hours of training in the BHW competency training standard. Compared to the 2014 version, the new manual was well received by pilot trainees because of the use of conversational national language. The manual and the facilitators guide was released by the health ministry on October 2022 for public use.

Popul. Med. 2023;5(Supplement):A727 DOI: 10.18332/popmed/163766

Group work in a health promotion subject: the role of compassion for oneself, toward others, and from others

Lisa Buckley1, Withanage Perera1

1The University of Queensland, School of Public Health, Australia

Background and Objective: It is argued that health promotion knowledge is important part of health system in ensuring that the health programs and services are accessible to all Filipinos. Therefore, it is important to ensure that their knowledge and skills are not only updated but also aligned with the Philippine national health sector reform strategies. This project, supported by World Health Organization Philippines, aimed to update the 2014 BHW Reference Manual, integrating different training initiatives and policies concerning them. Consultations were done with different bureau directors of the health ministry to solicit guidance on the policies that must be considered in the development of the training manual. Recent manual of procedures of different health programs and policy issuances were reviewed to identify tasks expected from BHWs. Key informant interviews, including BHWs in select urban and rural areas, were interviewed to determine the actual tasks expected from BHWs. Training manuals from different reputable institutions were also gathered and reviewed. An initial draft was developed, and disseminated to different health ministry program managers for comments. The second draft, translated into local language, with accompanying facilitators guide was pilot tested by 20 BHWs in two urban and two rural areas for 10 days. The national policies on BHW roles (as indicated in a legislation), competency training standard, national reorientation on health promotion, and integration of health services were incorporated in the BHW training manual. The amount of content per topic was determined by the prescribed number of hours of training in the BHW competency training standard. Compared to the 2014 version, the new manual was well received by pilot trainees because of the use of conversational national language. The manual and the facilitators guide was released by the health ministry on October 2022 for public use.

COACHING IN SPORTS DEVELOPMENT

Matching age-specific coaching content to young athlete motor development

Vesna Karadzic1, Dragana Jovanovic1, Milena Vasic1, Biljana Kilibarda1, Miljan Ljubicic1, Verica Jovanovic1, Svetlana Vrga1

1Institute of Public Health of Serbia, Dr Subotica S, Serbia

Background and Objective: In the scope of the Joint Action on Strengthened International Health Regulations and Preparedness in the EU (SHARP JA), WP6 is focusing on trainings, local exercises and exchange of working practices. Training needs assessment pointed out that recovery management is one of the topics of great interest for training and practice exchange. The aim of this study is to explore existing practices in recovery management to set up the scope of recovery management training (RMT).

Methods: Methodology used to fulfil the aims of this study was a literature review of scientific articles published in leading international journals in past 20 years. Key words in searching of scientific literature were: recovery, disaster, disaster management, community. In this review, two aspects were considered: recovery process after different type of disasters and areas of recovery. Results: According to the type of disaster, the majority of research articles dealt with the recovery process after earthquakes (45,79%), floods (14,95%), hurricanes (14,02%), and tsunamis (14,95%), while the most prevalent areas of recovery were: households (46,15%), businesses (21,15%) and critical infrastructures (including energy, transport, WASH) (13,46%). Additionally, reviewed articles also considered and pointed to the potential barriers in the recovery process, as well as challenges and outcomes. Conclusion: Recovery is not extensively explored in scientific literature and currently is mostly focused on narrow areas. Lessons learned on challenges and barriers from previous recovery processes should be addressed in future trainings. In building capacities in recovery management, it is of great importance to apply holistic approach.

Popul. Med. 2023;5(Supplement):A729 DOI: 10.18332/popmed/164000

Importance of motor development in the training of young athletes

Marta Wilhelmi1, Marta Wilhelm1, Ágnes Nagy2

1University of Pécs Institute of Sport Sciences and Physical Education, University of Pécs, Faculty of Sciences, Pécs Ifjúság u. 6. 7624 Pécs,Hungary, Hungary
2University of Pécs

Methods: 120 Hungarian athletes under the age of 12 took part in this research. We have developed our own test system to measure motor development level, including 6 track tests, 3 fundamental movement tests, 5 functional movement tests, 4 movement maturity tests.

Results: Assessed athletes have a significant degree of motor development deficiencies affecting their performance measured with field tests. Functional movement patterns show a significant correlation with field tests (r=0.524). Athletes who had better indicators in movement maturity tests, performed significantly better in field tests (p=0.020).

Conclusions: Results support our theory that a special movement development program is necessary to incorporate into already existing young athlete trainings. Coaches need to possess knowledge of age-specific training, to be able recognizing movement literacy deficits. If those deficiencies are not recognised in time, we risk to significantly impair the effectiveness of movement learning and motor control, thus also risking the development of sport talents. Ágnes Virág Nagy is a recipient of the prestigious National Science Fellowship
of the PhD Student Scholarship of the Cooperative Doctoral Program supported by the National Research, Development and Innovation Fund.

**Incorporating the Sustainable development goals into the undergraduate medical curriculum**

Sinead Hurley1, Freya Molloy1, Maisoon Mairghani1, David Sklar2, Debbi Stanistreet1

1Royal College of Surgeons in Ireland Ireland

Methods: Semi structured interviews were carried out with key stakeholders at RCS SI to investigate their perspectives on approaches to incorporating SDGs into the medical curriculum. A sample of 11-15 participants with diverse backgrounds across a broad range of specialties were selected, using purposive sampling. Transcripts were coded and thematically analysed by adapting Braun and Clarke thematic analysis.

Results: Five main themes emerged from the analysis on stakeholder perspectives: 1. Faculty Awareness, 2. Challenges of curriculum change, 3. Recognition of sustainability as a fundamental health issue, 4. Opportunities and challenges of a multicultural University and 5. Leadership needs. Both barriers and facilitators to integrating SDGs into the curriculum were explored such as an overloaded curriculum and competing agendas. Recommendations from the study were to incorporate SDG content into the RCSI medical graduate profile, into case based learning (CBL) using a standardised socio-ecological framework, provide staff with educational resources and include SDGs in future research, publications and outputs. These results will help shape the medical curriculum to incorporate sustainability concepts which is fundamental for the future of healthcare and medical education.

**Health literacy with the project “Pathways to Longevity” at the Social Service of Commerce - Rio de Janeiro, SESC RIO DE JANEIRO**

Denise Anjos1, Suzana dos Santos1, Denise Anjos1

1 Sesc RJ Brazil, 2 Sesc Rio Brazil

Background and Objectives: The Social Service of Commerce (Sesc) is an institution founded in 1946, which started with health activities only, but over the years it has expanded to many areas such as culture, sports, among others. In the 1970s, the first instrument was developed to systematize health education activities, the “Policy of Education for Health at Sesc”. Later, in the 2000s, the Activity Model of “Health Education” was created, a guiding document for educational practices and Health Literacy (HL) at Sesc. HL deals with the ability to access, recognize, process and understand information about health, considering that HL permeates formal instruction and people may not be able to understand health information.

Methods: The “Pathways to Longevity” project emerged from the need to meet the demands of the population that is assisted by SESC Rio. Such activities seek to reflect on aging, and over the years with HL practices, we have seen that walking towards longevity must start in childhood. In November 2022, SESC promoted the launch of “Monica’s Gang comic book”, with a large publisher to bring the children’s audience closer to HL. The comic book was developed as a methodological instrument in health actions.

Results: The cartoon was distributed and discussed with 3500 children participating in the activities, through the health themes contained in the comic book. The childrens good receptivity and understanding of the presented content showed how effective this method is for HL activities with this audience. Conclusion: HL is a new subject in Brazil, and these discussions, actions and studies need to be expanded. With the project and use of the comic book, we realized that we need to improve the HL instruments, so that the relationship between the understanding and the applicability of the HL can be observed.

1Sesc RJ Brazil, 2 Sesc Rio Brazil

Background and Objectives: The Social Service of Commerce (Sesc) is an institution founded in 1946, which started with health activities only, but over the years it has expanded to many areas such as culture, sports, among others. In the 1970s, the first instrument was developed to systematize health education activities, the “Policy of Education for Health at Sesc”. Later, in the 2000s, the Activity Model of “Health Education” was created, a guiding document for educational practices and Health Literacy (HL) at Sesc. HL deals with the ability to access, recognize, process and understand information about health, considering that HL permeates formal instruction and people may not be able to understand health information.

Methods: Semi structured interviews were carried out with key stakeholders at RCS SI to investigate their perspectives on approaches to incorporating SDGs into the medical curriculum. A sample of 11-15 participants with diverse backgrounds across a broad range of specialties were selected, using purposive sampling. Transcripts were coded and thematically analysed by adapting Braun and Clarke thematic analysis.

Results: Five main themes emerged from the analysis on stakeholder perspectives: 1. Faculty Awareness, 2. Challenges of curriculum change, 3. Recognition of sustainability as a fundamental health issue, 4. Opportunities and challenges of a multicultural University and 5. Leadership needs. Both barriers and facilitators to integrating SDGs into the curriculum were explored such as an overloaded curriculum and competing agendas. Recommendations from the study were to incorporate SDG content into the RCSI medical graduate profile, into case based learning (CBL) using a standardised socio-ecological framework, provide staff with educational resources and include SDGs in future research, publications and outputs. These results will help shape the medical curriculum to incorporate sustainability concepts which is fundamental for the future of healthcare and medical education.

**Comparison of conventional cardiopulmonary resuscitation (cpr) training course versus video-based simulation on nursing students of dow university of health sciences**

Dr. Abbas1, Muhammad Hydrie2

1 Dow University of Health Sciences SUPARCO Road Gulzar-e-Hijri ojha campus Pakistan, 2 Dow University of Health Sciences Dubai United Arab Emirates

Background and Objectives: Conclusion: Methods: This prospective experimental study recruited 60 nursing undergraduate students and were randomly divided into two groups 30 each; one group received CPR training only and other group received both CPR video and training. Pretest: Students were given CPR knowledge questionnaire before the training session which comprises of 20 knowledge based questions. Training: Instructor demonstrated all the necessary steps needed to perform effective CPR on a mannequin, use of airway adjuncts and step of AED. In second group video component was added, they were shown a CPR training video. Post-test: After the session post-test were taken from all the students. Post-training skill evaluation: All students performed hands-on performance one by one on mannequins. Results: Knowledge scores in post-test were higher than in pretest. Our findings showed no difference in knowledge scores found between two groups in pretest and post-test [p-value 0.410, p-value 0.705] respectively. Analysis of skills were done by chi-square and findings showed no significant difference in steps; scene safety, check response, call for help, initiation of CPR, breathing, open the airway, steps of AED; post resuscitation care and disposition of pt in both groups [p-value >0.05]. Funding: The findings of this study showed that both CPR training methods were effective in improving knowledge. However, more researches are needed to be done to assess the effectiveness of video training only.

**Permanent education as a strategy to strengthen multidisciplinary teams to work in indigenous health in Brazil**

Patricia Silva1, Rosana Antunes1, Janete Lago1, Whitney Oliveira2, Emmanuel Junior2, Alkena Bermudez3, Sabrina Soares1, Midyia Targino1, Virgilia Gomes1

1Ministry of Health in Brazil Brazil, 2 Ministry of Health in Brazil Brazil

The National Policy for Permanent Education in Health was established as a strategy of the Unified Health System for the training and development of workers. Permanent Education in Health constitutes a fundamental strategy for the transformation of work so that it becomes a place of critical, reflective,
propositional and technically competent action. In the field of indigenous health, the Special Secretariat for Indigenous Health (SESAI), created in 2010, is responsible for managing the Indigenous Health Care Subsystem (SASISUS). The Subsystem is made up of 34 Special Indigenous Health Districts (DSEI), which are units inserted in indigenous lands, enabling the organization of health care services. The Multidisciplinary Teams of Indigenous Health (EMSI), are responsible for these territories and for organizing services in the DSEI and the Permanent Education activities of health professionals who work in indigenous territories, are based on the National Policy for Permanent Education in Health and by the guidelines of the National Policy for Health Care for Indigenous Peoples (PNAIPI), training professionals to align their actions and offer health care services in accordance with the reality of indigenous peoples, as well as preparing them to act in context intercultural. Data from spreadsheets sent by the 34 DSEI in the year 2021 were used and according to the goals defined in the District Plan for Indigenous Health for the period 2020-2023, it was verified the reach of 76.4% and 22.5% referring to the number of qualified workers in the improvement of health work and for acting in an intercultural context, respectively. In view of this, the results achieved demonstrate that Permanent Education actions with the aim of incorporating interculturality in the health actions of professionals working in the DSEI are of great relevance for the improvement of these professionals, contributing to the improvement of health care.

Role of professional training institutes in building Health Workforce Capacity: example of IAPH
Abdullatif Hussein1, Faris Lamı2
1International Academy of Public Health (IAPH), Amman, Jordan, 2International Academy of Public Health (IAPH), Jordan
The public health systems success depends critically on the availability of a competent workforce. As a Results, building the capacity of a public health workforce is critical to strengthening national health systems ability to address current and future population health challenges. Continuous Professional Development (CPD) for the public health workforce is essential to ensure best practices in a discipline that involves multi-professional, multi-disciplinary, and multi-organizational activities. Particularly in the wake of the COVID-19 pandemic, the significance of practice-based public health has been emphasized. So, to effectively promote, protect, and improve the population’s health, public health professionals need to have a broad range of knowledge and skills. A long-standing observation has been that the public health workforce is in jeopardy, and the health workforce generally lacks adequate public health competence. In the Eastern Mediterranean Region (EMR), most countries already face an overall shortage of healthcare workers, with weak competencies, geographical maldistribution, and a lack of specialized health workers. As a specialized public health educational institution in the region, The International Academy of Public Health (IAPH) Aims at responding to current and anticipated public health training needs and forging effective partnerships and synergies to scale up public health education and capacity for more resilient health systems and better population health. IAPH offers accredited training programs in various public health disciplines in different modalities, face-to-face, blended and online. In this workshop, IAPH, in collaboration with its partners, will demonstrate a model capable of sustaining capacity building and responding to public health needs during times of turmoil.

Workshop Objectives: This workshop Aims to highlight the importance of capacity building for the public health workforce and how professional training institutes respond to the need of the public health workforce. The specific Objectives of the workshop are to: 1. Highlight the importance of CPD for the public health workforce, 2. Present IAPH as a model for providing multidisciplinary professional training, 3. Explain the IAPH model of online training. Key questions: 1. How to maximize the value of CPD for the health workforce? 2. How can regional training institutes contribute to filling the gap in the quantity and quality of competent professionals? 3. How does IAPH contribute to building health workforce capacity in the EMR? Workshop Topics: 1. CPD concepts and approaches, 2. IAPH training model, 3. LMS demonstration

Methods: The workshop will be started with a presentation that covers the three topics and meets the set Objectives. The facilitator will engage attendees to actively participate in the Discussion through questions and answers, sharing experiences, and providing comments and suggestions on the presented topics. A considerable time will be allocated for the wrap-up and Conclusions. Workshop evaluation: At the end of the workshop, an evaluation form will be filled out by the participants to assess the participants’ satisfaction.

Sharing good practice from global accreditation in public health education
Friday Okonofua1, Nick Viggiani2,3,4, Hattham Bashier, Colleen Fisher1,5,6
1Agency for Public Health Education Accreditation (APHEA), Nigeria, 2University of the West of England, Bristol, United Kingdom, 3Agency for Public Health Education Accreditation (APHEA), United Kingdom, 4Agency for Public Health Education Accreditation (APHEA), Jordan, 5School of Population and Global Health, The University of Western Australia, Perth, Australia, 6Department of Public Health and Preventive Medicine, Second Faculty of Medicine, Charles University, Prague, Czech Republic
In 2012 The World Health Organization (WHO) estimated a shortfall of 7.2 million professional health workers (1) and in 2022 this prediction was revised upwards to a 10 million deficit by the year 2030 (2). There is universal agreement that low and lower-middle income countries will bear the brunt of these shortfalls, referred to as an “inverse care law where areas in most need are least served. Previously in 2006, the World Health Organization had argued that “shortfalls will require building new institutions - for example, more schools of public health are needed” (3). More recently in 2022 the strategy focussed on building the “capacity of vocational and educational institutions, including related to faculty, competency-based curriculum, clinical learning opportunities, infrastructure and technology for learning, accreditation, and regulatory mechanisms to enable increased student intake and improve and maintain the quality of education.” Furthermore, these activities should be strengthened through harnessing global partnerships, financing, and technology (4). Aims and Objectives: The aim of this workshop is to transfer knowledge of some of the latest innovative practices in public health education and training identified through accreditations in four WHO regions. The objective is to increase audience knowledge and understanding of pioneering practices in public health, continuous professional development (CPD) training, curricula, programmes and schools. The longer term objective is to encourage use of online resources where examples of good practice can be shared and discussed. The format will allow for brief presentations of activities followed by discussion: 1. Integrating community outreach – Nigeria, 2. Engaging students in quality improvement - United Kingdom, 3. COVID-19 response: online workforce training – Jordan, 4. Innovating student research routes – Australia. Key question: How can accreditation and regulatory mechanisms help build and strengthen capacity of vocational and educational institutions to improve and maintain the quality of education through global partnerships and technology? Preparing the public health workforce through credentials, certificates and certifications
Allison Foster1, Laura King1, Kaye Bender1
1National Board of Public Health Examiners, Washington, United States, 2Council on Education for Public Health, Silver Spring, United States
This workshop will focus on the differences and relative benefits of degrees (credentials), certificate programs and certification programs from a perspective when resources such as time and money are limited. Degrees are a time-intensive course of study designed to provide students with a balanced education and the skills necessary to pursue a specific career field. Certificates provide a relatively simple way to ensure regional workforce have learned a very specific set of skills or area of knowledge at a specific point of time. Because certificates are commonly offered online, they are a convenient short-term option for continuing education. Certifications provide employers with a reliable way to identify qualified staff who have demonstrated their knowledge in their field, their commitment, and a willingness to stay current through recertification. Certified individuals have positive incentives to life-long learning as well as marketable evidence of their competency. Certifications also provide assurance that certified employees are competent across various domains, not only in their area of specialty. The COVID-19
pandemic has highlighted the need for assurance of workforce competency and also for the ability of the workforce to learn new skills quickly. The panel will discuss the difference between certifications, degrees and certificate programs. It will explain how certification programs are developed and how employers and governments can use certifications in workforce development. The workshop will also include individuals with degrees and certifications to provide firsthand accounts of their experience. Participants will actively participate by sharing their thoughts on the advantages and barriers of degree programs, certificates and certifications in their region. They will then compare benefits of each with the needs in their country/region and will work with session leaders to develop a recommendation by the end of the session. Learning outcomes by the end of the workshop, participants will be able to: 1. Distinguish between certificates, degrees and certifications, 2. Explain how certifications ensure the workforce has the skills knowledge and abilities needed to perform in their field, 3. Understand how each option can increase employee recruitment and retention and strengthen the public health workforce.

Closing the gap: the distribution of postgraduate medical specialty training posts to narrow health inequalities

Kate Atkinson1, Ginny Bowbrick1, Jack Haywood2, Adrian Brooke3, Aidan Fowler4
1NHS England United Kingdom

Outline: In England, postgraduate specialty training posts have often been distributed based on historical arrangements, meaning posts are not always best aligned with patient needs. This has resulted in an imbalance in specialty training posts. In addition, we know that around 80% of specialty trainees completing their training settle within 50 miles of where they trained, meaning there is a resultant shortage of specialist senior clinicians across the country. This imbalance of specialists contributes to health and healthcare inequalities.

In 2018, Health Education England (HEE) and NHS England (NHSE) collaboratively commenced a programme to work towards an equitable distribution of specialty training places across the country. This will result in a fairly distributed medical workforce for the future which will in turn take a step towards addressing health inequalities. The programme will both redistribute current posts as well as allocate any new posts to underserved areas.

The programme is intended to be fair to all specialties that have not previously received support from the programme (e.g. orthopaedics, general practice). The aim of this programme is to ensure that the distribution of specialist training posts is equitable and that trainees are able to train in the specialty of their choice.

The programme was implemented in August 2022 in three specialties – cardiology, haematology, and obstetrics and gynaecology. There is a plan to redistribute most of the remaining specialties starting in the next 7 years in 3 phases.

The workshop aims to: 1) discuss the importance of equitable distribution of specialty training posts in England; 2) discuss the current challenges in achieving an equitable distribution of specialty training posts; 3) discuss the current barriers to achieving an equitable distribution of specialty training posts; 4) discuss the current challenges in achieving an equitable distribution of specialty training posts; 5) discuss the current barriers to achieving an equitable distribution of specialty training posts; 6) discuss the current challenges in achieving an equitable distribution of specialty training posts; 7) discuss the current barriers to achieving an equitable distribution of specialty training posts; 8) discuss the current challenges in achieving an equitable distribution of specialty training posts; 9) discuss the current barriers to achieving an equitable distribution of specialty training posts; 10) discuss the current challenges in achieving an equitable distribution of specialty training posts; 11) discuss the current barriers to achieving an equitable distribution of specialty training posts; 12) discuss the current challenges in achieving an equitable distribution of specialty training posts; 13) discuss the current barriers to achieving an equitable distribution of specialty training posts;

School-based comprehensive sexual health education - from evidence to implementation and evaluation: case study from Italy

Alice Chinelli1, Lara Tavoschi2, Johanna Marquardt3, Domenico Martinelli1, Marco Ubbiali1, Alice Chinelli1, Lara Tavoschi1
1University of Pisa Italy, 2University of Pisa, Italy, 3Bundeszentrale für Gesundheitliche Aufklärung (BZgA), Germany, 4University of Foggia Italy, 5University of Verona Italy

Brief outline of the overall workshop

Sexual and reproductive health (SRH) is a key dimension of health and well-being of individuals, especially relevant for young people. Global health organisations (e.g. WHO, UNESCO, E/CDC) and multicountry reviews recognise school-based sexuality education (SBSE), as one of the most important means of promoting sexual well-being of adolescents and a key component of HIV and sexually transmitted infections (STIs) prevention. International evidence recommends that SBSE should be addressed with a global approach to sexuality, that UNESCO defines as comprehensive sexuality education (CSE). SBSE, however, is still not available for many young people around the world, including Italian adolescents. Italy, in fact, is one of a few European countries that still lacks a comprehensive approach to SBSE coherently and equally implemented across the country, or included in schools’ curricula. EduForIST project, funded by the Italian Ministry of Health in 2019, aims at providing an overview of SBSE in Italy and to develop and implement two pilot projects in secondary schools across the country.

Specific aims/objectives and component parts

- Introduction: Sexuality and education: how to address this dimension in schools?
- Sexuality education represents an educative action that, nurtured by medical and scientific information, is aimed at making people flourishing in all the directions of their existence.

* School-based sexuality education in Europe and central asia: 2016 IPPF and BZgA initiated a scope review to get an overview of the progress made in developing and integrating SBSE into formal school settings in 26 countries of the WHO European Region. The main key findings and recommendations as well as a
Updated ecdc core competencies in applied infectious disease epidemiology: Processes, outcomes and opportunities for international academic collaboration

1University College Dublin ASPHER / University College Dublin "School of Public Health, Physiotherapy & Sports Science, Woodview House, Belfield, Dublin. D004 V1W8" Ireland, 2School of Public Health Physiotherapy and Sports Science, University College Dublin, Association of Schools of Public Health in the European Region (ASPHER), Dublin, Ireland, 3Maastricht University, The Netherlands, 4Ben Gurion University of the Negev, Israel

* How to evaluate a sbse intervention: experience from an italian pilot project: starting from an epistemological reflection on the concept of evaluation in education, we proposed a framework that enable sexual educators in evaluating the implementation of the pilot project, using a qualitative approach. The written texts have been analysed through a phenomenological approach, showing the strengths and weaknesses of the project, the favourable conditions of the setting/ institutions and the postures required to a competent educator.

Conclusions: Future perspectives and recommendations for sbse in Italy

Key questions

The workshop aims at enhancing public health interest and to foster debate on the topic of SBSE and the need to promote its implementation in the school context.

The following questions will be addressed: which role can school play in promoting SRH?-what is CSE and which topics should address?-which stakeholders should be involved in the creation and implementation of SBSE interventions?-which outcomes can be evaluated and which results can be expected?-how can a SBSE intervention be evaluated?

Kingdom
Outline
Whilst the idea of the need for an ethical approach to public health practice has been around for many years, over the last 20 years there has been a specific body of work directed at identifying and defining the scope of ethical public health and getting it into practice, which is the focus of other workshops on the program. As public health is concerned with the health of whole populations and ecosystems, rather than individuals, the conventionally described pillars of clinical ethics – autonomy, beneficence, non-maleficence, and justice – do not align with public health practice, because of the communitarian nature of public health.

Public health is concerned with populations and communities and not individuals, and with wide range issue such as disease prevention and health protection (such as screening and pandemic preparedness), risk identification and harm reduction (such as smoking and seatbelt use), and environmental protection (such as oversee of antibiotics and climate change). As a discipline it is considered as “science of social justice” and well placed to advocate for equity of access to safe health care and therapeutics, and for policy decisions which affect the health of whole populations in both health care and other areas which of direct concern to social determinants aspects of life, such as safe and secure housing, equal education, access to employment, safe food, clean air and water, not just for now but into the future.

Therefore, it is true that Public Health Ethics are incorporated into every-day public health work, taught in schools of public health, and made the business of the whole public health workforce.

In this workshop we will build on the content of other related public health ethics in practice workshops to consider how to embed public health ethics into public health curricula.

Aims and objectives: The aim of this workshop is to outline the current work being undertaken to define public health ethics, to identify ways in which public health ethics can be incorporated into public health education and training. In particular, the three objectives of this workshop are to Identify the behaviours that constitute public health ethics Consider what competencies for public health ethics might inform public health education curricula, beyond merely “using codes of ethical practice” as a core competency Prioritise what public health ethics content should be taught in public health curricula.

Key questions: How can public health ethics content be taught in public health education and training programs AND What public health ethics teaching and learning resources need to be developed to support public health educators?

Decolonizing approaches to transforming public health, valuing indigenous knowledge and human rights
Emma Patu, Summer Finlay, Christina Ore, Adrian Patu

Indigenous Peoples globally have been practicing Planetary Health Population Health Promotion and Public Health for Millennia. In is embedded in our ways of knowing doing and being.

This workshop will feature Indigenous Public Health Experts who will share their knowledge and insight on how to engage, work with and for Indigenous Populations. This work shop will also serve to offer education to our broader public health community on how Indigenous knowledge underpins public health and how we can understand Indigenous knowledge systems and approaches, aligned heavily with Human rights approaches and values to strengthen public health practice and how to decolonise Public Health.

Participants with go away with practical actions and ability to apply ideas and frameworks in their practice which will help to increase efficacy in systems change approaches to address inequities for the most vulnerable populations, many of whom are Indigenous. In a world where climate change and planetary health are key to the survival of human kind it is essential that we step beyond the boundaries of what we think we know and engage in practices and knowledge that exist and work in harmony with the environment, natural and built and are founded on the notion of the survival of the collective.

Spatial patterns and inequalities in skilled birth attendance and caesarean delivery in sub-Saharan Africa
Firew Bobo, Augustine Asante, Mirkuzie Woldie, Angela Dawson, Andrew Hayen
1University of Technology Sydney, Sydney, Australia, 2School of Population Health, University of New South Wales, Sydney, Australia, 3Harvard T.H. Chan School of Public Health, Addis Ababa, Ethiopia, 4School of Public Health, Faculty of Health, University of Technology Sydney, Sydney, Australia

Background: Improved access to and quality obstetric care in health facilities reduces maternal mortality and morbidity. We examined spatial patterns, within-country wealth-related inequalities and predictors of inequality in skilled birth attendance and caesarean deliveries in sub-Saharan Africa.

Methods: We analysed the most recent Demographic and Health Survey (DHS) data from 25 sub-Saharan African countries. We used the concentration index (CCI) to measure within-country wealth-related inequality in skilled birth attendance (SBA) and caesarean section. We fitted a multilevel Poisson regression model to identify predictors of inequality in having SBA and caesarean section.

Results: The rate of SBA ranged from 24.3% in Chad to 96.7% in South Africa. The overall coverage of caesarean delivery was 5.4% (95% CI: 5.2% to 5.6%), ranging from 1.4% in Chad to 24.2% in South Africa. The overall wealth-related absolute inequality in having a skilled attendant at birth was extremely high, with a difference of 46.2 percentage points between the poorest quintile (44.4%) and the richest quintile (90.6%). In 10 out of 25 countries, the caesarean section rate was less than 1% among the poorest quintile, but the rate was more than 15% among the richest quintile in nine countries. Four or more antenatal care contacts, improved maternal education, higher household wealth status, and frequently listening to the radio increased the rates of having skilled attendant at birth and caesarean section. Women who reside in rural areas and those who have to travel long distances to access health facilities were less likely to have skilled attendant at birth or caesarean section.

Conclusions: There were significant within-country wealth-related inequalities in having skilled attendant at birth and caesarean delivery. Efforts to improve access to birth at the facility should begin in areas with low coverage and directly consider the needs and experiences of vulnerable populations.

Mortality from chronic noncommunicable diseases in Portuguese-speaking countries and sustainable development goals targets in 2030
Deborah Malta,1, Citizian Gomes,1, Guilherme Veloso,2, Juliana Souza,3, Patricia Oliveira,4, Paula Freitas,3, Filipe Santos,1, Albano Ferreira,4, Paulo Ferrinho,4, Mohns Nagavi,2, António Ribeiro1
1Universidade Federal de Minas Gerais, Brazil, 2Universidade Federal Fluminense, Brazil, 3Ministerio da Saude, Brazil, 4Universidade Katayaval Biwa, Benguela, Angola, 5Universidade Nova de Lisboa, Instituto de Higiene e Medicina Tropical, Portugal, 6Institute for Health Metrics and Evaluation, Seattle, United States

Non-Communicable Diseases (NCDs) are one of the main global health problems, being responsible for a large number of premature deaths, disabilities and loss of quality of life. There are still few studies on the performance of the Portuguese Language Community in the 2030 Agenda, making it an opportunity to advance in this diagnosis and thus contribute to the strengthening of partnerships that allow monitoring progress in achieving the goals of the SDGs.

Objective: We analyzed trends in premature mortality from chronic noncommunicable diseases (NCDs) between 1990 and 2019, the projections until 2030 and the risk factors attributable to these diseases in the Community of Portuguese Speaking Countries (CPLP).

Methods: Estimates from the Global Burden of Disease study and analysis of the performance of the Portuguese language community in the 2030 Agenda, making it an opportunity to advance in this diagnosis and thus contribute to the strengthening of partnerships that allow monitoring progress in achieving the goals of the SDGs.

Results: Portugal, Brazil, Equatorial Guinea, Angola and Guinea-Bissau have declining premature mortality rates from NCDs and; East Timor, Cape Verde, São Tomé and Príncipe and Mozambique showed an increase in rates. Projections indicate that none of the countries is expected to achieve the goals of reducing premature mortality from NCDs by one third by 2030. The attributable burden of disease showed that the most important risk factors in 2019 were: high systolic blood pressure, tobacco, dietary risks, high body mass index and air pollution.

Conclusions: here are many differences in the burden of NCDs in CPLP member countries. In addition, none of these countries is expected to achieve the goal of reducing deaths from NCDs by one third by 2030. Portugal and Brazil presented the best performances and, Angola, Guinea-Bissau, Mozambique and Equatorial Guinea, the worst. In order to make effective progress, it is imperative to build partnerships and exchanges between CPLP member countries.

Exploring health equity in Lesotho's child grants program
Eloïde Besnier1, Thandise Hlabana2,3, Céline Sieu4, Virginia Kotzias5, Kathrin Beck6,7, Kimanzi Muthengi1
1Centre for Global Health Inequalities Research (CHAIN), Department of Sociology and Political Science/Department of Public Health and Nursing, Norwegian University of Science and Technology, Norway, 2National University of Lesotho, Lesotho, 3University of Hull, United Kingdom, 4UNICEF Lesotho country office, Lesotho, 5Centre for Global Health Inequalities Research (CHAIN), Department of Sociology and Political Science, Norwegian University of Science and Technology, Norway, 6Centre for Global Health Inequalities Research (CHAIN), Norway, 7Centre for Fertility and Health, Norway, 8Norwegian Institute of Public Health, Norwegian University of Science and Technology, Norway

Despite their growing popularity, little is known about how cash transfers can affect health disparities in targeted communities. Lesotho's Child Grant Program (CGP) is an unconditional cash transfer targeting poor and vulnerable households with children. Started in 2009, the CGP is one of Lesotho's key programs in developing the country's social protection system. Using the CGP's early phases as a case study, this research aims to capture how program stakeholders understood and operationalized the concept of health equity in Lesotho's CGP. The qualitative analysis relied on a desk review and semi-structured key informant interviews with program stakeholders. The program documents were coded deductively while the interview transcripts were coded inductively. Both materials were analyzed thematically before comparing their findings. When differences or disagreements arose within a theme, we explored potential determining factors for these variations according to the program's chronology, the stakeholders' affiliations and their role(s) in the CGP. The definitions of health equity in the context of the CGP reflected the complexity and multi-dimensional (or even debated) nature of the concept. This concept was overwhelmingly defined as focusing on children's access to health services for the most disadvantaged households. There was less agreement about other definitions of the concept, which seemed to be terminologies primarily used by specific stakeholders. These discrepancies in the definitions were further reflected in the role concept played in the CGP, as the least common definitions were also comparatively less integrated into the program. Even the most common definitions of this concept didn't seem fully operationalized throughout the program, especially in the day-to-day operations and reporting at the local level. This operationalization gap not only affected the study of selected health spillover effects of the CGP but also might have undermined other program impacts related to specific health disadvantages or gaps.

Gypsies and Travellers' health status, access to healthcare and health prevention in relation to their environmental and living conditions in Nouvelle Aquitaine, France 2019–2022
Aude Mondeilh1, Stephanie Ventronter1,2,3, Gilles Brabant1, Sahar Haidar2, Elodie Richard4
1Bordeaux Population Health Centre, University of Bordeaux, France, 2Santé publique France, Saint Maurice, France, 3Bordeaux Population Health, Université de Bordeaux, France, 4PHARès, Centre Inserm U1219, Bordeaux, France, 5Fédération Nationale des Associations Solidaires d’Action avec les Tsiganes et les Gens du Voyage (FNASAT-GDV), France, 6Bordeaux Population Health, Université de Bordeaux, Bordeaux, France

Background and Objectives: Although crucial role of social determinants on health is well known, such as precarious living conditions, some undererved population remains under-investigated in France such as Gypsies and Travellers. We aimed to describe for the first time in France, Gypsies and Travellers' living conditions – including environmental exposure, and factors associated with their health status and their access to healthcare and prevention.

Methods: A cross-sectional study with a three-stage random sample design (living area, household, individual) was conducted between October 2019 and March 2022, in Nouvelle-Aquitaine. Trained social workers administered face-to-face questionnaires to collect data on adults and children including demographics and socioeconomic situation, living conditions, mobility, health status and access to healthcare and prevention (vaccination, screening, literacy). Anthropometric measurements, vaccination records and environmental exposure questionnaire were also collected.

Results: 1030 adults and 337 children were included with a very high participation rate (73.6%). For children, 77.8% had full measles-mumps-rubella vaccination coverage, 16.2% were overweight and 7.6% suffered from behavioural and emotional difficulties. Over 74% of the households had housing insecurity, 22.2% did not have a drinking water supply, and 43% were located less than 200 meters from a major road. 71.3% of the adults were overweight (including obesity), 14.4% reported diabetes, 24.7% hypertension, and 14.0% depressive disorder. The prevalence of depressive syndrome was significantly higher in adults living in precarious and unauthorized housing than in those with adequate housing (19.2 vs 14.7%, p=0.04). Concerning access to healthcare, 82.6% had visited a general practitioner in the previous year.

Conclusions: Traveller children and adults faced deleterious environmental and living conditions potentially affecting their health and their access to healthcare and prevention. These results demonstrate the need for urgent action targeting underserved populations, taking into account their specific needs.

Changing scenario of economic dependency and self-rated health among older adults in India from 2004 to 2018
Jyoti Das1
1International Institute for Population Sciences, Mumbai, India

Introduction: The demographic structure is changing with a continuous increase in the proportion and number of older adults. Complementary to it, the proportion of younger cohort is decreasing, laying a more significant challenge to the care and well-being of older population.

Methodology: This study is based on the 60 and above population using two rounds of the National Sample Survey, the 61st, 2004-05 (34,831) and the 75th, 2017-18 (42,762). For analysis, Descriptive statistics and the Probit regression model were employed.

Results: The Results show that although the highest proportion of elderly was completely dependent (61st round: 52% and 75th round: 47%), partial dependence had increase by 10% in 15 years. Poor SRH was higher among economically dependent older adults and remained so after considering socio-economic factors.

Conclusions: This study recommends policy interventions related to social-welfare schemes for geriatric health—further, consideration of providing pensions to economically vulnerable social sections.

Whistleblowing as an anti-corruption strategy in health and pharmaceutical organizations: a scoping review

Taryn Viani1, Brieth Molines1,2
1World Health Organization Collaborating Centre for Governance, Accountability, and Transparency in the Pharmaceutical Sector, University of Toronto, United States, 2Public Health Program, Orange County Campus, University of San Francisco, San Francisco, United States

Introduction: Vaccinations are one of the most powerful preventive tools potentially help to address the observed inequity.

Multicomponent measures to assess the sustainability of diets: a systematic review

Mariana Rei1,2,3, Alejandra Costa3,4,5, Sofia Sosa6,7, Sofia Costa8,9, Colin Sage10, Duarte Torres10,11, Sara Rodrigues10,11,12
1Faculty of Nutrition and Food Sciences, University of Porto, Porto, Portugal, 2Epidemiology Research Unit (EPIUnit), Institute of Public Health, University of Porto, Porto, Portugal, 3Laboratory for Integrative and Translational Research in Population Health (ITR), Faculty of Medicine, University of Porto, Portugal, 4Laboratory for Integrative and Translational Research in Population Health (ITR), Portugal, 5Faculty of Medicine, University of Porto, Portugal, 6Epidemiology Research Unit (EPIUnit), Institute of Public Health, University of Porto, Porto, Portugal, 7Laboratory for Integrative and Translational Research in Population Health (ITR), Faculty of Medicine, University of Porto, Portugal, 8Faculty of Nutrition and Food Sciences, University of Porto, Porto, Portugal, 9Laboratory for Integrative and Translational Research in Population Health (ITR), University of Porto, Portugal

Background and Objectives: Whistleblowing can bring suspected wrongdoing to the attention of someone who is in a position to rectify the problem. This can help deter corruption and promote health equity. The objective of this research is to understand the extent and type of evidence on whistleblowing as an anti-corruption strategy in health and pharmaceutical organizations in low- and middle-income countries (LMICs) and to inform future research agendas.

Methods: This scoping review searched the PubMed, Scopus, and Embase databases from 2005-2020, limited to English language. We also searched websites of multilateral agencies or international non-governmental organizations for policy documents, guidance and reports. Titles and abstracts were screened to remove those where the focus was not health, pharmaceuticals, whistleblowing, or LMIC context. Articles focused on research misconduct were excluded. Full text articles were assessed for eligibility on these same criteria. Included sources were analysed thematically, based on five categories including definitions and models; evidence of reporting frequency; factors influencing whistleblowing; cultural context; and outcomes.

Results: The review found 22 sources including reports, policies, and guidance documents (12, 55%), news articles (4, 18%), policy analyses/reviews (3, 14%), commentaries (2, 9%), and empirical studies (1, 5%). Most sources described whistleblowing policy and system components such as how whistleblowing is defined, who can report, and how confidentiality is assured. Few articles documented types and frequency of corruption identified through whistleblowing or factors associated with whistleblowing. Several studies mentioned cultural norms as a potential limitation to whistleblowing effectiveness. About one-third of the sources described fear of retaliation and noted the need to strengthen protection for whistleblowers. Conclusions: Research on whistleblowing is scarce in health and pharmaceutical organizations in LMIC. Documentation of policies, factors associated with whistleblowing, and whistleblowing outcomes is needed and could help countries to mainstream whistleblowing as a sectoral anti-corruption strategy.

Use of child restraint systems in the Gulf region: a systematic review

Marguerite Sendall1, Nejood Nasher2, Shouq Baker3, Huda Almotawa1
1Department of Health Law, Policy, and Management, Boston University, United States, 24Department of Clinical and Experimental Medicine, University of Pisa, Pisa, Italy, 3Department of Clinical and Experimental Medicine, University of Pisa, Pisa, Italy

Introduction: Child restraints are effective in reducing the risk of injury in traffic accidents. The use of child restraints is mandatory in many countries. However, in the Gulf region, the use of child restraints is still low. The purpose of this review is to identify and assess the evidence on the use of child restraints in the Gulf region.
Background: The United Nations General Assembly has a target to halve the number of worldwide deaths and injuries from road accidents by 2030. Globally, road traffic injuries and deaths are the leading cause of death for children and young adults aged 5-29 years (WHO, 2022). Child Restraint Systems (CRS) have been identified as a preventive measure. Objective: The Objective of this systematic review is to review the evidence about the use of CRS in the Gulf region.

Methods: PRISMA guidelines were used to conduct a review of the evidence-based literature about the use of CRS in the Gulf region. The search for literature was conducted on PubMed, Web of Science, Public Health ProQuest, and Cochrane. The date range was 1 January 2019 to 31 August 2022. MeSH terms were used to narrow initial search terms. Retrievals were stored in Endnote. Before manual screening, 31 duplicates were eliminated using the Al-Rayyan web tool. Three reviewers manually screened the remaining 188 studies; 12 studies were excluded. Next, 176 studies were sought for retrieval; 12 studies were not retrieved. Then, 164 studies were assessed for eligibility; 159 studies were excluded because they were not relevant, conducted in the Gulf region, older than 2019 or the population was not relevant.

Results: Five studies will be included in the final review. All studies are cross-sectional. Two studies were conducted in Qatar, two studies were conducted in Saudi Arabia and one study was conducted in the United Arab of Emirates. Preliminary Findings suggest the use of CRS in the Gulf region is influenced by a suite of different factors including lack of knowledge about risks and proper usage and the influence of local culture and attitudes. Conclusions: The authors will complete the final analysis and draw conclusions in time for the conference in May 2023.

Teaching and learning of social determinants in health in the region of the Americas

Maria Gómez1, Maria Gómez2, Erwin Hernández2, Camilo Correal3
1University of La Sabana, Sweden, 2Karolinska Institutet, Sweden, 3University of La Sabana, Colombia

Introduction: The Americas region is currently considered the most unequal in the world; therefore, to overcome these inequalities, human resources in health play a central role, that is why, it is considered necessary to strengthen in the health science programs, the teaching and learning of Social Determinants in Health to promote their intervention and approach.

Methodology: A review of the literature on the teaching and learning of Social Determinants in the Americas was carried out, by searching for official documents and articles in databases (Web of Science, Clinicalkey, PubMed, Science Direct and Lilacs). 68 documents were selected and organized in the teaching and learning of Social Determinants, their relationship with Interprofessional Education, and their importance and social responsibility.

Results: The region of the Americas has made significant progress in several countries in terms of the inclusion of public policies that act on determinants and that help human health resources to be formed with a primary care approach. However, the health sciences faculties in the region must deepen their knowledge of research and pedagogical strategies that facilitate the teaching and learning of determinants; in turn, progress is observed in the inclusion of Interprofessional Education in the region.

Conclusions: The comprehensive approach to determinants in the region plays a fundamental role in reducing social inequalities and improving the health of its inhabitants.

Conditional cash transfer programs and HIV/AIDS incidence in Guatemala: an exploratory analysis

Ernestina Tecu1, Ernestina Tecu1, Cristian Figueroa2
1Universidad Rafael Landívar, Guatemala, 2Instituto de Saúde Coletiva (ISC-UFBa), Guatemala

Background and Objectives: HIV/aids incidence rose 40% during the COVID-19 pandemic in Guatemala. Previous scholarly work shows that targeting social and economic vulnerabilities reduces HIV incidence rates. Thus, this study aimed to analyze the relationship between conditional cash transfer programs (CTP) and HIV/aids incidence in Guatemala. Methods: This work is part of a larger study titled: "conditional cash transfer programs (CTP) and HIV/aids incidence in Guatemala: 2013-2021". We conducted a cross-sectional exploratory analysis for 2018. HIV/aids incidence rates, coverage of the CTP, amount of cash received, and health assistance rates were calculated for the 340 municipalities. Data was collected from Guatemala’s Ministry of Health, and Ministry of Social Development. We used direct standardization method for rates comparability. We categorized incidence rates and CTP coverage for risk estimation. Finally, we investigated association through bivariate analysis.
Results: Highest coverage of the CTP was 5.2%. Municipalities in the Northeast had the highest coverage of both CPT and health assistance, and those in the metropolitan area had the lowest. Medium-sized cities in the Northern and Central regions had the highest standardized rates of HIV/aids and had no coverage of CTP. We found that HIV incidence rates were negatively correlated to CTP coverage (p: -0.113 p<0.05) and the amount of cash received (p: -0.123 p<0.05); and 3) women with health assistance rates (p: 0.144 p<0.01). Lastly, municipalities with CTP coverage <1% had greater odds for having high HIV incidence rates (OR: 1.76 I95%: 1.1 – 2.8). Conclusions: Conditional cash transfer programs are associated with the reduction of HIV/aids incidence rates. This evidence marks the urge to include public policies targeting programmatic vulnerabilities in the HIV/aids prevention programs, in order to achieve the global agenda goals for reducing HIV transmission rates. The study’s second phase will include longitudinal and multivariate analysis to better describe this association.

Enhancing health equity and public health infrastructure

Kelly Morning1, Gerold Dermid1
1School of Public Health, University of Nevada, Reno, United States, 2School of Public Health, University of Nevada, Reno, United States

The Nevada Public Health Training Center (NVPHTC) and Larson Institute for Health Impact and Equity (Larson Institute) have worked with health officials throughout Nevada to implement multiple workforce development assessments and create action plans based on survey findings. In 2019, NVPHTC re-launched a Workforce Development Survey to examine the status of Nevada’s current public health workforce as well as competencies changes since 2015. With over 800 responses, Findings were used to identify distinctions within different populations of the public health workforce. Analysis highlighted key findings and significant differences in competencies, training preferences, and other characteristics between survey participants based on demographics such as ethnicity and race. In early 2021, the Larson Institute developed and implemented another needs assessment survey. This assessment was aimed at identifying opportunities to enhance health equity within public health programs, clinics and organizational settings. The Larson Institute leveraged its partnerships with state and local health authorities, healthcare systems, and non-profit partners to disseminate the first statewide Public Health Workforce Health Equity Needs Assessment and had nearly 600 responses. Key findings from the equity survey showcased a need for action within the public health workforce. Workforce development findings helped the Larson Institute develop Nevada’s workforce by recognizing the unique needs of different members and encourage efforts to further diversify all public health roles, from support staff to directors and senior leaders. With each needs assessment, the Larson Institute supported development of comprehensive strategies for enhancing health equity and public health infrastructure. This included the development of individualized action plans and recommendations for best practices, including enhancing knowledge and promoting equity-driven conversations that address the environmental, social, and economic conditions impacting health. Beyond Nevada, this presentation will emphasize the need to act and support the advancement of health equity initiatives for healthier communities everywhere.

Measuring health equity in the ASEAN region: conceptual framework and assessment of data availability

Bryanna Mariñas1, Capucine Barcellona1, Si Ying Tan1
1Yale-NUS College, National University of Singapore, Singapore, 2Saw Swee Hock School of Public Health, National University of Singapore, Singapore

Background: Existing research on health equity falls short of identifying a comprehensive set of indicators for measuring across health systems. Health systems in the ASEAN region, in particular, lack a standardized framework to assess health equity. This paper proposes a comprehensive framework to measure health equity in the ASEAN region and highlights current gaps in data availability according to its indicator components.

Methods: A comprehensive literature review was undertaken to map out a core set of indicators to evaluate health equity at the health system level. Secondary data collection was subsequently conducted to assess current data availability for ASEAN states in key global health databases, national health accounts, and policy documents.

Results: A robust framework to measure health equity was developed comprising 143 indicators across Health System Inputs, Outputs, and Outcomes. Across the ASEAN region, the Inputs sub-component of Health Financing had data available for all indicators (160/160, 100%), while Access to Essential Medicine had the least data available (6/30, 20%). Under Outputs and Outcomes, Coverage of Selected Interventions (161/270, 59.63%) and Population Health (350/350, 100%) had the most data available, while other indicator sub-components had little to none (3 38%). Cambodia had the most complete data overall (79.72%) while Vietnam had the least (66.43%). Figure 1. Proposed conceptual framework for measuring health equity in ASEAN.

Conclusions: The data availability gaps highlighted in this study underscore the need for a standardised framework to guide data collection and benchmarking of health equity in ASEAN. There is a need to prioritise regular data collection for overlooked indicator areas and in countries with low levels of data availability. The application of this indicator framework and resulting data availability analysis could be conducted beyond ASEAN to enable cross-regional benchmarking of health equity.

Understanding the non-use of harm reductions services by socially included women who use drugs

Sarah Perrin1
1Bordeaux Population Health - ISPED, University of Bordeaux, France

Women who use drugs represent 20% to 30% of those who visit harm reduction structures in Europe. Socially included people are also a minority in these services. Socially included women who use drugs are therefore doubly invisible in harm reduction structures. This communication Aims to explain the lower attendance by socially included women of harm reduction structures, in France and in Quebec. The results presented are based on 97 interviews carried out with socially included women and men who use drug, with harm reduction professionals and actors in drug-related public policies, in Bordeaux and Montreal. Harm reduction structures are, in both cities, more designed to meet the needs of a precarious men who use drugs. In Bordeaux as in Montreal, non-mixed spaces dedicated to women are rare, whereas non-mixed spaces have been shown to encourage the arrival of women in the services. The services and schedule proposed by the structures also correspond more to the needs of precarious drug users. However, structures exist which could better meet the needs of women and socially included people, but the drug users interviewed do not seek them either. This non-use can be explained by four main reasons: first, the participants believe that they do not need help. Secondly, some have already spoken about their drug use to professionals who are not specialized in the management of drug consumption, and they have felt judged or misunderstood, which subsequently constitutes an obstacle to health care. Third, most participants are unaware of the existing services. Fourth, the interviewees refuse to be assimilated to the marginalized public targeted by most of the harm reduction structures, in a strategy of avoiding stigma. Several recommendations can be considered to improve harm reduction among a female and socially included population, their non-use of the services constituting a public health problem.

Application of health equity audit to emergency care for acute myocardial infarction

Anna Acampora1, Laura Angelici1, Teresa Spada2, Nicolás Zengarini3, Giulia Cesaroni4, Nera Agabiti3
1Dipartimento di Epidemiologia del Servizio Sanitario Regionale del Lazio, Rome, Italy, 2Dipartimento di Epidemiologia del SSS del Lazio, ASL Roma 1, Rome, Italy, 3Servizio Sovrazone di Epidemiologia ASL T03, Regione Piemonte, Torino, Italy, 4Dipartimento di Epidemiologia del SSS del Lazio, ASL Roma 1, Rome, Italy

Background and Objective: Identifying and addressing health inequalities is a public health priority for Health Services to guarantee equitable access to effective care and health opportunities. Health Equity Audit (HEA) is a systematic methodology to evaluate inequalities in the distribution of health determinants, in the access to healthcare services and in the outcomes across the population, to define and implement actions to reduce them and to evaluate their impact. The objective of this work was to apply the HEA to in-hospital emergency care for Acute Myocardial Infarction (AMI) in Lazio Region, Italy.

Methods: A multidisciplinary group of different professionals was identified and an equity profile was defined. A conceptual framework was elaborated, the entry points for possible inequalities were identified. According to the framework, indicators, health determinants and data sources were identified. After data elaboration, results were fed back to relevant professionals in the participating hospitals (cardiology, emergency, health management) with the invitation to
organize audit meeting and to identify improving actions. 
Results: The identified entry points include risk for AMI, access to timely health procedure, access to diagnosis and/or treatment, adherence to post-acute treatment, outcomes. Health determinants included sex, education, socio-economic position, occupation, geographical area and country of origin. The sources of data were health information systems of the Lazio Region. Data firstly elaborated regard the inequalities in access to timely Percutaneous-Transluminal-Coronary-Angioplasty (PTCA) for patients with ST-elevation myocardial infarctionSTEMI and 30-days mortality after AMI, according to sex and education. The access to timely PTCA is lower in female while the 30-days mortality is higher in less educated patients.

Conclusions: HEA allowed to identify possible mechanisms for inequalities generation. Returning results to professionals involved in the care-pathways we expect to increase their awareness about the problems and to stimulate the adoption of improving actions and finally to reduce the gaps.

Popul. Med. 2023;5(Supplement):A763 DOI: 10.18332/popmed/165309

Australian child and youth health and education wellbeing policy: are we addressing the social determinants of health? 
Clare Littletont1
Tommie University Australia, Adelaide, Australia

Background: Children and youth are an important population group requiring specific policies to address their needs. In Australia, most children and youth are doing well, however, certain equity groups are not. To address health equity in policy, applying a social determinants of health approach is considered best practice. For over 10 years governments in Australia have been called upon to address the social determinants of health, however, there has been limited action. Health and education departments are typically most involved in policy development for children and youth. To date, there have been limited systematic analyses of Australian child and youth health policies, and selected education wellbeing policies, with a social determinants of health and health equity focus and this study aims to contribute to addressing this gap.

Methods: We conducted a policy analysis study across 26 Australian child and youth health policies, and selected education wellbeing policies. We used an existing prior coding framework with a social determinants of health and health equity lens to understand the extent to which the social determinants of health and health equity were addressed. Policies were dated 2009 onwards.

Results: Across 26 selected policies only 10% of strategies addressed the social determinants of health. We report on the social determinants of health addressed, to some degree, which includes early childhood development, education, parental workplace conditions, healthy settings, and housing, and to a lesser extent, public transport and regulation. Conclusions: This study demonstrates a lack of policy action on the social determinants of health. Rather, the application of a siloed, and predominantly acute care approach. However, there is recognition of equity across all policies; an emphasis on housing as a determinant of health; and a link between health and education departments through education wellbeing policies, specifically addressing the issue of mental health.

Popul. Med. 2023;5(Supplement):A764 DOI: 10.18332/popmed/165326

Defining rural surgery: the Philippine perspective
Brent Viray1, Michael Leon2,©, Crisostomo Arcilla3,©, Anthony Perez4,©, Rodney Dofitas4,©, Jose Marfori4,©, May Viray4,©
1Aurora Memorial Hospital, General Emilio Aguinaldo Memorial Hospital, Philippines, 2School of Health and Related Research, University of Sheffield, United Kingdom, 3Institute of Public Health, Jagiellonian University Medical College, Krakow, Poland, 4University of the Philippines, Philippines, 5Philippine General Hospital, Philippines, 6Rural Health Unit, Dingalan, Aurora, Philippines

Rural Surgery (RS) has been practiced and defined in developed countries (i.e., USA, Canada, and Australia) comprised largely of a huge land mass as general surgery practice done outside of their urban communities. It is characterized as a surgical practice that is rewarding as the surgeon is placed in professional isolation closely-knit personally in the community as he/she is expected to deliver even in the absence of more sophisticated health technologies and surgical techniques.

The authors subscribed to these deceptions but would like to advance a more progressive and bottom-up approach of defining RS especially in an archipelagic developing country like the Philippines with 7107 islands. RS practice is generally defined as general surgery with heightened inclination on incorporating the social determinants of health on the Rural Surgeon’s management algorithms and surgical Methods. While he/she performs the common appendectomy, cholecystectomies, inguinal hernia repair and wound debridement, half of his/her management plan is formulated before and after the patient’s admission. A keen inclination on how the health systems work and referral system is a large component of the plan. Rural Filipino patients are unique in the sense that mostly sought consult after initial presentation or complications of their disease because of compound social factors like limitation in geographical access, financial capability, health-seeking behavior, and education as compared to their urban counterparts. The authors would suggest that defining RS in developing country as the practice of general surgery performed in disadvantaged areas with surgical management concocted with heightened considerations in the social determinants of health and the surgical health system of the area. Thereby, the authors also advocate that RS in the Philippines be more inclusive and should be aligned in the ongoing implementation of the Universal Health Care Act while it embraces the inevitable facets of challenging social determinants of health.

Popul. Med. 2023;5(Supplement):A765 DOI: 10.18332/popmed/165327

Catastrophic injury related disability - A social determinant-based approach to achieving optimal community rehabilitation outcomes
Chebiwot Kipsaina1,©, Angelita Martin1,2
1Brightwater Research Centre, Brightwater Care Group, Inglewood, Australia, 2Curtin Medical School, Curtin University, Bentley, Australia, 3The University of Western Australia, Crawley, Australia

Background and Objectives: Disability constitutes a major social problem. Globally, 1 billion people - approximately 15% of the population live with some form of disability, of which one-third is as a result of preventable injury. Furthermore, nearly 4% of this population experience significant difficulties in functioning often requiring health care services. In recognizing the urgent need to attenuate the social and health inequalities associated with disability, 74th the World Health Assembly in 2021 adopted a resolution to provide the highest attainable standard of health for persons with disabilities by making the health sector more disability-inclusive and therefore ensuring no one is left behind in achieving the Sustainable Development Goals. The social determinant-based approach to disability related to catastrophic injury has seldom been applied in this area. We aim to describe the impact of health determinant approach on injury related disability rehabilitation outcomes not otherwise documented.

Methods: Prospective, mixed methods study within a Participatory Action Research approach with three-phase design: Phase 1: Scoping review of existing literature on catastrophic injury and disability. Secondary data review about injury and disability. Phase 2: Participants with catastrophic injury and disability: Development and implementation of a comprehensive general assessment database (demographics, injury details, social determinants measures, quality of life, knowledge and skills on disability), Open-ended survey; Clinical assessments. Data analysis. Phase 3: Key experts working with participants and/or with specialised knowledge: Qualitative interviews.

Results: The results will showcase the impact of applying a health determinants approach that has the potential to inform improved community-based rehabilitation and health service delivery of injury related disability.

Conclusions: New evidence will be generated regarding effective health determinants approach for addressing injury related disability and reducing health inequalities. Such information will be important to instigate the needed paradigm shift from conventional approach to disability to a social-determinant one.

Popul. Med. 2023;5(Supplement):A766 DOI: 10.18332/popmed/165329

Inappropriate and inedible: public health insights into supermarket donations to an Australian food bank
Sharonna Mossensoni1, Roslyn Giglia2, Claire Pulker1, Christina Pollard1,2
1Curtin University, Australia, 2Foodbank of Western Australia, Australia, 3East Metropolitan Health Service, Australia, 4Enable Institute, Curtin University, Australia

Background and Objective: Food banks provide food to people experiencing food insecurity, supporting the Sustainable Development Goals (SDGs) 2 and 12 (reducing hunger and waste by 2030). They source, warehouse and distribute food to community agencies and individuals, relying largely on donated food from major supermarkets. The donation of unwanted or surplus products is publicly framed as a food waste solution: rescuing tonnes of surplus food from landfill and feeding the needy. The quantity (kilograms) of donated food is well documented, but the quality is unknown. This study measured the quality of supermarket food donated to an Australian food bank. Methods: An audit of all donated food over five consecutive weekdays in May 2022 was conducted at a major food bank warehouse in Australia. All deliveries were documented using digital imagery on
a hand-held mobile device. Photographs were manually annotated to capture pre-determined public health and nutrition quality measures: type, brand and variety of product; delivery details (donor, weight of product, date marking); food safety and product quality.

Results: 1500 images collected for 72 donations, of which 36 were ‘mixed loads’ containing miscellaneous product lines in a single delivery. Supermarkets donated 61% of all loads containing 75% of product. Sixty-eight percent of products were categorised as ultra-processed (according to the NOVA level of processing), 9% were ‘unsatisfactory’ due to damaged packaging (ripped, dented +/- product exposed/leaking), compromised product (overripe, contaminated, blown or visible mould), or donated on/past the ‘best before’ or ‘use by’ dates. Products were sorted for distribution to clients and unsatisfactory items sent to landfill. Conclusions: The quality of foods donated by Australian supermarkets was predominantly inappropriate in terms of nutrition and safety for human consumption. There is an urgent need for a system to improve the efficiency, equity and effectiveness of food donations to food banks.

DOI: 10.18332/popmed/165339

Equity and gender orientation of antimicrobial resistance policy formulation in Australia and Germany
Victoria Saint1, Clare Littleton2
1School of Public Health, Bielefeld University, Germany. 2Torrens University, Australia

Background and Objective: Antimicrobial resistance (AMR) is one of the biggest contemporary threats to population health, food security and sustainable development globally. Significant progress has been made to tackle AMR, especially through a One Health approach. In line with the World Health Organization call to consider how AMR affects “people in their daily lives at work, home and in their communities”, greater focus is needed on equity, social determinants of health (SDH) and gender dimensions of AMR. Methods: This study explored national AMR policy formulation in Australia and Germany with a focus on health equity, SDH and gender. We analysed national AMR policies in both countries and interviewed key stakeholders about the development and implementation of these policies, using a cross-disciplinary (public health and political science) approach. Results: We present cross country analysis of the two policies including conceptualisation of health and AMR, types of goals and strategies pursued, and the extent to which health equity, SDH and gender are recognised or targeted for action. We then present findings of semi-structured interviews that explore stakeholder perspectives about how health equity, SDH and gender are embedded in current policy and opportunities for expanding this focus in future AMR policies. Conclusions: While the emphasis and styles of the policies differ, in both policies equity, SDH and gender are only considered in a limited manner. The policies predominantly reflect a biomedical framing, with a narrow understanding of prevention and a focus on awareness raising and behavioural change. We therefore discuss areas for expansion and provide insights on how the policy agenda in the future could reflect a stronger consideration of these dimensions of AMR.

Popul. Med. 2023;5(Supplement):A768
DOI: 10.18332/popmed/165393

Assessing community barriers exacerbating viral non-suppression in children living with HIV (CLHIV) in Mangochi, Malawi
Ndifanjani Namacha1, Henry Nsonga2, Clement Udedi3
1Malawi AIDS Counseling and Resource Organization (MACRO), Malawi, 2Malawi AIDS Counseling and Resource Organization (MACRO), Lilongwe, Malawi

Background: According to the National HIV/AIDS policy 2022-2027, Malawi achieved the 90-90-90 treatment targets in 2020 and is on course towards achieving 95:95:95 targets by 2025. This means viral suppression must be at 95% among HIV positive clients. Though remarkable progress has been made towards HIV mitigation and prevention clinically, community barriers have stalled progress by invoking poor ART adherence and/or treatment failure. The aim of this study was to identify and mitigate the root causes of high viral load in CLHIV in Mangochi district.

Methods: A cohort of 2146 CLHIV with an initial suppression rate of 73% (1566) was enrolled under a case management program and assessed at household level to establish the factors that affect their adherence to ART. Standard questionnaires were administered and analysis was done using DHS2.

Results: The assessment revealed factors such as parental neglect, misleading religious counsel, food shortages, long distances to health facilities and sharing of medication with other HIV positive clients as some of the underlying causes of viral non-suppression in CLHIV. The program responded with interventions such as case conferences, identification of treatment supporters, provision of nutritional support and transport support to needy clients, active viral load tracking, frequent household visits and virtual reminders via phone calls. As a result, an additional 148 CLHIV attained viral suppression to bring the total number of CLHIV with suppressed viral load to 1714 (80%) within six months.

Conclusions: Clinical support provided to CLHIV in health-facilities is insufficient to achieve viral suppression. A coordinated approach with community structures is required to ensure CLHIV receive a continuum of care in their communities to achieve viral suppression as part of epidemic control.

The emerging field of legal epidemiology and its global potential for better health
Scott Burris1,2
1UK Faculty of Public Health, American Public Health Association (APHA), Philadelphia, United States, 2Temple University, Philadelphia, United States

Background/Objectives: Legal Epidemiology (LE) is the scientific study of the health effects of laws and legal practices. In the past decade, it has gained a strong foothold in US public health, and is growing as a field globally. It builds on robust methods of policy surveillance to measure law, and a range of methods for quasi-experimental evaluation prevailing in epidemiology, economics and other social sciences. LE provides useful tools for interdisciplinary research, but also a vocabulary and specific competencies that public health professionals can use to increase their comfort and effectiveness in engaging legal factors in their work. The objective of this presentation is to demonstrate the range and utility of LE for global public health.

Methods: Review of prior research, existing competencies, available methods and tools, and effective applications of LE in policy development and advocacy. Results: LE research includes evaluation of: 1) the effects/side effects of "interventional" public health laws such as road safety or tobacco control laws; 2) the relationship of "infrastructural" health laws (establishing the powers and duties of health agencies) and health system effectiveness; and 3) "incidental" public health laws (the many laws that shape the social determinants of health, such as income support, anti-discrimination, tax, housing and education laws). All these areas are important, but law is a particularly potent and malleable tool for addressing social determinants. Clear method of legal measurement and the use of modern software and AI tools has improved "policy surveillance," the scientific tracking of laws of public health importance. The presentation will describe CityHealth.org, a successful intervention using legal data to promote the spread of healthy policies in the largest US cities.

Conclusions: Legal epidemiology provides a range of effective methods, tools and concepts for helping improve the use of law and legal change for better health globally.

Complementary medicine approaches among homeless individuals in Switzerland: Desirable? Relevant? A mixed-method descriptive study
Véronique Grazioli1, Laurent Hyvert2, Chantal Berna3, Hangartner Evelyne1, Luana Schaad1, Justin Nikles1, Taháé Anongbà4, Patrick Bodenmann1
1Center for Primary Care and Public Health, Unisanté, Switzerland, 2Lausanne University Hospital, Switzerland, 3Sleep-in, Lausanne, Switzerland, 4Center for primary care and public health, Unisanté, Switzerland

Background and Objectives: Despite their important health needs, homeless individuals (HomI) face barriers to healthcare, including lack of trust due to negative experiences. Whereas emerging Findings from the US suggest that complementary medicine (CM) may help engage this population into the healthcare system, there is a dearth of research exploring this thematic in Europe. This study aimed to explore CM interests and needs among HomI in Switzerland.

Methods: Participants (N= 123) were HomI in French-speaking Switzerland who completed a questionnaire assessing interests in 17 CM approaches. A subset of participants (n= 19) and 13 professionals (healthcare and social workers, shelter watchers) participated in semi-structured interviews exploring their perceptions of CM. Descriptive statistics and conventional content analysis were used to analyze quantitative and qualitative data.

Results: The top 5 most endorsed approaches included osteopathy, (61.5% interested), therapeutic massage (59.2%), nutritional supplements (57.1%)
music therapy (50.8%) and acupuncture (49.1%). Three themes emerged from the qualitative analysis: 1) CM meets Homl’ interests and might help address several of their health needs; 2) Importance to follow specific rules to engage Homl in CM interventions; 3) Setting priorities (CM interventions vs. more basic needs). According to both professionals and Homl, CM interventions, such as music therapy, osteopathy or animal therapy might lead to improvements in self-confidence, well-being, social isolation and chronic pain. All participants recommended offering CM interventions in existing structures and involving professionals to promote them. Finally, a few participants questioned the relevance to develop a CM offer, highlighting more urgent social needs to be fulfilled first.

Conclusions: Main findings suggest that developing CM approaches, such as osteopathy or music therapy might meet Homl interests and health needs. Using a community-based participatory paradigm would ensure following the recommendations to develop the offer within existing structures and involve professionals to promote the intervention. Popul. Med. 2023;5(Supplement):A771 DOI: 10.18332/pommed/165470

From evidence to practice: implementing effective nutrition and high-quality early childhood education in low resource settings, the successful case of the Guatemala city municipal nurseries Ana Palacios1, Erik Parker2, Lisa Villanueva3, Matthew Flynn4, Helen Bland5, Stephanie Dickerson6, Lizavana Jurakic7, Joseph Telfair1, Giulio Barocco1,2, Eloenora Croci3, Paolo Bogoni4, Antonella Calabretti4, Helen Bland5, dziyana Nazaruk1,2, Joseph Telfair1, Giulio Barocco1,2, Eloenora Croci3, Paolo Bogoni4, Antonella Calabretti4, Helen Bland5, Dziyana Nazaruk1,2, Joseph Telfair1, Giulio Barocco1,2, Eloenora Croci3, Paolo Bogoni4, Antonella Calabretti4, Helen Bland5

1Georgia Southern University, United States, 2Indiana University Bloomington, United States, 3The Mathile Institute for the Advancement of Human Nutrition, Guatemala

Background: In Guatemala, the IV National Maternal and Child Health Survey 2014-2015 indicated that about one every two children < 5 years-of-age are stunted (length-height-for-age z-scores<-2). Childcare programs offer a cost-effective opportunity to deliver early education and learning opportunities, health, and nutrition services in a safe environment, especially for children in poverty or suffering from neglect. The purpose of this study was to compare growth outcomes, math performance, fluid intelligence, and receptive vocabulary between 8-year-old children in second grade that attended the Guatemala City Municipal Nurseries (GCMM) and received micronutrient supplements vs. sex, grade, and age-matched children (controls) that did not attend the municipal preschools.

Methods: A cross-sectional design nested in a retrospective cohort between 2015-2019 was performed. Both GCMM children and control participants were asked to complete a math-, a receptive language- and a fluid intelligence test. Primary caregivers completed a sociodemographic survey. General and generalized linear mixed effect models were constructed to compare children that attended the GCMM vs. controls prior to elementary school. Models were adjusted by maternal education, sex, asset score, and school, data collection year, and case/control pair were included in the models as random effects.

Results: Children that attended the GCMM exhibited greater math and fluid intelligence scores relative to controls in adjusted models [ß = 6.48; 95% CI (2.35–10.61)] and [ß = 1.20; 95% CI (0.12–2.29)], respectively. Lower odds of intelligence scores relative to controls in adjusted models [ß = 6.48; 95% CI (0.09–8.9)]. Conclusions: Our findings support the effectiveness of integrating high-quality early nutrition and education via childcare programs serving low-resourced populations, in child’s nutritional status and academic performance. This model may be scalable and prove effective in improving children wellbeing from impoverished backgrounds.

Rapid methodsto monitor nutrients in sustainable healthy diets of collective catering systems Giulio Barocco1,2, Eleonora Croci1, Paolo Bogni1, Antonella Calabretti3, Francesco Bucci1, Tiziana Longo1, Andrea Pernarcio1, Arianna Marsi1, Sofia Scalisi1, Jacopo Sepe1, Gabriella Guzzo1

1The Local Health Agency of Trieste, Trieste, Italy, 2Faculty of Medicine, Trieste University, Trieste, Italy, 3Faculty of Medicine, The Local Health Agency of Trieste integrated with Trieste University, Italy, 4Faculty of Medicine, The Local Health Agency of Trieste Integrated with Trieste University, Italy, 5Faculty of Medicine, The Local Health Agency of Trieste integrated with Trieste University, Italy, 6Faculty of Medicine, The Local Health Agency of Trieste integrated with Trieste University, Italy, 7Faculty of Medicine, The Local Health Agency of Trieste integrated with Trieste University, Italy

Background: The WHO and FAO in the “Sustainable Healthy Diet guiding principles” (SHD) underline synergies among foods, nutrients present in dietary patterns and their bioavailability, degree of food processing, and subsequent health impact, even on non communicable disease, reported in target 3.4.1 of SDGs. In Italy almost one in 10 people eat a meal in collective catering (CC) every day. In accordance with SHD, the Italian Ministry of Health (MH) in the national guidelines for CC indicate activating procedures for the conservation of nutritional qualities (NQ) of micronutrients and bioactive substances. The central purchasing bodies of the Region of Friuli Venezia Giulia have applied these criteria, introducing the process of critical control points of nutrient analysis (NACCP) in the Public Procurement for the school catering of 26 municipalities and for all 18 regional hospital CC with more than 3 million meals per year served. The aim of the project was to develop rapid and cheap methods for monitoring the NQ of meals by applying the NACCP process.

Methods: 80 samples of vegetables, meat and fish with different degrees of processing were taken from the CC and analysed both with chemical techniques and with optical rapid techniques (600 analyses).

Results: The samples were subjected to conventional analyses to determine the oxidation state and the content of characterizing molecules such as polyphenols, histamine, and total compounds of Maillard. The same samples were then analyzed by color measurements. The results showed a good correlation between the two analytical systems, in particular the color measurements and the Maillard compounds and the color measurements and the oxidation state.

Conclusions: Project findings can be applied in the NACCP process to rapidly cost-effectively monitor the nutritional quality of CC meals, and adhere to WHO and FAO the SHD guiding principles and MH guidelines for CC.

Popul. Med. 2023;5(Supplement):A773 DOI: 10.18332/pommed/165580

Unemployment status subsequent to cancer diagnosis and therapies: a systematic review and meta-analysis Martina Chimenti1, Giustino Morlino1, Martina Chimenti1, Giustino Morlino1, Leonardo Palombi1, Leonardo Gialloreti1, Francesco Torino1

1Roma Tor Vergata, Italy

Background and Objective: In the years to come, cancer cases are expected to increase by 60%; for this reason, and due to improved treatments, the number of cancer survivors will increase considerably. Therefore, it is important to assess the social impact cancer and treatments will have on these individuals, especially those of working age. The purpose of our study is to examine whether cancer and subsequent treatments are associated with job loss or change in employment status.

Methods: Eight prospective studies were included in the systematic review and meta-analysis, with a total of 11,495 individuals aged 18-65 years, analyzing treatment regimens and psychophysical and social status in a post-cancer follow-up of at least 2 years. In the meta-analysis, a comparison was made between recovered unemployed cases and cases from a standard reference population. The Results are summarized graphically using forest plot.

Results: The study found that cancer and subsequent treatment are risk factors for unemployment with an overall Relative Risk of 7.24 (In RR: 1.98, 95% CI: 1.32 - 2.63). Individuals undergoing chemotherapy and/or radiation treatment for those with brain and colorectal cancers are more likely to develop disabilities that negatively affect the risk of unemployment. Finally, variables such as: low educational level, female sex, older age, overweight and obesity before the start of therapy are associated with a higher risk of unemployment.

Conclusions: In the future, it is necessary for people with cancer to have greater access to specific health, social welfare and employment support programs. In addition, it is desirable that they become increasingly involved in the choice of therapeutic treatment.

Popul. Med. 2023;5(Supplement):A774 DOI: 10.18332/pommed/165591

Observed neighborhood physical disorder and health behaviors in a large urban area Jesse Plascak1, Tatyana Desire-Brisard2, Darren Mays3, Brittny Keller-Hamilton1, Andrew Rundlie1, Emma Rose1, Electra Paskett4, Stephen Mooney4

1College of Medicine, The Ohio State University, United States, 2School of Public Health, Rutgers University, United States, 3College of Medicine, The Ohio State University, United States, 4Mailman School of Public Health, Columbia University, United States, 5Brigham Young University, United States, 6College of Medicine, The Ohio State University, United States, 7School of Public Health, University of Washington, United States

Neighborhood physical disorder is an indicator of urban disinvestment that may act as a psychosocial stressor. This study tested associations between observed neighborhood physical disorder and health behaviors among a large population-based sample. Individual-level data of this cross-sectional study were from adult
Maintaining personal health in a complex environment: how slum dwellers in Nigeria use lay consultation networks to make personal treatment decisions

Chinwe Onuegbu1
1Division of Health Sciences, Warwick Medical School, University of Warwick, United Kingdom

Background and Objective: Poor healthcare in urban slums in developing regions represents a complex humanitarian crisis requiring innovative and bottom-up solutions. How slum dwellers manage their health despite huge health risks and poor healthcare access, by utilising their social connections and social capital, is poorly understood. Drawing on social network theory, this study examined how slum dwellers in Nigeria used their Lay Consultation Networks (informal and naturally occurring networks with whom people discuss illness symptoms and health problems) to make treatment decisions.

Method: A mixed-method approach was adopted. Surveys (n=480) and semi-structured interviews (n=30) were conducted among working-age adults in two slums in Ibadan (large south-Western city), Oyo state, Nigeria. A public reference group comprising community members and researchers at the University of Ibadan was constituted to guide the study.

Results: Most participants consulted 1 to 3 informal network members during illness. Those consulting non-family members were significantly more likely to use alternative medicine than formal care. Use of online-based networks was scarce mainly due to poor digital literacy, and lack of digital devices. Network members shared advice about prescriptions and treatments (learnt from others or through their own experiences) with ill persons, some useful and some not. Limited neighborhood trust, busy work schedules, discrimination, and stigmatization of certain groups contributed to shaping who participants could talk to. Participants displayed a strong sense of agency when implementing advice or support from others.

Conclusions: Lay consultation networks can be an integral part of the overall health system. They can be incorporated into health policies and programmes to increase coverage and effectiveness of health interventions in slums and disadvantaged communities in low-and-middle-income countries.

Household food security and household dietary diversity in rural Bangladesh during the COVID-19 pandemic - baseline results from a community-based cluster randomized controlled trial

Tanvir Huda1, Michael Dibley1, Tazeen Tahsina2, Afrin Ibqai1, Mohammad Hasan1
1Sydney School of Public Health, The University of Sydney, Australia, 2International Centre for Diarrhoeal Disease Research, Bangladesh

Background: There has been a limited decline in undernutrition rates in Bangladesh. Household food security is one of the major factors. Despite Bangladeshs remarkable progress in agricultural production, household food insecurity persists, especially in rural areas. This study examined household food insecurity and household dietary diversity in the rural areas of northwest Bangladesh during the COVID-19 Pandemic.

Methods: The study used data from baseline assessment of a large cluster randomized trial on social protection and child undernutrition. The data were collected from December 2020 to October 2021 from 2756 households. The Household Food Insecurity experience scale (FAO 2018) was used to assess household food insecurity, while the household dietary diversity was measured by the household dietary diversity score (FAO 2006).

Results: Nearly 35% of all households were moderately or severely food insecure. The prevalence of food insecurity among land-rich farmers or professionals was much lower (26%) than among families of other occupations (42%). The prevalence of food insecurity among families with educated women was almost half (22%) compared to families with uneducated women (45%). The mean HDDS was six food groups indicating that families had, on average, access to 6 out of twelve food groups daily. The dominant consumed food groups were cereals (90%), fish (75%), and vegetables (79%), while the lesser consumed food groups were eggs (28%), legumes (22%), meat (25%), milk (38%). We did not find any significant seasonal variation in household food security and dietary diversity.

Discussion: Our findings showed that the percentage of households experiencing moderate to severe food insecurity during the pandemic was more significant than the pre-pandemic national average (15%). Most families relied on less expensive food choices during the pandemic period. The seasonal poverty period (Monga in the local language) did not further affect food security and dietary diversity.

A posteriori derived dietary patterns of adults in Italy: results from the third Italian National Food Consumption Survey, INRAN-SCAI 2005-06

Nicolò Scarsi1, Nicolò Scarsi2, Angelo Pezzullo3, Cosimo Savoia4, Roberta Pastorino5, Gian Raspolini5, Stefania Boccia1
1Section of Hygiene, Department of Life Sciences and Public Health, Università Cattolica del Sacro Cuore, Rome, Italy

A large body of literature showed the importance of dietary patterns (DPs) analysis in nutritional epidemiology. The objective of this research was to derive and characterize adults dietary patterns in a large Italian population-based cohort and to assess individuals’ diet adherence with z-scores. Participants to the third Italian National Food Consumption Survey (INRAN-SCAI 2005-06) were included. We classified all food items (N = 878) into 24 pre-defined food groups according to a modified version of the updated food classification system FoodEx2. Dietary patterns were obtained through principal component analysis, after adjusting log-transformed input variables, without minimum values, using the residual method. Relying on data from 2831 subjects (median age 47, IQR 35-60), five principal components (PC) were retained, explaining 33.6% of the overall variance. PC1 was similar to the high-fat diet characterized by positive loadings for vegetables, starchy roots, eggs products, fat and oils, and low amount of alcoholic beverages. PC2 was a picture of a carnivorous eating behavior, positively charged by processed meat, offals, other meats, juices, special nutritional, composite food, and snacks. PC3 was representative of a health conscious, positively loaded by vegetables, fruits and water, negatively associated with the consumption of pork meat and alcoholic beverages. PC4 showed similarities with a vegetarian diet, positively loaded by grain products, vegetables, herbs, and spices. The last PC represents an unhealthy dietary pattern, positively charged by sugar and confectionery, non-alcoholic beverages and negatively correlated with vegetable consumption. According to z-scores, 69% of our cohort showed high DPs adherence. These findings are valuable for understanding the dietary habits of adults in Italy, to orient public health policies and promote healthier food behaviors in the future.

DOI: 10.18332/popmed/165711
of health-relevant information: Health Care (HC), Disease Prevention (DP), and Health Promotion (HP), which are fundamental for improving individual and population health.

Methods: In 2021, a national survey of a representative sample of the Italian population aged 18+ years (N=3,500) was conducted in the framework of the WHO M-POHL (Measuring Population and Organizational Health Literacy) network.

The validated HL questionnaire at 12 items (HLS-12) included general HL, sociodemographic characteristics, risk factors, lifestyles sections. For each of the 3 HL domains, 4 items were analysed. For each HL item, a 4-point Likert scale was applied: very easy, easy, difficult, very difficult. For the 3 HL domains (healthcare, disease prevention, health promotion), the percentage of very easy+easy answers was used as a score and classified in 5 groups (0%, 25%, 50%, 75%, 100%).

Results: For all the 3 HL domains, the majority of participants were in the 75% and 100% groups (63.1% for HC, 56.6% for DP, 70.7% for HP). They were mostly in the 18-29 age group (72.3% for HC, 59.9% for DP, 72.7% for HP), women for HP only (72.5%), with a high educational level (66.6% for HC, 59.0% for DP, 72.4% for HP), living in north Western regions (65.1% for HC and 58.4% for DP) and central Italy (74.2% for HP).

Conclusions: The results on HL domains of the general HL highlighted the need to improve HL especially in adult and elderly population, in those with a lower level of education, and in the Southern and Central areas of the country. Better HL level could improve the general population’s ability to manage health information regarding care, prevention, and promotion of health.

The relationship between blood pressure variability and cognitive function
Yang Zhao1, Lili Song1

1The George Institute for Global Health, Beijing, China

Background and Objective: It has been well-established that long-term blood pressure variability (BPV) plays an important role in the progression of cerebrovascular vascular damage and the incidence of cardiovascular diseases. Knowledge about the association between long-term BPV and cognitive performance was scarce and ambiguous. This study aims to systematically examine the potential association between BPV and the trajectory of cognitive decline among Chinese adults, by using nationally representative population-based data from an 8-year prospective cohort.

Methods: We used four waves (2011-2018) of the China Health and Retirement Longitudinal Study, including 5696 participants aged ≥45 years. BPV was measured using the within-individual standard deviation (SD) of mean systolic blood pressure (SBP) obtained from three waves visits, and the coefficient of variation (CV). The cognitive function was measured as the total score of episodic memory and mental status, with a higher cognition score indicating superior cognitive functions. Multivariable linear regression models were applied.

Results: The mean value of SBP, mean SD of SBP and mean CV of SBP was 128.05 mm Hg and was 10.28 and 0.08, respectively. Both the SD (coefficient= -0.092, 95% CI= -0.144, -0.040) and CV of SBP variability (coefficient= -0.085, 95% CI= -0.137, -0.034) significantly decreased the risk of cognitive function. Subgroup analyses revealed significant relationships in both females and males. Further high-quality studies are warranted to evaluate and confirm the benefit of BPV-lowering strategies for preventing cognitive impairment.

Disentangling the multigenerational transmissions of socioeconomic disadvantages and mental health problems by gender and across lineages: findings from the Stockholm Birth cohort multigenerational study
Baojing Li1, Stéphane Cullati1, Emily Finne1, Melanie Boeckmann1, Julia Zielke1

1Stockholm University, Sweden

Background and objective: There is a paucity of research examining the patterning of socioeconomic disadvantages and mental health problems across multiple generations. The significance of research on multigenerational processes is based on a concern with how socioeconomic, mental health, and gender inequalities evolve over a longer period of time. The current study therefore aimed to investigate the interconnected transmissions of socioeconomic disadvantages and mental health problems from grandparents to grandchildren through the parents, as well as the extent to which these transmissions differ according to lineage (i.e., through matrilineal/matrilineal descent) and grandchild gender.

Methods: Drawing on the Stockholm Birth Cohort Multigenerational Study, the sample included 21,416 unique lineages by grandchild gender centered around cohort members born in 1953 (parental generation) as well as their children (grandchild generation) and their parents (grandparental generation). Based on local and national register data, socioeconomic disadvantages were operationalized as low income, and mental health problems as psychiatric diagnoses. A series of path models based on structural equation modelling were applied to estimate the associations between low income and psychiatric disorders across generations and for each lineage-gender combination.

Results: We found a multigenerational transmission of low income through the patriline to grandchildren. Psychiatric disorders were transmitted through both the patriline and matriline, but only to grandsons. The patriline-grandson transmission of psychiatric disorder partially operated via low income of the fathers. Furthermore, grandparents’ psychiatric disorders influenced their grandchildren’s income.

Conclusions: We conclude that there is evidence of transmissions of socioeconomic disadvantages and mental health problems across three generations, although these transmissions differ by lineage and grandchild gender. Our findings further highlight that grandparents’ mental health problems could cast a long shadow on their children’s and grandchildren’s socioeconomic outcomes, and that socioeconomic disadvantages in the intermediate generation may play an important role for the multigenerational transmission of mental health problems.

Educational trajectories and inequalities in longevity: a comparison across 14 European countries
Cornelia Wagner1, Stéphane Cullati1, Stefan Sieber1, Tim Huhts2, Arnaud Chiolero1, Cristian Carmeli1

1University of Fribourg Switzerland, 2University of Lausanne Switzerland, 3Maastricht University Netherlands

Background: While educational gradients in longevity have been observed consistently in adult Europeans, these inequalities have been understudied within the context of family- and country-level influences. We utilized population-based multi-generational multi-country data to assess the role (1) of parental and individual education in shaping intergenerational inequalities in longevity, and (2) of country-level social net expenditure in mitigating these inequalities.

Methods: We analyzed data from 52,271 adults born before 1965 who participated in the Survey of Health, Ageing and Retirement in Europe, comprising 14 countries. Mortality from all causes (outcome) was ascertained between 2013 and 2020. Educational trajectories (exposure) were High-High (reference), Low-High, Low-High, and Low-Low, corresponding to the sequence of parental-individual educational attainment. We quantified inequalities as years of life lost (YLL) between the ages of 50 and 90 estimated via differences in the area under standardized survival curves. We assessed the association between country-level social net expenditure and YLL via meta-regression.

Results: Inequalities in longevity due to educational trajectories were associated with low individual education regardless of parental education. Compared to High-High, having Low-High and Low-Low led to 2.2 (95% confidence intervals: 1.0 to 3.5) and 2.9 (2.2 to 3.6) YLL, while YLL for Low-High were 0.4 (0.2 to 0.9). A 1% increase in social net expenditure led to an increase of 0.01 (-0.3 to 0.3) YLL for Low-High, 0.007 (-0.1 to 0.2) YLL for Low-High, and a decrease of 0.02 (0.1 to 0.2) YLL for Low-Low.

Conclusion: In European countries, individual education could be the main driver of inequalities in longevity for adults older than 50 years of age and born before 1965. Further, higher social expenditure is not associated with smaller educational inequalities in longevity.

Masculinities in focus: how can the consideration of gender roles pave the way for gender-transformative healthcare services and improve health for all?
Céline Miani1, Sudeepa Khanal-Bhattarai1, Stephanie Batram-Zantvoort1, Jan Morawe1, Emily Finne1, Melanie Boeckmann1, Julia Zielke1

1Bielefeld University Germany

Background and objective: How are men addressed by healthcare services? How is the role of men understood in the construction of gender-equitable health? Through a mixed-methods project on masculinities and health, we investigated the gender-transformative potential of reflecting on and taking into account gender roles in the design and implementation of healthcare services.

Methods: We conducted a systematic review on smoking cessations interventions
for expecting and new parents, narrative interviews on the construction of masculinities in relation to family planning and contraception decisions, and a scoping review on masculinities and health in gender-transformative interventions.

Results: With regard to smoking cessation (n=9 studies), we found that current healthcare structures tend not to engage specifically with fathers, and that men are forced into rather classic and passive gender roles that leave little room for change. Yet, in the interviews (n=15), we found that men consider their role in reproductive health, contraception and family planning as complex and would like to take on more responsibility, be more proactive and engaged. This finding echoes the results of the scoping review (n=24 studies), which shows that a more critical approach to masculinity is possible and can lead to concrete and measurable improvements in health outcomes, especially in the fields of domestic violence, AIDS/HIV, sexual health and general well-being.

Conclusion: Not taking into account masculinities in the design and implementation of healthcare services appears as a missed opportunity that reinforces stereotypes and traditional gender roles. Although transfer from theory to practice on the one hand, and from lived experiences to interventions on the other hand, remains challenging, men themselves and a handful of promising and innovative approaches point toward the potential of gender-transformative healthcare services to improve health for all.

Monitoring health in the Brazilian municipalities for the Sustainable Development Goals (SDGs)
Rômulo Paes-Sousa, Fabrício Silveira, Gabriela Silva
1 Fiocruz Minas, Brazil

Background and Objectives: This study proposes a summary index for monitoring the health-related SDG's indicators in Brazilian municipalities, enabling both the interiorization of the 2030 Agenda in the territory, reducing inequalities in the space, and its effective adoption in policymaking.

Methods: The ecological study comprises 23 SDGs health indicators for the 5570 municipalities of the country analyzed in the period between 2015-2021. The empirical Bayesian rate was adopted to smooth each data series due to the spatial effect previously detected. The annual municipal index and 7 thematic subindexes (maternal health; infant health; non-communicable diseases; infectious diseases; injuries/violence; environmental; coverage) were standardized from 0 (worst performance) to 100 (best performance). Each are weighted by symmetrical regional-level indexes. The municipalities are ranked according to the level of sophistication of the local health equipment.

Results: Four main regional health profiles were identified in the country: (i) the north region is characterized by low technological complexity and huge gaps in most health topics; (ii) the Northeast presents the highest spatial disparities in the country; (iii) the south the highest thematic disparities, with the country’s best profile on maternal and child health themes and the worst in some infectious diseases and topics of violence and injuries; finally, (IV) the Southeast and Midwest regions present the best overall infrastructure of health in the country, which reflects on the index.

Conclusion: The evaluation of the health SDGs at disaggregated levels requires the recognition of the spatial dependence of health phenomena. Indeed, both health and disease seem less local than a regional phenomenon in the country’s territory. By enabling the continuous monitoring of the indicators over time, the methodology developed opens new paths for the achievement of the SDGs.

Post-pandemic health inequalities: global estimates of the evolution of the health-related SDG indicators
Rômulo Paes-Sousa, Vanessa Miranda, Fabrício Silveira
1 Fiocruz Minas Brazil, 2 Fiocruz Minas / UFMG, Brazil

Background and objective: The world has entered a critical period for accelerating the responses to the main global challenges expressed in the Sustainable Development Goals (SDGs), from the elimination of poverty and hunger to improving health to tackling climate change. Many of the previous efforts, however, have been hampered by the direct and indirect impact of the COVID-19 pandemic.

Against this backdrop, this study estimates the impact of the COVID-19 pandemic on the health-related indicators, making it possible to size the countermeasures necessary to keep the commitments of the 2030 Agenda.

Methods: We explore the evolution of 40 health-related SDGs indicators, covering seven major health themes, using the information available for 185 countries in the period between 2000 and 2019. A global factorial counterfactual evolution curve is estimated by using panel data models. The curves allow the extrapolation of the impact of revisions of the expected growth of the Gross National Product per capita on the potential evolution of each indicator for all countries.

Results: The disproportionately greater economic losses in the poorest countries may increase global health inequalities in the aftermath of the COVID-19 pandemic. Although the average expected loss in the evolution of the health-related indicators is around 5%, in some countries the damage is five times worse, amplified by the indirect impact of economic losses on maternal and children health indicators. At the same time, the greater fiscal room to accommodate increases of expenditures in the developed world should also contribute to increase global disparities.

Conclusions: The study’s findings reveal the importance of incorporating the fight against health inequalities in the global development agendas, which can be oriented by the SDGs.

"We’ve been portrayed as commodities who because of their age are a bit of a nuisance": A qualitative analysis of older people’s socio-ecological determinants of health and well-being during the COVID-19 pandemic in Ireland
Viveka Guzman, Frank Doyle, Ronan Foley, Penny Wilson, Noeline Crowe, Peter Craven, Albie Smith, Gerry Hegarty, Maria Perti
1 Royal College of Surgeons in Ireland, Beaux Lane House, Mercer Street Lower, Dublin, Ireland, 2 Maynooth University, Maynooth, Co. Kildare, WE23

Background: Evidence indicates that older people with biological and social vulnerabilities are at high risk of short- and long-term consequences related to the COVID-19 pandemic. However, studies have also highlighted that the crisis may present opportunities for personal growth if individuals are met with appropriate resources and support. This study’s aim was to explore the perceptions of older people regarding how individual, social, and environmental factors supported or hindered their well-being and health during COVID-19.

Methods: We analyzed data collected between April-May and October-November 2021 from the Well-being, Interventions, and Support during Epidemics (WISE) study, a qualitative investigation of community-dwellers based in Ireland and aged 65 years or over. Participants (n=57) completed written submissions, narrative interviews, and/or go-along interviews detailing their experiences during the pandemic. Framework analysis was carried out in NVivo 12 to identify determinants, linkages, and explanations within Bronfenbrenner’s socio-ecological model.

Results: Mean age of participants was 74.9 years, 57% were female, 45% lived alone, and 88% lived in urban or suburban areas. Our findings highlight the heterogeneous effect of COVID-19 across diverse older individuals who held distinct concerns, capabilities, and roles in society before and during the pandemic. Contextual characteristics such as housing, access to nature and neighbourhood social and built environments had an influential role in participants’ well-being and supports. We identified mixed views regarding public health restrictions, but a consensus emerged questioning the suitability of one-size-fits-all approaches based on chronological age. Moreover, respondents suggested that some negative consequences could have been avoided by collaborating with older people and with the provision of clearer communications.

Conclusion: Our analysis identified interdependencies between individual characteristics and socio-ecological factors that influenced participants’ development of adaptive strategies, coping mechanisms, and availability of supports. These represent areas of opportunity for the development of age-friendly interventions during and beyond public health crises.

Food choices and nutrient intake of workers in the hospital canton of San Daniele del Friuli, Italy
Diana Menis, Federica Fiori, Daniela Zago, Peter Cautero, Lucia Lesa, Alessandro Conté, Laura Brunelli, Maria Parpinelli
1 Department of Medicine, University of Udine, Udine, Italy, 2 Azienda Sanitaria Universitaria Friuli Centrale, Italy, 3 Medical Directorate, University of Udine, Hospital of San Daniele-Tolmezzo, Azienda Sanitaria Universitaria Friuli Centrale, San Daniele del Friuli, Udine, Italy, 4 Department of Medicine, Azienda Sanitaria Universitaria Friuli Centrale, University of Udine, Italy, 5 Accreditation, Quality, and Clinical Risk Unit, Azienda Sanitaria Universitaria Friuli Centrale, Udine, Italy

Background and Objective: Recently, the awareness of the role that food play in human and planetary health has grown. Although the nutritional and environmental benefits of plant-based diets are widely recognized, little is known about the availability of healthy foods in workplaces. Our aim was to evaluate food choices...
and nutritional composition of the meals consumed in a hospital canteen in Italy. Methods: An observational study was conducted in San Daniele del Friuli hospital on 5 working days in September 2022; photos of lunch trays of all workers who agreed to participate were taken before and after the meal. Energy and nutrient intakes were assessed after visual estimation of wastes using the Italian food composition database for epidemiological studies (bda-ieo.it). Recipes and portions were provided by canteen staff. Intakes were compared to the Italian Dietary Reference Values (DRVs).

Results: 480 photos of 240 meals were analyzed. Overall, the lunch met the DRVs. The meals contained a median of 642 (511–826) kcal (men: 781 kcal; women: 607 kcal), of which 18 (15–23)%E came from proteins, 34 (27–39)%E from fats, 44 (37–50)%E from carbohydrates, and 2 (2–4)%E from fiber. About half of the participants consumed high fats and low carbohydrates. Vegetarian meals (N=30; 13%) contained high amount of fats (41; 37–48)%E and saturated fatty acids (10; 8–17)%E, as meal was usually replaced with cheese. Vegan options (N=15; 6%) consisted mainly of soups, rice, vegetables, and fruits and were low in energy (599; 449–645 kcal) and protein (13; 9–15 g/tray vs. 34; 25–42 g/tray in omnivorous meals).

Conclusion: We observed inadequate nutrient composition in vegetarian and vegan meals. Dietary intervention programs are needed to promote healthier behaviors. However, poor food choices may be partially attributed to the lack of variety of vegetarian/vegan alternatives offered in the canteen.

Access to COVID-19 prevention, diagnosis and care for migrants and ethnic minorities in the WHO European Region: a systematic review
Chiara De Marchi,1 Arianna Bellini,1 Angela Gatta,1 Maria Tosti,1 Franca D’Angelo1, Silvia Declich1, Elena Mazzalai2,1 Salvatore Scarso1,1 Giulia Marchetti1, Caterina Ferrari1,1 Francesco Mondera,1 Giancosimo Mancini1,1 Igor Aloise1,1 Marise Sabato1,1 Leonardo Siena1,1 Dara Giannini1,1 Federica Turatto1,1 Maurizio Marceca1,1 Davide Rasella2,1, Iracema Lua1,1 Andrea Silva1,1 Priscila Pinto1,1 Laio Magno2,3, James Macinko1,3, Ronaldo Coelho1,3, Louis Souza4,5, Inés Durado6,1,1 1Institute of Collective Health at the Federal University of Bahia (ISC/UFBA); Center for Integration of Data and Knowledge for Health (CIDACS), Gonçalo Moniz Institute, Oswaldo Cruz Foundation, Brazil, 2ISGlobal, Hospital Clinic - Universitat de Barcelona, Barcel, Spain, 3Department of Life Sciences, ICS/UFBA, Brazil, 6Department of Health Policy and Management, University of California, Los Angeles, USA, 5Department of Chronic Conditions Diseases and Sexually Transmitted Infections, Ministry of Health, Brazil, 4Institute of Collective Health at the Federal University of Bahia (ISC/UFBA), Brazil

Background & Objective: The COVID-19 pandemic has had a major impact on Migrants and Ethnic Minorities (MEMs) population in terms of risk of SARS-CoV-2 infection, morbidity, and mortality. The COVID-19 pandemic was defined as a syndemic for its interaction with pre-existing socio-economic determinants of health, widening health inequalities and worsening health outcomes. The aim of this study is to investigate inequalities in access to healthcare for COVID-19 in the WHO European Region compared to the general population. Migrants represent almost 10% of the population living in the WHO European Region, so the issue is of particular interest to this region.

Methods: A systematic review was conducted, collecting studies on MEMs’ access to healthcare for COVID-19 in the WHO European Region in terms of access to prevention, diagnosis, and care, published from January 2020 to February 2022, on the following databases: Medline, Embase, Scisearch, Esiobase.

Results: Of the 19 studies identified, 11 were about vaccine hesitancy, 5 about vaccine execution, 2 on access to COVID-19 testing and 1 was about access to information on COVID-19. Around 65% of the studies were conducted in UK. Overall, MEMs population faced higher barriers to the access to vaccination, turned out to be more vaccine hesitant and faced more difficulties in access to COVID-19 information and testing.

Conclusion: These findings highlight the inequalities MEMs population faced accessing healthcare services for COVID-19. Social determinants of health are one of the main factors involved in the genesis of health inequalities: a framework of structural racism leading to lower trust in government choices, together with a disadvantaged socio-economic status, determined inequalities in accessing healthcare services and health information. These findings underline the need for policymakers to prioritize strategies for building trust and engage ethnic minorities, and to overcome the socio-economic barriers when designing health promotion programs.

Evaluating the intersectionality of social determinants of health on AIDS using a cohort of 28.3 million Brazilians
Davide Rasella1,2, Iracema Lua1, Andrea Silva1, Priscila Pinto1, Laio Magno2, James Macinko1, Ronaldo Coelho1, Louis Souza1, Inés Durado6,1,1 1Institute of Collective Health at the Federal University of Bahia (ISC/UFBA); 2Center for Integration of Data and Knowledge for Health (CIDACS), Gonçalo Moniz Institute, Oswaldo Cruz Foundation, Brazil, 3ISGlobal, Hospital Clinic - Universitat de Barcelona, Barcel, Spain, 4Department of Life Sciences, ICS/UFBA, Brazil, 5Department of Health Policy and Management, University of California, Los Angeles, USA, 6Department of Chronic Conditions Diseases and Sexually Transmitted Infections, Ministry of Health, Brazil

Background and Objective: Societies that live with socio-structural inequalities and health inequities need to better understand these processes. In that regard intersectionality theory becomes fundamental to public health. The scientific literature on HIV/AIDS presents associations and isolated effects of some social determinants of health (SDH), but the intersection between them is still poorly addressed. Thus, our objective was to evaluate the intersectional effects of SDH on AIDS outcomes: incidence, mortality, and case-fatality rates.

Methods: A retrospective cohort of 28.3 million individuals was evaluated over a 9-year period (2007-2015). The multivariable Poisson regression were estimated using robust standard errors clustered on the municipality of residence, for each outcome. The intersections and combined effects were evaluate from the dummy variables of interaction for the highest exposure categories of the variables race/ skin color, education, and wealth. Interactions additive was estimated from the index of synergy (S).

Results: The risk of getting sick and dying from AIDS was higher in the intersection groups of the 3 highest exposure categories: black people, lower wealth, and lower education, had the highest AIDS incidence (34.33/100,000py; RRa:3.07, 95%CI:2.68-3.52) mortality (14.10/100,000py; RRa:5.01, 95%CI:4.04-6.22) and case-fatality rates (7.53/100py; RRa:1.62; 95%CI:1.18-2.21). This intersection represents a positive additive interaction for the risk of getting sick (S:1.60) and dying (S:2.40) from AIDS. Among people living with AIDS the synergistic effect for case-fatality was even greater (S:2.95).

Conclusion: The intersections of identities that mark socio-structural inequalities, amplify the risks of getting sick and dying from AIDS, exceeding the sum of the risks of each exposure separately. The skin color stands out, since the (sub) groups with the combination of black color were those with the worst outcomes. Since this is an unchangeable characteristic, it highlights the need for social
timings as the most important area for regulation, to consider the broader factors within marketing that may normalise gambling for young people.

The impact of celebrity and influencer endorsement on the gambling attitudes of Australian young people

Samantha Thomas1, Hannah Pitt1, Simon McCarthy1
'Deakin University, Australia

Background: Research shows that young people perceive celebrity endorsement as having an influential impact on the appeal of gambling for young people. While regulations have focused on limiting the times gambling marketing can be shown, very little consideration has been given to the overall appeal strategies used within advertising, and how these might reach young people via different media platforms. This study aimed to understand young people's perceptions about the use of celebrity and influencer endorsement in gambling promotions, the impact of these strategies, and young people's perceptions of the policy mechanisms that could be used to respond.

Methods: 21 focus groups were conducted using photo elicitation techniques. Participants were asked questions relating to celebrity and influencer endorsements of gambling advertising, what they could recall about this marketing, and their attitudes towards these forms of promotion. Data was analysed using reflexive thematic analysis.

Results: Young people recalled seeing gambling marketing that featured celebrities and influencers in a range of media spaces. They perceived that both celebrities and influencers would have an impact on the normalisation of gambling because young people look up to them and would be prompted to want to try the brand advertised as a way of showing support. However, young people were also critical of such endorsements. Banning celebrities and influencers from gambling ads was supported by most young people in this study.

Conclusion: This research provides an in-depth understanding of young people's attitudes towards celebrity and influencer endorsements of gambling. This extends previous literature that shows celebrity endorsements as particularly influential for young people, and suggests that influencers are effective in normalising gambling for young people. Policy makers should move beyond thinking about

Results: 231 HAZs were identified (111 between provincial capitals and 120 in inner areas) with an average population of 22,000 inhabitants.

Conclusion: This tool can contribute to the Evidence-Based-Policy-Making process, promoting health service development and improving effectiveness of the Sicilian Health System in reducing inequalities.

What does the world think about working or not? World Values Study 2017-2022
Ana Perez Arreddondo1, Kennedy Alatinga1, Evelyn Ewere2, Calistus Agbam1, Katja Bender1
1International Centre for Sustainable Development (IZNE) of the University of Applied Science Bonn Rhein-Sieg (HBR), Sankt Augustin, Germany.
2Faculty of Planning and Land Management at SD Dumbo University of Business and Integrated Development Studies, Wa, Ghana.
3Center for Development Research (ZEF), University of Bonn, Bonn, Germany.

Background: Access to electricity is one of the enabling factors for healthcare service provision. From the sustainable development perspective, an essential requirement for improving health and caring for our environment is to assure that health facilities have sufficient and reliable access to the supply of clean and sustainable energy. The objective of this work is to investigate the users’ perceptions of electricity needs and electricity sources and the way those influence different attributes and their relevance for the diffusion of renewable electricity systems in healthcare facilities.

Methods: To identify preferences and choices, Stated Choice modelling was applied as the use of solar PV systems in health facilities is not widespread in Ghana. This method allows to present the respondents with hypothetical options, which have attributes close to the real world. Four attributes were considered, namely electricity system configuration, initial investment cost, monthly costs, and improvements to the reliability of the electricity supply.

Results: The largest share of the 200 health facilities interviewed reported services provision as outpatient treatment, provision of maternity services and family planning, which are relatively low electricity-intensive services. However, there was a general perception that increased reliability on the electricity supply can improve the health service provision and operation of the facilities. Moreover, despite that preferences towards the solar systems, the initial investment costs of the solar systems is still perceived as preventing the adoption of this technology.

Conclusion: From this study we can conclude that health facilities in Ghana rely greatly on the national supply which has issues with reliability, compromising the delivery of healthcare services. However, the adoption of alternative electricity technologies based on renewable sources is not likely to occur at the facility level without the engagement of other actors that can help bridging the barriers for adoption, as initial investment costs.

Knowledge and practice of biosafety among laboratory staff in Tunis governorate, Tunisia
Sondes Derouiche1, Nissa Bouaffif ep Ben Aliya1, Mohamed Makhlouf1, Salah Amor2, Hejjer Letaief1, Aicha Hechaichi1
1National Observatory of New and Emerging Diseases, Tunis, Tunisia, 2Dr Sfax, Tunisia, Minister of Health, Tunisia, Sfax, Tunisia, 3CO-Coordinator scientifique du programme FETP Tunisie

Background: Developing countries often lack biosafety standard operating procedures. A need to study biosafety practices among staff of state and private laboratories has been identified. This study aimed to assess the knowledge and practices of laboratory standard precautions (LSP) among laboratory staff in human and animal laboratories in the governorate of Tunis.

Methods: A cross-sectional descriptive study was conducted using a standardized questionnaire administered between December 2021 and January 2022. Data were collected among laboratory staff who agreed to participate in this study. Answers were judged according to the score granted to each item and used during a face-to-face interview.

Results: Among the 152 staff interviewed, 70% were from the public sector. The majority of staff was vaccinated against hepatitis B (84.5%). The overall level of knowledge was satisfactory in 51% of cases. In the area of proper use of personal protective equipment, 95% wore the mask and 80% the gloves. On a practical level, 66% of the staff questioned, regardless of their categories, had an adequate overall perception of biosafety.

Conclusion: Although this study revealed several limitations such as the reluctance and unavailability of laboratory staff during the study period, significant gaps affecting both knowledge and practice among laboratory staff in Tunis region have been identified. Continuous staff training based on behavior and on application of universal and specific hygiene measures as well as periodic evaluations of these laboratories is recommended.

The 2008 economic crisis’ impact on perinatal and infant mortality in Southern European countries
Julia Doetsch1, Ricardo Almendra2, Teresa Leão3, Eva Piloto4, Thomas Krafitt5, Henrique Barros6
1Institute of Public Health, University of Porto (ISUP), Epidemiological research unit (EPIUnit) Germany, 2CEGOT-Centre of Studies on Geography and Spatial Planning; Department of Geography and Tourism, University of Coimbra Milton Severo EPIUnit - Instituto de Saúde Pública da Universidade do Porto, Portugal, 3EPIUnit - Instituto de Saúde Pública da Universidade do Porto, Portugal, 4Faculty of Health, Medicine and Life Sciences, Care and Public Health Research Institute, Maastricht University, Maastricht, the Netherlands

Background and objective: The study of crises events provides important lessons to prepare for upcoming events. The Great Recessions impact on perinatal health in Europe can provide relevant insights on the healthcare and social protection systems’ response in the protection of the health of the most vulnerable groups. To assess time trends and international disparities in perinatal (PMR) and infant mortality (IMR), following the Great Recession, and their association with socioeconomic indicators in Portugal, Greece, Italy and Spain.

Methods: Associations were assessed through generalised linear models for all four countries. A Poisson jointpoint regression model was applied to explore PMR and IMR trends changes between 2000 and 2018. Country disparities were analysed using Mixed Effect Multilevel models.

Results: IMR and PMR have decreased overall in the four selected countries
between 2000 and 2018. Still, whereas in Spain, Italy and Portugal the decreasing age was significant (B = .017 per year, p <.001), as the effect of poverty was the greatest in middle-aged categories, while limited in younger and elderly groups. Conclusion: In a nationally representative US adult population, we showed that higher poverty enhances the acceleration of biological age, particularly in middle-aged persons. It might be hypothesized that the social stressors accumulated at younger age can promote health inequalities later in life.

DOI: 10.18332/popmed/164131

Reframing Health in Urban Airport Regions
Evelyne de Loeuw1, Alana Crimeen1, Robert Freestone2
1University of New South Wales Australia, 2University of New South Wales

Background and Objectives: The COVID-19 pandemic has elevated awareness of the role of airports in public health. However, the influence of airports on health goes beyond the spread of infectious diseases. In cities, airports have increasingly complex relationships with transportation networks, economies and industries, built and natural environments and social systems. A new international airport in Sydney, Australia, is being developed alongside an airport-focused city plan, creating the opportunity to interrogate the considerations given to determinants of health within urban airport planning.

Methods: A literature review was conducted to identify research, policies and programs of urban airport development relevant to health and health-adjacent planning approaches such as green infrastructure, sustainability, liveability and wellbeing. A content analysis of strategic planning documents for the Western Sydney Airport region was then conducted, identifying the presence and framing of these concepts at a local, regional and state level.

Results: There is a growing global trend towards airport policies and programs that, at a strategic level, align with the Sustainable Development Goals, reduce environmental impacts and promote urban integration. Many of these programs adopt health-adjacent goals. Health-explicit approaches primarily focus on environmental protection and pollution management. These findings are reflected in the Western Sydney Airport regional planning documents. However, the strategic plans of the near-airport area have a reduced presence of the health-promoting planning priorities of the greater region and an increased focus on the airport-specific planning requirements.

Conclusion: More consideration needs to be given to the broader public health implications of the airport. This includes problems such as disruptions to local transportation, presence of community spaces and the equitable distribution of economic benefit. Centralising a comprehensive focus on public health creates an opportunity to develop solutions to the conflict between urban airports and communities.

Identifying health literacy profiles among migrant communities to improve health and equity outcomes
Sónia Dias1, Maria Marques1, Ana Gama2, Christina Cheng3, Richard Osborne1
1NOVA School of Public Health, Public Health Research Centre, CHRC, Universidade NOVA de Lisboa, Lisboa, Portugal, 2NOVA School of Public Health, Universidade NOVA de Lisboa, Portugal, 3Centre of Global Health and Equity, Swinburne University of Technology, Melbourne, Australia

Background and Objectives: Health literacy is a key enabler to accelerating progress towards noncommunicable diseases targets in the Sustainable Development Goals. Gaining an understanding of people’s health literacy strengths, needs and preferences provides insight into whether individuals can access, understand, appraise, remember or use health information or engage with health services. Using health literacy as a measurable multidimensional concept, we aimed to identify priority groups of migrants at risk of poor health and equity outcomes.

Methods: We combined quantitative and qualitative cross-sectional data of 1126 migrants living in Portugal. Quantitative assessments used the Health Literacy Questionnaire (HLQ), with nine distinct dimensions and sociodemographic variables. Descriptive and hierarchical cluster analyses were performed to characterise and generate profiles of groups with similar health literacy patterns. Semi-structured interviews were conducted with 15 migrants, stratified by the identified clusters.
Socioeconomic disparities of life expectancy: Analysis of 34 Provinces in Indonesia as of 2019
Syarif Hasibuan1, Ede Darmawan2, Nitadewi3
1Indonesian Public Health Association, Faculty of Public Health, Universitas Kampus UI Depok, Indonesia, 2Indonesian Public Health Association (IPHA), Research and Community Service Center, Faculty of Public Health, Universitas Kampus UI Depok, Indonesia, 3Department of Health Policy and Administration, Faculty of Public Health Universitas Indonesia, Indonesian Public Health Association (IPHA) Kampus UI Depok, Indonesia
Background: Life expectancy at birth is one of the Human Development Index (HDI) that measure human development. More than half of Provinces in Indonesia have average of life expectancy at birth lower than the average of national life expectancy at birth (71.3 years). The range of gap is 10 years between Provinces with the lowest and highest life expectancy average at birth.
Objective: To analyze the effect of socioeconomic disparities to life expectancy at birth among provinces in Indonesia based on data 2019
Methods: We used aggregate data of Province and Districts Government Budget Allocation for Health from Ministry of Finance and other socioeconomic data form the Central Bureau of Statistics. Dependent variables included average life expectancy of people in each Provinces. Independent variables included the socioeconomic aspect from each Province such as availability of healthcare and physicians, dependency ratio estimates, government budget allocation for health and proportion of people with income below half of the median. Pearson correlation test used to see the correlation between dependent and independent variables.
Results: We found significant correlation between life expectancy average at birth with dependency ratio (r=0.467, p-value=0.00), proportion of people with income below median (r=0.386, p-value=0.02), and hospital ratio per 1.000 people (r=0.355, p-value=0.04). While there are no correlation between life expectancy average at birth with the other independent variable such as physician ratio per 100.000 people, public health center ratio per 100.000 people, poverty percentage and government budget allocation for health.
